SNx4AHC14 ヘキサ・シュミット・トリガ・インバータ

1 特長

- JESD 22 を上回る ESD 保護:
  - 2000V、人体モデル (A114-A)
  - 200V、マシン モデル(A115-A)
  - 1000V、デバイス帯電モデル (C101)
- 動作範囲:2V～5.5V
- 5V で ±8mA の出力駆動能力
- シュミット トリガ入力により入力ノイズ耐性を実現
- 低消費電力:I_{CC} = 20µA (最大値)
- JESD 17 準拠で
  250mA 超のラッチアップ性能

2 アプリケーション

- UPS
- 白物家電
- コンピュータ周辺機器
- プリンタ
- AC サーボ・ドライブ
- デスクトップ・コンピュータ

3 概要

SNx4AHC14 デバイスは、6 つの独立したインバータを備えています。これらのデバイスはブール関数 $Y = \overline{A}$ を実行します。

各回路は、独立したインバータとして機能しますが、シュミット・トリガ動作のため、正方向 (V_{T+}) と負方向 (V_{T-}) の信号に対する入力スレッショルド・レベルが異なります。

7 Detailed Description

7.1 Overview

The SNx4AHC14 Schmitt-Trigger devices contain six independent inverters. They perform the Boolean function $Y = \overline{A}$ in positive logic.

Schmitt-Trigger inputs are designed to provide a minimum separation between positive and negative switching thresholds. This allows for noisy or slow inputs that would cause problems such as oscillation or excessive current draw with normal CMOS inputs.

7.2 Functional Block Diagram

7.3 Feature Description

The wide operating range of the device allows it to be used in a variety of systems that use different logic levels. The outpus can drive up to 10 LSTTL loads each. The balanced drive outputs can source or sink 8 mA at 5-V V_{CC}.

7.4 Device Functional Modes

表 7-1 lists the functional modes of the SNx4AHC14.

8 Application and Implementation

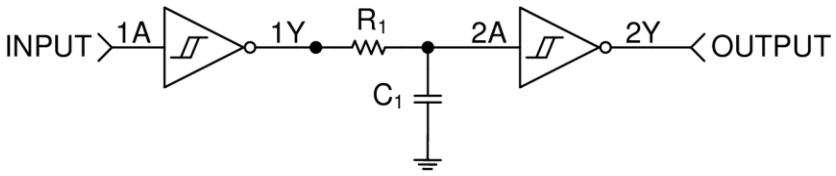
注

以下のアプリケーション情報は、TI の製品仕様に含まれるものではなく、TI ではその正確性または完全性を保証いたしません。個々の目的に対する製品の適合性については、お客様の責任で判断していただくことになります。お客様は自身の設計実装を検証しテストすることで、システムの機能を確認する必要があります。

8.1 Application Information

The SN74AHC14 device is a Schmitt-Trigger input CMOS device that can be used for a multitude of inverting buffer type functions. The application shown here takes advantage of the Schmitt-Trigger inputs to produce a delay for a logic input.

8.2 Typical Application



Copyright © 2016, Texas Instruments Incorporated

図 8-1. Simplified Application Schematic

8.2.1 Design Requirements

This device uses CMOS technology. Take care to avoid bus contention because it can drive currents that would exceed maximum limits. Parallel output drive can create fast edges into light loads so consider routing and load conditions to prevent ringing.

8.2.2 Detailed Design Procedure

This circuit is designed around an RC network that produces a slow input to the second inverter. The RC time constant, τ, is calculated from: $\tau = RC$.

The delay time for this circuit is from $t_{delay(min)} = -\ln |1 - V_{T+(min)} / V_{CC}| \tau$ to $t_{delay(max)} = -\ln |1 - V_{T+(max)} / V_{CC}| \tau$. It must be noted that the delay is consistent for each device, but because the switching threshold is only ensured between the minimum and maximum value, the output pulse length varies between devices. These values must be calculated by using the minimum and maximum V_{T+} values in the *Electrical Characteristics*.

The resistor value must be chosen such that the maximum current to and from the SN74AHC14 is 8 mA at 5-V V_{CC}.

8.2.3 Application Curve

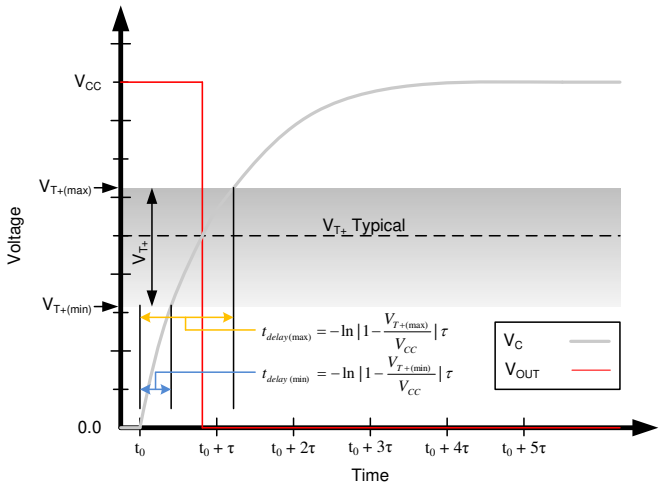


図 8-2. Ideal Capacitor Voltage and Output Voltage With Positive Switching Threshold

8.3 Power Supply Recommendations

The power supply can be any voltage between the minimum and maximum supply voltage rating located in the *Recommended Operating Conditions*. The V_{CC} terminal must have a good bypass capacitor to prevent power disturbance. TI recommends using a 0.1-µF capacitor on the V_{CC} terminal, and must be placed as close as possible to the pin for best results.

8.4 Layout

8.4.1 Layout Guidelines

When using multiple bit logic devices, inputs must never float. In many cases, functions or parts of functions of digital logic devices are unused, for example, when only two inputs of a triple-input AND gate are used or only three of the four buffer gates are used. Such inputs must not be left unconnected because the undefined voltages at the outside connections result in undefined operational states. All unused inputs of digital logic devices must be connected to a high or low bias to prevent them from floating. The logic level that must be applied to any particular unused input depends on the function of the device. Generally they are tied to GND or V_{CC}, whichever makes more sense or is more convenient. Floating outputs are generally acceptable, unless the part is a transceiver.

(1) **Status:** For more details on status, see our product life cycle.

(2) **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

(3) **RoHS values:** Yes, No, RoHS Exempt. See the TI RoHS Statement for additional information and value definition.

(4) **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

(5) **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.
