

THVD4431 120Ω の切り替え可能終端抵抗と IEC-ESD 保護機能を内蔵したマルチプロトコル (RS-232、RS-422、RS485) トランシーバ

1 特長

- TIA/EIA-485A および TIA/EIA-232F 規格の要件に適合またはそれを上回る性能
- RS-232 仕様のトランスミッタ 3 個とレシーバ 5 個
- RS-485 仕様のトランスミッタ 1 個とレシーバ 1 個
- RS-485 モード用のオンチップの切り替え可能な 120Ω 終端抵抗
- RS-232 信号伝送用チャージポンプを内蔵
- 電源電圧: 3V~5.5V
- ロジック データおよび制御信号用の 1.65V~5.5V 電源
- 5V 電源で 2.1V を超える RS-485 差動出力により PROFIBUS に準拠
- RS-232 モードでの大きな出力スイング (代表値 ±9V)
- SLR ピンで選択可能なデータレート:
 - RS-232 3T5R モード: 250kbps、1Mbps
 - RS-485 の半二重および全二重モード: 500kbps、20Mbps
- バス I/O 保護
 - ±16kV HBM ESD
 - ±8kV IEC 61000-4-2 接触および ±15kV 気中放電
 - ±4kV IEC 61000-4-4 高速過渡バースト
- RS-232 と RS-485 の両方のモードに対応する診断ループバック
- ディスエーブル状態でシャットダウンピンを使用して消費電流を低減 (代表値 10μA)
- グリッチなしの電源オン / オフによるホット プラグイン機能
- RS-485 仕様の 1/8 単位負荷 (最大 256 個のバスノード)
- RS-485 レシーバに対する開放、短絡、アイドル バスのフェイルセーフ
- バス短絡保護、サーマル シャットダウン
- 拡張周囲温度範囲: -40°C~125°C
- 省スペースで熱効率の高い 6mm × 6mm VQFN-40 パッケージ

2 アプリケーション

- 産業用 PC
- ファクトリ・オートメーションおよび制御
- HVAC システム
- ビル・オートメーション
- POS 端末
- グリッド・インフラ
- 産業用輸送

3 概要

THVD4431 は、RS-232、RS-422、RS-485 の各物理層をサポートする、高集積で堅牢なマルチプロトコルトランシーバです。このデバイスは、3 つのトランスミッタと 5 つのレシーバを搭載しており、3T5R RS-232 ポートを有効にできます。また、このデバイスには 1 つのトランスミッタと 1 つのレシーバが内蔵されており、半二重と全二重の RS-485 ポートを実現できます。モード選択ピンにより、プロトコルの共有バスおよびロジックピンが共通の単一のコネクタを共有できるようになります。RS-485 バスピンと RS-232 レシーバ入力の終端が統合されているため、外付け部品なしで完全な機能を持つ通信ポートを実現できます。このデバイスはスルーレート選択機能を備えており、これを使うと、SLR ピンの設定に基づいて 2 つの最大速度でこのデバイスを使うことができます。

このデバイスは、レベル 4 の IEC ESD 保護機能を内蔵しているため、システムレベルの外付け保護部品は不要です。RS-232 と RS-485 の両方に、ロジックからバスおよびバスからロジックパスに向う機能安全性をチェックし、ケーブルとコネクタの短絡をチェックする、診断ループバックモードが搭載されています。さらに、RS-485 レシーバのフェイルセーフ機能は、バス入力が開放または短絡しているとき、またはバスがアイドル状態のときに、受信したロジック出力をロジック High に駆動します。シャットダウンモードの消費電流は非常に小さく (代表値 10μA)、消費電力の制約が厳しいアプリケーションに最適です。このデバイスには、RS-232 用のチャージポンプ、および RS-232 と RS-485 の両方のドライバ / レシーバに電力を供給する 3~5.5V の電源が必要です。独立したロジック電源 V_{IO} (1.65V~5.5V) により、低レベルのマイクロコントローラとのインターフェイスが可能です。

パッケージ情報

部品番号	パッケージ (1)	パッケージ サイズ (2)
THVD4431	VQFN (40)	6mm × 6mm

- (1) 詳細については、[セクション 11](#) を参照してください。
- (2) パッケージ サイズ (長さ×幅) は公称値であり、該当する場合はピンも含まれます。

4 Pin Configuration and Functions

図 4-1. 40-Pin VQFN Package (RHA)
Top View

表 4-1. Pin Functions

NAME	NO.	TYPE	DESCRIPTION
L1	1	O	Logic output (RS-232)
L2	2	O	Logic output (RS-232/RS-485)
L3	3	I	Logic input (RS-232/RS-485). Integrated weak pull-up resistor .
L4	4	I	Logic input. Integrated weak pull-up resistor
L5	5	O	Logic output
L6	6	I	Logic input, Integrated weak pull-up resistor
L7	7	O	Logic output
L8	8	O	Logic output
V _{IO}	9	P	1.65 V to 5.5 V logic supply voltage

表 4-1. Pin Functions (続き)

NAME	NO.	TYPE	DESCRIPTION
GND ⁽¹⁾	10	G	Ground
SLR	11	I	Slew rate control, internal pull-down resistor. SLR=H enables slow speed
DIR	12	I	RS-485 TX/RX enable/disable. Internal pull-down resistor.
MODE2	13	I	MODE control pins, Integrated weak pull-down resistor
MODE0	14	I	
MODE1	15	I	
NC	16	NC	Not connected internally. Can be connected to supply, ground or left open on PCB.
TERM_TX	17	I	120 Ω Termination enable/disable across R1/R2 terminals. Internal Pull down resistor
TERM_RX	18	I	120 Ω Termination enable/disable across R3/R4 terminals. Internal Pull down resistor
SHDN	19	I	Device enable/disable. Internal pull-down resistor
V _{CC}	20	P	3 to 5.5V supply voltage
R8	21	I	RS-232 receiver input
R7	22	I	RS-232 receiver input
GND ⁽¹⁾	23	G	Ground
R6	24	O	RS-232 driver output
R5	25	I	RS-232 receiver input
GND	26	G	Ground
R4	27	I/O	RS-232 driver output or RS-485 inverting receiver input (B)
R3	28	I/O	RS-232 driver output or RS-485 non-inverting receiver input (A)
GND ⁽¹⁾	29	G	Ground
R2	30	I/O	RS-232 receiver input or RS-485 bus pin (Y or A)
R1	31	I/O	RS-232 receiver input or RS-485 bus pin (Z or B)
V _{CC}	32	P	3 to 5.5 V supply voltage
V-	33		Negative charge pump rail
C2-	34		Negative terminal of charge pump capacitor
C1-	35		Negative terminal of charge pump capacitor
NC	36	NC	Not connected internally. Can be left open or Grounded on PCB.
C1+	37		Positive terminal of charge pump capacitor
V _{CC}	38	P	3 to 5.5V supply voltage
C2+	39		Positive terminal of charge pump capacitor
V+	40		Positive charge pump rail

(1) GND pins 10, 23, 26, 29 all must be grounded on PCB.

5 Specifications

5.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)⁽¹⁾

		MIN	MAX	UNIT
Bus supply voltage	V _{CC} to GND	–0.5	6	V
Logic supply voltage	V _{IO} to GND	–0.5	V _{CC} + 0.2	V
Charge pump positive-output supply voltage	V+ to GND	–0.3	14	V
Charge pump negative-output supply voltage	V- to GND	–14	0.3	V
Bus voltage	Voltage at any bus pin (R1, R2, R3, R4, R5, R6, R7, R8) with respect to GND	–16	16	V
Differential bus voltage	(R1-R2) or (R2-R1), (R3-R4) or (R4-R3) with termination disabled	–22	22	V
Differential bus voltage RS485 mode	(R1-R2) or (R2-R1), (R3-R4) or (R4-R3) with termination enabled	–6	6	V
Input voltage	Range at any logic pin (L3, L4, L6, SLR, $\overline{\text{SHDN}}$, TERM_TX, TERM_RX, MODE0, MODE1, MODE2, DIR)	–0.3	V _{IO} + 0.2	V
Receiver output current	I _O (L1, L2, L5, L7, L8)	–8	8	mA
Storage temperature	T _{stg}	–65	150	°C
Junction temperature	T _J	–40	170	°C

- (1) Operation outside the Absolute Maximum Ratings may cause permanent device damage. Absolute Maximum Ratings do not imply functional operation of the device at these or any other conditions beyond those listed under Recommended Operating Conditions. If used outside the Recommended Operating Conditions but within the Absolute Maximum Ratings, the device may not be fully functional, and this may affect device reliability, functionality, performance, and shorten the device lifetime.

5.2 ESD Ratings

				VALUE	UNIT
V _(ESD)	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	Bus terminals (R1, R2, R3, R4, R5, R6, R7, R8) and GND	±16,000	V
			All pins except bus terminals and GND	±4,000	V
		Charged-device model (CDM), per JEDEC specification JESD22-C101 ⁽²⁾		±1,500	V

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

5.3 ESD Ratings [IEC]

				VALUE	UNIT
V _(ESD)		Contact discharge, per IEC 61000-4-2	Bus terminals (R1, R2, R3, R4, R5, R6, R7, R8) and GND	±8,000	V
		Air-gap discharge, per IEC 61000-4-2		±15,000	
V _(EFT)	Electrical fast transient in RS485 HD or FD mode	Per IEC 61000-4-4	Bus terminals (R1, R2, R3, R4)	±4,000	V

5.4 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
V_{CC}	Supply voltage	3		5.5	V
V_{IO}	I/O supply voltage	1.65		V_{CC}	V
V_I (RS-485)	Input voltage at any bus terminal (R1, R2, R3, R4) in RS-485 mode ⁽¹⁾	-7		12	V
V_{ID}	Differential input voltage in RS-485 receive mode [(R1-R2) or (R2-R1), (R3-R4) or (R4-R3)] with on-chip termination resistor disabled	-12		12	V
V_{ID}	Differential input voltage in RS-485 receive mode [(R1-R2) or (R2-R1), (R3-R4) or (R4-R3)] with on-chip termination resistor enabled	-5.5		5.5	V
V_I (RS-232)	Receiver input voltage in RS-232 mode	-15		15	V
V_{IH}	High-level input voltage (L3, L4, L6, SLR, SHDN, TERM_TX, TERM_RX, MODE0, MODE1, MODE2, DIR inputs)	$0.7 \cdot V_{IO}$		V_{IO}	V
V_{IL}	Low-level input voltage (L3, L4, L6, SLR, SHDN, TERM_TX, TERM_RX, MODE0, MODE1, MODE2, DIR inputs)	0		$0.3 \cdot V_{IO}$	V
I_O	Output current, driver in RS-485 mode	-60		60	mA
I_{OR}	Output current, receiver	$V_{IO} = 1.8 \text{ V or } 2.5 \text{ V}$		2	mA
I_{OR}	Output current, receiver	$V_{IO} = 3.3 \text{ V or } 5 \text{ V}$		4	mA
R_L	Differential load resistance in RS-485 mode	54	60		Ω
$1/t_{UI}$	Signaling rate in RS-485 mode	SLR = V_{IO}		500	kbps
		SLR = GND or floating		20	Mbps
	Signaling rate in RS-232 mode	SLR = V_{IO}		250	kbps
		SLR = GND or floating		1	Mbps
$1/t_{UI}$ (loopback)	Signaling rate in RS-485 loopback mode			0.5	Mbps
	Signaling rate in RS-232 loopback mode			1	Mbps
T_A ⁽²⁾	Operating ambient temperature	-40		125	$^{\circ}\text{C}$

- (1) The algebraic convention, in which the least positive (most negative) limit is designated as minimum is used in this data sheet.
- (2) Operation is specified for internal (junction) temperatures upto 150 $^{\circ}\text{C}$. Self-heating due to internal power dissipation should be considered for each application. Maximum junction temperature is internally limited by the thermal shut-down (TSD) circuit which disables the driver and receiver when the junction temperature reaches 170 $^{\circ}\text{C}$.

5.5 Thermal Information

THERMAL METRIC ⁽¹⁾		THVD4431	UNIT
		RHA (QFN)	
		40 PINS	
$R_{\theta JA}$	Junction-to-ambient thermal resistance	27.4	$^{\circ}\text{C/W}$
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	16.8	$^{\circ}\text{C/W}$
$R_{\theta JB}$	Junction-to-board thermal resistance	9.8	$^{\circ}\text{C/W}$
ψ_{JT}	Junction-to-top characterization parameter	0.2	$^{\circ}\text{C/W}$
ψ_{JB}	Junction-to-board characterization parameter	9.8	$^{\circ}\text{C/W}$
$R_{\theta JC(bot)}$	Junction-to-case (bottom) thermal resistance	2.7	$^{\circ}\text{C/W}$

- (1) For more information about traditional and new thermalmetrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.

5.6 Power Dissipation

PARAMETER		TEST CONDITIONS			Typical	Max	UNIT
P _D (RS-485)	Full Duplex mode with DIR = V _{IO} , MODE2, MODE1, MODE0 = 011, R2/R1 are externally connected to R3/R4 in loopback fashion; V _{IO} = V _{CC} = 5.5 V, T _A = 125 °C, L3 = square wave 50% duty	Unterminated, TERM_TX = L, TERM_RX = L	SLR = H	500 kbps	160	200	mW
			SLR = L	20Mbps	390	450	
		TERM_TX = TERM_RX = V _{IO}	SLR = H	500 kbps	430	500	mW
			SLR = L	20Mbps	500	575	

5.6 Power Dissipation (続き)

PARAMETER		TEST CONDITIONS		Typical	Max	UNIT
P_D (RS-232)	RS-232 mode with MODE2, MODE1, MODE0 = 001	$V_{CC} = V_{IO} = 5.5V$, R3, R4, R6 bus lines loaded with 3 k Ω , R3 load cap = 1000 pF, L3 toggling	SLR = L 1 Mbps	320	500	mW
		$V_{CC} = V_{IO} = 5.5V$, R3, R4, R6 bus lines loaded with 3 k Ω , R3 load cap = 2500 pF, L3 toggling	SLR = H 250 kbps	185	200	mW

5.7 Electrical Characteristics

over operating free-air temperature range (unless otherwise noted). All typical values are at 25°C and supply voltage of $V_{CC} = 5V$, $V_{IO} = 3.3V$, unless otherwise noted.

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT	
Driver_RS-485							
V _{OD}	Driver differential output voltage magnitude	R _L = 60 Ω, −7 V ≤ V _{test} ≤ 12 V (See 6-1)	1.5	2		V	
		R _L = 60 Ω, −7 V ≤ V _{test} ≤ 12 V, 4.5 V ≤ V _{CC} ≤ 5.5 V (See 6-1)	2.1	3		V	
		R _L = 100 Ω (See 6-2)	2	2.5		V	
		R _L = 54 Ω, 4.5 V ≤ V _{CC} ≤ 5.5 V (See 6-2)	2.1	3.3		V	
		R _L = 54 Ω (See 6-2)	1.5	3.3		V	
Δ V _{OD}	Change in magnitude of differential output voltage	R _L = 54 Ω or 100 Ω (See 6-2)	−50		50	mV	
V _{OC}	Common-mode output voltage	R _L = 54 Ω or 100 Ω (See 6-2)		V _{CC} /2	3	V	
ΔV _{OC(SS)}	Change in steady-state common-mode output voltage	R _L = 54 Ω or 100 Ω (See 6-2)	−50		50	mV	
I _{OS}	Short-circuit output current (bus terminals)	DIR = V _{IO} , -7 V ≤ (V _{R2} or V _{R1}) ≤ 12 V, or R1 shorted to R2	−250		250	mA	
I _{OZD}	Driver High impedance output leakage current on R1 and R2 in Full duplex mode	MODE2, MODE1, MODE0 = 011 , TERM_TX = GND, DIR = GND, V _{CC} = GND or 5.5V, V _O = -7V, +12V	-125		125	μA	
		MODE2, MODE1, MODE0 = 011, TERM_TX = V _{IO} , DIR = GND, V _{CC} = 5.5V, V _O = -7V, +12V	- 325		350	μA	
Receiver_RS-485							
I _I	Bus input current (termination disabled)	Half and full duplex modes, DIR = 0 V, V _{CC} and V _{IO} = 0 V or 5.5 V	V _I = 12 V		75	125	μA
			V _I = −7 V	−125	−70		μA
I _{RXT}	Receiver bus input leakage current with termination enabled	Full duplex mode, V _{CC} and V _{IO} = 5.5 V, TERM_RX = V _{IO}	V _I = - 7 to 12 V	−325		325	μA
V _{TH+}	Positive-going input threshold voltage ⁽¹⁾	Over common-mode range of - 7 V to 12 V		- 70		- 40	mV
V _{TH-}	Negative-going input threshold voltage ⁽¹⁾		−200	−150		mV	
V _{HYS}	Input hysteresis		25	80		mV	
C _{A,B}	Input differential capacitance	Measured between R3 and R4, f = 1 MHz		45			pF
V _{OH}	Output high voltage, L2 pin	I _{OH} = −4 mA, V _{IO} = 3 to 3.6 V or 4.5 V to 5.5 V	V _{IO} − 0.4	V _{IO} − 0.2			V
V _{OL}	Output low voltage, L2 pin	I _{OL} = 4 mA, V _{IO} = 3 to 3.6 V or 4.5 V to 5.5 V		0.2		0.4	V
V _{OH}	Output high voltage, L2 pin	I _{OH} = −2 mA, V _{IO} = 1.65 to 1.95 V or 2.25 V to 2.75 V	V _{IO} − 0.4	V _{IO} − 0.2			V
V _{OL}	Output low voltage, L2 pin	I _{OL} = 2 mA, V _{IO} = 1.65 to 1.95 V or 2.25 V to 2.75 V		0.2		0.4	V
I _{OZ}	Output high-impedance current, L2 pin	V _O = 0 V or V _{IO} , DIR = V _{IO} , MODE2, MODE1, MODE0= 010 (half duplex mode)	−2			2	μA
Driver_RS-232							
V _{OH}	High-level output voltage	All DOUT (R3, R4, R6) at R _L = 3 kΩ to GND, DIN (L3, L4, L6) = GND; V _{CC} = 3 V to 3.6 V	5	5.5	7.2		V
V _{OL}	Low-level output voltage	All DOUT (R3, R4, R6) at R _L = 3 kΩ to GND, DIN (L3, L4, L6) = V _{IO} ; V _{CC} = 3 V to 3.6 V	−7.2	−5.5	−5		V

5.7 Electrical Characteristics (続き)

over operating free-air temperature range (unless otherwise noted). All typical values are at 25°C and supply voltage of $V_{CC} = 5\text{ V}$, $V_{IO} = 3.3\text{ V}$, unless otherwise noted.

PARAMETER		TEST CONDITIONS		MIN	TYP	MAX	UNIT
V _{OH}	High-level output voltage	All DOUT (R3, R4, R6) at R _L = 3 kΩ to GND, DIN (L3, L4, L6) = GND; V _{CC} = 4.5 V to 5.5 V		7.8	9	11	V
V _{OL}	Low-level output voltage	All DOUT (R3, R4, R6) at R _L = 3 kΩ to GND, DIN (L3, L4, L6) = V _{IO} ; V _{CC} = 4.5 V to 5.5 V		−11	−9	−7.8	V

7 Detailed Description

7.1 Overview

THVD4431 is a highly integrated and robust multiprotocol transceiver supporting RS-232, RS-422 and RS-485 physical layers. The device has three transmitters and five receivers to enable 3T5R RS-232 port. Device also integrates one transmitter and one receiver to enable half and full duplex RS-485 port. MODE selection pins enable shared bus and logic pins for the protocols to share a common single connector.

The device has SLR pin which allows it to be used for two different maximum speed settings for RS-232 and for RS-485. This is beneficial as customers can qualify one device and use it in two separate end-applications. The devices also have flexible I/O supply pin V_{IO} which enables digital interface voltage range, from 1.65V to 5.5V, different from bus voltage supply 3V to 5.5V.

7.2 Functional Block Diagrams

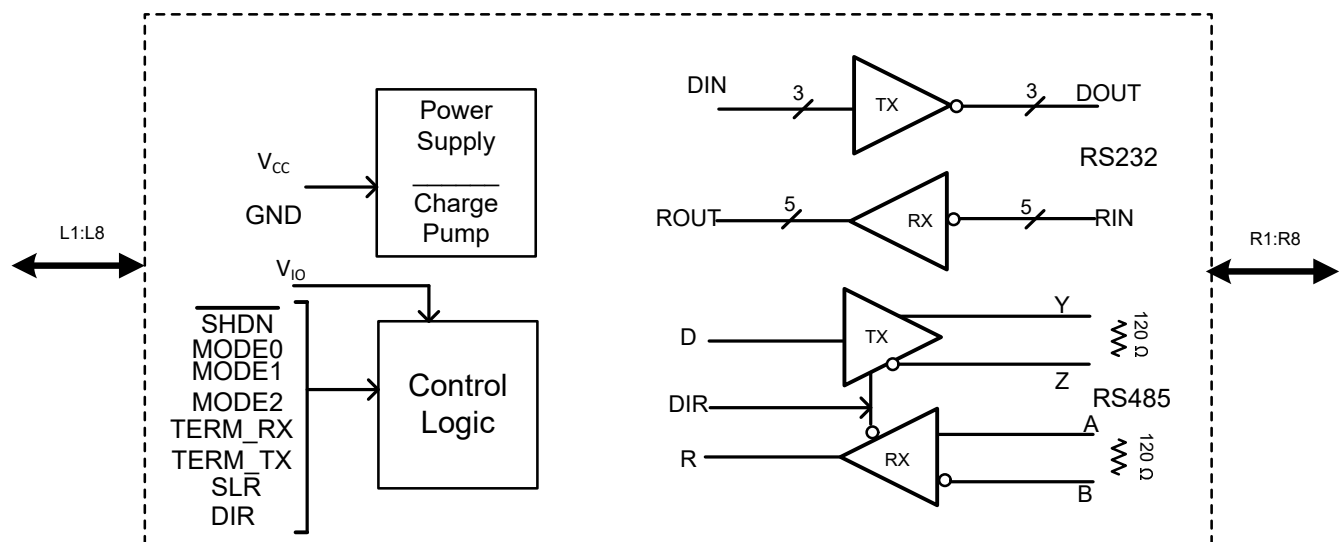

图 7-1. THVD4431 Block Diagram

7.3 Feature Description

7.3.1 Integrated IEC ESD and EFT Protection

Internal ESD protection circuits protect all the transceiver bus pins (driver and receiver) against electrostatic discharges (ESD) according to IEC 61000-4-2 up to ± 8 kV for contact discharge and ± 15 kV for air discharge for all operating modes. Bus lines in RS-485 mode can also withstand electrical fast transients (EFT) according to IEC 61000-4-4 for up to ± 4 kV.

7.3.2 Protection Features

The THVD4431 bus pins are protected against any DC supply shorts in the range of -16 V to +16 V. In the RS-485 mode, the short circuit current is limited to ± 250 mA to comply with the TIA/EIA-485A standard. In RS-232 mode, current limiting of ± 60 mA is applicable for scenarios where bus pins can short to ground.

The device also features thermal shutdown protection that disables the driver and the receiver if the junction temperature exceeds the T_{SHDN} threshold due to excessive power dissipation on-chip.

Supply undervoltage protection is present on both V_{CC} and V_{IO} supplies. This maintains the bus output and receiver logic output in known driven state when both the supplies are above their rising undervoltage thresholds. Table below describes the device behavior in various scenarios of supply levels.

表 7-1. Supply Function Table

V _{CC}	V _{IO}	Driver Output	Receiver Output
> UV _{VCC(rising)}	> UV _{VIO(rising)}	For RS-485 mode, determined by DIR and L3 inputs. For RS-232 mode, determined by L3, L4, L6 inputs. For shutdown mode, Hi-Z	For RS-485 mode, determined by DIR and (R1-R2) or (R3-R4) inputs. For RS-232 mode, determined by R1, R2, R5, R7, R8 inputs. For shutdown mode, Hi-Z
< UV _{VCC(falling)}	> UV _{VIO(rising)}	High impedance	Undetermined
> UV _{VCC(rising)}	< UV _{VIO(falling)}	High impedance	High impedance
< UV _{VCC(falling)}	< UV _{VIO(falling)}	High impedance	High impedance

7.3.3 RS-485 Receiver Fail-Safe Operation

The RS-485 differential receiver of the THVD4431 is *failsafe* to invalid bus states caused by the following:

- Open bus conditions, such as a disconnected connector
- Shorted bus conditions, such as cable damage shorting the twisted-pair together
- Idle bus conditions that occur when no driver on the bus is actively driving

In any of these cases, the differential receiver outputs a failsafe logic high state so that the output of the receiver is not indeterminate.

Receiver failsafe is accomplished by offsetting the receiver thresholds such that the *input indeterminate* range does not include zero volts differential. To comply with the RS-422 and RS-485 standards, the receiver output must output a high when the differential input V_{ID} is more positive than 200 mV, and must output a low when V_{ID} is more negative than –200 mV. The receiver parameters which determine the failsafe performance are V_{TH+}, V_{TH–}, and V_{HYS} (the separation between V_{TH+} and V_{TH–}). As shown in the *Receiver Function table*, differential signals more negative than –200 mV always causes a low receiver output, and differential signals more positive than 200 mV always causes a high receiver output.

When the differential input signal is close to zero, it is still above the V_{TH+} threshold, and the receiver output is high. Only when the differential input is more than V_{HYS} below V_{TH+} does the receiver output transition to a low state. Therefore, the noise immunity of the receiver inputs during a bus fault conditions includes the receiver hysteresis value, V_{HYS}, as well as the value of V_{TH+}.

7.3.4 Low-Power Shutdown Mode

Driving the $\overline{\text{SHDN}}$ pin low puts the device into the shutdown mode. This is the lowest power mode of the device and current consumption is 10 uA typical. All the blocks get disabled in this mode.

7.3.5 On-chip Switchable Termination Resistor

THVD4431 has 2 termination resistors of nominal 120 Ω , one across R1/R2 and another across R3/R4 in RS-485 mode. Both termination resistors are enabled or disabled using pins as described in 表 7-2. Both the termination resistors can be enabled or disabled independent of the state of driver or receiver. Termination is OFF in RS-232 loopback, RS-232 3T5R, RS-485 loopback, unpowered and thermal shutdown modes.

表 7-2. On-chip Termination Function

Signal state	Device mode	Function	Comments
TERM_TX = V_{IO}	Full duplex mode	120 Ω enabled between R1 and R2	Termination between R1/R2 is disabled by default
TERM_TX = GND or floating	Full duplex mode	120 Ω disabled between R1 and R2	
TERM_RX = V_{IO}	Full duplex mode	120 Ω enabled between R3 and R4	Termination between R3/R4 is disabled by default
TERM_RX = GND or floating	Full duplex mode	120 Ω disabled between R3 and R4	
TERM_RX = X, TERM_TX = V_{IO}	Half duplex mode	120 Ω enabled between R1 and R2	In half duplex mode, TERM_RX is don't care and TERM_TX has higher priority
TERM_RX = X, TERM_TX = GND	Half duplex mode	120 Ω disabled between R1 and R2	

The on-chip 120 Ω termination resistor is designed for minimum variation across temperature and across common mode voltage on bus pins. The termination block offers a resistive load to the bus, and does not alter the magnitude or phase of the bus signals from DC to 20Mbps signaling. See the typical characteristic curves for variation of termination resistor with voltage and temperature.

7.3.6 Operational Data Rate

THVD4431 can be used in slow speed or fast speed RS-485 and RS-232 applications by configuring Slew rate control (SLR) pin. 表 7-3 describes slew rate control function.

表 7-3. Slew Rate Control Function

Signal state	Driver	Receiver	Comment
SLR = V_{IO}	Maximum speed of operation for RS-485 = 500kbps. Maximum speed of operation in RS-232 mode is 250kbps	Maximum speed of operation for RS-485 = 500kbps. Maximum speed of operation in RS-232 mode is 250kbps	Active high slew rate limiting applied on driver output. In this configuration, glitch filter in receiver path for RS-485 is enabled
SLR = GND or floating	Maximum speed of operation for RS-485 = 20Mbps. Maximum speed of operation in RS-232 mode is 1Mbps	Maximum speed of operation for RS-485 = 20Mbps. Maximum speed of operation in RS-232 mode is 1Mbps	Slew rate limiting on driver output disabled.

For RS-485 half and full duplex modes, receiver path in the slow speed mode (500 kbps) provides additional noise filtering. To attenuate high frequency noise pulses from the bus which can be wrongly interpreted as valid data, SLR = V_{IO} enables a low pass filter to filter out pulses with frequency higher than typical 700 kHz.

7.3.7 Diagnostic Loopback

THVD4431 provides complete path diagnostic loopback modes for both RS-232 and RS-485. These modes internally short bus outputs to bus inputs. So, if data is toggled from logic input, data reaches bus and is reflected back on logic buffer output. This enables MCU to detect bus side short (due to connector/cable) by comparing logic input and logic output.

In RS-232 loopback mode, L3 reflects on L2/R2/R3; L4 reflects on L1/R4/R1; L6 reflects on L5, L7, L8, R5, R6, R7 and R8 enabling to detect short to ground on all bus pins from R1 through R8. RS-232 loopback mode is optimized for -40°C to 85°C ambient temperature. RS-232 diagnostic loopback can be performed on a node (DUT1) even with another node (DUT2) connected via cable, but listening node (DUT2) is not allowed to transmit anything on the RS232 lines while loopback check by DUT1 is ongoing.

In RS-485 loopback mode, internally R2 gets connected to R3 and R1 gets connected to R4. L3 input data is routed to driver output terminals and receiver input terminals and reflects on L2. DIR and TERM_RX are not supported in this mode. Specific to this mode, external termination on R3/R4 is not supported, but R1/R2 can have internal or external termination. This is able to detect short between R1/R2 and between R3/R4 bus terminals. Recommended maximum data rate for RS-485 diagnostic loopback to detect cable or connector shorts is 500kbps with $SLR = V_{IO}$.

7.3.8 Integrated Charge pump for RS-232

THVD4431 has integrated high-efficiency and low-noise charge pump to generate large output voltages for RS-232 signals. Charge pump consists of a voltage doubler and an inverter to regulate the voltage to nominal ± 5.5 V or to ± 9.5 V for 3.3 V or 5-V V_{CC} operation respectively. Charge pump needs four external ceramic capacitors (2 flying capacitors and 2 storage capacitors) and allows for single supply operation for RS-232. For a generic description of RS-232 charge pump operation, please refer to the blog: [How the RS-232 transceiver's regulated charge-pump circuitry works.](#)

7.4 Device Functional Modes

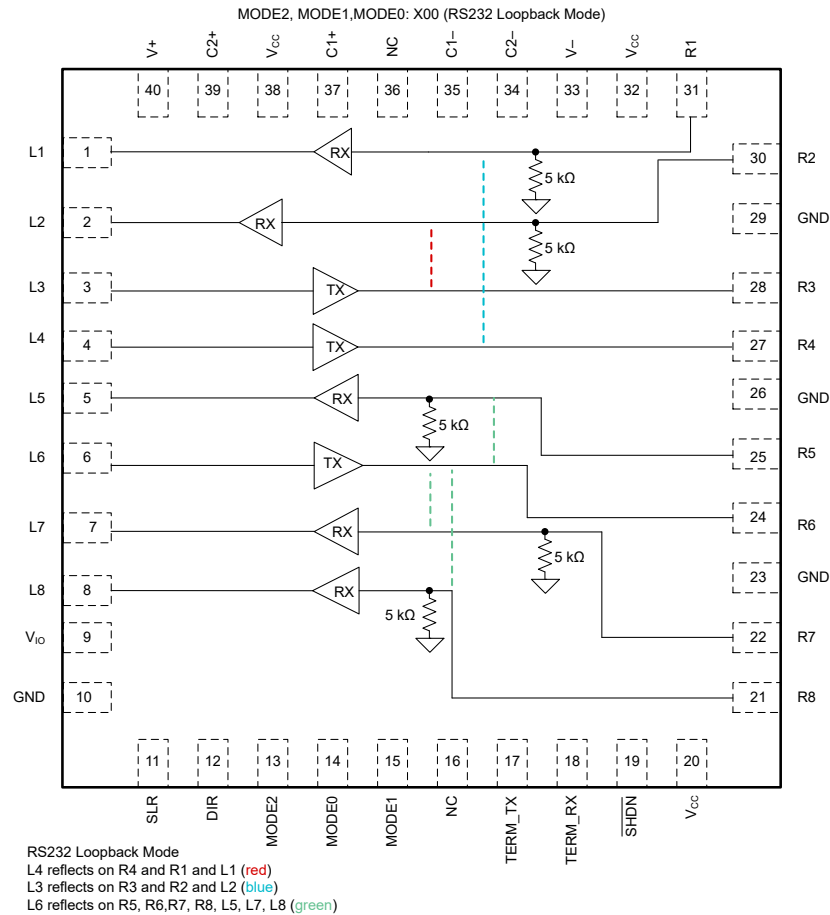

図 7-2. RS-232 Loopback Mode

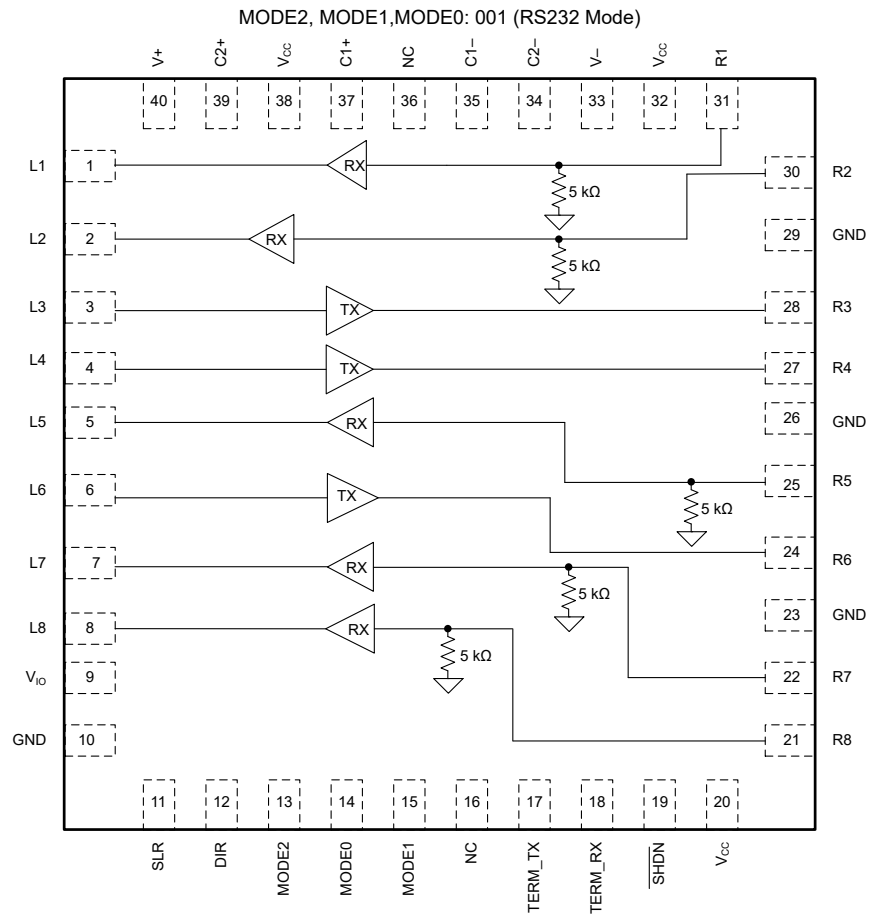

図 7-3. RS-232 3T5R Mode

図 7-4. RS485 Half duplex and Full duplex mode

図 7-5. RS-485 Loopback Mode

7.4.1 RS-485 Functionality

When the driver enable pin, DIR, is logic high, the differential outputs R2 and R1 follow the logic states at data input L3. A logic high at L3 causes R2 to turn high and R1 to turn low. In this case, the differential output voltage defined as $V_{OD} = V_{R2} - V_{R1}$ is positive. When L3 is low, the output states reverse: R1 turns high, R2 becomes low, and V_{OD} is negative.

When DIR is low, both outputs turn high-impedance. In this condition, the logic state at L3 is irrelevant. The DIR pin has an internal pull-down resistor to ground, thus when left open the driver is disabled (high-impedance) by default. The L3 pin has an internal pull-up resistor to V_{IO} , thus, when left open while the driver is enabled, output R2 turns high and R1 turns low.

表 7-4 is valid for both half duplex and full duplex modes, and is independent of state of TERM_TX, TERM_RX and SLR pins.

表 7-4. Driver Function Table

INPUT	ENABLE	OUTPUTS		FUNCTION
L3	DIR	R2	R1	
H	H	H	L	Actively drive bus high
L	H	L	H	Actively drive bus low
X	L	High impedance	High impedance	Driver disabled
X	OPEN	High impedance	High impedance	Driver disabled by default
OPEN	H	H	L	Actively drive bus high by default

In full duplex mode, if $\overline{\text{SHDN}}$ is high, receiver is always enabled. In half duplex mode, receiver is enabled if DIR = Low/floating and disabled if DIR = V_{IO} . When the differential input voltage defined as $V_{ID} = V_{R2} - V_{R1}$ or $V_{R3} - V_{R4}$ is higher than the positive input threshold, V_{TH+} , the receiver output, L2, turns high. When V_{ID} is lower than the negative input threshold, V_{TH-} , the receiver output, L2, turns low. If V_{ID} is between V_{TH+} and V_{TH-} the output is indeterminate.

Internal biasing of the receiver inputs causes the output to go failsafe-high when the transceiver is disconnected from the bus (open-circuit), the bus lines are shorted to one another (short-circuit), or the bus is not actively driven (idle bus).

In half duplex mode, when DIR is high, the receiver output is high-impedance and the magnitude and polarity of V_{ID} are irrelevant.

表 7-5 is valid irrespective of state of TERM_TX, TERM_RX and SLR pins. Other logic outputs L1, L5, L7 and L8 remain high in RS-485 mode.

表 7-5. Receiver Function Table

DIFFERENTIAL INPUT	OUTPUT	FUNCTION
$V_{ID} = V_{R2} - V_{R1}$ (Half duplex mode) or $V_{R3} - V_{R4}$ (Full duplex mode)	L2	
$V_{TH+} < V_{ID}$	H	Receive valid bus high
$V_{TH-} < V_{ID} < V_{TH+}$?	Indeterminate bus state
$V_{ID} < V_{TH-}$	L	Receive valid bus low
X	High impedance for DIR = V_{IO} in Half duplex mode	Receiver disabled in half duplex mode for DIR = V_{IO}
Open-circuit bus	H	Fail-safe high output
Short-circuit bus	H	Fail-safe high output
Idle (terminated) bus	H	Fail-safe high output

7.4.2 RS-232 Functionality

In RS-232 mode, only way to disable driver is to go in shutdown mode by pulling $\overline{\text{SHDN}}$ pin low. A logic high at inputs for driver L3, L4 and L6 causes driver outputs R3, R4 and R6 to be driven low towards negative charge pump output V-. A logic low at inputs for driver L3, L4 and L6 causes driver outputs R3, R4 and R6 to be driven high towards positive charge pump output V+. If logic inputs are left floating due to the pull-up resistors on driver logic inputs, the driver outputs are driven low towards V-.

表 7-6 is valid irrespective of the state of SLR pin.

表 7-6. Driver Function Table

INPUT	ENABLE	OUTPUTS	FUNCTION
L3, L4, L6	$\overline{\text{SHDN}}$	R3, R4, R6	
H	H	Low (driven towards V-)	Normal operation with inverting logic
L	H	H (Driven towards V+)	Normal operation with inverting logic
X	L	High impedance	TX and RX are disabled in shutdown mode
Open	H	Low (driven towards V-)	Since pull-up on logic input pin, output driven low by default

For the RS-232 receiver, if the receiver bus inputs are above rising threshold V_{IT+} , corresponding received logic output goes low. Also, if the receiver bus inputs are below falling threshold V_{IT-} , corresponding received logic output goes high.

表 7-7 is valid irrespective of the state of SLR pin.

表 7-7. Receiver Function Table

RS-232 BUS INPUT	LOGIC OUTPUT	FUNCTION
V_{IRx} (voltage on R1, R2, R5, R7 or R8)	L1, L2, L5, L7, L8	
$V_{IT+} < V_{IRx}$	L	Normal operation with inverting logic
$V_{IT-} < V_{IRx} < V_{IT+}$?	Indeterminate bus state
$V_{IRx} < V_{IT-}$	H	Normal operation with inverting logic
X	High impedance for $\overline{\text{SHDN}} = \text{GND}$	Receiver disabled in shutdown mode
Open-circuit bus	H	Fail-safe high output

7.4.3 Mode Control

RS-232 3T5R to RS-232 loopback mode transition and RS-232 loopback mode to RS-232 3T5R direct mode transition is not allowed. These 2 mode transitions must go through shutdown mode in between. Rest all combination of mode transitions are allowed.

表 7-8. MODE Control Function Table

MODE2	MODE1	MODE0	Operating mode	Function
X	Logic low	Logic low	RS-232 loopback, charge pump is ON, V+/V- are regulated	L3 reflects on L2/R2/R3; L4 reflects on L1/R4/R1; L6 reflects on L5, L7, L8, R5, R6, R7 and R8
X	Logic low	Logic high	RS-232 3T5R mode, charge pump is ON, V+/V- are regulated	3T5R mode; L3, L4, L6 are Logic inputs for RS232 driver; L1, L2, L5, L7, L8 are Logic outputs
X	Logic high	Logic low	RS-485 half duplex mode (charge pump is off)	L2 is RX Logic output; L3 is Driver Logic input; R1 R2 are Bus inverting and non-inverting terminals respectively
Logic low or float	Logic high	Logic high	RS-485 full duplex mode (charge pump is off)	R1R2 are inverting and non-inverting driver terminals; R3R4 are non-inverting and inverting receiver terminals.
Logic high	Logic high	Logic high	RS-485 loopback mode (charge pump is off)	R1, R2, R3, R4 continue to be bus terminals and reflect data on L3; DIR is don't care in this mode; TERM_RX not supported. External termination on R3/R4 not supported. R1/R2 can have internal or external termination.

8 Application and Implementation

注

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Application Information

THVD4431 is a highly integrated multiprotocol transceiver supporting RS-232, RS-422 and RS-485 physical layer and is used for asynchronous data transmissions. MODE pins allow for the configuration of different operating modes. Device allows point-to-point RS-232 communication port and multipoint RS-485 communication port over common connector. The device also features integrated 120Ω switchable termination resistor on RS-485 bus lines which enables same device to be used for middle nodes or end nodes in an RS-485 network. When the device is configured in RS-232 mode, RS-485 circuits and 120Ω termination are disabled and do not interfere in RS-232 communication. For RS-232 communication, charge pump and $5k\Omega$ resistor to ground on receiver bus pins is integrated in the device. This $5k\Omega$ resistor and charge pump is automatically disabled in RS-485 mode. Slew rate limiting pin is provided so that same device can be used in slow speed or fast speed RS-485 and RS-232 applications. When ultra low power consumption is needed, device can be put in shutdown mode using $\overline{\text{SHDN}}$ pin. All these features make the device completely flexible and suitable for various application needs. Integration of termination resistor saves significant PCB area compared to discrete implementation.

8.2 Typical Application

An RS-485 bus consists of multiple transceivers connecting in parallel to a bus cable. To eliminate line reflections, each cable end is terminated with a termination resistor, R_T , whose value matches the characteristic impedance, Z_0 , of the cable. This method, known as parallel termination, generally allows for higher data rates over longer cable length.

図 8-1. Typical RS-485 Network With Half-Duplex Transceivers

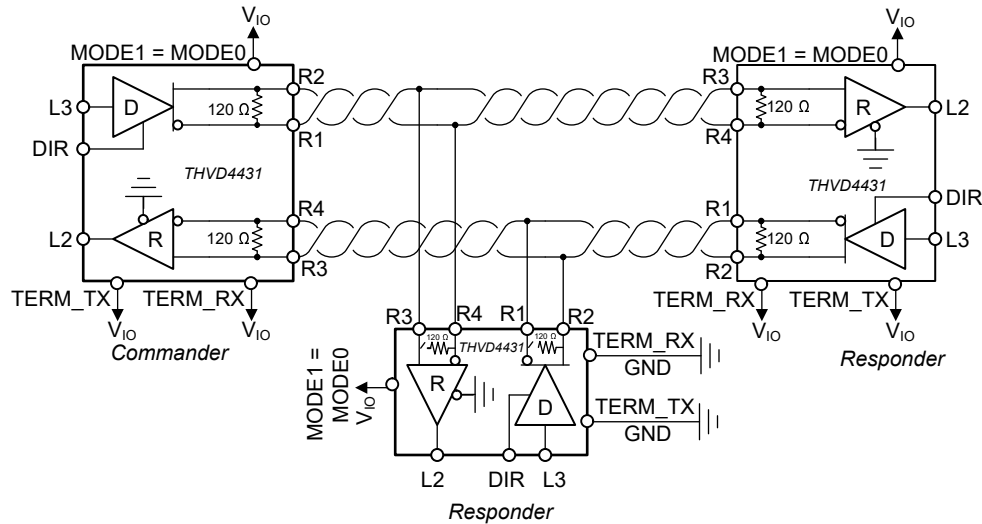

図 8-2. Typical RS-485 Network With Full-Duplex Transceivers

THVD4431 can be used in both networks (half and full duplex) and at all nodes (end node or middle nodes) since device has the configurability based on MODE2, MODE1, MODE0 pins and TERM_TX, TERM_RX pins.

THVD4431 also consists of three line drivers, five line receivers and dual charge pump circuit to enable RS-232 point-to-point serial communication. Full duplex transmission with hardware flow control is feasible with this device. This device provides the electrical interface between an asynchronous communication controller and the serial-port connector.

8-3. RS-232 serial communication

8.2.1 Design Requirements

RS-485 is a robust electrical standard suitable for long-distance networking that may be used in a wide range of applications with varying requirements, such as distance, data rate, and number of nodes. RS-232 is more suitable for debug or configuration point to point applications.

8.2.1.1 Data Rate and Bus Length for RS-485

There is an inverse relationship between data rate and cable length, which means the higher the data rate, the shorter the cable length. Conversely, the lower the data rate, the longer the cable length. While most RS-485 systems use data rates between 10 kbps and 100 kbps, some applications require data rates up to 250 kbps at distances of 4000 feet and longer. Longer distances are possible by allowing for small signal jitter of up to 5 or 10%.

8-4. Cable Length vs Data Rate Characteristic

8.2.1.2 Stub Length for RS-485 Network

When connecting a node to the bus, the distance between the transceiver inputs and the cable trunk, known as the stub, should be as short as possible. Stubs present a non-terminated piece of bus line which can introduce reflections of varying phase as the length of the stub increases. As a general guideline, the electrical length, or round-trip delay, of a stub should be less than one-tenth of the rise time of the driver, thus giving a maximum physical stub length as shown in 式 1.

$$L_{(STUB)} \leq 0.1 \times t_r \times v \times c \quad (1)$$

where

- t_r is the 10/90 rise time of the driver
- c is the speed of light (3×10^8 m/s)
- v is the signal velocity of the cable or trace as a factor of c

8.2.1.3 Bus Loading for RS-485 Network

The RS-485 standard specifies that a compliant driver must be able to drive 32 unit loads (UL), where 1 unit load represents a load impedance of approximately 12 kΩ. Because the THVD4431 in RS-485 half and full duplex mode consists of 1/8 UL transceivers which represents load resistance of approximately 96 kohm, connecting up to 256 receivers to the bus is possible for a limited common mode range of - 7 V to 12 V.

8.2.2 Detailed Design Procedure

8-5 suggests an application schematic for THVD4431. The device has all logic pins on one side and bus side pins on other side to enable a flow-through layout in end application.

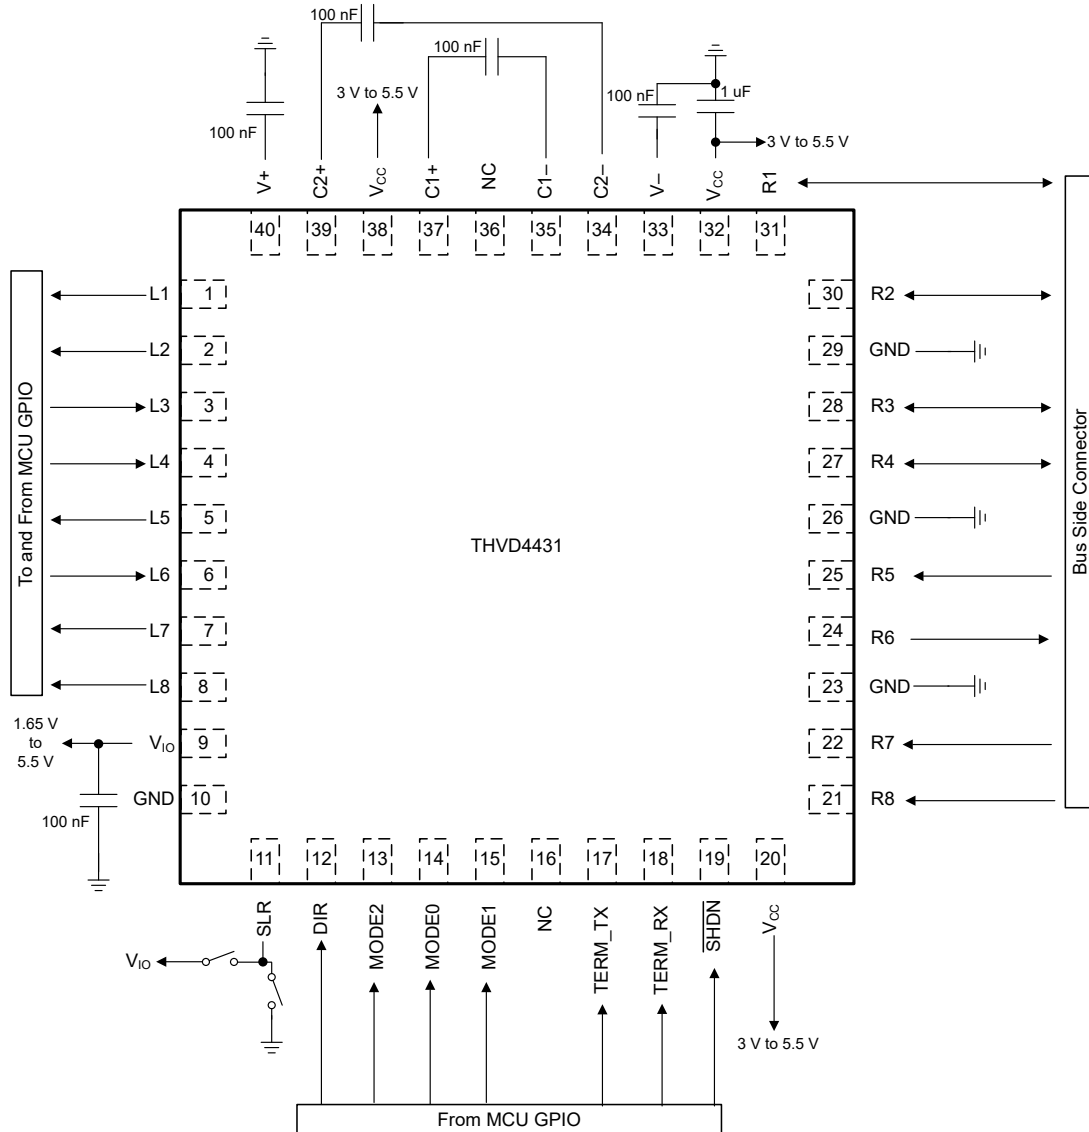

図 8-5. Typical application diagram for THVD4431

All V_{CC} power pins should have 1 μ F decoupling capacitor close to the respective device pins. RS-232 charge pump is designed such that 100 nF charge pump capacitors work for both 3.3 V and 5 V operating V_{CC} supply.

8.2.3 Application Curves (continued)

8.3 Power Supply Recommendations

For reliable operation at all data rates and supply voltages, each supply should be decoupled with a ceramic capacitor located as close to the supply pins as possible. Recommended bypass capacitor for V_{CC} is 1 μF , for V_{IO} is 100 nF, for $V+$, $V-$ charge pump voltage supplies is 100 nF. Besides this, two charge pump flying capacitors of 100 nF each are needed between $C1+$, $C1-$ terminals and between $C2+$, $C2-$ terminals. For $V_{CC} = 3.3\text{V} \pm 10\%$, $V+$ and $V-$ voltages are regulated to +5.5V and -5.5V typically. If an application needs larger RS-232 output voltages, $V_{CC} = 5\text{V} \pm 10\%$ is recommended because $V+$ and $V-$ are regulated to $\pm 9.5\text{V}$.

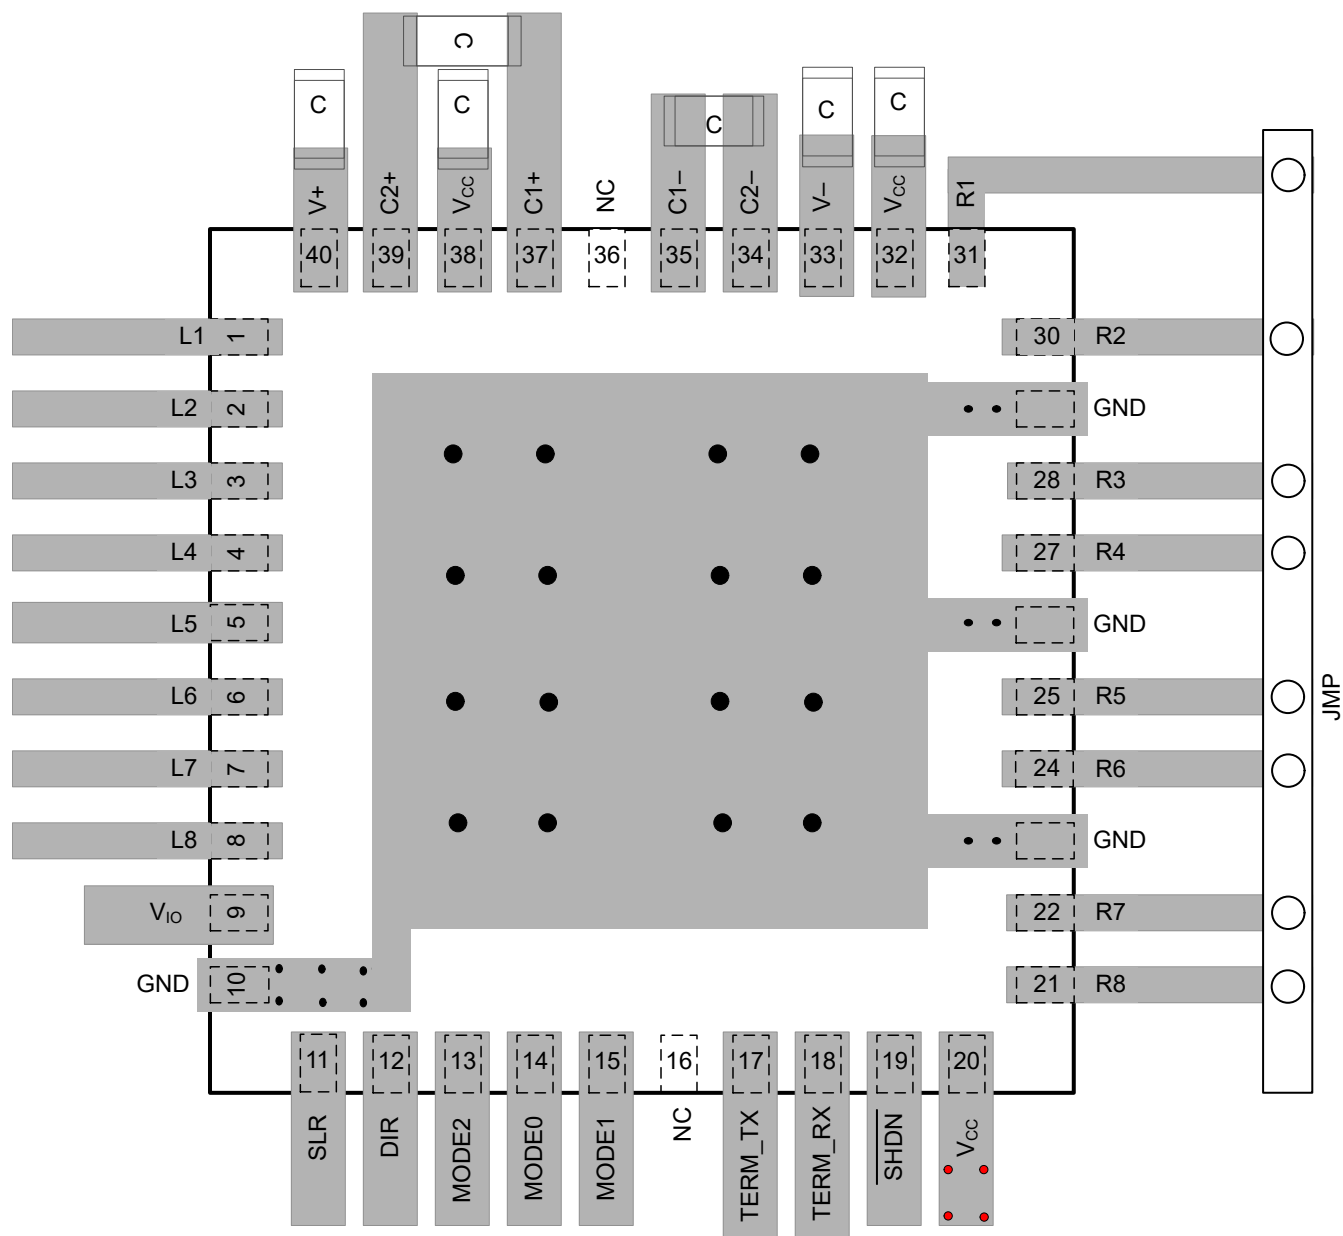

8.4 Layout

8.4.1 Layout Guidelines

Robust and reliable bus node design often requires the use of external transient protection devices to protect against surge transients that may occur in industrial environments. THVD4431 has integrated IEC ESD and EFT protection. So if the application does not need IEC Surge protection, external transient protection may not be needed. Since these transients have a wide frequency bandwidth (from approximately 3 MHz to 300 MHz), high-frequency layout techniques should be applied during PCB design.

1. Place the external protection circuitry close to the bus connector to prevent noise transients from propagating across the board.
2. Use V_{CC} and ground planes to provide low inductance. Note that high-frequency currents tend to follow the path of least impedance and not the path of least resistance.
3. Design the protection components into the direction of the signal path. Do not force the transient currents to divert from the signal path to reach the protection device.
4. Apply decoupling capacitors and charge pump capacitors as close as possible to the respective device pins such as V_{CC} , V_{IO} , $V+$, $V-$, $C1+$ to $C1-$, $C2+$ to $C2-$ pins of transceiver.
5. Use at least two vias for V_{CC} and ground connections of decoupling capacitors and protection devices to minimize effective via inductance.
6. Optionally, use 1-k Ω to 10-k Ω pull-up and pull-down resistors for control lines to limit noise currents in these lines during transient events.

9 Device and Documentation Support

9.1 Device Support

9.1.1 サード・パーティ製品に関する免責事項

サード・パーティ製品またはサービスに関するテキサス・インスツルメンツの出版物は、単独またはテキサス・インスツルメンツの製品、サービスと一緒に提供される場合に関係なく、サード・パーティ製品またはサービスの適合性に関する是認、サード・パーティ製品またはサービスの是認の表明を意味するものではありません。

9.2 ドキュメントの更新通知を受け取る方法

ドキュメントの更新についての通知を受け取るには、www.tij.co.jp のデバイス製品フォルダを開いてください。[通知] をクリックして登録すると、変更されたすべての製品情報に関するダイジェストを毎週受け取ることができます。変更の詳細については、改訂されたドキュメントに含まれている改訂履歴をご覧ください。

9.3 サポート・リソース

[テキサス・インスツルメンツ E2E™ サポート・フォーラム](#)は、エンジニアが検証済みの回答と設計に関するヒントをエキスパートから迅速かつ直接得ることができる場所です。既存の回答を検索したり、独自の質問をしたりすることで、設計に必要な支援を迅速に得ることができます。

リンクされているコンテンツは、各寄稿者により「現状のまま」提供されるものです。これらはテキサス・インスツルメンツの仕様を構成するものではなく、必ずしもテキサス・インスツルメンツの見解を反映したものではありません。テキサス・インスツルメンツの[使用条件](#)を参照してください。

9.4 Trademarks

テキサス・インスツルメンツ E2E™ is a trademark of Texas Instruments.

すべての商標は、それぞれの所有者に帰属します。

9.5 静電気放電に関する注意事項

この IC は、ESD によって破損する可能性があります。テキサス・インスツルメンツは、IC を取り扱う際には常に適切な注意を払うことを推奨します。正しい取り扱いおよび設置手順に従わない場合、デバイスを破損するおそれがあります。

ESD による破損は、わずかな性能低下からデバイスの完全な故障まで多岐にわたります。精密な IC の場合、パラメータがわずかに変化するだけで公表されている仕様から外れる可能性があるため、破損が発生しやすくなっています。

9.6 用語集

PACKAGING INFORMATION

Orderable part number	Status (1)	Material type (2)	Package Pins	Package qty Carrier	RoHS (3)	Lead finish/ Ball material (4)	MSL rating/ Peak reflow (5)	Op temp (°C)	Part marking (6)
THVD4431RHAR	Active	Production	VQFN (RHA) 40	4000 LARGE T&R	Yes	NIPDAU	Level-1-260C-UNLIM	-40 to 125	THVD 4431
THVD4431RHAR.A	Active	Production	VQFN (RHA) 40	4000 LARGE T&R	Yes	NIPDAU	Level-1-260C-UNLIM	-40 to 125	THVD 4431

⁽¹⁾ **Status:** For more details on status, see our [product life cycle](#).

⁽²⁾ **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

⁽³⁾ **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

⁽⁴⁾ **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

⁽⁵⁾ **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

⁽⁶⁾ **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.
