

TUSB2E11 USB 2.0-eUSB2 リピータ

1 特長

- USB 2.0 および eUSB2 (rev 1.2) に準拠
- ロースピード、フルスピード、ハイスピード信号伝送
- クラス最高の高速合計ジッタ: 20ps
- レジスタ アクセス プロトコル レセプタ対応
- ホスト モードおよびデバイス モードをサポート (デュアル ロール デバイス)
- I²C かストラップ ピンかを自動検出
 - USB 2.0 ハイスピード チャンネル補償設定用の 3 本のストラップ ピン
 - I²C デバイス インターフェイスを使用すると、より柔軟な設定が可能
- さまざまなデバイス バリエーションを用意
 - eUSB2 1.0V または 1.2V 信号インターフェイス
 - さまざまな eUSB2 トレース損失補償レベルで多様な製品フォーム ファクタに対応
 - 1.2V または 1.8V I²C インターフェイス
- オプションのバッテリー充電および検出サポート
 - BC 1.2 CDP または DCP デバイダ モードのアドバタイズ
 - データ認識型 USB Type-C™ 互換の BC 1.2 SDP、CDP、DCP デバイダ モード検出機能
 - チャージャのアドバタイズと検出を切り替えるデュアル ロールの自動スイッチング
- CTA-936 USB CarKit UART のサポート
- 自動再開 ECR と L2 割り込み再開モードをサポート
- オプションの GPIO: 割り込み GPIO2、デバッグ、I²C ↔ GPIO0/1
- I²C からアクセスできる製造試験用のデバッグ機能

2 アプリケーション

- ノート PC およびデスクトップ PC
- 携帯電話
- タブレット
- ウェアラブル
- ポータブル・エレクトロニクス

3 概要

TUSB2E11 は、デバイス モードとホスト モードの両方をサポートする USB 規格準拠の eUSB2 - USB 2.0 リピータです。

このデバイスは、USB ロースピード (LS) 信号、フルスピード (FS) 信号、ハイスピード (HS) 信号をサポートしています。

このデバイスは、堅牢な相互運用性、最適な性能、消費電力を実現するために、特許申請中の複数の設計を採用しています。

I²C インターフェイスを使用しないシステムでは、このデバイスは最大 20Ω の USB 2.0 チャンネル等価直列抵抗 (ESR) に対応する 3 本のストラップ ピンによる 8 つの個別設定を提供します。このデバイスは、最大 10 インチまでのさまざまなレベルの eUSB2 トレース長補償機能を備えるバリエーションが利用可能です。

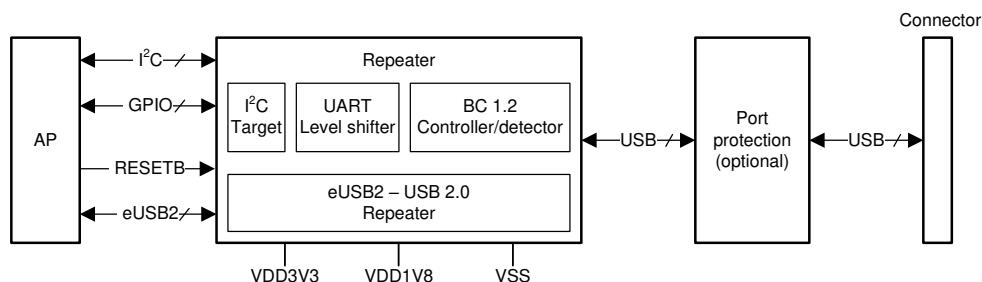

I²C インターフェイスを使用すると、さらに柔軟性が向上し、デバイスの RX イコライゼーションと TX 振幅、スループレート、プリアンプを微調整して、電気的適合性試験への対応とチャンネル損失の補償が可能です。

各種のデバッグ オプションが利用可能であり、3 本の GPIO ピンを使用してさまざまな USB バス状態や割り込みを監視するように構成できるほか、CTA-936 UART モードで SoC デバッグ機能を利用できます。GPIO0 および GPIO1 は、汎用 I²C から GPIO へのブリッジとして使用できます。

パッケージ情報

部品番号 ⁽¹⁾	パッケージ ⁽²⁾	パッケージ サイズ ⁽³⁾
TUSB2E11	YCG (DSBGA, 15)	1.75mm × 1.05mm

- (1) 製品比較表を参照してください。
- (2) 詳細については、セクション 14 を参照してください。
- (3) パッケージ サイズ (長さ × 幅) は公称値であり、該当する場合はピンも含まれます。

L2 State Interrupt Resume	supported	supported

4.1 Device Variants

The following table describes the key differences between TUSB2E11x device variants.

表 4-3. Device Variant Information

Orderable Device	Package Type	Package Drawing	Pins	Version	I/O Voltage ⁽¹⁾	Device Marking
TUSB2E111YCGR	WCSP	YCG	15	B1	1.8V	T2E111A
TUSB2E112YCGR	WCSP	YCG	15	B1	1.2V	T2E112

(1) **I/O Voltage:** I2C Bus voltage and GPIO voltage

For more information and availability of device variants such as eUSB2 1.0 signaling interface, 1.2V I²C interface, and 1.2V GPIO interface please contact [support](#).

5 Pin Configuration and Functions

図 5-1. TUSB2E11 YCG Package, 15-Pin DSBGA (Top View)

表 5-1. Pin Functions

PIN		TYPE ⁽²⁾	REST STATE	ASSOCIATED ESD SUPPLY	DESCRIPTION
NAME	NO.				
VDD3V3	B2	PWR	N/A	N/A	3.3V Supply Voltage
VDD1V8	D2, E3	PWR	N/A	N/A	1.8V Supply Voltage
VSS	A3, D3	GND	N/A	N/A	GND
RESETB	D1	I	N/A	VDD1V8	<ul style="list-style-type: none"> Active Low Reset Upon de-assertion of RESETB, the repeater is enabled and be in eUSB2 default mode awaiting configuration from eDSPr or eUSPr. If RESETB is not actively controlled, a pullup resistor 100kΩ to VDD1V8 is required.

表 5-1. Pin Functions (続き)

PIN		TYPE ⁽²⁾	REST STATE	ASSOCIATED ESD SUPPLY	DESCRIPTION				
NAME	NO.								
SCL	C3	I	Internal pulldown 1MΩ typical (disabled after reset) ⁽¹⁾	VDD1V8	I ² C Clock	Device Mode Matrix	SCL	SDA	Mode
							Low	See 表 5-4 for more details	Non-I ² C USB Repeater
SDA	B3	I/O	Hi-Z ⁽¹⁾	VDD1V8	Bidirectional I ² C data Open drain I/O		High	Low	Non-I ² C UART mode Repeater
							High	High	I ² C Enabled
GPIO2	C2	I/O	Internal pulldown 1MΩ typical (disabled after reset)	VDD1V8	<ul style="list-style-type: none"> In I²C mode GPIO2 is an open-drain active low level interrupt output. Connect GPIO2 to input of APU and a pullup resistor to use interrupt features In non I²C mode GPIO2 defaults to USB configuration input at power up reset. When a pullup resistor is used to set high input, ensure VIH is met accounting for internal pulldown as small as 500kΩ GPIO2 is an open-drain output after reset and can be left floating when not used. 				
GPIO0	B1	I/O	Internal pulldown 1MΩ typical (disabled after reset) ⁽¹⁾	VDD1V8	Defaults to an input mode at power up reset. RESETB assertion and de-assertion or soft reset reverts GPIO0 to input mode <ul style="list-style-type: none"> In I²C mode GPIO0 defaults to control Carkit UART mode: active low to enable Carkit UART mode. Default Carkit UART direction is DP → eDP (RX) and eDN → DN (TX). GPIO0 must be pulled up to be in USB repeater mode. In non I²C mode GPIO0 defaults to USB configuration input at power up reset. When a pullup resistor is used to set high input, ensure VIH is met accounting for internal pulldown as small as 500kΩ 				
GPIO1	C1	I/O	Internal pulldown 1MΩ typical (disabled after reset) ⁽¹⁾	VDD1V8	Defaults to an input mode at power up reset. RESETB assertion and de-assertion or soft reset reverts GPIO1 to input mode <ul style="list-style-type: none"> In I²C mode GPIO1 defaults to debug input In non I²C mode GPIO1 defaults to USB Configuration input at power up reset. When a pullup resistor is used to set high input, ensure VIH is met accounting for internal pulldown as small as 500kΩ 				
eDN	A2	I/O	Hi-Z	VDD1V8	eUSB2 port D-				
eDP	A1	I/O	Hi-Z	VDD1V8	eUSB2 port D+				
DN	E2	I/O	Hi-Z	VDD3V3	USB port D-				
DP	E1	I/O	Hi-Z	VDD3V3	USB port D+				

- (1) When configured as an input but not actively driven, use 1MΩ external pulldown to strap low.
 (2) I = input, I/O = input or output, PWR= power, GND = ground

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)⁽¹⁾

		MIN	MAX	UNIT
Supply voltage range	V _{DD3V3}	−0.3	4.32	V
Analog Supply voltage range	V _{DD1V8}	−0.3	2.1	V
Voltage range	DP, DN, (with OVP enabled), 1000 total number of short events and cumulative duration of 1000 hrs.	−0.3	6	V
Voltage range	eDP, eDN	−0.3	1.6	V
Voltage range	RESETB, GPIO0, GPIO1, GPIO2, SCL, SDA	−0.3	2.1	V
Junction temperature	T _{J(max)}		125	°C
Storage temperature	T _{stg}	−65	150	°C

- (1) Operation outside the *Absolute Maximum Ratings* may cause permanent device damage. Absolute maximum ratings do not imply functional operation of the device at these or any other conditions beyond those listed under *Recommended Operating Conditions*. If briefly operating outside the *Recommended Operating Conditions* but within the *Absolute Maximum Ratings*, the device may not sustain damage, but it may not be fully functional. Operating the device in this manner may affect device reliability, functionality, performance, and shorten the device lifetime.

6.2 ESD Ratings

			VALUE	UNIT
V _(ESD)	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins ⁽¹⁾	±1500	V
		Charged device model (CDM), per JEDEC specification JS-002, all pins ⁽²⁾	±500	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
V _{DD3V3}	Supply voltage (VDD3V3)	3.0	3.3	3.6	V
V _{DD1V8}	Analog Supply voltage (VDD1V8)	1.62	1.8	1.98	V
V _{I2C_Pullup}	I2C and GPIO open drain Bus Voltage (1.2 V Variant)	1.08	1.2	1.32	V
V _{I2C_Pullup}	I2C and GPIO open drain Bus Voltage (1.8 V Variant)	1.62	1.8	1.98	V
USB Voltage	DP, DN	0		3.6	V
eUSB2 voltage	eDP, eDN	0		1.32	V
Digital voltage	GPIO0, GPIO1, GPIO2, SCL, SDA (1.8 V Variant)	0		1.98	V
Digital voltage	GPIO0, GPIO1, GPIO2, SCL, SDA (1.2 V Variant)	0		1.32	V
RESETB	RESETB (1.2 V or 1.8 V Variant)	0		1.98	V
T _A	Operating free-air temperature	−20		85	°C
T _J	Junction temperature	−20		105	°C
T _{CASE}	Case temperature	−20		105	°C

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
T _{PCB}	PCB temperature (1 mm away from the device)	–20		92	°C

6.4 Thermal Information

THERMAL METRIC ⁽¹⁾		TUSB2E11	UNIT
		YCG (DSBGA)	
		15 PINS	
R _{θJA}	Junction-to-ambient thermal resistance	90.5	°C/W
R _{θJC(top)}	Junction-to-case (top) thermal resistance	0.6	°C/W
R _{θJB}	Junction-to-board thermal resistance	22.9	°C/W
Ψ _{JT}	Junction-to-top characterization parameter	0.4	°C/W
Ψ _{JB}	Junction-to-board characterization parameter	22.9	°C/W

(1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.

6.5 Electrical Characteristics

over operating free-air temperature range (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
POWER						
P _{WC_1V8}	Absolute worst case peak power consumption (VDD1V8 only) for power supply budgeting	I2C interface active, GPIOs in output mode, repeater in HS mode with USB transmitting, maximum RX EQ, max TX VOD and PE settings, maximum transition density. T _A = –20°C to 85°C.			280	mW
P _{WC_3V3}	Absolute worst case peak power consumption (VDD3V3 only) for power supply budgeting	I2C interface active, GPIOs in output mode, repeater in HS mode with USB transmitting, maximum RX EQ, max TX VOD and PE settings, maximum transition density. T _A = –20°C to 85°C.			30	mW
P _{WCFS_3V3}	Absolute worst case peak power consumption (VDD3V3 only) for power supply budgeting	I2C interface active, GPIOs in output mode, repeater in FS mode with USB Asynchronous traffic. T _A = –20°C to 85°C.			75	mW
P _{HS_IOC}	USB Audio ISOC High-speed	Maximum TX Vod/Maximum TX PE for both USB and eUSB2. Averaged over 8 ms and only 1 uFrame with data packet. Toff threshold = 1/32. Host Peripheral Mode.		35		mW
P _{PD}	Powered down	Device powered, RESETB=Low, T _A =25°C, (DP/DN Voltage ≤ VDD3V3).			9	μW
P _{Disabled}	Disabled	Device powered, I2C/GPIO interfaces functional but idle, repeater is disabled and put into the lowest power state and non-functional. T _A =25°C, (DP/DN Voltage ≤ VDD3V3).		43	95	μW
P _{Detach}	USB unconnected	I2C/GPIO interfaces idle, repeater is connected to a eUSB2 PHY and waiting for a USB attach event. T _A = 25°C, (DP/DN Voltage ≤ VDD3V3)		43	85	μW
P _{Suspend}	L2 Suspend (host mode)	I2C/GPIO interfaces idle, USB link is in L2, repeater is monitoring for a resume/ remote wake event. T _A = 25°C, (DP/DN Voltage ≤ VDD3V3). In peripheral mode additional current is present due the DP pull up.		45	85	μW

6.5 Electrical Characteristics (続き)

over operating free-air temperature range (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
P _{Sleep}	L1 Sleep	I2C/GPIO interfaces idle, repeater is supporting a USB connection, USB link is in L1 (host exists L1 every 1 ms) and repeater is monitoring for a L1 exit event. T _A = 25°C, (DP/DN Voltage ≤ VDD3V3)		2.3	5	mW
P _{LS_Active}	Low Speed Active	I2C/GPIO interfaces idle, repeater in LS mode, maximum transition density. T _A = 85°C.		7.2	24	mW
P _{FS1_Active}	Full Speed Active (ASYNCR Traffic)	I2C/GPIO interfaces idle, repeater in FS mode, maximum transition density. T _A = 85°C.		45	80	mW
P _{FS2_Active}	Full Speed Active (ISO Traffic)	I2C/GPIO interfaces idle, repeater in FS mode, maximum transition density. T _A = 85°C.		9	24	mW
P _{HS_Idle_Host}	High Speed Idle (Host mode)	L0.Idle. T _A = 85°C. (Typical at 25°C).		26	70	mW
P _{HS_Idle_Peripheral}	High Speed Idle (Peripheral mode)	L0.Idle. T _A = 85°C. (Typical at 25°C).		108	200	mW
DIGITAL INPUTS						
V _{IH}	High level input voltage	GPIO0, GPIO1, GPIO2 (1.2 V Variant)	0.702			V
V _{IH}	High level input voltage	GPIO0, GPIO1, GPIO2 (1.8 V Variant)	1.053			V
V _{IL}	Low-level input voltage	GPIO0, GPIO1, GPIO2 (1.2 V Variant)			0.462	V
V _{IL}	Low-level input voltage	GPIO0, GPIO1, GPIO2 (1.8 V Variant)			0.693	V
V _{IL}	Low-level input voltage	RESETB			0.35	V
V _{IH}	High level input voltage	RESETB	0.75			V
I _{IH}	High level input current	V _{IH} = 1.98 V, VDD3V3=3.0 V or 0 V, VDD1V8=1.62 V or 0 V RESETB, GPIO0, GPIO1			0.5	μA
I _{IL}	Low level input current	V _{IL} = 0 V, VDD3V3=3.0 V or 0 V, VDD1V8=1.62 V or 0 V RESETB, GPIO0, GPIO1			0.5	μA
DIGITAL OUTPUTS						
V _{OH}	High level output voltage	GPIO0, GPIO1, GPIO2, push-pull I/O mode (I _{OH} = 20 μA and maximum 3 pF C _{load}) (1.2 V Variant)	0.81			V
V _{OH}	High level output voltage	GPIO0, GPIO1, GPIO2, push-pull I/O mode (I _{OH} = 20 μA and maximum 3 pF C _{load}) (1.8 V Variant)	1.21			V
V _{OL}	Low level output voltage	GPIO0, GPIO1, GPIO2, push-pull I/O mode (I _{OL} = 1 mA) (1.2 V Variant)			0.25	V
V _{OL}	Low level output voltage	GPIO0, GPIO1, GPIO2, push-pull I/O mode (I _{OL} = 1 mA) (1.8 V Variant)			0.35	V
I _{OL_PP}	Low level output current in push-pull mode	GPIO0, GPIO1, GPIO2 (1.2 V Variant), VOL=0.4 V	2.5	4	5.6	mA
I _{OL_PP}	Low level output current in push-pull mode	GPIO0, GPIO1, GPIO2 (1.8 V Variant), VOL=0.4 V	4	6	8	mA
I _{OH_PP}	High level output current in push-pull mode	GPIO0, GPIO1, GPIO2, push-pull I/O mode, V _{OH} =0.9 V (1.2 V Variant)	22			μA
I _{OH_PP}	High level output current in push-pull mode	GPIO0, GPIO1, GPIO2, push-pull I/O mode, V _{OH} =0.9 V (1.8 V Variant)	50			μA
I2C (SDA, SCL)						
V _{IL}	Low level input voltage, 1.2 V variant	SDA, SCL, V _{I2C_Pullup} = 1.08 V			0.387	V

6.5 Electrical Characteristics (続き)

over operating free-air temperature range (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
V _{IL}	Low level input voltage, 1.8 V variant	SDA, SCL, V _{I2C_Pullup} = 1.96 V			0.588	V

6.7 Timing Requirements

		MIN	NOM	MAX	UNIT
I/O TIMING					
t_GPIO_PW	Minimum GPIO pulse width for interrupt event	8			μs
RESET TIMING					
t_VDD1V8_RAMP	Ramp time for VDD1V8 to reach minimum 1.62 V			2	ms
t_VDD3V3_RAMP	Ramp time for VDD3V3 to reach minimum 3.0 V			2	ms
t_aRESETB	Duration for RESETB to be asserted low to complete reset while powered	10			us
t_RH_READY	Time for the device to be ready to accept RAP and I ² C requests and eUSB2 interface to be ready after RESETB is de-asserted or (VDD1V8 and VDD3V3) reach the minimum recommended voltages, whichever is later.			3	ms
t_RS_READY	Time for the device to be ready to accept RAP and I ² C requests and eUSB2 interface to be ready after a soft reset through I ² C.			350	μs
REPEATER TIMING					
T _{J1E}	Total additive jitter for eUSB2 to USB 2.0 (output jitter – input jitter) of the repeater.		20	42	ps
T _{J1I}	Total additive jitter for USB 2.0 to eUSB2 (output jitter – input jitter) of the repeater.		17	42	ps
T _{e_to_U_DJ1}	eUSB2 to USB 2.0 repeater FS jitter to next transition (Per <i>Low-Speed /Full-Speed DC Specifications for 1.2 V ± 10%</i> ⁽¹⁾ condition for supply and GND delta).	–6.0		+6.0	ns
T _{U_to_e_DJ1}	USB 2.0 to eUSB2 repeater FS jitter to next transition (Per <i>Low-Speed /Full-Speed DC Specifications for 1.2 V ± 10%</i> ⁽¹⁾ condition for supply and GND delta).	–3.0		+3.0	ns
T _{DJ2_e2U}	repeater FS paired transition jitter in eUSB2 to USB 2.0 direction (relaxed relative to THDJ2 defined by USB 2.0 ± 1 ns). eUSB2 in 1.2 V signaling mode.	–1.5		+1.5	ns
T _{DJ2_U2e}	repeater FS paired transition jitter in USB 2.0 to eUSB2 direction (relaxed relative to THDJ2 defined by USB 2.0 ± 1 ns). eUSB2 in 1.2 V signaling mode.	–1.5		+1.5	ns
MODE TIMING					
T _{MODE_SWITCH}	Time needed to change mode from UART bypass mode to and from USB mode			1	μs
T _{UART_START}	Time needed to start transmitting UART data, post toggling GPIO0 to '0' when in UART strap mode (SCL=1, SDA=0 at power-up)			2	ms
I2C (FM+)					
t _{SU_STA}	Start setup time, SCL (T _r =72 ns – 120 ns), SDA (T _r =6.5 ns – 81.5 ns), 1 MHz FM+	260			ns
t _{SU_STO}	Stop setup time, SCL (T _r =72 ns – 120 ns), SDA (T _r =6.5 ns – 81.5 ns), 1 MHz FM+	260			ns
t _{HD_STA}	Start hold time, SCL (T _r =72 ns – 120 ns), SDA (T _r =6.5 ns – 81.5 ns), 1 MHz FM+	260			ns
t _{SU_DAT}	Data input or false start/stop, setup time, SCL (T _r =72 ns – 120 ns), SDA (T _r =6.5 ns – 81.5 ns), 1 MHz FM+	50			ns
t _{HD_DAT}	Data input or False start/stop, hold time, SCL (T _r =72 ns – 120 ns), SDA (T _r =6.5 ns – 81.5 ns), 1 MHz FM+	0			ns
t _{VD_DAT} , t _{VD_ACK}	SDA output delay, SCL (T _r =72 ns – 120 ns), SDA (T _r =6.5 ns – 81.5 ns), 1 MHz FM+	20		450	ns
t _{HD_DAT_SL}	Data hold time when device is transmitting	6.67			ns
t _{SP}	Glitch width suppressed	50		91	ns
t _{BUF}	Bus free time between a STOP and START condition (Master minimum spec that device must tolerate)	0.5			μs

6.7 Timing Requirements (続き)

		MIN	NOM	MAX	UNIT
t_{LOW}	Low period for SCL clock (minimum spec that device must tolerate)	0.5			μs
t_{HIGH}	High period for SCL clock (minimum spec that device must tolerate)	0.26			μs
I2C (FM)					
$t_{\text{SU_STO}}$	Stop setup time, SCL ($T_r=180\text{ ns} - 300\text{ ns}$), SDA ($T_f=6.5\text{ ns} - 106.5\text{ ns}$), 400 kHz FM	600			ns
$t_{\text{HD_STA}}$	Start hold time, SCL ($T_r=180\text{ ns} - 300\text{ ns}$), SDA ($T_f=6.5\text{ ns} - 106.5\text{ ns}$), 400 kHz FM	600			ns
$t_{\text{SU_STA}}$	Start setup time, SCL ($T_r=180\text{ ns} - 300\text{ ns}$), SDA ($T_f=6.5\text{ ns} - 106.5\text{ ns}$), 400 kHz FM	600			ns
$t_{\text{SU_DAT}}$	Data input or false start/stop, setup time, SCL ($T_r=180\text{ ns} - 300\text{ ns}$), SDA ($T_f=6.5\text{ ns} - 106.5\text{ ns}$), 400 kHz FM	100			ns
$t_{\text{HD_DAT}}$	Data input or false start/stop, hold time, SCL ($T_r=180\text{ ns} - 300\text{ ns}$), SDA ($T_f=6.5\text{ ns} - 106.5\text{ ns}$), 400 kHz FM	0			ns
$t_{\text{VD_DAT}}, t_{\text{VD_ACK}}$	SDA output delay, SCL ($T_r=180\text{ ns} - 300\text{ ns}$), SDA ($T_f=6.5\text{ ns} - 106.5\text{ ns}$), 400 kHz FM	20		900	ns
$t_{\text{HD_DAT_SL}}$	Data hold time when device is transmitting	13.5			ns
t_{SP}	Glitch width suppressed	50		91	ns
t_{BUF}	Bus free time between a STOP and START condition (minimum spec that device must tolerate)	1.3			μs
t_{LOW}	Low period for SCL clock (minimum spec that device must tolerate)	1.3			μs
t_{HIGH}	High period for SCL clock (Master minimum spec that device must tolerate)	0.6			μs
I2C (STD)					
$t_{\text{SU_STO}}$	Stop setup time, SCL ($T_r=600\text{ ns} - 1000\text{ ns}$), SDA ($T_f=6.5\text{ ns} - 106.5\text{ ns}$), 100 kHz STD	4			μs
$t_{\text{HD_STA}}$	Start hold time, SCL ($T_r=600\text{ ns} - 1000\text{ ns}$), SDA ($T_f=6.5\text{ ns} - 106.5\text{ ns}$), 100 kHz STD	4			μs

7-2. eUSB2 TX Output (Ingress) Jitter, Eye Mask Test Setup

8 Detailed Description

8.1 Overview

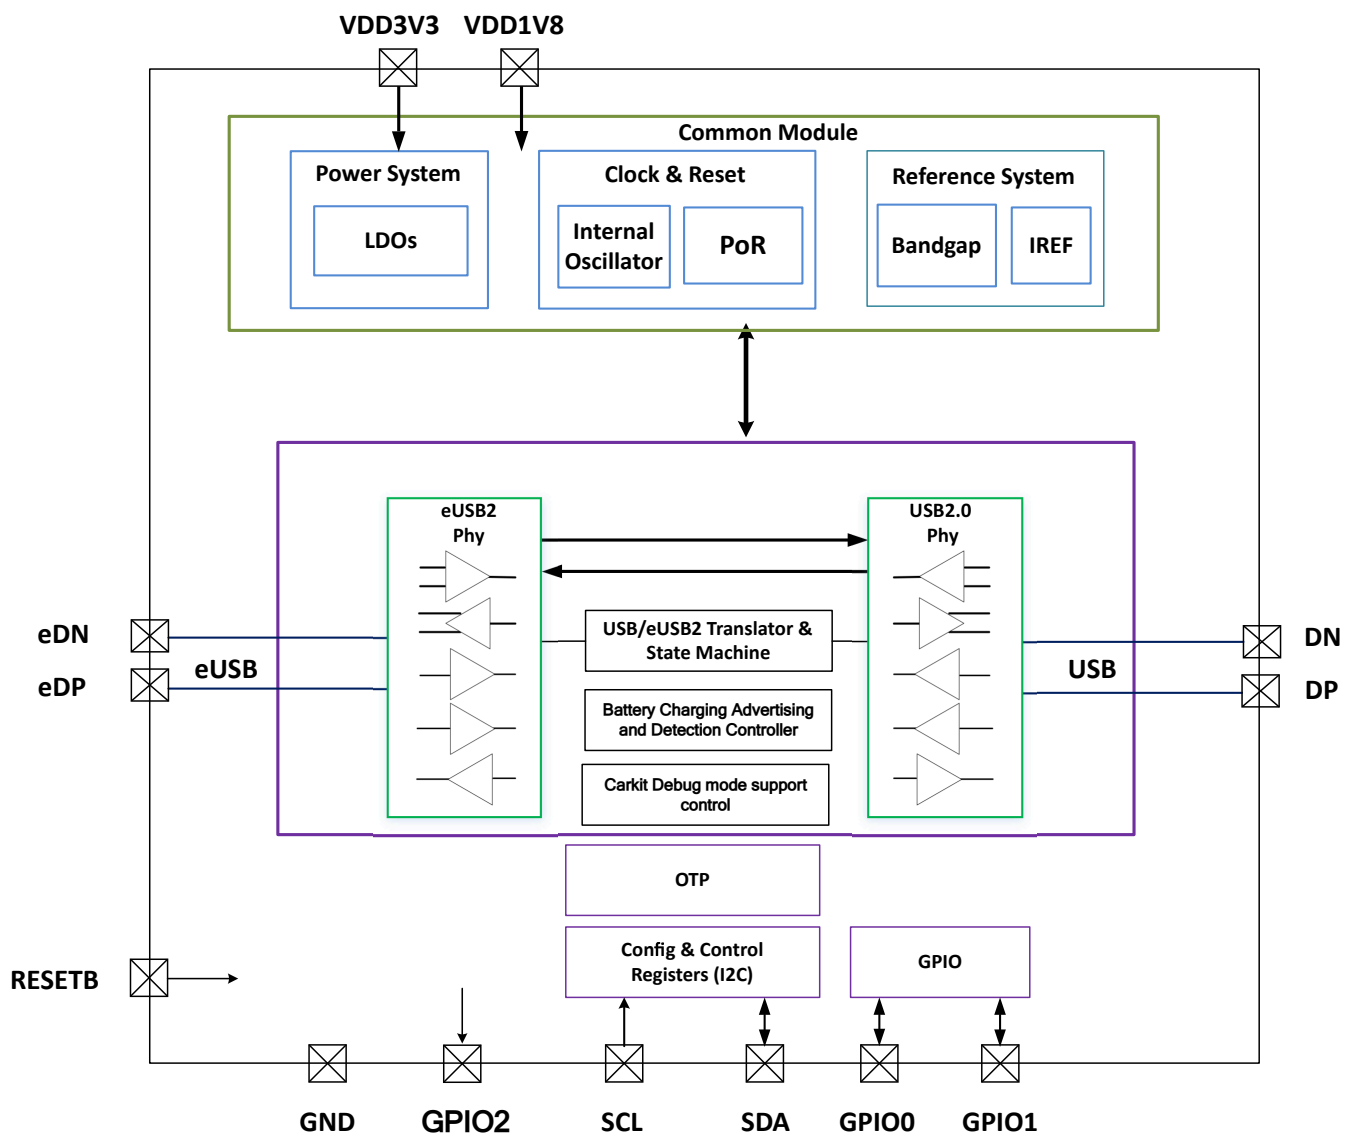

The TUSB2E11 is an eUSB2 to USB 2.0 repeater that resides between the SoC with an eUSB2 port and an external connector that supports USB 2.0. The device can be configured by the register access protocol (RAP) or through the I²C. The repeater is configurable as either a host or device repeater (DRD repeater).

I²C port supports up to 1MHz (fast mode plus) for internal register access. A subset of internal registers can be accessed through the register access protocol. Simultaneous register access using RAP and through the I²C is supported with RAP having priority over I²C.

To power up in I²C mode, make sure both SDA and SCL have pullup resistors to appropriate I²C bus voltage.

GPIO2 output pin can be configured to provide an active low open-drain or selectable active low or active high push-pull level sensitive interrupt output to the SoC.

8.2 Functional Block Diagram

8.3 Feature Description

The TUSB2E11 is an USB compliant eUSB2 to USB 2.0 repeater supporting both device and host modes. Both USB and eUSB2 offer fully tunable TX and RX through I²C. Additionally, USB TX and RX can be tuned when I²C is not used.

8.4 Device Functional Modes

8.4.1 Repeater Mode

Upon de-assertion of RESETB or software reset and after t_{RH_READY} or t_{RS_READY}, the TUSB2E11 enables and enters the default state. In the default state, the TUSB2E11 is ready to accept eUSB2 packets, RAP, and I²C requests. The repeater will either be in host repeater mode or peripheral repeater mode depending on the receipt of either host mode enable or peripheral mode enable.

When the TUSB2E11 is repeating high-speed packets, either from eUSB2 to USB 2.0 or from USB 2.0 to eUSB2, up to 4UI (may include partial UI) of HS SOP can be truncated. This is the same as a standard USB 2.0 HUB operating in high speed mode which can truncate up to 4UI.

When the TUSB2E11 is repeating high-speed packets from eUSB2 to USB 2.0, up to 1.6UI of random dribble bits (may include partial UI) can be introduced after HS EOP. This is the less than a standard USB 2.0 HUB operating in high speed mode which can have up to 4UI of random dribble bits.

When the TUSB2E11 is repeating high-speed packets from USB 2.0 to eUSB2, up to 5UI of random dribble bits (may include partial UI) can be introduced after HS EOP. This is more than a standard USB 2.0 HUB operating in high speed mode which can have up to 4UI of random dribble bits. eDSPr/eUSPr receiving eUSB2 high-speed packets should ignore 5UI of dribble bits after detecting no stuffed bit insertion indicating HS EOP.

表 8-1. Number of Hubs Supported with Host and Peripheral Repeater

Number of eUSB2 Repeaters	Number of Hubs Operating at HS	Number of Hubs Operating at FS	
1	4	2	Number of hubs operating at FS is reduced due to T _{e_to_U_DJ1} and T _{RJR1} . Number of hubs operating at HS is reduced due to 2 3 1 SOP truncation and EOP dribble
2	3	1	
0	5	5	non-eUSB2 system for reference

8.4.2 Power Down Mode

RESETB can be used as a power down pin when asserted low. Power down mode puts the TUSB2E11 in lowest power mode.

8.4.3 Disabled Mode

The repeater can be disabled by setting DISABLE bit through the I²C.

8.4.4 UART Mode

In I²C mode GPIO0 defaults to being an enable control for Carkit UART mode. GPIO0 is an active low signal to enable Carkit UART mode. GPIO0 is intended to be controlled through APU or SoC. When APU or SoC is not powered on or the firmware has not been loaded, the GPIO0 is low, enabling the UART mode to allow APU or SoC debug interface to be accessed through the USB port.

Default Carkit UART direction is DP → eDP (RX) and eDN → DN (TX).

On the rising edge of GPIO0, followed by T_{MODE_SWITCH}, the TUSB2E11 enables and enters the default state. In the default state, the TUSB2E11 is ready to accept eUSB2 port reset, configuration or RAP. The repeater mode will be configured as host or peripheral depending on the eUSB2-defined configuration received from eUSBr and acknowledged by the repeater.

UART mode enable is controlled through GPIO0 after power up. This can be changed through UART_use_bit1_P1 bit in UART-PORT1 register, so UART mode enable can be controlled through a register instead of GPIO0.

8.4.5 Auto-Resume ECR

Optional host repeater auto-resume is supported by the TUSB2E11 in L1/L2 by driving Resume K at D+/D- until SOResume is received from eDSPr. In addition, the TUSB2E11 eUSPh holds the Remote Wake line state until SOResume is received from eDSPr.

This auto-resume feature provides host controller extra time to exit low power state and issue SOResume while the TUSB2E11 UDSP drives resume within 1 ms (TURSM) hub resume timing requirement. To take advantage of this low power feature, host controller shall implement low power mechanism to detect wake on eDSPr lines while host controller is in low power state.

This auto-resume is not needed if host controller is capable of initiating SOResume within 1 ms of detecting Remote Wake on eDSPr.

This auto-resume is enabled by default but can be disabled via bit 6 of register 0x78. This auto-resume ECR mode is disabled when L2 interrupt mode is enabled. When L2 interrupt mode is enabled, resume K at D+/D- is still driven when Remote wake is detected on UDSP but eUSPh is held at SE0 instead of in Remote Wake state. See the *L2 State Interrupt Modes* section for more details.

图 8-1. Timing Diagram for Auto-Resume for HS/FS

8.4.6 L2 State Interrupt Modes

To prevent signaling on eUSB2 while the eDSP is powered off, make sure both L2 remote wake interrupt and disconnect event interrupt modes are enabled. The special remote wake sequence when L2 remote wake interrupt mode is enabled.

- System enables interrupt USB_REMOTE_WAKE_P1.
- Repeater is in host mode and has received a CM.L2.
- Repeater detects wake on USB 2.0
- Repeater asserts interrupt.
- Repeater reflects *resume* on USB 2.0, but does not signal wake on eUSB2.
- Repeater waits for eDSPr to signal start of resume with no intervening configuration, connect, or reset sequence.

- Repeater and eDSP follow normal eUSB2 protocol to signal resume starting and ending in L0.

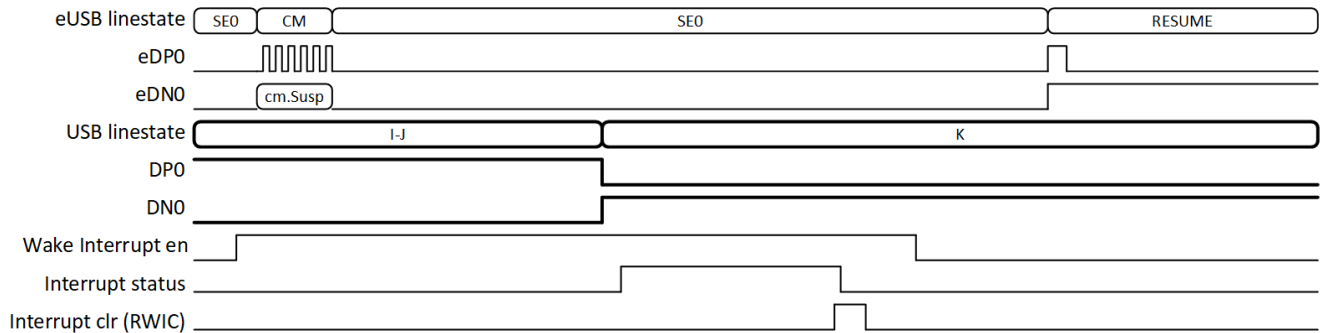

図 8-2. Timing Diagram for Wake Interrupt for HS/FS

The special wake on disconnect sequence when disconnect event interrupt mode is enabled

- System enables interrupt USB_DISCONNECT_P1.
- Repeater is in host mode and has received a CM.L2.
- Repeater detects SE0 for disconnect on USB 2.0.
- Repeater asserts interrupt.
- Interrupt must be cleared prior to eDSPr reinitializing the TUSB2E11 as a host.
- Repeater does not signal or report USB 2.0 SE0 on eUSB2.
- Repeater waits for eDSPr to power up, which starts with port reset announcement.
- Repeater and eDSP follow normal eUSB2 protocol, ending in unconnected state of host mode.

図 8-3. Timing Diagram for Disconnect Interrupt for HS/FS

8.4.7 Attach Detect Interrupt Mode

When attach event detect is enabled, the TUSB2E11 issues an interrupt event instead of signaling attach on eUSB2.

- System enables interrupt USB_DETECT_ATTACH_P1. Interrupt has to be enabled prior to any connect event.
- Repeater is in host mode.
- Repeater detects attach on USB 2.0.
- Repeater debounces attach for 60μs and asserts interrupt instead of signaling attach on eUSB2.
- Interrupt must be disabled prior to eDSPr reinitializing as a host to process attach through normal mechanism.

図 8-4. Timing Diagram for Attach Detect Interrupt for HS/FS

8.4.8 GPIO Mode

GPIO0

The GPIO0 pin is in input mode at power up, and is sampled during reset.

The GPIO0 defaults to active low UART mode (bypass mode) enable control after power up. This can be changed through the UART_use_bit1_P1 bit in UART-PORT1 register, so GPIO0 can be repurposed. Refer to [UART Mode](#).

The GPIO0 pin can be configured to be input or output mode through the I²C register write. Output event is selected through the I²C register. Refer to *GPIO0_CONFIG register* for more information.

The GPIO0 input status change can be reported through the GPIO2 as an interrupt if enabled through the I²C. Status change trigger can be programmed to be edge trigger or level trigger through the I²C.

The GPIO0 pin in output mode defaults to open-drain output but can be configured to be push-pull output. GPIO0 pin can drive up to 3pF loads when in push-pull mode.

The GPIO0 pin reverts back to input upon RESETB assert, de-assert, or soft reset.

In non I²C mode, the GPIO0 is used for USB PHY tuning.

GPIO1

The GPIO1 pin is in input mode at power up, and is sampled during reset.

The GPIO1 is configured as an enable control for battery charger detection in repeater default state if DEFAULT_STATE_BC_P1 is set to 0x01 through the BC_CONTROL register.

The GPIO1 pin can be configured to be input or output mode through the I²C register write. Output event is selected through the I²C register. Refer to *GPIO1_CONFIG register*.

The GPIO1 input status change can be reported through the GPIO2 as an interrupt if enabled through the I²C. Status change trigger can be programmed to be edge trigger or level trigger through the I²C.

The GPIO1 pin in output mode defaults to open-drain output but can be configured to be push-pull output. GPIO1 pin can drive up to 3pF loads when in push-pull mode.

The GPIO1 pin reverts back to input upon RESETB assert, de-assert, or soft reset.

In non I²C mode, the GPIO1 is used for USB PHY tuning.

GPIO2

The GPIO2 pin defaults to open drain interrupt (INT) active low output at power up but can be programmed through the I²C to be a push-pull output. In push-pull mode, the device can be programmed to be either active high or active low. The interrupt output is a level-sensitive interrupt. Trigger events can be selected through the I²C.

Connect GPIO2 to APU to use interrupt functions and a pullup resistor (open drain mode).

The GPIO2 interrupt output can be configured through the INT_ENABLE and INT_STATUS registers.

The GPIO2 can be configured as battery charger detect indicator instead of the interrupt output through the BC_CONTROL register.

In non I²C mode, the GPIO2 is used for USB PHY tuning.

8.4.9 USB 2.0 High-Speed HOST Disconnect Detection

The USB 2.0 specification does not specify high-speed output differential swing V_{OD} during disconnect without external load. Only chirp level and the HS host disconnect threshold are specified. Specification implicitly assumes high-speed output differential swing V_{OD} doubles during disconnect. However, the high-speed output differential swing during disconnect depends on the USB 2.0 TX output swing and pre-emphasis setting, as the common-mode voltage increase saturates the output swing level. If the output swing level is saturated, the VOD may not double.

The HS host disconnect threshold shall be adjusted to provide the most margin to avoid false disconnect as well as failure to detect a disconnect. See 表 8-2.

表 8-2. Recommended USB 2.0 High-speed HOST Disconnect Thresholds per USB HSTX Amplitude and Pre-Emphasis

USB HS TX Pre-Emphasis						
USB HS TX Amplitude (Vp-p)	0.5dB (0h)	0.9dB (1h)	1.2dB (2h)	1.7dB (3h)	2.1dB (4h)	2.5dB (5h)

8.4.10 Frame Based Low Power Mode

The USB2.0 standard defines high-speed microframes that occur every 125μs. Using a patented design, the TUSB2E11 monitors idle conditions within every high-speed microframe. The TUSB2E11 will enter a low power state if the bus is idle for greater than FRAME_LP_OFF_THRESHOLD and will remain in the low power state

until the start of the next μ SOF. This feature is enabled by default and can be disabled by clearing HOST_FRAME_LP_EN or DEVICE_FRAME_LP_EN bits.

表 8-3 shows an example of the typical high-speed idle power the TUSB2E11 consumes based on the value of the FRAME_LP_OFF_THRESHOLD and whether or not the frame base low power is enabled. These results assume the TUSB2E11 is in host repeater mode.

表 8-3. Typical High-Speed Idle Power for Frame Base LP Mode

HOST_FRAME_LP_EN	FRAME_LP_OFF_THRESHOLD	1.8V current (mA)	3.3V current (mA)
0 (Disabled)	N/A	56	2.8
1 (Enabled)	0x0 (1/32)	11	2.0
1 (Enabled)	0x1 (1/16)	12	2.0
1 (Enabled)	0x2 (1/8)	15	2.1
1 (Enabled)	0x3 (1/4)	22	2.2

注

Frame based low power mode is enabled by default. If using TUSB2E11 in pin-strap mode, this feature can not be disabled. Contact [support](#) if a device variant with frame based low power mode disabled in pin-strap mode is needed.

8.4.11 Battery Charging

The TUSB2E11 supports standard USB battery charging specification 1.2 (BC1.2) and the divider mode and 1.2V DCP proprietary charging protocols as listed in 表 8-4. The BC1.2 functionality includes charger advertisement and charger detection when enabled in non-I2C mode using strap (refer to 表 5-4) or I2C mode through register configuration.

When the TUSB2E11 is configured as a host repeater, the TUSB2E11 supports charger advertisement whereas when the TUSB2E11 is configured as peripheral repeater it supports charger detection. When configured as peripheral repeater, the TUSB2E11 detects charger type if Battery Charging detection in peripheral mode is enabled. The TUSB2E11 can detect ACP3, ACP2, ACP1, DCP 1.2V biased short mode, USB standard DCP short mode and CDP types of charger. When configured as a host repeater, the TUSB2E11 acts as charger advertiser if CDP is enabled. The TUSB2E11 can advertise ACP3, DCP 1.2V, DCP or CDP modes. When in an unconfigured state, the behavior of battery charging state machine is controlled by strap settings in non-I2C mode or by register settings in I2C mode. When the TUSB2E11 is in an unconfigured state charger advertisement mode, GPIO0 directs system to power-cycle VBUS to enable a portable device to exit dedicated charging port mode and switch to host or peripheral state where data transfer is possible.

表 8-4. Battery Charging Supported Protocols

Charging Protocol	Standard or Proprietary	Charging Current (A)	Data Transfer Allowed	Charger Detection or Advertise
SDP (Standard Downstream Port)	Standard BC1.2	0.5 or 0.9	Yes	Detection
CDP (Charging Downstream Port)	Standard BC1.2	1.5	Yes	Detection and Advertise
DCP (Dedicated Charging Port)	Standard BC1.2	1.5	No	Detection and Advertise
1.2V DCP	Proprietary	2	No	Detection and Advertise
ACP0 or Divider Mode 0	Proprietary	0.5	No	Detection
ACP1 or Divider Mode 1	Proprietary	1	No	Detection
ACP2 or Divider Mode 2	Proprietary	2.1	No	Detection
ACP3 or Divider Mode 3	Proprietary	2.4	No	Detection and Advertise

In I2C mode, the behavior of the battery charging state machine in the TUSB2E11 is controlled by the DEFAULT_STATE_BC_P1, BC_DETECTION_EN_P1, and CDP_2_EN_P1 register fields. In the unconfigured state, the battery charging state machine also depends on EN_BC input from GPIO1 in I2C mode.

表 8-5. Battery Charging Behavior in I2C Mode

GPIO1 (BC_EN)	DEFAULT_STATE_BC_P1 bit	TUSB2E11 Behavior in each state		
		Unconfigured	Host Repeater	Peripheral repeater
Low	X	No action	As per CDP_2_EN_P1.	Act as charger detector including divider mode detector once SOC directs repeater to connect when BC_DETECTION_EN_P1 set.
High	0x0	No Action		
High	0x1	Act as a charger detector including divider mode.		
High	0x2	Advertise standard DCP if 1P2V_MODE_DIS = 1, else advertise 1.2V DCP.		
High	0x3	If 1P2V_MODE_DIS = 0, then advertise ACP3 → 1.2V DCP → DCP until no connect in auto cycling mode. If 1P2V_MODE_DIS = 1 then advertise ACP3 → DCP until no connect in auto cycling mode.		

8.5 Manufacturing Test Modes

The following test procedures show how to use I²C to enter test modes to perform continuity test of DP/DM during manufacturing or debug. During this mode the TUSB2E11 does not operate as a repeater.

8.5.1 USB DP Test Procedure

I²C Commands to use DP pullup to test DP/DM continuity:

Enable GPIOs and DP Pull-up:

h00, hA0 <-set gpio0 to push-pull output mode

h40, hA0 <-set gpio1 to push-pull output mode

hD5, h28

hD6, h04

hD7, h10 <-DP pullup is now on

hCE, h18

hDC, h15 <-muxes DP / DM status onto GPIO lines

Status Readback Check:

h00 = hA0 <-DM status on bit 4 (normal, DM low)

h40 = hB0 <-DP status on bit 4 (normal, DP high)

h00 = hB0 <-DM status on bit 4 (DP + DM shorted together)

h40 = hA0 <-DP status on bit 4 (DP shorted to ground)

Exit Test Mode:

hB2, h80 <-soft reset (end test)

8.5.2 USB DM Test Procedure

I²C Commands to use DM pullup to test DP/DM continuity:

Enable GPIOs and DM Pull-up:

h00, hA0 <-set gpio0 to push-pull output mode

h40, hA0 <-set gpio1 to push-pull output mode

hD5, h28

hD6, h04

hD7, h08 <-DM pullup is now on

hCE, h18

hDC, h15 <-mux DP / DM status onto GPIO lines

Status Readback Check:

h00 = hB0 <-DM status on bit 4 (normal, DM high)

h40 = hA0 <-DP status on bit 4 (normal, DP low)

h40 = hB0 <-DP status on bit 4 (DP + DM shorted together)

h00 = hA0 <-DM status on bit 4 (DM shorted to ground)

Exit Test Mode:

hB2, h80 <-soft reset (end test)

8.6 I²C Target Interface

I²C target interface enables access to internal registers by the system application processor. The primary function of the interface is to enable configuring various PHY parameters, controlling the GPIO pins, and enabling USB-BC functions. The TUSB2E11 repeater functions operate upon power up without requiring I²C configuration.

The TUSB2E11 has I²C 7-bit target address of 0x3E. 8-bit address of Write: 0x7C and Read: 0x7D.

I²C default target address can be changed at the factory through one time programming.

I²C drive strength can be changed through the I²C.

表 8-6. Recommended I²C Drive Strength for I²C Bus Speed, Bus Pull Up and Bus Capacitance

I ² C FM+ (1MHz Max)	I ² C drive strength (I _{OL}) selection			
	I ² C bus pullup R _{PU}

10-200	≅8mA	≅4mA	≅2mA	≅2mA

図 8-5. I²C Write with Data

Use the following procedure to write data to the TUSB2E11 I²C registers (refer to 図 8-5):

1. The host initiates a write operation by generating a start condition (S), followed by the TUSB2E11 7-bit address and a zero-value “W/R” bit to indicate a write cycle.
2. The TUSB2E11 acknowledges the address cycle.
3. The host presents the register offset within the TUSB2E11 to be written, consisting of one byte of data, MSB-first.
4. The TUSB2E11 acknowledges the sub-address cycle.

5. The host presents the first byte of data to be written to the I²C register.
6. The TUSB2E11 acknowledges the byte transfer.
7. The host may continue presenting additional bytes of data to be written, with each byte transfer completing with an acknowledge from the TUSB2E11.
8. The host terminates the write operation by generating a stop condition (P).

図 8-6. I²C Read Without Repeated Start

Use the following procedure to write data to the TUSB2E11 I²C registers without a repeated Start (refer 図 8-6).

1. The host initiates a read operation by generating a start condition (S), followed by the TUSB2E11 7-bit address and a zero-value “W/R” bit to indicate a read cycle.
2. The TUSB2E11 acknowledges the 7-bit address cycle.
3. Following the acknowledge the host continues sending clock.
4. The TUSB2E11 transmit the contents of the memory registers MSB-first starting at register 00h or last read register offset+1. If a write to the I²C register occurred prior to the read, then the TUSB2E11 shall start at the register offset specified in the write.
5. The TUSB2E11 waits for either an acknowledge (ACK) or a not-acknowledge (NACK) from the host after each byte transfer; the I²C host acknowledges reception of each data byte transfer.
6. If an ACK is received, the TUSB2E11 transmits the next byte of data as long as host provides the clock. If a NAK is received, the TUSB2E11 stops providing data and waits for a stop condition (P).
7. The host terminates the write operation by generating a stop condition (P).

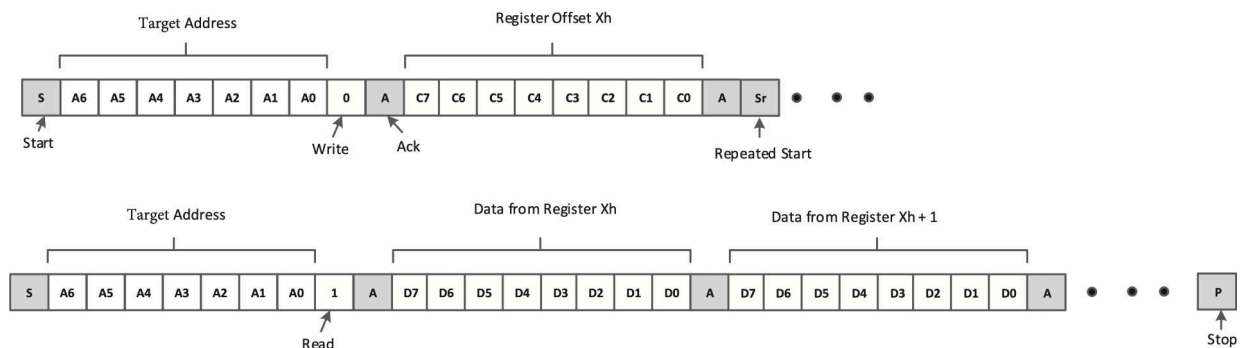

図 8-7. I²C Read with Repeated Start

Use the following procedure to write data to the TUSB2E11 I²C registers with a repeated Start (refer 図 8-7).

1. The host initiates a read operation by generating a start condition (S), followed by the TUSB2E11 7-bit address and a zero-value “W/R” bit to indicate a write cycle.
2. The TUSB2E11 acknowledges the 7-bit address cycle.
3. The host presents the register offset within the TUSB2E11 to be written, consisting of one byte of data, MSB-first.
4. The TUSB2E11 acknowledges the register offset cycle.
5. The host presents a repeated start condition (Sr).
6. The host initiates a read operation by generating a start condition (S), followed by the TUSB2E11 7-bit address and a one-value “W/R” bit to indicate a read cycle.
7. The TUSB2E11 acknowledges the 7-bit address cycle.
8. The TUSB2E11 transmit the contents of the memory registers MSB-first starting at the register offset.

9. The TUSB2E11 shall wait for either an acknowledge (ACK) or a not-acknowledge (NACK) from the host after each byte transfer; the I²C host acknowledges reception of each data byte transfer.
10. If an ACK is received, the TUSB2E11 transmits the next byte of data as long as host provides the clock. If a NAK is received, the TUSB2E11 stops providing data and waits for a stop condition (P).
11. The host terminates the read operation by generating a stop condition (P).

図 8-8. I²C Write Without Data

Use the following procedure to set a starting sub-address for I²C reads (refer to 図 8-8).

1. The host initiates a write operation by generating a start condition (S), followed by the TUSB2E11 7-bit address and a zero-value “W/R” bit to indicate a write cycle.
2. The TUSB2E11 acknowledges the address cycle.
3. The host presents the register offset within the TUSB2E11 to be written, consisting of one byte of data, MSB-first.
4. The TUSB2E11 acknowledges the register offset cycle.
5. The host terminates the write operation by generating a stop condition (P).

注

After initial power-up, if no register offset is included for the read procedure (refer to 図 8-6), then reads start at register offset 00h and continue byte by byte through the registers until the I²C host terminates the read operation. During a read operation, the TUSB2E11 auto-increments the I²C internal register address of the last byte transferred independent of whether or not an ACK was received from the I²C host.

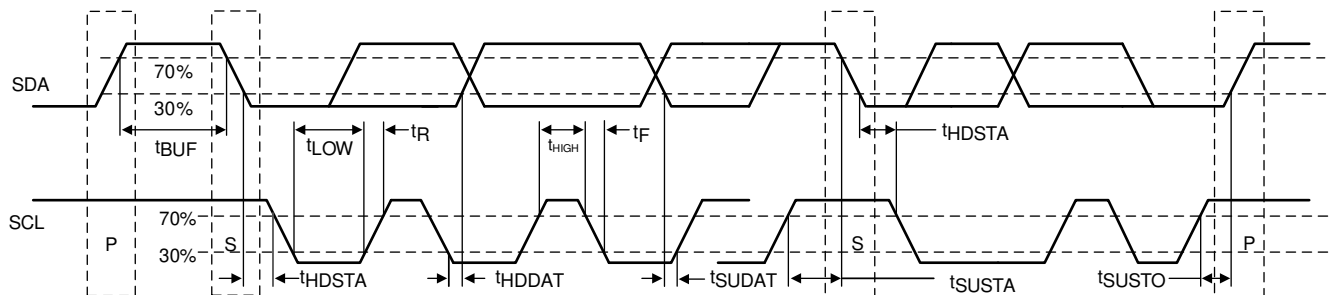

図 8-9. I²C Timing Diagram

9 Register Access Protocol (RAP)

The repeater in the TUSB2E11 supports the register access protocol (RAP) over eUSB2 to allow access to the related registers.

RAP accessible registers are indicated with corresponding RAP addresses in the register map. Default value of a subset of the registers are factory programmable and are indicated in register map.

10 Register Map

10.1 TUSB2E11 Registers

表 10-1 lists the TUSB2E11 registers. All register offset addresses not listed in 表 10-1 should be considered as reserved locations and the register contents should not be modified.

表 10-1. TUSB2E11 Registers

Offset	Acronym	Register Name	Section
70h	U_TX_ADJUST_PORT1	RAP Register for Port 1 (0h), Default through OTP	Go
71h	U_HS_TX_PRE_EMPHASIS_P1	RAP Register for Port 1 (1h), Default through OTP	Go
72h	U_RX_ADJUST_PORT1	RAP Register for Port 1 (2h), Default through OTP	Go
73h	U_DISCONNECT_SQUELCH_PORT1	RAP Register for Port 1 (3h), Default through OTP	Go
77h	E_HS_TX_PRE_EMPHASIS_P1	RAP Register for Port 1 (7h), Default through OTP	Go
78h	E_TX_ADJUST_PORT1	RAP Register for Port 1 (8h), Default through OTP	Go
79h	E_RX_ADJUST_PORT1	RAP Register for Port 1 (9h), Default through OTP	Go
0h	GPIO0_CONFIG		Go
40h	GPIO1_CONFIG		Go
50h	UART_PORT1	RAP Register for Port 1 (20h)	Go
B0h	REV_ID		Go
B2h	GLOBAL_CONFIG		Go
B3h	INT_ENABLE_1		Go
B4h	INT_ENABLE_2		Go
B5h	FRAME_LP_CONTROL	Controls for Frame Based LP mode	Go
B6h	BC_CONTROL		Go
B7h	BC_STATUS_1		Go
A3h	INT_STATUS_1		Go
A4h	INT_STATUS_2		Go
60h	CONFIG_PORT1		Go
F5h	TEST_MODE1		Go

Complex bit access types are encoded to fit into small table cells. 表 10-2 shows the codes that are used for access types in this section.

表 10-2. TUSB2E11 Access Type Codes

Access Type	Code	Description
Read Type		
H	H	Set or cleared by hardware
R	R	Read
RH	R H	Read Set or cleared by hardware
Write Type		
W	W	Write
W1C	W 1C	Write 1 to clear
WtoP	W	Write
Reset or Default Value		
- n		Value after reset or the default value

10.1.1 GPIO0_CONFIG Register (Offset = 00h) [Reset = 00h]

GPIO0_CONFIG is shown in [GPIO0_CONFIG Register Field Descriptions](#).

Return to the [Summary Table](#).

表 10-3. GPIO0_CONFIG Register Field Descriptions

Bit	Field	Type	Reset	Description
7	GPIO0_OD_PP	R/W	0h	GPIO0 output type 0h = open-drain output 1h = push pull output
6	Reserved	R	0h	Reserved
5	GPIO0_DIRECTION	R/W	0h	GPIO0 direction 0h = input 1h = output
4	GPIO0_INPUT_STATUS	RH	0h	Logical value of GPIO0 pin input (0=Low, 1=High) 0h = input is low 1h = input is high
3-0	GPIO0_OUTPUT_SELECT	R/W	0h	Dh = HIGH_OUTPUT – output is forced static high Eh = LOW_OUTPUT – output is forced static low

10.1.2 GPIO1_CONFIG Register (Offset = 40h) [Reset = 00h]

GPIO1_CONFIG is shown in [GPIO1_CONFIG Register Field Descriptions](#).

Return to the [Summary Table](#).

表 10-4. GPIO1_CONFIG Register Field Descriptions

Bit	Field	Type	Reset	Description
7	GPIO1_OD_PP	R/W	0h	GPIO1 output type selection 0h = open-drain output 1h = push pull output
6	GPIO1_IN_TRIGGER_TYPE	R/W	0h	GPIO1 input trigger type selection for interrupt 0h = edge trigger input 1h = level trigger input (GPIO2 output reflects the input level state)
5	GPIO1_DIRECTION	R/W	0h	GPIO1 direction selection 0h = input 1h = output
4	GPIO1_INPUT_STATUS	RH	0h	Logical value of GPIO1 pin input status (0=Low, 1=High) 0h = input is low 1h = input is high

表 10-4. GPIO1_CONFIG Register Field Descriptions (続き)

Bit	Field	Type	Reset	Description
3-0	GPIO1_OUTPUT_SELECT	R/W	0h	<p>GPIO1 output selection</p> <p>0h = Remote wakeup – host repeater is receiving remote wake but has not seen start of resume</p> <p>1h = USB disconnect – host repeater is actively forwarding LS/FS disconnect.</p> <p>2h = USB_HS_Unsquelched – host repeater in L0 seeing USB HS or in reset seeing Chirp</p> <p>3h = PVTB – HOST repeater is actively transmitting ESE1 due to HS disconnect.</p> <p>4h = DEFAULT – waiting to be configured host/peripheral</p> <p>5h = HOST – in host repeater mode</p> <p>6h = PERIPHERAL – in peripheral repeater mode</p> <p>7h = CONNECTED – repeater is connected, connection seen acknowledged by start of reset</p> <p>8h = RESET – reset in progress, reset is detected is high, L0 is low</p> <p>9h = L0 – fully configured and repeating data, keep-alive and reset/disconnect</p> <p>Ah = L1 – device has received CM.FS/CM.L1, has stopped repeating and is waiting for wake or resume</p> <p>Bh = L2 – device has received CM.L2, has stopped repeating and is waiting for wake or resume.</p> <p>Ch = GPIO1_HS_TEST – in host repeater in L0 mode, received CM.TEST</p> <p>Dh = HIGH_OUTPUT – output is forced static high</p> <p>Eh = LOW_OUTPUT – output is forced static low</p> <p>Fh = OVP – over voltage (DP/DN voltage > VOVP_TH) detected on the USB DP/DN</p>

10.1.3 U_TX_ADJUST_PORT1 Register (Offset = 70h) [Reset = 7Ch]

U_TX_ADJUST_PORT1 is shown in [表 10-5](#).

Return to the [Summary Table](#).

Hardware default value can be overridden through factory programmable OTP for this register.

表 10-5. U_TX_ADJUST_PORT1 Register Field Descriptions

Bit	Field	Type	Reset	Description
7-6	U_HS_TERM_P1	RH/W	1h	<p>0h = 42.75Ω (typical)</p> <p>1h = 45Ω (typical) (default)</p> <p>2h = 47.25Ω (typical)</p> <p>3h = 49.5Ω (typical)</p>
5-4	U_HS_TX_SLEW_RATE_P1	RH/W	3h	<p>0h = 425 ps (typical)</p> <p>1h = 465 ps (typical)</p> <p>2h = 510 ps (typical)</p> <p>3h = 625 ps (typical) (OTP default)</p>

表 10-5. U_TX_ADJUST_PORT1 Register Field Descriptions (続き)

Bit	Field	Type	Reset	Description
3-0	U_HS_TX_AMPLITUDE_P1	RH/W	Ch	0h = 800mV – 7.5%, 740mV (typical) 1h = 800mV – 5.0%, 760mV (typical) 2h = 800mV – 2.5%, 780mV (typical) 3h = 800mV (USB 2.0 specification nominal), 800mV (typical) (B0 OTP default) 4h = 800mV + 2.5%, 820mV (typical) 5h = 800mV + 5.0%, 840mV (typical) 6h = 800mV + 7.5%, 860mV (typical) 7h = 800mV + 10%, 880mV (typical) 8h = 800mV + 12.5%, 900mV (typical) 9h = 800mV + 15%, 920mV (typical) Ah = 800mV + 17.5%, 940mV (typical) Bh = 800mV + 20%, 960mV (typical) Ch = 800mV + 22.5%, 980mV (typical) (B1 OTP default) Dh = 800mV + 25%, 1000mV (typical) Eh = 800mV + 27.5%, 1020mV (typical) Fh = 800mV + 30%, 1040mV (typical)

10.1.4 U_HS_TX_PRE_EMPHASIS_P1 Register (Offset = 71h) [Reset = 3Ch]

U_HS_TX_PRE_EMPHASIS_P1 is shown in [表 10-6](#).

Return to the [Summary Table](#).

Hardware default value can be overridden through factory programmable OTP for this register.

表 10-6. U_HS_TX_PRE_EMPHASIS_P1 Register Field Descriptions

Bit	Field	Type	Reset	Description
7	CDP_2_EN_P1	RH/W	0h	0h = CDP advertising disabled 1h = CDP advertising enabled

3	FORCE_HS_L0	R/W	0h	Force repeater into high-speed L0 state for test purposes only. 0h = normal repeater mode (setting this bit to 0 does not return the device to normal repeater mode, the device required a hard reset, soft reset or power cycled) 1h = forced high-speed L0 mode
2-0	Reserved	R/W	Xh	Variant ID. 00h = 1.2V I/O 02h = 1.8V I/O Must not change the value, rewrite the value that is read.

11 Application and Implementation

注

以下のアプリケーション情報は、TI の製品仕様に含まれるものではなく、TI ではその正確性または完全性を保証いたしません。個々の目的に対する製品の適合性については、お客様の責任で判断していただくことになります。お客様は自身の設計実装を検証しテストすることで、システムの機能を確認する必要があります。

11.1 Application Information

The TUSB2E11 can be used in either HOST or Peripheral implementation. The mode is configured by the eUSB2 SoC.

11.2 Typical Application

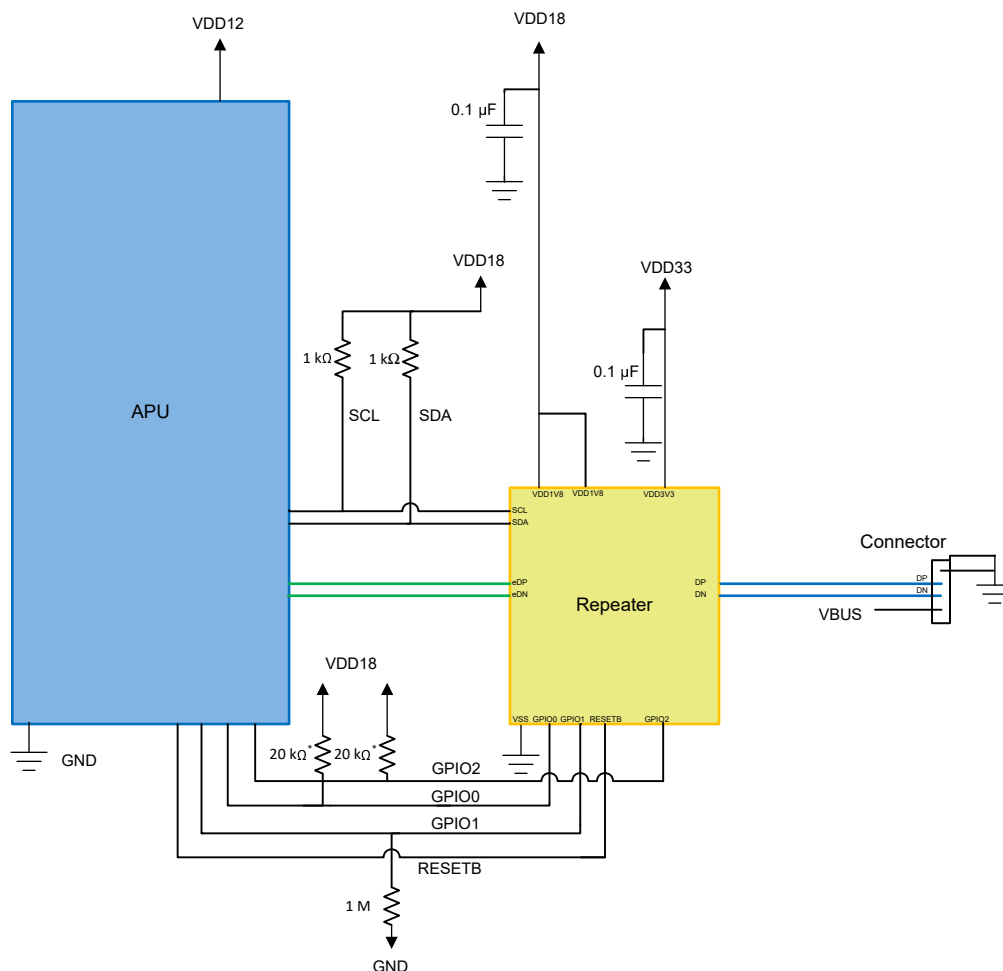

図 11-1. Typical System Implementation Using 1.8V I²C Variant

The 0.1 μF recommendation per supply pin is based on capacitor placement of 2 mm or less trace length away. If the placement of capacitor is further away, the value of the capacitor needs to be redetermined to account for the additional trace inductance and maintain resonance around 12 MHz. Additionally, make sure the system power design has adequate bulk capacitance to account for maximum transient current expected by the device when transitioning from low power mode to active mode. GPIO2 can be optionally used as interrupt output. Make sure to adjust the pullup resistor on GPIO[0:2] based on the leakage of the APU I/O so that VIH and VIL of GPIO0 are met.

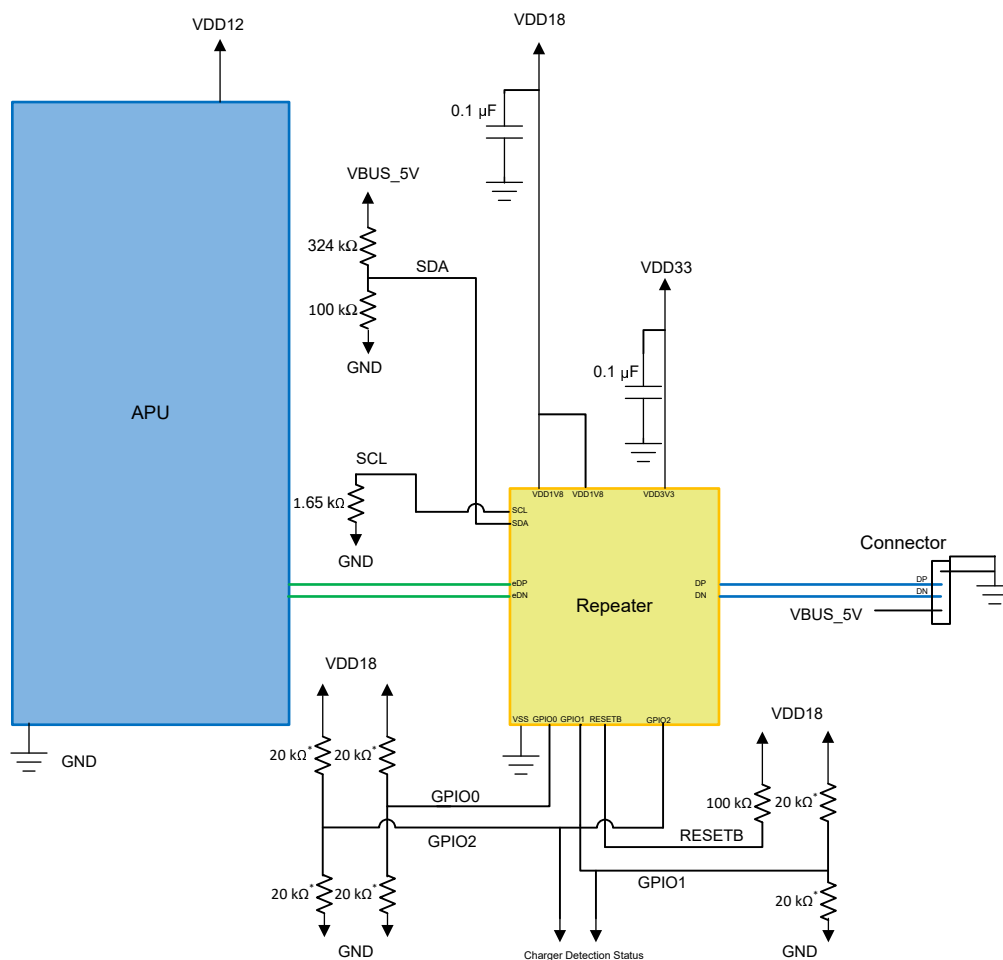

図 11-2. Typical System Implementation Using 1.8V Variant without I²C (Configured for Charger Detection)

The 0.1μF recommendation per supply pin is based on capacitor placement of 2 mm or less trace length away. If the placement of the capacitor is further away, then the value of the capacitor needs to be redetermined to account for the additional trace inductance and maintain resonance around 12MHz. Additionally, make sure the system power design has adequate bulk capacitance to account for maximum transient current expected by the device when transitioning from low power mode to active mode. GPIO2 can be optionally used as interrupt output. Select the pullup and pulldown resistors on GPIO[0:2] based on the USB PHY tuning needs. Use SDA for Vbus_valid detection with a voltage divider. GPIO1 and GPIO2 can be routed as needed for charger detection status. Pull-down resistor value on SCL determines the battery charging mode.

11.2.1 Design Requirements

The TUSB2E11 requires a valid reset signal as described in the [Power Supply Recommendations](#) section.

For design examples, use the parameters shown in [表 11-1](#), [表 11-2](#), and [表 11-3](#).

表 11-1. Design Parameters for High Loss USB 2.0 System Using I²C

PARAMETER			VALUE ⁽¹⁾
V _{DD3V3}			3.3V ±10%
V _{DD1V8}			1.8V ±5%
I ² C support required in system (Yes or No)			Yes
Parameter	Register	Setting	Value

表 11-1. Design Parameters for High Loss USB 2.0 System Using I²C (続き)

PARAMETER			VALUE ⁽¹⁾
USB 2.0 TX Swing (peak to peak)	U_TX_ADJUST_PORT1 (Offset = 70h)	7Ch	980mVp-p
USB 2.0 TX Pre-emphasis	U_HS_TX_PRE_EMPHASIS_P1 (Offset = 71h)	3Ch	2.1dB
USB 2.0 RX Equalization	U_RX_ADJUST_PORT1 (Offset = 72h)	92h	1.09dB
USB 2.0 HS host disconnect threshold (peak differential)	U_DISCONNECT_SQUELCH_PORT1 (Offset = 73h)	83h	685mV
USB 2.0 HS squelch/RX sensitivity threshold (peak differential)	U_DISCONNECT_SQUELCH_PORT1 (Offset = 73h)	83h	111mV

表 11-2. Design Parameters for Medium Loss USB 2.0 System Using I²C

PARAMETER			VALUE ⁽¹⁾
V _{DD3V3}			3.3V ±10%
V _{DD1V8}			1.8V ±5%
I ² C support required in system (Yes or No)			Yes
Parameter	Register	Setting	Value
USB 2.0 TX Swing (peak to peak)	U_TX_ADJUST_PORT1 (Offset = 70h)	79h	920mVp-p
USB 2.0 TX Pre-emphasis	U_HS_TX_PRE_EMPHASIS_P1 (Offset = 71h)	39h	0.9dB
USB 2.0 RX Equalization	U_RX_ADJUST_PORT1 (Offset = 72h)	92h	1.09dB
USB 2.0 HS host disconnect threshold (peak differential)	U_DISCONNECT_SQUELCH_PORT1 (Offset = 73h)	83h	685mV
USB 2.0 HS squelch/RX sensitivity threshold (peak differential)	U_DISCONNECT_SQUELCH_PORT1 (Offset = 73h)	83h	111mV

(1) These parameters are starting values for a high loss system. Further tuning might be required based on specific loss profile and measurements.

表 11-3. Design Parameters for Medium Loss USB 2.0 System without I²C and Configured for Charger Detection

PARAMETER				VALUE ⁽¹⁾
V _{DD3V3}				3.3V ±10%
V _{DD1V8}				1.8V ±5%
I ² C support required in system (Yes or No)				No
SCL (pulldown resistor to ground)				1.65kΩ
SDA (pulldown resistor to ground)				100kΩ
SDA (pullup resistor to VBUS5V)				324kΩ
Parameter	GPIO0	GPIO1	GPIO2	Value
USB 2.0 TX Swing (peak to peak)	Float	Pull-up	Pull-up	920mVp-p
USB 2.0 TX Pre-emphasis	Float	Pull-up	Pull-up	0.9dB
USB 2.0 RX Equalization	Float	Pull-up	Pull-up	1.09dB
USB 2.0 HS host disconnect threshold (peak differential)	Float	Pull-up	Pull-up	685mV
USB 2.0 HS squelch/RX sensitivity threshold (peak differential)	Float	Pull-up	Pull-up	98mV

(1) These parameters are starting values for a medium loss system. Further tuning might be required based on specific loss profile and measurements.

11.2.2 Detailed Design Procedure

The best PHY setting is dependent upon the signal chain loss characteristics of the target platform. The recommendation is to start with lowest level of compensation for TX swing and pre-emphasis, and then increment until the optimal eye diagram margin is achieved. The same recommendation apply to the RX sensitivity or squelch threshold setting where TI recommends to adjust from low threshold until optimum RX sensitivity and squelch margins are achieved.

To optimize the TUSB2E11 RX equalization, monitor the corresponding TX eye diagram to achieve best RX EQ setting. In other words, to optimize eUSB2 RX equalization, monitor USB 2.0 TX eye and monitor eUSB2.0 TX eye to optimize USB RX equalization.

HS host disconnect threshold shall be adjusted to provide the most margin to avoid false disconnect as well as failure to detect a disconnect. See [表 8-2](#).

注

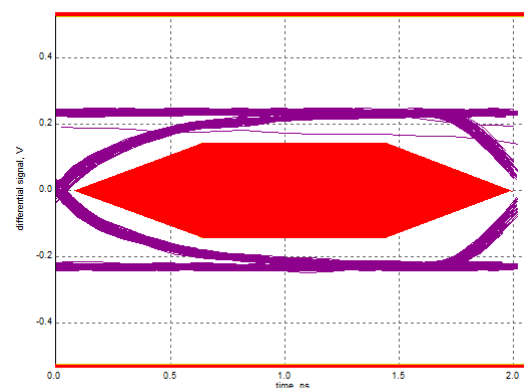

The TUSB2E11 compensates for extra attenuation in the signal path according to the configuration of the TX and RX settings. General recommendation is to use just enough pre-emphasis and equalization to achieve eye margin and not over-equalize to avoid excessive jitter. Maximum PE width and slew rates are recommended.

11.2.3 Application Curves

U_HS_TX_AMPLITUDE_P1 = 3h

図 11-3. USB 2.0 TX Eye Diagram with Near-End Mask

E_HS_TX_AMPLITUDE_P1 = 3h

図 11-4. eUSB2 TX Eye Diagram with eTP1 (Terminated) Mask

11.3 Power Supply Recommendations

11.3.1 Power Up Reset

RESETB pin is active low reset pin and can also be used as a power down pin.

The TUSB2E11 does not have power supply sequence requirements between VDD3V3 and VDD1V8.

Make sure the maximum VDD3V3 and VDD1V8 ramp time to reach minimum supply voltages is 2ms.

Digital and analog inputs may be applied when VDD3V3 and VDD1V8 are in unpowered state.

Internal power on reset circuit along with the external RESETB input pin allows for proper initialization when RESETB is de-asserted high prior to the power rails being valid. If RESETB de-assert high before the power supplies are stable, internal power on reset circuit holds off internal reset until the supplies are stable.

I²C/RAP and eUSB2 interfaces are ready after t_{RH_READY} upon de-assertion of RESETB or power up.

I²C/RAP and eUSB2 interfaces are ready after [t_{RH_READY}](#) upon soft reset through the I²C.

Upon de-assertion of RESETB (after [t_{RH_READY}](#)) or software reset (after [t_{RH_READY}](#)), the TUSB2E11 enables and enters the default state. In the default state, the TUSB2E11 is ready to accept eUSB2 packets, RAP and I²C requests. The repeater can either be in host repeater mode or device repeater mode depending on the receipt of either host mode enable or peripheral mode enable.

11.4 Layout

11.4.1 Layout Guidelines

1. Place supply bypass capacitors as close to VDD1V8 and VDD3V3 pins as possible and avoid placing the bypass caps near the eDP/eDN and DP/DN traces.
2. Route the high-speed USB signals using a minimum of vias and corners which reduces signal reflections and impedance changes. When a via must be used, increase the clearance size around the via to minimize the capacitance. Each via introduces discontinuities in the transmission line of the signal and increases the chance of picking up interference from the other layers of the board. Be careful when designing test points on twisted pair lines; through-hole pins are not recommended.
3. When it becomes necessary to turn 90°, use two 45° turns or an arc instead of making a single 90° turn. This reduces reflections on the signal traces by minimizing impedance discontinuities.
4. Do not route USB traces under or near crystals, oscillators, clock signal generators, switching regulators, mounting holes, magnetic devices or ICs that use or duplicate clock signals.
5. Avoid stubs on the high-speed USB signals due to signal reflections. If a stub is unavoidable, then the stub must be less than 200 mil.
6. Route all high-speed USB signal traces over continuous GND planes, with no interruptions.
7. Avoid crossing over anti-etch, commonly found with plane splits.
8. Due to high frequencies associated with the USB, a printed circuit board with at least four layers is recommended; two signal layers separated by a ground and power layer as shown in [Figure 11-5](#).

Figure 11-5. Four-Layer Board Stack-Up

11.4.2 Example Layout for Application with 1.8V I²C Variant

Figure 11-6 shows how GPIO2 can be optionally used as an open drain interrupt output with a pullup resistor to VDD18.

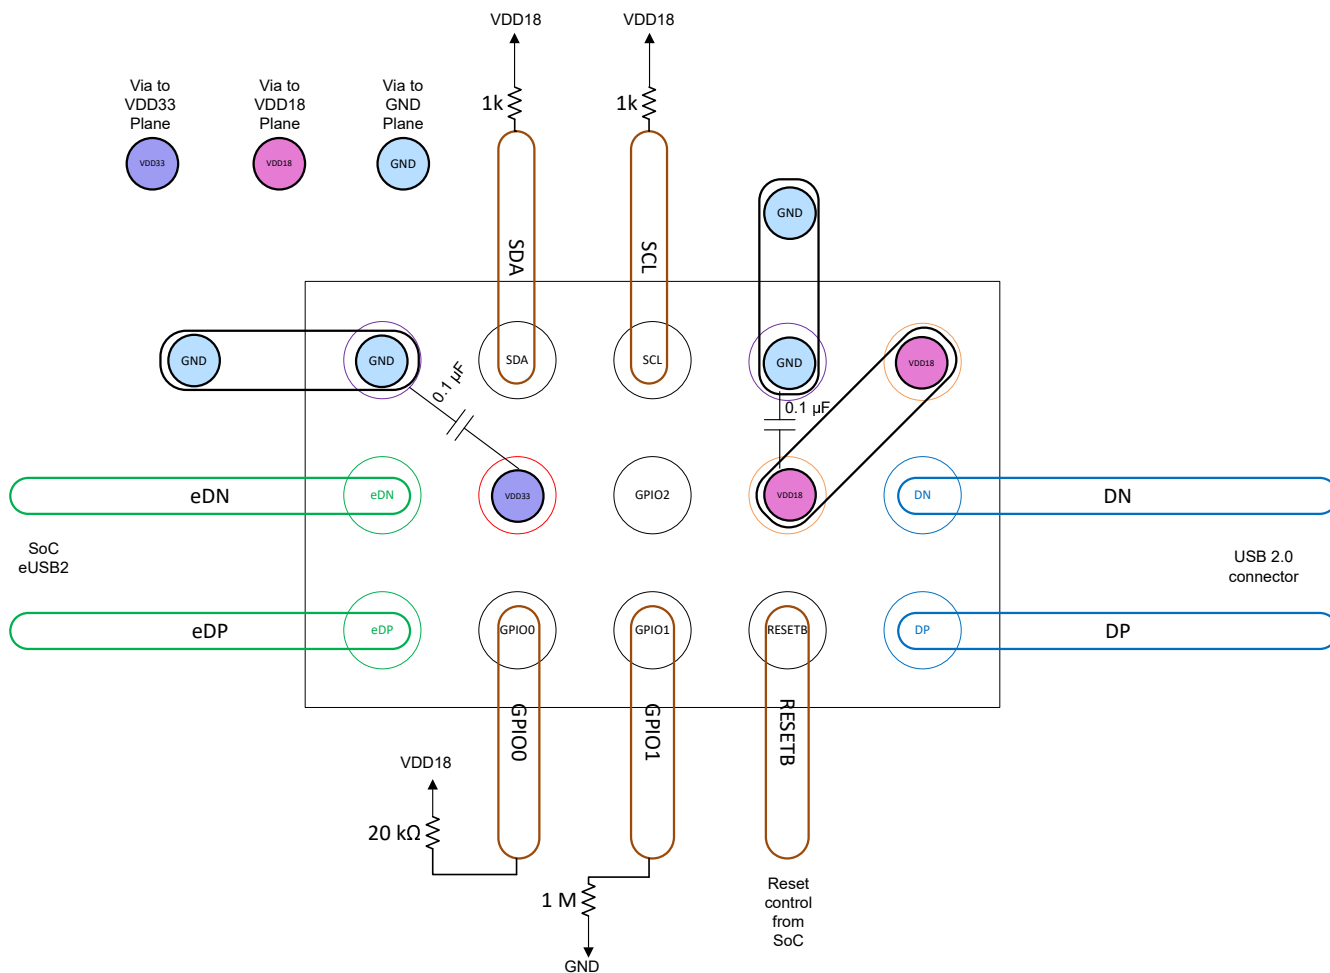

Figure 11-6. Example Layout for Application with 1.8V I²C Variant

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

4. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release.

重要なお知らせと免責事項

TI は、技術データと信頼性データ (データシートを含みます)、設計リソース (リファレンス・デザインを含みます)、アプリケーションや設計に関する各種アドバイス、Web ツール、安全性情報、その他のリソースを、欠陥が存在する可能性のある「現状のまま」提供しており、商品性および特定目的に対する適合性の黙示保証、第三者の知的財産権の非侵害保証を含むいかなる保証も、明示的または黙示的にかかわらず拒否します。

これらのリソースは、TI 製品を使用する設計の経験を積んだ開発者への提供を意図したものです。(1) お客様のアプリケーションに適した TI 製品の選定、(2) お客様のアプリケーションの設計、検証、試験、(3) お客様のアプリケーションに該当する各種規格や、その他のあらゆる安全性、セキュリティ、規制、または他の要件への確実な適合に関する責任を、お客様のみが単独で負うものとし、TI は一切の責任を拒否します。

上記の各種リソースは、予告なく変更される可能性があります。これらのリソースは、リソースで説明されている TI 製品を使用するアプリケーションの開発の目的でのみ、TI はその使用をお客様に許諾します。これらのリソースに関して、他の目的で複製することや掲載することは禁止されています。TI や第三者の知的財産権のライセンスが付与されている訳ではありません。お客様は、これらのリソースを自身で使用した結果発生するあらゆる申し立て、損害、費用、損失、責任について、TI およびその代理人を完全に補償するものとし、TI は一切の責任を拒否します。

TI の製品は、[TI の販売条件](#)、または [ti.com](#) やかかる TI 製品の関連資料などのいずれかを通じて提供する適用可能な条項の下で提供されています。TI がこれらのリソースを提供することは、適用される TI の保証または他の保証の放棄の拡大や変更を意味するものではありません。

お客様がいかなる追加条項または代替条項を提案した場合でも、TI はそれらに異議を唱え、拒否します。
