

# REF2125 低ドリフト、低消費電力、小型のシリーズ電圧リファレンス クリーン・スタート付き

## 1 特長

- 初期精度:  $\pm 0.05\%$  (最大値)
- 温度ドリフト係数:  $6\text{ppm}/^\circ\text{C}$  (最大値)
- 動作温度範囲  $-40^\circ\text{C}\sim+125^\circ\text{C}$
- 出力電流:  $\pm 10\text{mA}$
- 低静止電流:  $95\mu\text{A}$  (最大値)
- 広い入力電圧範囲:  $12\text{V}$
- 出力1/fノイズ( $0.1\text{Hz}\sim 10\text{Hz}$ ):  $5\mu\text{V}_{\text{pp}}/\text{V}$
- 優れた長期安定性:  $30\text{ppm}/1000\text{時間}$
- 小型の5ピンSOT-23パッケージ

## 2 アプリケーション

- 高精度データ・アキュジション・システム
- 電力監視
- PLCアナログI/Oモジュール
- 産業用計測機器
- フィールド・トランスミッタ
- 試験用機器
- $4\sim 20\text{mA}$ ループ・センサ
- LCRメータ

## 3 概要

REF2125デバイスは、低温度ドリフト( $6\text{ppm}/^\circ\text{C}$ )、低消費電力、高精度のCMOS電圧リファレンスで、消費電力を $95\mu\text{A}$ 未満に抑えて、 $\pm 0.05\%$ の初期精度と低動作電流を実現します。また、出力ノイズが $5\mu\text{V}_{\text{pp}}/\text{V}$ と非常に低いため、高分解能のデータ・コンバータやノイズの影響を受けやすいシステムで高いシグナル・インテグリティを維持できます。

デバイスの低い出力電圧ヒステリシスと低い長期出力電圧ドリフトにより、安定性とシステム信頼性がさらに改善されています。さらに、動作電流の低い( $95\mu\text{A}$ )小型デバイスであるため、バッテリー駆動の携帯アプリケーションに最適です。

REF2125は、 $-40^\circ\text{C}\sim+125^\circ\text{C}$ の広い温度範囲で動作が規定されています。その他の電圧オプションについては、TIの営業担当者にお問い合わせください。

## 7 Parameter Measurement Information

### 7.1 Solder Heat Shift

The materials used in the manufacture of the REF2125 have differing coefficients of thermal expansion, resulting in stress on the device die when the part is heated. Mechanical and thermal stress on the device die can cause the output voltages to shift, degrading the initial accuracy specifications of the product. Reflow soldering is a common cause of this error.

In order to illustrate this effect, a total of 32 devices were soldered on four printed circuit boards [16 devices on each printed circuit board (PCB)] using lead-free solder paste and the paste manufacturer suggested reflow profile. The reflow profile is as shown in Figure 22. The printed circuit board is comprised of FR4 material. The board thickness is 1.65 mm and the area is 114 mm × 152 mm.

Figure 22. Reflow Profile

The reference and bias output voltages are measured before and after the reflow process; the typical shift is displayed in Figure 23. Although all tested units exhibit very low shifts (< 0.01%), higher shifts are also possible depending on the size, thickness, and material of the printed circuit board. An important note is that the histograms display the typical shift for exposure to a single reflow profile. Exposure to multiple reflows, as is common on PCBs with surface-mount components on both sides, causes additional shifts in the output bias voltage. If the PCB is exposed to multiple reflows, solder the device in the second pass to minimize its exposure to thermal stress.

Figure 23. Solder Heat Shift Distribution,  $V_{REF}$  (%)

## 7.2 Long-Term Stability

One of the key parameters of the REF2125 reference is long-term stability. Typical characteristic expressed as curves shows the typical drift value for the REF2125 is 30 ppm from 0 to 1000 hours. This parameter is characterized by measuring 32 units at regular intervals for a period of 1000 hours. It is important to understand that long-term stability is not ensured by design and that the output from the device may shift beyond the typical 30 ppm specification at any time. For systems that require highly stable output voltages over long periods of time, the designer should consider burning in the devices prior to use to minimize the amount of output drift exhibited by the reference over time

**Figure 24. Long Term Stability - 1000 hours ( $V_{REF}$ )**

## 7.3 Thermal Hysteresis

Thermal hysteresis is measured with the REF2125 soldered to a PCB, similar to a real-world application. Thermal hysteresis for the device is defined as the change in output voltage after operating the device at 25°C, cycling the device through the specified temperature range, and returning to 25°C. Hysteresis can be expressed by Equation 1:

$$V_{HYST} = \left( \frac{|V_{PRE} - V_{POST}|}{V_{NOM}} \right) \times 10^6 \text{ (ppm)}$$

where

- $V_{HYST}$  = thermal hysteresis (in units of ppm)
- $V_{NOM}$  = the specified output voltage
- $V_{PRE}$  = output voltage measured at 25°C pre-temperature cycling
- $V_{POST}$  = output voltage measured after the device has cycled from 25°C through the specified temperature range of -40°C to +125°C and returns to 25°C. (1)

Typical thermal hysteresis distribution is as shown in [Figure 25](#).

**Thermal Hysteresis (continued)**

**Figure 25. Thermal Hysteresis Distribution (V<sub>REF</sub>)**

**7.4 Power Dissipation**

The REF2125 voltage reference is capable of source and sink up to 10 mA of load current across the rated input voltage range. However, when used in applications subject to high ambient temperatures, the input voltage and load current must be carefully monitored to ensure that the device does not exceed its maximum power dissipation rating. The maximum power dissipation of the device can be calculated with [Equation 2](#):

$$T_J = T_A + P_D \times R_{\theta JA}$$

where

- P<sub>D</sub> is the device power dissipation
- T<sub>J</sub> is the device junction temperature
- T<sub>A</sub> is the ambient temperature
- R<sub>θJA</sub> is the package (junction-to-air) thermal resistance (2)

Because of this relationship, acceptable load current in high temperature conditions may be less than the maximum current-sourcing capability of the device. In no case should the part be operated outside of its maximum power rating because doing so can result in premature failure or permanent damage to the device.

## 7.5 Noise Performance

Typical 0.1-Hz to 10-Hz voltage noise can be seen in [Figure 26](#). Device noise increases with output voltage and operating temperature. Additional filtering can be used to improve output noise levels, although care must be taken to ensure the output impedance does not degrade ac performance. Peak-to-peak noise measurement setup is shown in [Figure 26](#).

**Figure 26. 0.1-Hz to 10-Hz Noise ( $V_{REF}$ )**

## 8 Detailed Description

### 8.1 Overview

The REF2125 is part of a family of low-noise, precision bandgap voltage references that are specifically designed for excellent initial voltage accuracy and drift. The *Functional Block Diagram* is a simplified block diagram of the REF2125 showing basic band-gap topology.

### 8.2 Functional Block Diagram

### 8.3 Feature Description

#### 8.3.1 Supply Voltage

The REF2125 family of references features an extremely low dropout voltage. The REF2125 can be operated with a supply of only 1 mV above the output voltage in an unloaded condition. For loaded conditions, a typical dropout voltage versus load is shown on the front page. The REF2125 features a low quiescent current that is extremely stable over changes in both temperature and supply. The typical room temperature quiescent current is 72  $\mu\text{A}$ , and the maximum quiescent current over temperature is just 95  $\mu\text{A}$ . Supply voltages below the specified levels can cause the REF2125 to momentarily draw currents greater than the typical quiescent current. Use a power supply with a fast rising edge and low output impedance to easily prevent this issue.

#### 8.3.2 Low Temperature Drift

The REF2125 is designed for minimal drift error, which is defined as the change in output voltage over temperature. The drift is calculated using the box method, as described by [Equation 3](#):

$$\text{Drift} = \left( \frac{V_{\text{REF(MAX)}} - V_{\text{REF(MIN)}}}{V_{\text{REF}} \times \text{Temperature Range}} \right) \times 10^6 \quad (3)$$

#### 8.3.3 Load Current

The REF2125 family is specified to deliver a current load of  $\pm 10$  mA per output. The  $V_{\text{REF}}$  output of the device are protected from short circuits by limiting the output short-circuit current to 18 mA. The device temperature increases according to [Equation 4](#):

$$T_J = T_A + P_D \times R_{\theta JA}$$

where

- $T_J$  = junction temperature ( $^{\circ}\text{C}$ ),
  - $T_A$  = ambient temperature ( $^{\circ}\text{C}$ ),
  - $P_D$  = power dissipated (W), and
  - $R_{\theta JA}$  = junction-to-ambient thermal resistance ( $^{\circ}\text{C}/\text{W}$ )
- (4)

The REF2125 maximum junction temperature must not exceed the absolute maximum rating of  $150^{\circ}\text{C}$ .

## Feature Description (continued)

### 8.3.4 Clean Start Feature

In many applications (for example, loop powered applications), the supply at VIN has inductive impedance. This can cause the supply to dip during start-up because of the large output capacitor connected to the voltage reference and the inductive supply. The REF2125 family has an internal clean start block to control the peak of the inrush current during start-up. This feature is illustrated in [Functional Block Diagram](#). The peak of inrush current can be calculated as [Equation 5](#):

$$I_{PEAK} \approx 466\mu\text{A} + 13.54\mu\text{A} \times R_{CS}$$

where

- $I_{PEAK}$  = Peak of inrush current ( $\mu\text{A}$ ), has a range of [0.5 mA, 19 mA],
  - $R_{CS}$  = External resistor connected to the CS pin
- (5)

During power up,  $I_{PEAK}$  is split between the device current and output current. The output current ( $I_{OUT}$ ) is split between output capacitor and load current ( $I_{LOAD}$ ). The device current can be estimated to be  $I_Q + I_{OUT}/183$ , where  $I_Q$  is quiescent current at no load. Hence for a given  $I_{LOAD}$  it is important to choose  $R_{CS}$  such that  $I_{PEAK}$  is larger than  $I_{LOAD}$ . Above equations capture typical characteristics and hence it is suggested to include  $\pm 25\%$  margins while budgeting for inrush current and also while choosing  $R_{CS}$  for a given  $I_{LOAD}$ . This inrush current continues to stay at the limiting value ( $I_{PEAK}$ ) till output reaches close to  $V_{REF}$  (2.5 V).

When a  $C_{CS}$  is also connected in parallel to  $R_{CS}$ , The inrush current limit shall rise exponentially to the steady state value ( $I_{PEAK}$ ) as calculated using above equations, with a time constant of  $R_{CS} \times C_{CS}$ . Hence the initial (and maximum) rate of rise of inrush current shall be  $I_{PEAK} / (R_{CS} \times C_{CS})$ . Because the inrush current rate is limited, the loop powered supply dip is controlled.

## 8.4 Device Functional Modes

### 8.4.1 EN Pin

When the ENABLE pin of the REF2125 is pulled high, the device is in active mode. The device must be in active mode for normal operation. The REF2125 can be placed in a low-power mode by pulling the ENABLE pin low. When in shutdown mode, the output of the device becomes high impedance and the quiescent current of the device reduces to 2  $\mu\text{A}$  in shutdown mode. The EN pin must not be pulled higher than VIN supply voltage. See the [Thermal Information](#) for logic high and logic low voltage levels.

### 8.4.2 Negative Reference Voltage

For applications requiring a negative and positive reference voltage, the REF2125 and OPA735 can be used to provide a dual-supply reference from a 5-V supply. [Figure 27](#) shows the REF2125 used to provide a 2.5-V supply reference voltage. The low drift performance of the REF2125 complements the low offset voltage and zero drift of the OPA735 to provide an accurate solution for split-supply applications. Take care to match the temperature coefficients of R1 and R2.

## 9 Applications and Implementation

### NOTE

Information in the following applications and setups sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### 9.1 Application Information

As this device has many applications and setups, there are many situations that this datasheet can not characterize in detail. Basic applications includes positive/negative voltage reference and data acquisition systems. For more information see application sections in the REF32xx data sheet.

### 9.2 Typical Application: Basic Voltage Reference Connection

The circuit shown in [Figure 28](#) shows the basic configuration for the REF2125 references. Connect bypass capacitors according to the guidelines in [Input and Output Capacitors](#).

Copyright © 2017, Texas Instruments Incorporated

**Figure 28. Basic Reference Connection**

#### 9.2.1 Design Requirements

A detailed design procedure is described based on a design example. For this design example, use the parameters listed in [Table 1](#) as the input parameters.

**Table 1. Design Example Parameters**

DESIGN PARAMETER	VALUE
Input voltage $V_{IN}$	5 V
Output voltage $V_{OUT}$	2.5 V
REF2125 input capacitor	1 $\mu$ F
REF2125 output capacitor	10 $\mu$ F

#### 9.2.2 Detailed Design Procedure

##### 9.2.2.1 Input and Output Capacitors

A 1- $\mu$ F to 10- $\mu$ F electrolytic or ceramic capacitor can be connected to the input to improve transient response in applications where the supply voltage may fluctuate. Connect an additional 0.1- $\mu$ F ceramic capacitor in parallel to reduce high frequency supply noise.

A ceramic capacitor of at least 0.1  $\mu$ F must be connected to the output to improve stability and help filter out high frequency noise. An additional 1- $\mu$ F to 10- $\mu$ F electrolytic or ceramic capacitor can be added in parallel to improve transient performance in response to sudden changes in load current; however, keep in mind that doing so increases the turnon time of the device.

Best performance and stability is attained with low-ESR, low-inductance ceramic chip-type output capacitors (X5R, X7R, or similar). If using an electrolytic capacitor on the output, place a 0.1- $\mu\text{F}$  ceramic capacitor in parallel to reduce overall ESR on the output.

### 9.2.2.2 $V_{IN}$ Slew Rate Considerations

In applications with slow-rising input voltage signals, the reference exhibits overshoot or other transient anomalies that appear on the output. These phenomena also appear during shutdown as the internal circuitry loses power.

To avoid such conditions, ensure that the input voltage wave-form has both a rising and falling slew rate close to 6 V/ms.

### 9.2.2.3 Shutdown/Enable Feature

The REF2125 references can be switched to a low power shut-down mode when a voltage of 0.5 V or lower is input to the ENABLE pin. Likewise, the reference becomes operational for ENABLE voltages of 1.6 V or higher. During shutdown, the supply current drops to less than 2  $\mu\text{A}$ , useful in applications that are sensitive to power consumption.

If using the shutdown feature, ensure that the ENABLE pin voltage does not fall between 0.5 V and 1.6 V because this causes a large increase in the supply current of the device and may keep the reference from starting up correctly. If not using the shutdown feature, however, the ENABLE pin can simply be tied to the IN pin, and the reference remains operational continuously.

## 9.2.3 Application Curves

## 10 Power-Supply Recommendations

The REF2125 family of references feature an extremely low-dropout voltage. These references can be operated with a supply of only 50 mV above the output voltage. TI recommends a supply bypass capacitor ranging between 0.1  $\mu\text{F}$  to 10  $\mu\text{F}$ .

## 11 Layout

### 11.1 Layout Guidelines

Figure 31 illustrates an example of a PCB layout for a data acquisition system using the REF2125. Some key considerations are:

- Connect low-ESR, 0.1- $\mu$ F ceramic bypass capacitors at  $V_{IN}$ ,  $V_{REF}$  of the REF2125.
- Decouple other active devices in the system per the device specifications.
- Using a solid ground plane helps distribute heat and reduces electromagnetic interference (EMI) noise pickup.
- Place the external components as close to the device as possible. This configuration prevents parasitic errors (such as the Seebeck effect) from occurring.
- Do not run sensitive analog traces in parallel with digital traces. Avoid crossing digital and analog traces if possible, and only make perpendicular crossings when absolutely necessary.

### 12.5 静電気放電に関する注意事項

すべての集積回路は、適切なESD保護方法を用いて、取扱いと保存を行うようにして下さい。

静電気放電はわずかな性能の低下から完全なデバイスの故障に至るまで、様々な損傷を与えます。高精度の集積回路は、損傷に対して敏感であり、極めてわずかなパラメータの変化により、デバイスに規定された仕様に適合しなくなる場合があります。

## 13 メカニカル、パッケージ、および注文情報

以降のページには、メカニカル、パッケージ、および注文に関する情報が記載されています。これらの情報は、指定のデバイスに対して提供されている最新のデータです。このデータは予告なく変更されることがあり、ドキュメントが改訂される場合もあります。本データシートのブラウザ版を使用されている場合は、画面左側の説明をご覧ください。

**PACKAGING INFORMATION**

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "-" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
