

# TPS65262-2 入力電圧 4.5V~18V、出力電流 3A/1A/1A、トリプル同期整流降圧型コンバータ、デュアル、可変、350mA/150mA LDO 搭載

## 1 特長

- 動作時入力電圧範囲: 4.5~18V
- 帰還基準電圧: 0.6V ±1%
- 最大連続出力電流: 3A/1A/1A
- 600kHz の固定スイッチング周波数
- 入力電圧範囲のデュアル LDO を内蔵: 1.3~18V、連続出力電流: 350mA/150mA
- Buck1 のソフトスタート時間をプログラム可能
- Buck2 と Buck3 のソフトスタート時間は 1ms 固定
- Buck2 と Buck3 のループ補償を内蔵
- 各 Buck の専用イネーブル・ピン
- パルス・スキップ・モード (PSM) と強制連続電流モード (FCCM) をサポート
- 出力電圧パワー・グッド・インジケータ
- 過熱保護
- 32 ピン VQFN (RHB) 5mm × 5mm パッケージ
- 過電圧保護、過電流および短絡保護、過熱保護

## 2 アプリケーション

- DTV
- セット・トップ・ボックス
- ホーム・ゲートウェイおよびアクセス・ポイント・ネットワーク
- ワイヤレス・ルータ
- 監視機器
- POS 機器

## 3 概要

TPS65262-2 は、出力電流 3A/1A/1A のモノリシック・トリプル同期降圧型 (バック) コンバータです。4.5V~18V の幅広い入力電源電圧範囲は、5V、9V、12V、または 15V パワー・バスのほとんどの中間バス電圧動作に対応できます。コンバータは定周波数ピーク電流モードを備え、アプリケーションを単純化しながら、設計者が目的のアプリケーションに合わせてシステムを最適化できるよう設計されています。このデバイスは、600kHz の固定スイッチング周波数で動作します。外付け部品数を低減するため、Buck2 と Buck3 のループ補償を内蔵しています。Buck1 と Buck2/Buck3 は位相差 180° で動作するため (Buck2 と Buck3 は同相動作)、入力フィルタの要件が最小化されます。

TPS65262-2 は、MODE ピンが GND に接続されている場合、パルス・スキップ・モード (PSM) で動作し、MODE ピンが HIGH に駆動されている場合またはフローティング状態の場合、連続電流モード (FCC) で動作します。PSM モードでは、軽負荷時にスイッチング損失を低減することで高い効率を実現します。FCC モードでは、ノイズ耐性が高まり、RF 干渉が低減されます。

TPS65262-2 は、2 つの低ドロップアウト電圧リニア・レギュレータ (LDO) も内蔵しています。これらの LDO は入力電圧範囲が 1.3~18V、連続出力電流が 350mA/150mA であり、独立したイネーブルを備え、出力電圧は可変です。

どちらかの出力電圧がレギュレーション範囲を外れると、パワー・グッド・ピンがアサートされます。

### パッケージ情報 (1)

部品番号	パッケージ	本体サイズ (公称)
TPS65262-2	RHB (VQFN, 32)	5.00mm × 5.00mm

- (1) 利用可能なパッケージについては、このデータシートの末尾にある注文情報を参照してください。

## 5 Pin Configuration and Functions

(There is no electric signal down bonded to thermal pad inside IC. Exposed thermal pad must be soldered to PCB for optimal thermal performance.)

**图 5-1. 32-Pin Plastic VQFN RHB Package Top View**

**表 5-1. Pin Functions**

PIN		DESCRIPTION
NAME	NO.	
LVIN2	1	Input power supply for LDO2. Connect LVIN2 pin as close as possible to the (+) terminal of an input ceramic capacitor (suggest 1 $\mu$ F).
LOUT2	2	LDO2 output. Connect LOUT2 pin as close as possible to the (+) terminal of an output ceramic capacitor (suggest 1 $\mu$ F).
LFB2	3	Feedback Kelvin sensing pin for LDO2 output voltage. Connect this pin to LDO2 resistor divider.
LEN2	4	Enable for LDO2. Float to enable.
PGOOD	5	An open-drain output, asserts low if output voltage of any buck is beyond regulation range due to thermal shutdown, overcurrent, undervoltage, or ENx shut down.
MODE	6	Switch FCC mode and PSM mode. Pull high or leave floating, FCC mode. Pull low, PSM mode.
FB2	7	Feedback Kelvin sensing pin for buck2 output voltage. Connect this pin to buck2 resistor divider.
EN2	8	Enable for buck2. Float to enable. Can use this pin to adjust the input undervoltage lockout of buck2 with a resistor divider.
BST2	9	Boot strapped supply to the high side floating gate driver in Buck2. Connect a capacitor (recommend 47 nF) from BST2 pin to LX2 pin.
LX2	10	Switching node connection to the inductor and bootstrap capacitor for Buck2. The voltage swing at this pin is from a diode voltage below the ground up to VIN2 voltage.
PGND2	11	Power ground connection of Buck2. Connect PGND2 pin as close as possible to the (–) terminal of VIN2 input ceramic capacitor.
VIN2	12	Input power supply for Buck2. Connect VIN2 pin as close as possible to the (+) terminal of an input ceramic capacitor (suggest 10 $\mu$ F).
VIN3	13	Input power supply for Buck3. Connect VIN3 pin as close as possible to the (+) terminal of an input ceramic capacitor (suggest 10 $\mu$ F).
PGND3	14	Power ground connection of Buck3. Connect PGND3 pin as close as possible to the (–) terminal of VIN3 input ceramic capacitor.
LX3	15	Switching node connection to the inductor and bootstrap capacitor for Buck3. The voltage swing at this pin is from a diode voltage below the ground up to VIN3 voltage.

**表 5-1. Pin Functions (continued)**

PIN		DESCRIPTION
NAME	NO.	
BST3	16	Boot strapped supply to the high side floating gate driver in Buck3. Connect a capacitor (recommend 47 nF) from BST3 pin to LX3 pin.
EN3	17	Enable for Buck3. Float to enable. Can use this pin to adjust the input undervoltage lockout of Buck3 with a resistor divider.
FB3	18	Feedback Kelvin sensing pin for buck3 output voltage. Connect this pin to Buck3 resistor divider.
AGND	19	Analog ground common to buck controllers and other analog circuits. It must be routed separately from high current power grounds to the (-) terminal of bypass capacitor of input voltage VIN.
V7V	20	Internal LDO for gate driver and internal controller. Connect a 10-μF capacitor from the pin to power ground.
COMP1	21	Error amplifier output and loop compensation pin for Buck1. Connect a series resistor and capacitor to compensate the control loop of buck1 with peak current PWM mode.
SS1	22	Soft-start and tracking input for Buck1. An internal 5-μA pullup current source is connected to this pin. The soft-start time can be programmed by connecting a capacitor between this pin and ground.
FB1	23	Feedback Kelvin sensing pin for Buck1 output voltage. Connect this pin to Buck1 resistor divider.
EN1	24	Enable for Buck1. Float to enable. Can use this pin to adjust the input undervoltage lockout of Buck1 with a resistor divider.
BST1	25	Boot strapped supply to the high side floating gate driver in buck1. Connect a capacitor (recommend 47 nF) from BST1 pin to LX1 pin.
LX1	26	Switching node connection to the inductor and bootstrap capacitor for buck1. The voltage swing at this pin is from a diode voltage below the ground up to VIN1 voltage.
PGND1	27	Power ground connection of buck1. Connect PGND1 pin as close as possible to the (-) terminal of VIN1 input ceramic capacitor.
VIN1	28	Input power supply for buck1. Connect VIN1 pin as close as possible to the (+) terminal of an input ceramic capacitor (suggest 10 μF).
LEN1	29	Enable for LDO1. Float to enable.
LFB1	30	Feedback Kelvin sensing pin for LDO1 output voltage. Connect this pin to LDO1 resistor divider.
LOUT1	31	LDO1 output. Connect LOUT1 pin as close as possible to the (+) terminal of an output ceramic capacitor (suggest 1 μF).
LVIN1	32	Input power supply for LDO1. Connect LVIN1 pin as close as possible to the (+) terminal of an input ceramic capacitor (suggest 1 μF).
PAD	—	There is no electric signal down bonded to thermal pad inside IC. Exposed thermal pad must be soldered to PCB for optimal thermal performance.

## 6 Specifications

### 6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted) (operating in a typical application circuit)<sup>(1)</sup>

		MIN	MAX	UNIT
Voltage	VIN1, VIN2, VIN3, LVIN1, LVIN2	−0.3	20	V
	LX1, LX2, LX3 (Maximum withstand voltage transient <20 ns)	−1.0	20	
	BST1, BST2, BST3 referenced to LX1, LX2, LX3 pins respectively	−0.3	7	
	MODE, LEN1, LEN2, EN1, EN2, EN3, PGOOD, V7V	−0.3	7	
	LOUT1, LOUT2	−0.3	7	
	FB1, FB2, FB3, LFB1, LFB2, COMP1, SS1	−0.3	3.6	
	AGND, PGND1, PGND2, PGND3	−0.3	0.3	
T <sub>J</sub>	Operating junction temperature	−40	125	°C
T <sub>stg</sub>	Storage temperature	−55	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions beyond those indicated under *recommended operating conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

### 6.2 ESD Ratings

			VALUE	UNIT
V <sub>(ESD)</sub>	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins <sup>(1)</sup>	±2000	V
		Charged device model (CDM), per JEDEC specification JESD22-C101, all pins <sup>(2)</sup>	±500	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process. *Pins listed as 1 kV can actually have higher performance.*
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process. *Pins listed as 250 V can actually have higher performance.*

### 6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	MAX	UNIT
Voltage	VIN1, VIN2, VIN3, LVIN1, LVIN2	4.5	18	V
	LX1, LX2, LX3 (maximum withstand voltage transient <20 ns)	−0.8	18	
	BST1, BST2, BST3 referenced to LX1, LX2, LX3 pins respectively	−0.1	6.8	
	MODE, LEN1, LEN2, EN1, EN2, EN3, PGOOD, V7V	−0.1	6.3	
	FB1, FB2, FB3, LFB1, LFB2, COMP1, SS1	−0.1	3	
	LOUT1, LOUT2	−0.1	5.5	
T <sub>J</sub>	Operating junction temperature	−40	125	°C

### 6.4 Thermal Information

THERMAL METRIC <sup>(1)</sup>		TPS65262-2	UNIT
		RHB (VQFN)	
		32 PINS	
R <sub>θJA</sub>	Junction-to-ambient thermal resistance	32	°C/W
R <sub>θJC(top)</sub>	Junction-to-case (top) thermal resistance	24.2	°C/W
R <sub>θJB</sub>	Junction-to-board thermal resistance	6.4	°C/W
ψ <sub>JT</sub>	Junction-to-top characterization parameter	0.2	°C/W
ψ <sub>JB</sub>	Junction-to-board characterization parameter	6.4	°C/W

THERMAL METRIC <sup>(1)</sup>	TPS65262-2	UNIT
	RHB (VQFN)	
	32 PINS	
$R_{\theta Jc(bot)}$ Junction-to-case (bottom) thermal resistance	1.3	°C/W

- (1) For more information about traditional and new thermal metrics, see the *Semiconductor and IC Package Thermal Metrics* application report, [SPRA953](#).

## 6.5 Electrical Characteristics

$T_J = -40^{\circ}\text{C}$  to  $125^{\circ}\text{C}$ , typical values are at  $T_J = 25^{\circ}\text{C}$  (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT

## 7 Detailed Description

### 7.1 Overview

The TPS65262-2 is a monolithic, triple, synchronous step-down (buck) converter with 3-A/1-A/1-A output currents. A wide 4.5- to 18-V input supply voltage range encompasses most intermediate bus voltages operating off 5-V, 9-V, 12-V, or 15-V power bus. The feedback voltage reference for each buck is 0.6 V. Each buck is independent with dedicated enable, soft-start and loop compensation.

The TPS65262-2 implements a constant frequency, peak current mode control that simplifies external loop compensation. The switching frequency is fixed 600 kHz. The switching clock of buck1 is 180° out-of-phase operation from the clocks of buck2 and buck3 channels to reduce input current ripple, input capacitor size and power supply induced noise.

The TPS65262-2 has been designed for safe monotonic startup into pre-biased loads. The default start-up is when VIN is typically 4.5 V. The ENx pin also can be used to adjust the input voltage undervoltage lockout (UVLO) with an external resistor divider. In addition, the ENx pin has an internal 3.6-μA current source, so the EN pin can be floating for automatically powering up the converters.

The TPS65262-2 reduces the external component count by integrating the bootstrap circuit. The bias voltage for the integrated high-side MOSFET is supplied by a capacitor between the BST and LX pins. A UVLO circuit monitors the bootstrap capacitor voltage VBST-VLX in each buck. When VBST-VLX voltage drops to the threshold, LX pin is pulled low to recharge the bootstrap capacitor. The TPS65262-2 can operate at 100% duty cycle as long as the bootstrap capacitor voltage is higher than the BOOT-LX UVLO threshold which is typically 2.1 V.

The TPS65262-2 features a PGOOD pin to supervise each output voltage of buck converters. The TPS65262-2 has power good comparators with hysteresis, which monitor the output voltages through feedback voltages. When all bucks are in regulation range and power sequence is done, PGOOD is asserted to high.

The SS (soft start, tracking) pin is used to minimize inrush currents during power up. A small value capacitor or resistor divider is coupled to the pin for soft start or voltage tracking.

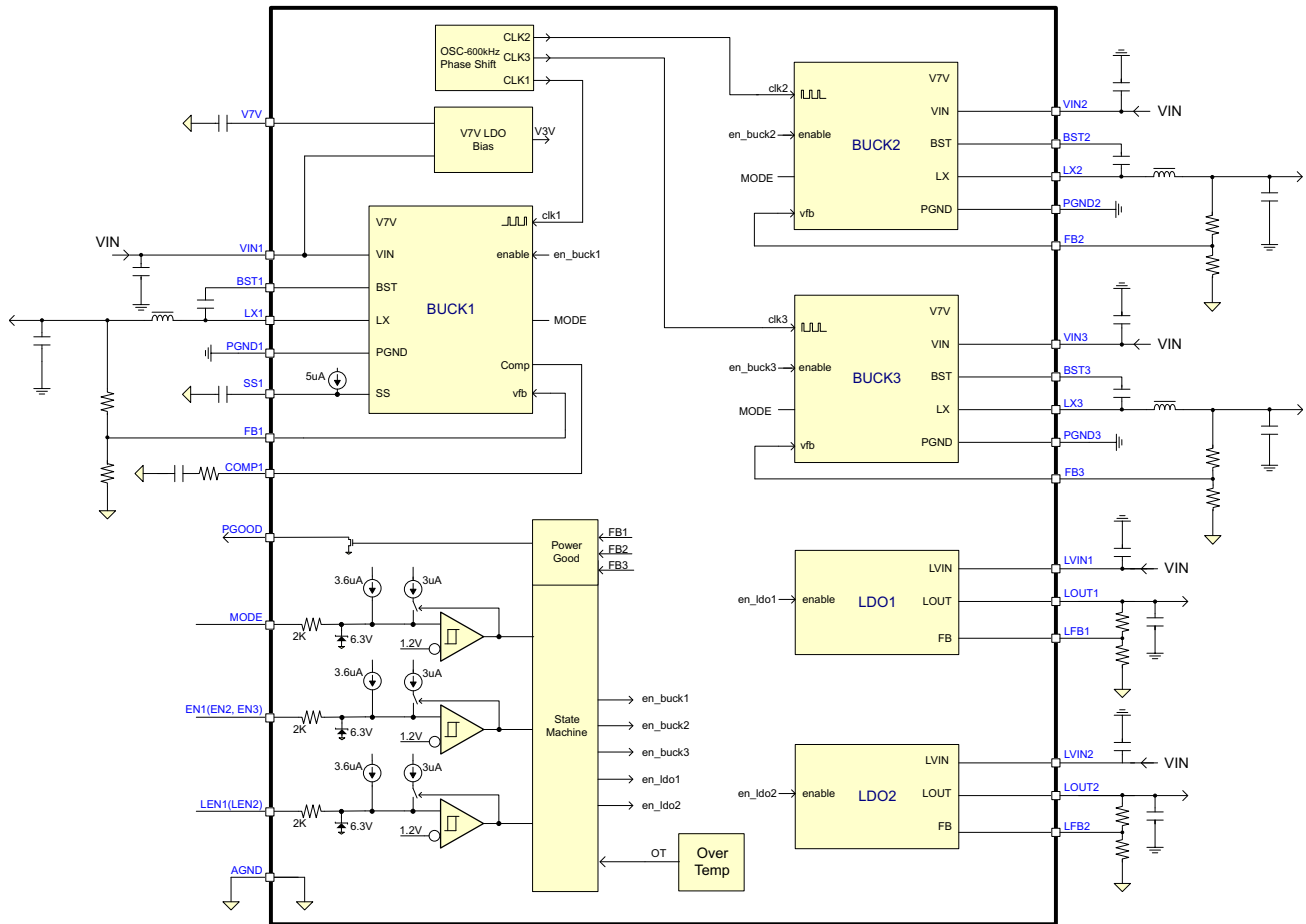

The TPS65262-2 operates in pulse skipping mode (PSM) with connecting MODE pin to GND and operates in forced continuous current (FCC) mode with driving MODE pin to high or leaving float.

The TPS65262-2 integrates low drop-out voltage linear regulators (LDO) with input voltage from 1.3 to 18 V, independent enable and adjustable outputs, up to 350 mA for LDO1 and 150 mA for LDO2 continuous output current.

The TPS65262-2 is protected from overload and over temperature fault conditions. The converter minimizes excessive output overvoltage transients by taking advantage of the power good comparator. When the output is over, the high-side MOSFET is turned off until the internal feedback voltage is lower than 105% of the 0.6-V reference voltage. The TPS65262-2 implements both high-side MOSFET overload protection and bidirectional low-side MOSFET overload protections to avoid inductor current runaway. If the over current condition has lasted for more than the OC wait time (0.5 ms), the converter shuts down and restart after the hiccup time (14 ms). The TPS65262-2 shuts down if the junction temperature is higher than thermal shutdown trip point 160°C. When the junction temperature drops 20°C (typical) below the thermal shutdown trip point, the TPS65262-2 is restarted under control of the soft-start circuit automatically.

The TPS65262-2 is available in a 32-lead thermally-enhanced VQFN (RHB) package.

## 7.2 Functional Block Diagram

## 7.3 Feature Description

### 7.3.1 Adjusting the Output Voltage

The output voltage of each buck is set with a resistor divider from the output of buck to the FB pin. TI recommends to use 1% tolerance or better divider resistors.

**7-1. Voltage Divider Circuit**

$$R_2 = R_1 \times \frac{0.6}{V_{out} - 0.6} \quad (1)$$

To improve efficiency at light loads consider using larger value resistors. If the values are too high, the regulator is more sensitive to noise. The recommended resistor values are shown in [表 7-1](#).

**表 7-1. Output Resistor Divider Selection**

OUTPUT VOLTAGE (V)	R1 (kΩ)	R2 (kΩ)
1	10	15
1.2	10	10
1.5	15	10
1.8	20	10
2.5	31.6	10
3.3	45.3	10
3.3	22.6	4.99
5	73.2	10
5	36.5	4.99

### 7.3.2 Enable and Adjusting Undervoltage Lockout

The EN1/2/3 pin provides electrical on/off control of the device. After the EN1/2/3 pin voltage exceeds the threshold voltage, the device starts operation. If each ENx pin voltage is pulled below the threshold voltage, the regulator stops switching and enters low Iq state.

The EN pin has an internal pullup current source, allowing the user to float the EN pin for enabling the device. If an application requires controlling the EN pin, use open drain or open collector output logic to interface with the pin.

The device implements internal UVLO circuitry on the VIN pin. The device is disabled when the VIN pin voltage falls below the internal VIN UVLO threshold. The internal VIN UVLO threshold has a hysteresis of 500mV. If an application requires a higher UVLO threshold on the VIN pin, then the ENx pin can be configured as shown in [Figure 7-2](#). When using the external UVLO function TI recommends to set the hysteresis to be greater than 500mV.

The EN pin has a small pullup current  $I_p$  which sets the default state of the pin to enable when no external components are connected. The pullup current is also used to control the voltage hysteresis for the UVLO function because it increases by  $I_h$  after the EN pin crosses the enable threshold. The UVLO thresholds can be calculated using [Equation 2](#) and [Equation 3](#).

$$R_1 = \frac{V_{START} \left( \frac{V_{ENFALLING}}{V_{ENRISING}} \right) - V_{STOP}}{I_p \left( 1 - \frac{V_{ENFALLING}}{V_{ENRISING}} \right) + I_h} \quad (2)$$

$$R_2 = \frac{R_1 \times V_{ENFALLING}}{V_{STOP} - V_{ENFALLING} + R_1 (I_h + I_p)} \quad (3)$$

where

- $I_h = 3 \mu A$
- $I_p = 3.6 \mu A$
- $V_{ENRISING} = 1.2 V$
- $V_{ENFALLING} = 1.15 V$

✎ 7-2. Adjustable VIN Undervoltage Lockout

### 7.3.3 Soft-Start Time

The voltage on the SS1 pin controls the start-up of buck1 output. When the voltage on the SS1 pin is less than the internal 0.6-V reference, The TPS65262-2 regulates the internal feedback voltage to the voltage on the SS1 pin instead of 0.6 V, allowing VOUT to rise smoothly from 0 V to its regulated voltage without inrush current. The device has an internal pullup current source of 5  $\mu$ A (typical) that charges an external soft-start capacitor to provide a linear ramping voltage at SS1 pin.

Buck1 soft-start time can be calculated approximately by 式 4.

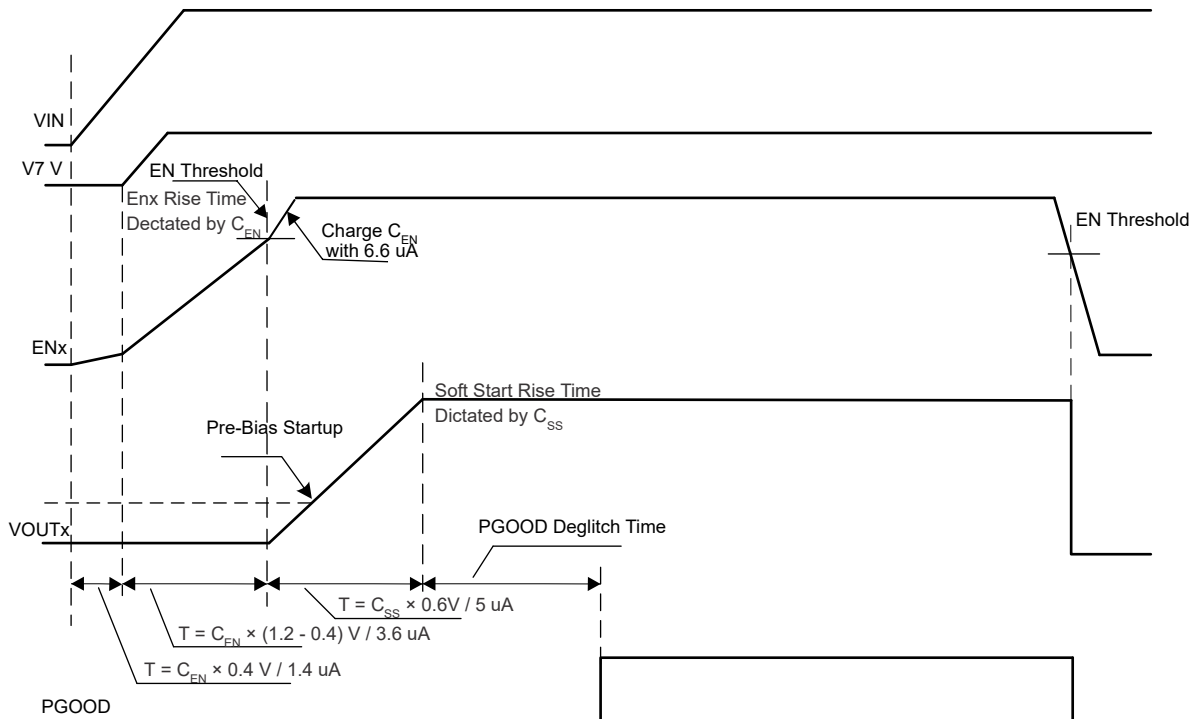

Buck2 and Buck3 have fixed 1-ms soft start time.

$$T_{ss}(ms) = C_{ss}(nF) \times \left( \frac{0.6V}{5\mu A} \right) \quad (4)$$

### 7.3.4 Power-Up Sequencing

The TPS65262-2 has dedicated enable pin for each converter. The converter enable pins are biased by a current source that allows for easy sequencing by the addition of an external capacitor. Disabling the converter with an active pull-down transistor on the ENx pin allows for a predictable power-down timing operation. ✎ 7-3 shows the timing diagram of a typical buck power-up sequence with connecting a capacitor at ENx pin.

A typical 1.4- $\mu$ A current is charging ENx pin from input supply. When ENx pin voltage rise to typical 0.4 V, the internal V7V LDO turns on. A 3.6- $\mu$ A pullup current is sourcing ENx. After ENx pin voltage reaches to 1.2 V typical, 3- $\mu$ A hysteresis current sources to the pin to improve noise sensitivity. If all output voltages are in the regulation, PGOOD is asserted after PGOOD deglitch time.

**FIG 7-3. Startup Power Sequence**

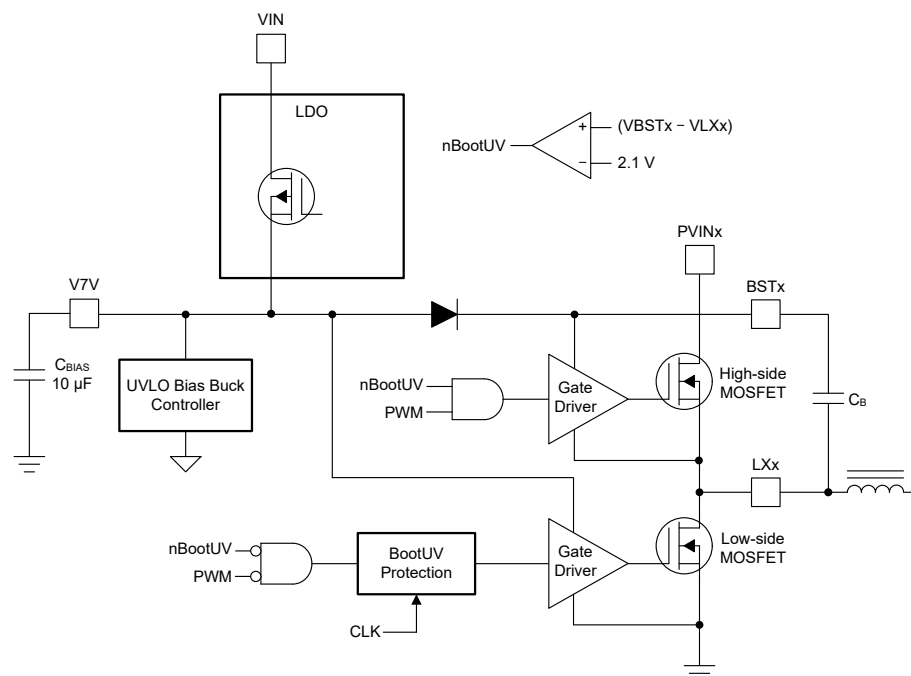

### 7.3.5 V7V Low Dropout Regulator and Bootstrap

Power for the high-side and low-side MOSFET drivers and most other internal circuitry is derived from the V7V pin. The internal built-in low dropout linear regulator (LDO) supplies 6.3 V (typical) from VIN to V7V. A 10- $\mu F$  ceramic capacitor must be connected from V7V pin to power ground.

If the input voltage, VIN decreases to UVLO threshold voltage, the UVLO comparator detects V7V pin voltage and forces the converter off.

Each high-side MOSFET driver is biased from the floating bootstrap capacitor, CB, shown in [FIG 7-4](#), which is normally recharged during each cycle through an internal low-side MOSFET or the body diode of low-side MOSFET when the high-side MOSFET turns off. The boot capacitor is charged when the BST pin voltage is less than VIN and BST-LX voltage is below regulation. The recommended value of this ceramic capacitor is 47 nF. TI recommends a ceramic capacitor with an X7R or X5R grade dielectric with a voltage rating of 10 V or higher because of the stable characteristics overtemperature and voltage. Each low-side MOSFET driver is powered from V7V pin directly.

To improve drop out, the device is designed to operate at 100% duty cycle as long as the BST to LX pin voltage is greater than the BST-LX UVLO threshold, which is typically 2.1 V. When the voltage between BST and LX drops below the BST-LX UVLO threshold, the high-side MOSFET is turned off and the low-side MOSFET is turned on allowing the boot capacitor to be recharged.

#### 7-4. V7V Linear Dropout Regulator and Bootstrap Voltage Diagram

### 7.3.6 Out-of-Phase Operation

To reduce input ripple current, the switch clock of buck1 is 180° out-of-phase from the clock of buck2 and buck3. This enables the system having less input current ripple to reduce input capacitor size, cost, and EMI.

### 7.3.7 Output Overvoltage Protection (OVP)

The device incorporates an OVP circuit to minimize output voltage overshoot. When the output is overloaded, the error amplifier compares the actual output voltage to the internal reference voltage. If the FB pin voltage is lower than the internal reference voltage for a considerable time, the output of the error amplifier demands maximum output current. After the condition is removed, the regulator output rises and the error amplifier output transitions to the steady state voltage. In some applications with small output capacitance, the load can respond faster than the error amplifier. This leads to the possibility of an output overshoot. Each buck compares the FB pin voltage to the OVP threshold. If the FB pin voltage is greater than the OVP threshold, the high-side MOSFET is turned off preventing current from flowing to the output and minimizing output overshoot. When the FB voltage drops lower than the OVP threshold, the high-side MOSFET turns on at the next clock cycle.

### 7.3.8 PSM

If the MODE pin is connected to GND, the TPS65262-2 can enter high-efficiency PSM operation at light load current.

When a controller is enabled for PSM operation, the peak inductor current is sensed and compared with 230-mA current typically. Because the integrated current comparator catches the peak inductor current only, the average load current entering PSM varies with the applications and external output filters. In PSM, the sensed peak inductor current is clamped at 230 mA.

When a controller operates in PSM, the inductor current is not allowed to reverse. The reverse current comparator turns off the low-side MOSFET when the inductor current reaches zero, preventing it from reversing and going negative.

Due to the delay in the circuit and current comparator t<sub>tdly</sub> (typical 50 ns at V<sub>in</sub> = 12 V), the real peak inductor current threshold to turn off high-side power MOSFET can shift higher depending on inductor inductance and

input/output voltages. The threshold of peak inductor current to turn off high-side power MOSFET can be calculated by 式 5.

$$I_{L\_PEAK} = 230\text{mA} + \frac{v_{in} - v_{out}}{L} \times t_{dly} \quad (5)$$

After the charge accumulated on Vout capacitor is more than loading need, COMP pin voltage drops to low voltage driven by error amplifier. There is an internal comparator at COMP pin. If comp voltage is lower than 0.35 V, power stage stops switching to save power.

图 7-5. PSM Current Comparator

### 7.3.9 Slope Compensation

To prevent the sub-harmonic oscillations when the device operates at duty cycles greater than 50%, the device adds built-in slope compensation, which is a compensating ramp to the switch current signal.

### 7.3.10 Overcurrent Protection

The device is protected from over current conditions by cycle-by-cycle current limiting on both the high-side MOSFET and the low-side MOSFET.

#### 7.3.10.1 High-Side MOSFET Overcurrent Protection

The device implements current mode control which uses the COMP pin voltage to control the turn off of the high-side MOSFET and the turn on of the low-side MOSFET on a cycle by cycle basis. Each cycle the switch current and the current reference generated by the COMP pin voltage are compared. When the peak switch current intersects the current reference, the high-side switch is turned off.

#### 7.3.10.2 Low-Side MOSFET Overcurrent Protection

While the low-side MOSFET is turned on, its conduction current is monitored by the internal circuitry. During normal operation the low-side MOSFET sources current to the load. At the end of every clock cycle, the low-side MOSFET sourcing current is compared to the internally set low-side sourcing current limit. If the low-side sourcing current is exceeded, the high-side MOSFET is not turned on and the low-side MOSFET stays on for the next cycle. The high-side MOSFET is turned on again when the low-side current is below the low-side sourcing current limit at the start of a cycle.

The low-side MOSFET can also sink current from the load. If the low-side sinking current limit is exceeded, the low-side MOSFET is turned off immediately for the rest of that clock cycle. In this scenario both MOSFETs are off until the start of the next cycle.

Furthermore, if an output overload condition (as measured by the COMP pin voltage) has lasted for more than the hiccup wait time which is programmed for 0.5 ms shown in 图 7-6, the device will shut down itself and restart after the hiccup time 14ms. The hiccup mode helps to reduce the device power dissipation under severe overcurrent condition.

**7-6. Overcurrent Protection**

### 7.3.11 Power Good

The PGOOD pin is an open drain output. After feedback voltage of each buck is between 95% (rising) and 105% (falling) of the internal voltage reference, the PGOOD pin pull-down is de-asserted and the pin floats. TI recommends to use a pullup resistor between the values of 10 and 100 kΩ to a voltage source that is 5.5 V or less. The PGOOD is in a defined state after the VIN input voltage is greater than 1 V, but with reduced current sinking capability. The PGOOD achieves full current sinking capability after the VIN input voltage is above UVLO threshold, which is 4.25 V.

The PGOOD pin is pulled low when any feedback voltage of buck is lower than 92.5% (falling) or greater than 107.5% (rising) of the nominal internal reference voltage. Also, the PGOOD is pulled low, if the input voltage is under-voltage locked up, thermal shutdown is asserted, the EN pin is pulled low or the converter is in a soft-start period.

### 7.3.12 Thermal Shutdown

The internal thermal shutdown circuitry forces the device to stop switching if the junction temperature exceeds 160°C typically. The device reinitiates the power up sequence when the junction temperature drops below 140°C typically.

**表 7-2. Related Parts**

PART NUMBER	DESCRIPTION	COMMENTS
TPS65261	4.5- to 18-V, triple buck with input voltage power failure indicator	Triple buck 3-A/2-A/2-A output current, features an open drain RESET signal to monitor power down, automatic power sequencing
TPS65263	4.5- to 18-V, triple buck with I <sup>2</sup> C interface	Triple buck 3-A/2-A/2-A output current, I <sup>2</sup> C controlled dynamic voltage scaling (DVS)
TPS65287	4.5- to 18-V, triple buck with power switch and push button control	Triple buck 3-A/2-A/2-A output current, up to 2.1-A USB power with over current setting by external resistor, push button control for intelligent system power-on/power-off operation
TPS65288	4.5- to 18-V, triple buck with dual power switches	Triple buck 3-A/2-A/2-A output current, 2 USB power switches current limiting at typical 1.2 A (0.8/1.0/1.4/1.6/1.8/2.0/2.2 A available with manufacture trim options)

## 7.4 Device Functional Modes

### 7.4.1 Operation With $V_{IN} < 4.5\text{ V}$ (Minimum $V_{IN}$ )

The device operates with input voltages above 4.5 V. The maximum UVLO voltage is 4.5 V and operates at input voltages above 4.5 V. The typical UVLO voltage is 4.25 V, and the device can operate at input voltages above that point. The device also can operate at lower input voltages; the minimum UVLO voltage is 4 V (rising) and 3.5 V (falling). At input voltages below the UVLO minimum voltage, the device does not operate.

### 7.4.2 Operation with EN Control

The enable rising edge threshold voltage is 1.2-V typical and 1.26-V maximum. With EN held below that voltage, the device is disabled and switching is inhibited. The IC quiescent current is reduced in this state. When the input voltage is above the UVLO threshold and the EN voltage is increased above the rising edge threshold, the device becomes active. Switching is enabled, and the soft-start sequence is initiated. The device starts at the soft-start time determined by the external soft start capacitor as shown in [Figure 8-3](#) to [Figure 8-8](#).

## 8 Application and Implementation

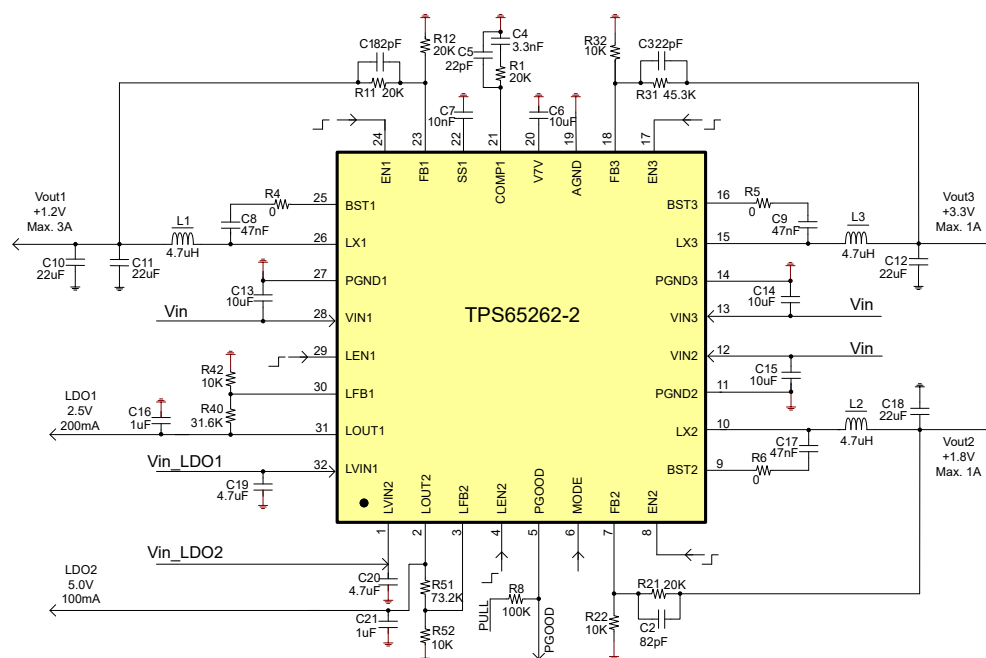

注

以下のアプリケーション情報は、TI の製品仕様に含まれるものではなく、TI ではその正確性または完全性を保証いたしません。個々の目的に対する製品の適合性については、お客様の責任で判断していただくことになります。お客様は自身の設計実装を検証しテストすることで、システムの機能を確認する必要があります。

## 8.1 Application Information

The device is triple-synchronous, step-down DC/DC converter with dual LDOs. The device is typically used to convert a higher DC voltage to lower DC voltages with continuous available output current of 3 A/1 A/1 A. The following design procedure can be used to select component values for the TPS65262-2. This section presents a simplified discussion of the design process.

## 8.2 Typical Application

### 8-1. Typical Application Schematic

### 8.2.1 Design Requirements

This example details the design of a triple-synchronous step-down converter. A few parameters must be known to start the design process. These parameters are typically determined at the system level. For this example, start with the following known parameters shown in 表 8-1.

表 8-1. Design Parameters

PARAMETER	VALUE
Vout1	1.2 V
Iout1	3 A
Vout2	1.8 V
Iout2	1 A
Vout3	3.3 V
Iout3	1 A
Buck1 transient response 1-A load step	±5%
Buck2, buck3 transient response 0.5-A load step	±5%
Input voltage	12 V normal, 4.5 to 18 V
Output voltage ripple	±1%
Switching frequency	600 kHz

## 8.2.2 Detailed Design Procedure

### 8.2.2.1 Output Inductor Selection

To calculate the value of the output inductor, use 式 6. LIR is a coefficient that represents the amount of inductor ripple current relative to the maximum output current. The inductor ripple current is filtered by the output capacitor. Therefore, choosing high inductor ripple currents impact the selection of the output capacitor because the output capacitor must have a ripple current rating equal to or greater than the inductor ripple current. In general, the inductor ripple value is at the discretion of the designer; however, LIR is normally from 0.1 to 0.3 for the majority of applications.

$$L = \frac{V_{inmax} - V_{out}}{I_o \times LIR} \times \frac{V_{out}}{V_{inmax} \times f_{sw}} \quad (6)$$

For the output filter inductor, it is important that the RMS current and saturation current ratings not be exceeded. The RMS and peak inductor current can be found from 式 8 and 式 9.

$$I_{ripple} = \frac{V_{inmax} - V_{out}}{L} \times \frac{V_{out}}{V_{inmax} \times f_{sw}} \quad (7)$$

$$I_{Lrms} = \sqrt{I_O^2 + \frac{\left( \frac{V_{out} \times (V_{inmax} - V_{out})}{V_{inmax} \times L \times f_{sw}} \right)^2}{12}} \quad (8)$$

$$I_{Lpeak} = I_{out} + \frac{I_{ripple}}{2} \quad (9)$$

The current flowing through the inductor is the inductor ripple current plus the output current. During power up, faults or transient load conditions, the inductor current can increase above the calculated peak inductor current level calculated above. In transient conditions, the inductor current can increase up to the switch current limit of the device. For this reason, the most conservative approach is to specify an inductor with a saturation current rating equal to or greater than the switch current limit rather than the peak inductor current.

### 8.2.2.2 Output Capacitor Selection

There are three primary considerations for selecting the value of the output capacitor. The output capacitor determines the modulator pole, the output voltage ripple, and how the regulator responds to a large change in load current. The output capacitance needs to be selected based on the most stringent of these three criteria.

The desired response to a large change in the load current is the first criteria. The output capacitor needs to supply the load with current when the regulator cannot. This situation can occur if there are desired hold-up times for the regulator where the output capacitor must hold the output voltage above a certain level for a specified amount of time after the input power is removed. The regulator is also temporarily not able to supply sufficient output current if there is a large, fast increase in the current needs of the load such as a transition from no load to full load. The regulator usually needs two or more clock cycles for the control loop to see the change in load current and output voltage and adjust the duty cycle to react to the change. The output capacitor must be sized to supply the extra current to the load until the control loop responds to the load change. The output capacitance must be large enough to supply the difference in current for 2 clock cycles while only allowing a tolerable amount of droop in the output voltage. 式 10 shows the minimum output capacitance necessary to accomplish this.

$$C_o = \frac{2 \times \Delta I_{out}}{f_{sw} \times \Delta V_{out}} \quad (10)$$

where

- $\Delta I_{out}$  is the change in output current.
- $f_{sw}$  is the regulator's switching frequency.
- $\Delta V_{out}$  is the allowable change in the output voltage.

式 11 calculates the minimum output capacitance needed to meet the output voltage ripple specification.

$$C_o > \frac{1}{8 \times f_{sw}} \times \frac{1}{\frac{V_{oripple}}{I_{oripple}}} \quad (11)$$

where

- $f_{sw}$  is the switching frequency
- $V_{oripple}$  is the maximum allowable output voltage ripple
- $I_{oripple}$  is the inductor ripple current

式 12 calculates the maximum ESR an output capacitor can have to meet the output voltage ripple specification.

$$R_{esr} < \frac{V_{oripple}}{I_{oripple}} \quad (12)$$

Additional capacitance de-ratings for aging, temperature and DC bias must be factored in which increases this minimum value. Capacitors generally have limits to the amount of ripple current they can handle without failing or producing excess heat. An output capacitor that can support the inductor ripple current must be specified. Some capacitor data sheets specify the root mean square (RMS) value of the maximum ripple current. 式 13 can be used to calculate the RMS ripple current the output capacitor needs to support.

$$I_{corms} = \frac{V_{out} \times (V_{inmax} - V_{out})}{\sqrt{12} \times V_{inmax} \times L \times f_{sw}} \quad (13)$$

### 8.2.2.3 Input Capacitor Selection

The TPS65262-2 requires a high quality ceramic, type X5R or X7R, input decoupling capacitor of at least 10  $\mu\text{F}$  of effective capacitance on the VIN input voltage pins. In some applications additional bulk capacitance can also be required for the VIN input. The effective capacitance includes any DC bias effects. The voltage rating of the input capacitor must be greater than the maximum input voltage. The capacitor must also have a ripple current rating greater than the maximum input current ripple of The TPS65262-2. The input ripple current can be calculated using 式 14.

$$I_{\text{inrms}} = I_{\text{out}} \times \sqrt{\frac{V_{\text{out}}}{V_{\text{inmin}}} \times \frac{(V_{\text{inmin}} - V_{\text{out}})}{V_{\text{inmin}}}} \quad (14)$$

The value of a ceramic capacitor varies significantly over temperature and the amount of DC bias applied to the capacitor. The capacitance variations due to temperature can be minimized by selecting a dielectric material that is stable over temperature. X5R and X7R ceramic dielectrics are usually selected for power regulator capacitors because they have a high capacitance to volume ratio and are fairly stable over temperature. The output capacitor must also be selected with the DC bias taken into account. The capacitance value of a capacitor decreases as the DC bias across a capacitor increases. The input capacitance value determines the input ripple voltage of the regulator. The input voltage ripple can be calculated using 式 15.

$$\Delta V_{\text{in}} = \frac{I_{\text{outmax}} \times 0.25}{C_{\text{in}} \times f_{\text{sw}}} \quad (15)$$

### 8.2.2.4 Loop Compensation

The TPS65262-2 incorporates a peak current mode control scheme. The error amplifier is a transconductance amplifier with a gain of 300  $\mu\text{S}$ . A typical type II compensation circuit adequately delivers a phase margin between 60° to 90°.  $C_b$  adds a high-frequency pole to attenuate high frequency noise when needed. To calculate the external compensation components, follow the following steps.

1. Switching frequency  $f_{\text{sw}}$  600 kHz is appropriate for application depending on L and C sizes, output ripple, EMI, and so forth, also gives best trade-off between performance and cost.
2. Set up crossover frequency,  $f_c$ , which is typically between 1/5 and 1/20 of  $f_{\text{sw}}$ .
3.  $R_C$  can be determined by

$$R_C = \frac{2\pi \times f_c \times V_o \times C_o}{G_{\text{m-EA}} \times V_{\text{ref}} \times G_{\text{m-PS}}} \quad (16)$$

Where  $G_{\text{m-EA}}$  is the error amplifier gain (300  $\mu\text{S}$ ),  $G_{\text{m-PS}}$  is the power stage voltage to current conversion gain (7.4 A/V).

4. Calculate  $C_C$  by placing a compensation zero at or before the dominant pole  $\left( f_p = \frac{1}{C_o \times R_L \times 2\pi} \right)$ .

$$C_C = \frac{R_L \times C_o}{R_C} \quad (17)$$

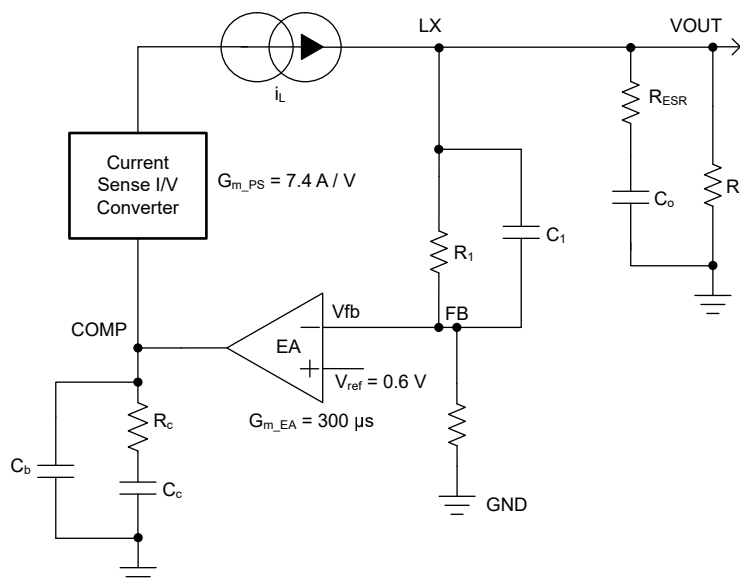

5. Optional  $C_b$  can be used to cancel the zero from the ESR associated with  $C_o$ .

$$C_b = \frac{R_{\text{ESR}} \times C_o}{R_C} \quad (18)$$

6. Type III compensation can be implemented with the addition of one capacitor,  $C_1$ . This allows for slightly higher loop bandwidths and higher phase margins. If used,  $C_1$  is calculated from 式 19.

$$C1 = \frac{1}{2\pi \times R1 \times f_c}$$

(19)

**8-2. DC/DC Loop Compensation**

### 8.2.3 Application Curves

$T_A = 25^\circ\text{C}$ ,  $V_{IN} = 12\text{ V}$ ,  $V_{OUT1} = 1.2\text{ V}$ ,  $V_{OUT2} = 1.8\text{ V}$ ,  $V_{OUT3} = 3.3\text{ V}$ ,  $f_{SW} = 600\text{ kHz}$ , PSM mode (unless otherwise noted)

## 8.3 Power Supply Recommendations

A wide 4.5- to 18-V input supply voltage range encompasses the most intermediate bus voltage operating off 5-, 9-, 12-, or 15-V power bus. The converter, with constant frequency peak current mode, is designed to simplify its application while giving designers options to optimize the system according to targeted applications.

## 8.4 Layout

### 8.4.1 Layout Guidelines

The TPS65262-2 supports a 2-layer PCB layout, shown in [8-37](#).

Layout is a critical portion of good power supply design. See [8-37](#) for a PCB layout example. The top contains the main power traces for VIN, VOUT, and LX. Also on the top layer are connections for the remaining pins of the TPS65262-2 and a large top side area filled with ground. The top layer ground area must be connected to the bottom layer ground using vias at the input bypass capacitor, the output filter capacitor and directly under the TPS65262-2 device to provide a thermal path from the exposed thermal pad land to ground. The bottom layer acts as ground plane connecting analog ground and power ground.

For operation at full rated load, the top side ground area together with the bottom side ground plane must provide adequate heat dissipating area. There are several signals paths that conduct fast changing currents or voltages that can interact with stray inductance or parasitic capacitance to generate noise or degrade the power supplies performance. To help eliminate these problems, the VIN pin must be bypassed to ground with a low ESR ceramic bypass capacitor with X5R or X7R dielectric. Care must be taken to minimize the loop area formed

by the bypass capacitor connections, the VIN pins, and the ground connections. The VIN pin must also be bypassed to ground using a low-ESR ceramic capacitor with X5R or X7R dielectric.

Because the LX connection is the switching node, the output inductor must be located close to the LX pins, and the area of the PCB conductor minimized to prevent excessive capacitive coupling. The output filter capacitor ground must use the same power ground trace as the VIN input bypass capacitor. Try to minimize this conductor length while maintaining adequate width. The small signal components must be grounded to the analog ground path.

The FB and COMP pins are sensitive to noise so the resistors and capacitors must be located as close as possible to the IC and routed with minimal lengths of trace. The additional external components can be placed approximately as shown.

## 9 Device and Documentation Support

### 9.1 ドキュメントの更新通知を受け取る方法

ドキュメントの更新についての通知を受け取るには、[ti.com](http://ti.com) のデバイス製品フォルダを開いてください。「更新の通知を受け取る」をクリックして登録すると、変更されたすべての製品情報に関するダイジェストを毎週受け取れます。変更の詳細については、修正されたドキュメントに含まれている改訂履歴をご覧ください。

### 9.2 サポート・リソース

**TI E2E™ サポート・フォーラム**は、エンジニアが検証済みの回答と設計に関するヒントをエキスパートから迅速かつ直接得ることができる場所です。既存の回答を検索したり、独自の質問をしたりすることで、設計に必要な支援を迅速に得ることができます。

リンクされているコンテンツは、該当する貢献者により、現状のまま提供されるものです。これらは TI の仕様を構成するものではなく、必ずしも TI の見解を反映したものではありません。TI の[使用条件](#)を参照してください。

### 9.3 Trademarks

TI E2E™ is a trademark of Texas Instruments.

すべての商標は、それぞれの所有者に帰属します。

### 9.4 静電気放電に関する注意事項

この IC は、ESD によって破損する可能性があります。テキサス・インスツルメンツは、IC を取り扱う際には常に適切な注意を払うことを推奨します。正しい取り扱いおよび設置手順に従わない場合、デバイスを破損するおそれがあります。

ESD による破損は、わずかな性能低下からデバイスの完全な故障まで多岐にわたります。精密な IC の場合、パラメータがわずかに変化するだけで公表されている仕様から外れる可能性があるため、破損が発生しやすくなっています。

### 9.5 用語集

[テキサス・インスツルメンツ用語集](#) この用語集には、用語や略語の一覧および定義が記載されています。

## 10 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

## PACKAGING INFORMATION

Orderable part number	Status (1)	Material type (2)	Package   Pins	Package qty   Carrier	RoHS (3)	Lead finish/ Ball material (4)	MSL rating/ Peak reflow (5)	Op temp (°C)	Part marking (6)
<a href="#">TPS65262-2RHBR</a>	Active	Production	VQFN (RHB)   32	3000   LARGE T&R	Yes	NIPDAU	Level-2-260C-1 YEAR	-40 to 85	TPS 65262-2
TPS65262-2RHBR.A	Active	Production	VQFN (RHB)   32	3000   LARGE T&R	Yes	NIPDAU	Level-2-260C-1 YEAR	-40 to 85	TPS 65262-2
<a href="#">TPS65262-2RHBT</a>	Active	Production	VQFN (RHB)   32	250   SMALL T&R	Yes	NIPDAU	Level-2-260C-1 YEAR	-40 to 85	TPS 65262-2
TPS65262-2RHBT.A	Active	Production	VQFN (RHB)   32	250   SMALL T&R	Yes	NIPDAU	Level-2-260C-1 YEAR	-40 to 85	TPS 65262-2

<sup>(1)</sup> **Status:** For more details on status, see our [product life cycle](#).

<sup>(2)</sup> **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

<sup>(3)</sup> **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

<sup>(4)</sup> **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

<sup>(5)</sup> **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

<sup>(6)</sup> **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

## TAPE AND REEL INFORMATION

\*All dimensions are nominal
