

TI Designs: TIDM-1020

SimpleLink™ CC3220ワイヤレスMCUベースのサーモスタットのリファレンス・デザイン、Alexa音声制御についての補遺

概要

このTIデザイン・ガイド補遺は、既存の『SimpleLink™ CC3220ワイヤレスMCUベースのサーモスタットのリファレンス・デザイン、BLEプロビジョニング付き』にクラウドへのAWS (Amazon Web Services) IoT (Internet-of-Things) 接続を実装して構築したソフトウェアの参考資料です。音声制御エコシステムの出現により、クラウドからの音声制御の実装は、多くのスマート・サーモスタット・システムの主要な要素になりました。このデザイン・ガイド補遺では、Alexaを使用する音声制御に必要な、Alexa音声サービス(AVS)クラウドとAWS環境の構成方法について詳説します。このデザイン・ガイド補遺は、サーモスタットの最終製品の開発者、エンジニア、システム評価担当者向けです。

この補遺では、CC3220SFベースのスマート・サーモスタットのリファレンス・デザインとAmazonクラウドとの統合を実証するためのリファレンス・コードと、CC3220SFデバイスを使用したAlexaとAWS IoT機能との接続方法を実証するAWS Lambda機能について紹介します。また、このリファレンス・デザインでは、スマート・サーモスタットの既存の機能として、インターネットやクラウドへの低消費電力での接続、リモート監視および制御、さらには、デバイスやアプリケーション・ファームウェアのセキュアなOTA (Over The Air)更新などの強化されたセキュリティ機能にも焦点を当てます。

E2E™ エキスパートに質問

新機能

- AWS IoTクラウドへの接続性を実証
- AVSと接続し、Alexa経由で直接音声制御が可能

アプリケーション

- サーモスタット
- HVACシステム・コントローラ
- ボイラー・システム
- ウェザーニュース
- ワイヤレス環境センサ
- 大気環境とガスの検出

1 System Description

This supplement builds on the [TIDM-1020](#) foundation and enables the use of Amazon's Alexa Voice Services to remotely control the smart thermostat with voice. This is achieved by removing the IBM cloud connectivity used in the base TIDM-1020 design, and replacing it with AWS IoT functionality that allows for direct connectivity to Amazon's suite of cloud services. Alongside the AWS IoT interface, the AWS cloud and AVS configuration are also demonstrated to build a fully-functioning voice-controlled smart device.

For this AWS IoT variant of the smart thermostat design, the same hardware as the existing TIDM-1020 is used. Furthermore, most of the code of TIDM-1020 is reused, leveraging the SimpleLink™ SDK platform. This common SDK code can easily be used with other SimpleLink connectivity platforms as well as the MSP432™ platforms. The entire design, including the firmware and hardware components, can be reconfigured or modified to suit specific system requirements and allow for scalability, should additional connectivity needs arise in the future.

The full description of the smart-thermostat features as well as instructions implementing the thermostat using the CC3220 family of devices, are provided in the main [SimpleLink™ CC3220 Wireless MCU-Based Thermostat Reference Design with BLE Provisioning](#) design guide. The scope of this TI reference design supplement is to implement voice control using Amazon Alexa. As such, unchanged sections of the TI design guide will not be repeated in this supplement. Only modified sections will be included, and it can be assumed that for omitted sections the corresponding section of the main design guide is still applicable.

1.1 Key System Specifications

[表 1](#) lists the key system specification and features of the TIDM-1020.

表 1. Key System Specifications

FEATURE	SPECIFICATION	ADDITIONAL DETAILS
Sensor integration	Temperature, humidity, air quality, atmospheric pressure	The TIDM-1020 demonstrates the integration of both analog and digital sensors. In this design, an air quality sensor is interfaced as an analog sensor.
Cloud connectivity	AWS IoT Cloud	Interface to the AWS cloud services
Provisioning	AP mode and SmartConfig™	Uses SimpleLink™ Wi-Fi® Starter Pro mobile application for Apple iOS or Android™ devices
HMI	HMI using a Kentec display and resistive touchscreen	—
Serial interface requirement	I ² C – all digital sensors SPI – interface to HMI ADC – analog sensors GPIOs – relay and LED control	This design can be used as a reference for the peripherals listed.
PIR sensor	Proximity-based display turn-on feature	—
Memory use – code	338 KB	Integrated development environment (IDE): Code Composer Studio™ (CCS) RTOS: TI-RTOS Compiler: TI v18.1.1.LTS

2 System Overview

This section is omitted as the content of this section is the same as that of the [SimpleLink™ CC3220 Wireless MCU-Based Thermostat Reference Design with BLE Provisioning](#) design guide.

3 Hardware, Software, Testing Requirements, and Test Results

3.1 Required Hardware

This section is omitted as the content of this section is the same as that of the [SimpleLink™ CC3220 Wireless MCU-Based Thermostat Reference Design with BLE Provisioning](#) design guide.

3.2 Getting Started Firmware

3.2.1 Required Software

- TIDM-1020 Software
- [Code Composer Studio \(CCS\) Integrated Development Environment \(IDE\)](#) (Arm® Compiler TI v18.1.1.LTS)
- [SimpleLink™ Wi-Fi® CC3220 Software Development Kit \(SDK\) v2.20.00.10](#)
- [Bluetooth® Plugin for SimpleLink™ MCU SDK v1.40.00.42](#) (required for BLE provisioning)
- [Sensor and Actuator Plug-ins for SimpleLink™ MCU SDKs v1.20.00.02](#)
- [SimpleLink™ SDK Plugin for Amazon Web Services v.2.00.00.09](#)
- [SimpleLink™ CC2640R2 SDK - Bluetooth® low energy](#) (required for BLE provisioning)
- [CCS UniFlash 4.3.1.1835 or newer](#)
- SimpleLink SDK Explorer, mobile application for [Apple iOS](#) or [Android](#) devices (required for BLE provisioning)
- [or SimpleLink™ Wi-Fi® Starter Pro](#), mobile application for Apple iOS or Android devices

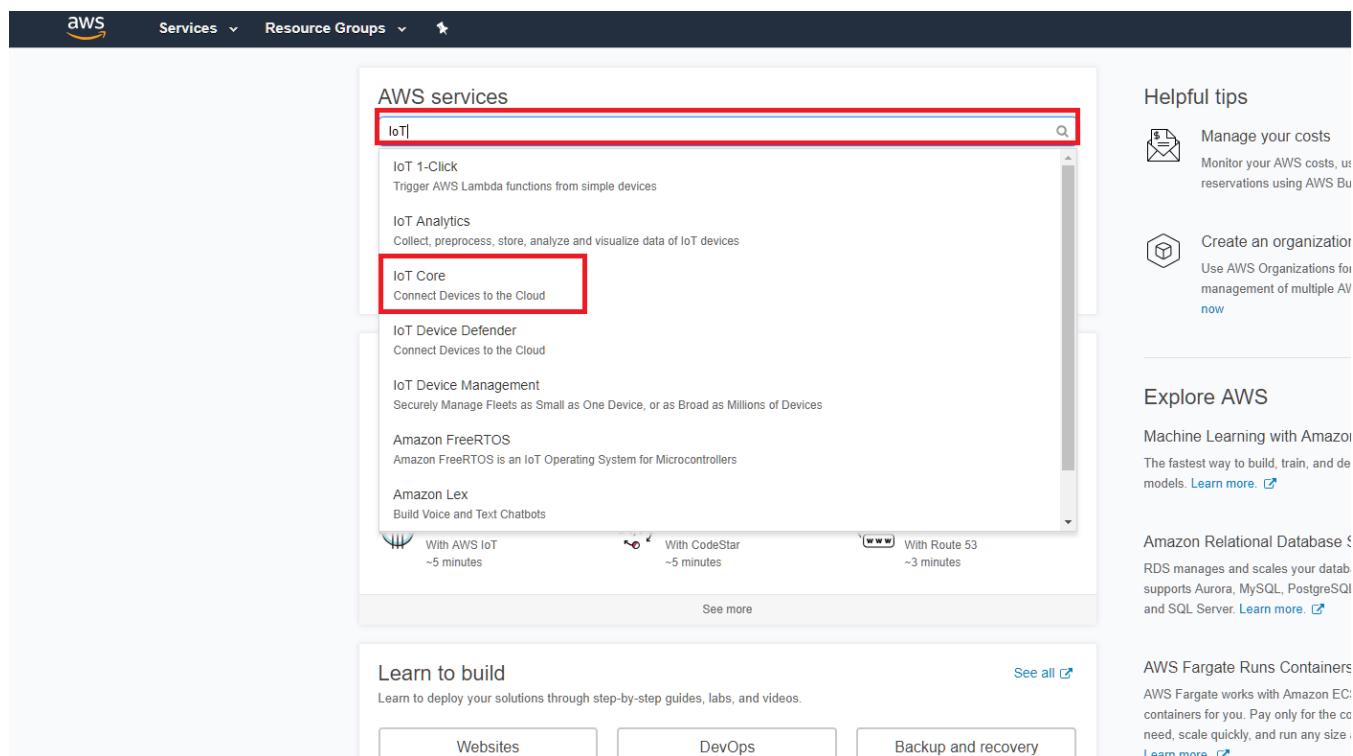

To import the software project into CCS, the required SDK and Plugin packages must be installed.

3.2.2 Opening and Configuring Amazon Web Services Account

3.2.2.1 Configuring AWS IoT and Adding a Thing

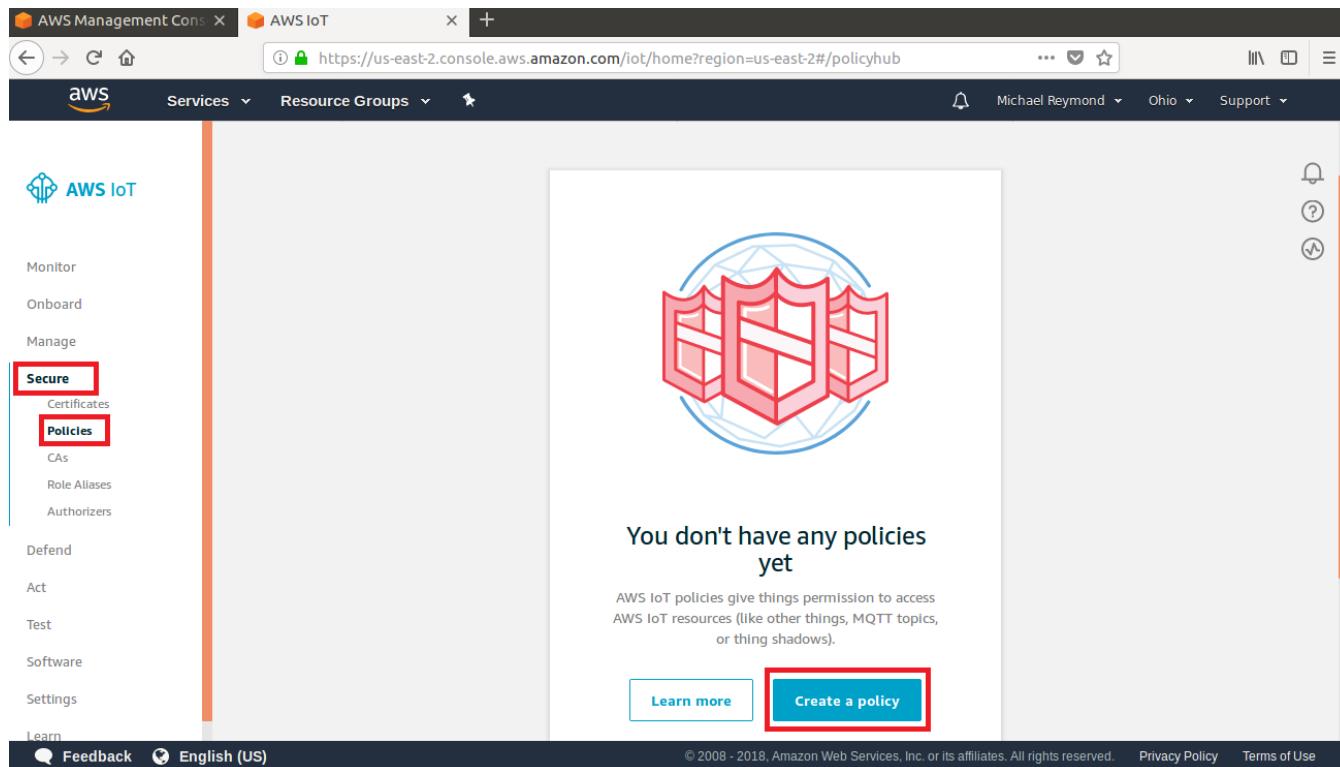

1. First, sign up for an AWS account at aws.amazon.com. The free 12 month trial account is sufficient for the purposes of this TI Design. Once you have successfully signed up, access the main developer console at console.aws.amazon.com.
2. Once at the console, access AWS IoT by typing in “IoT” into the search bar under “AWS services”, and then click on “IoT Core” in the drop-down menu that appears as shown in [図 1](#).

図 1. Accessing AWS IoT Core

3. In the next welcome screen, click “Get started” to get to the main dashboard. Then, click on Secure, then on Policies. In there, click on the “Create a policy” button as shown in [図 2.](#)

図 2. Accessing AWS IoT Policies

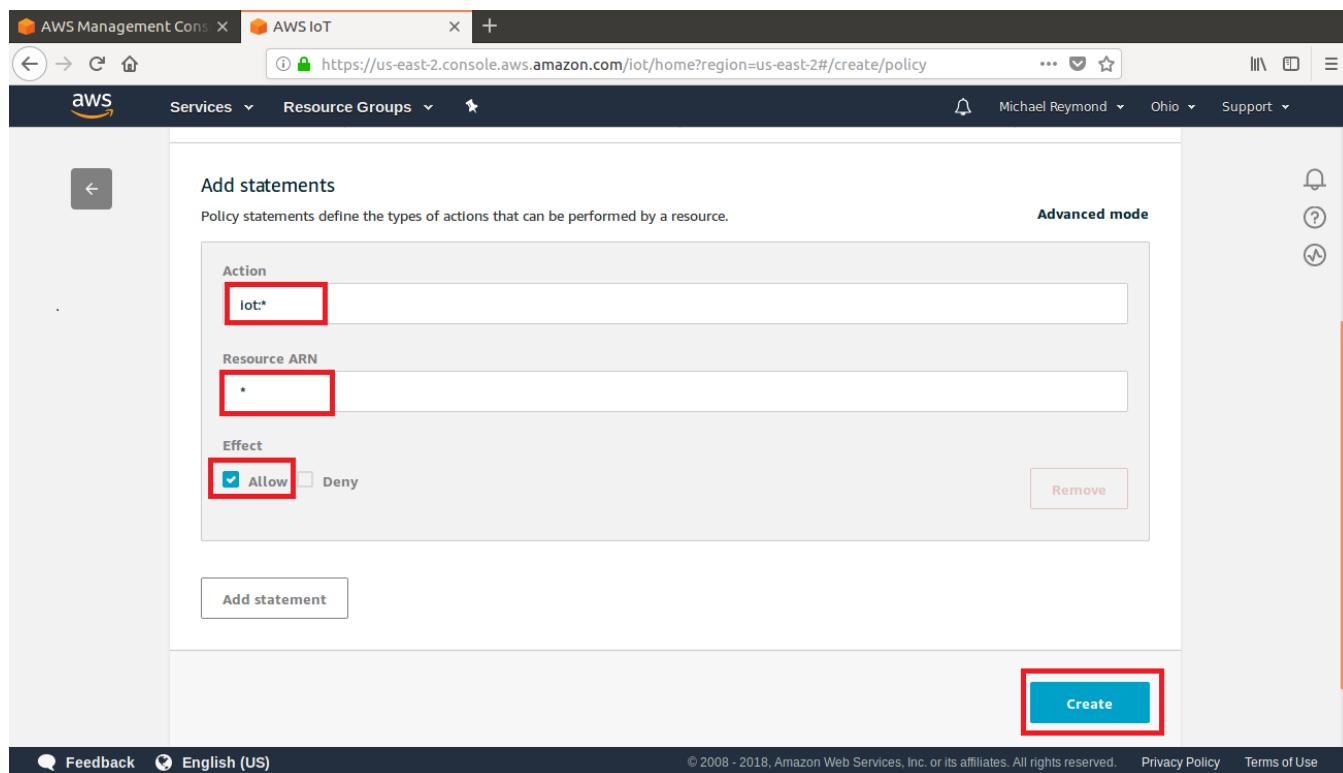

Type in a name for your policy, and then ensure that the following policy statements are configured:

- Action: iot:*
- Resource ARN: *
- Effect: Allow

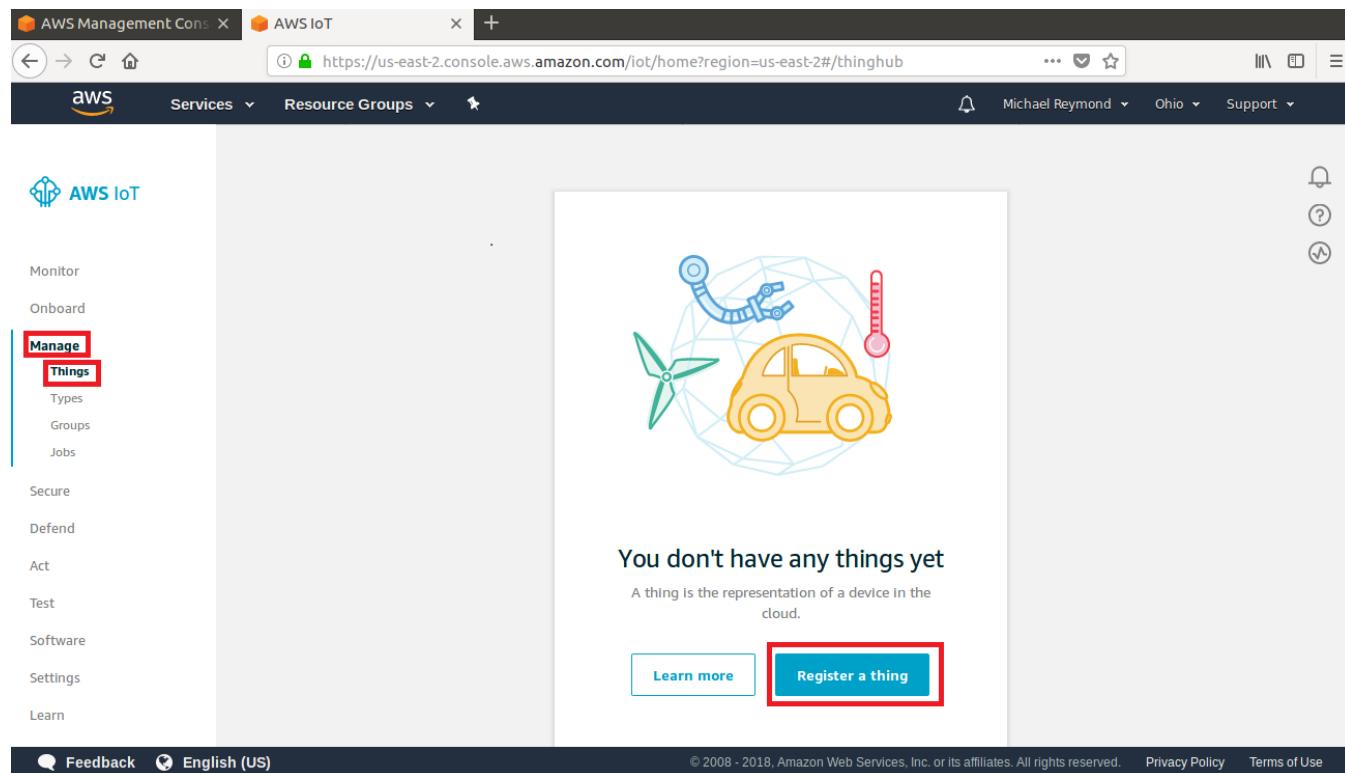

4. The policy settings should look like [図 3](#). Then, click on "Create".

図 3. Creating the AWS IoT Policy

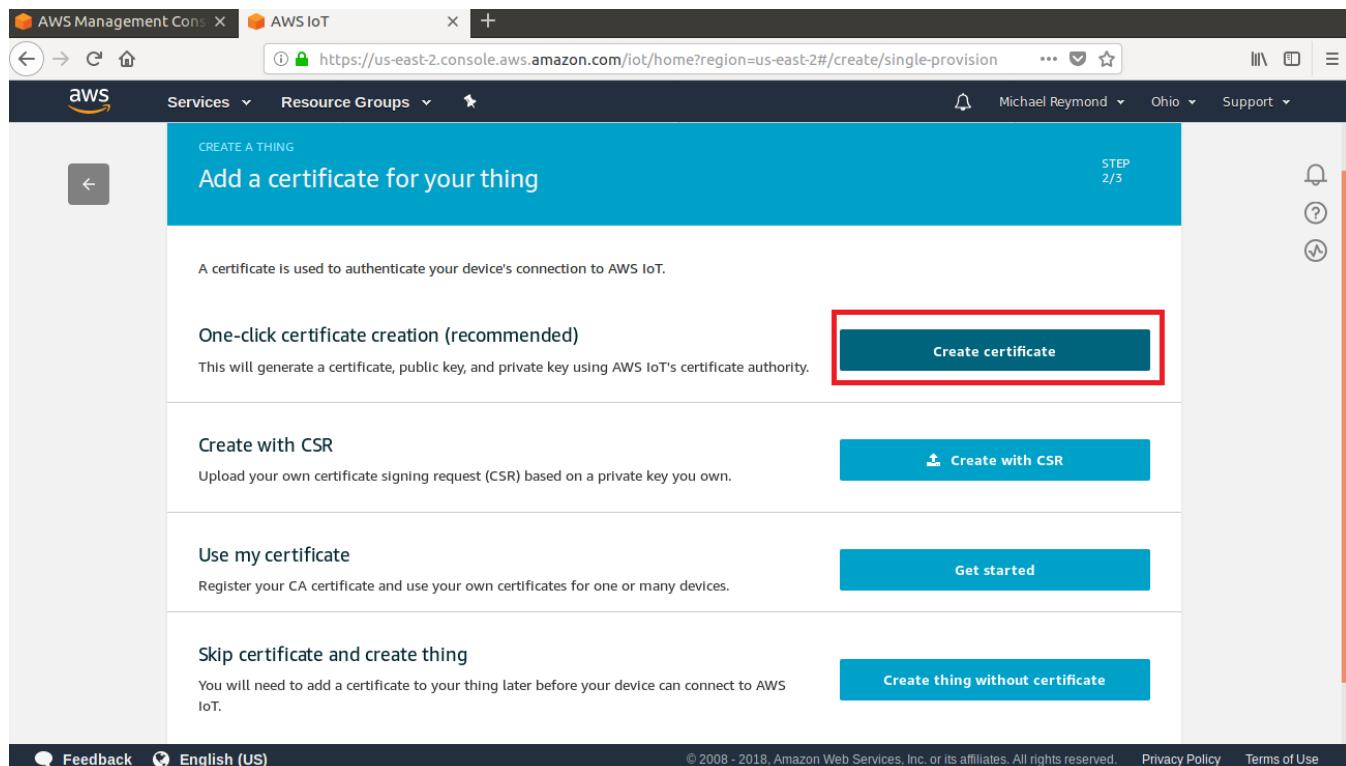

5. Next, click on “Manage” then “Things” to access the things hub. Click on “Show me later” to dismiss the intro message. Then, click on “Register a thing”, then “Create a single thing” to create your thermostat thing, as shown in 図 4.

図 4. Creating an AWS IoT Thing

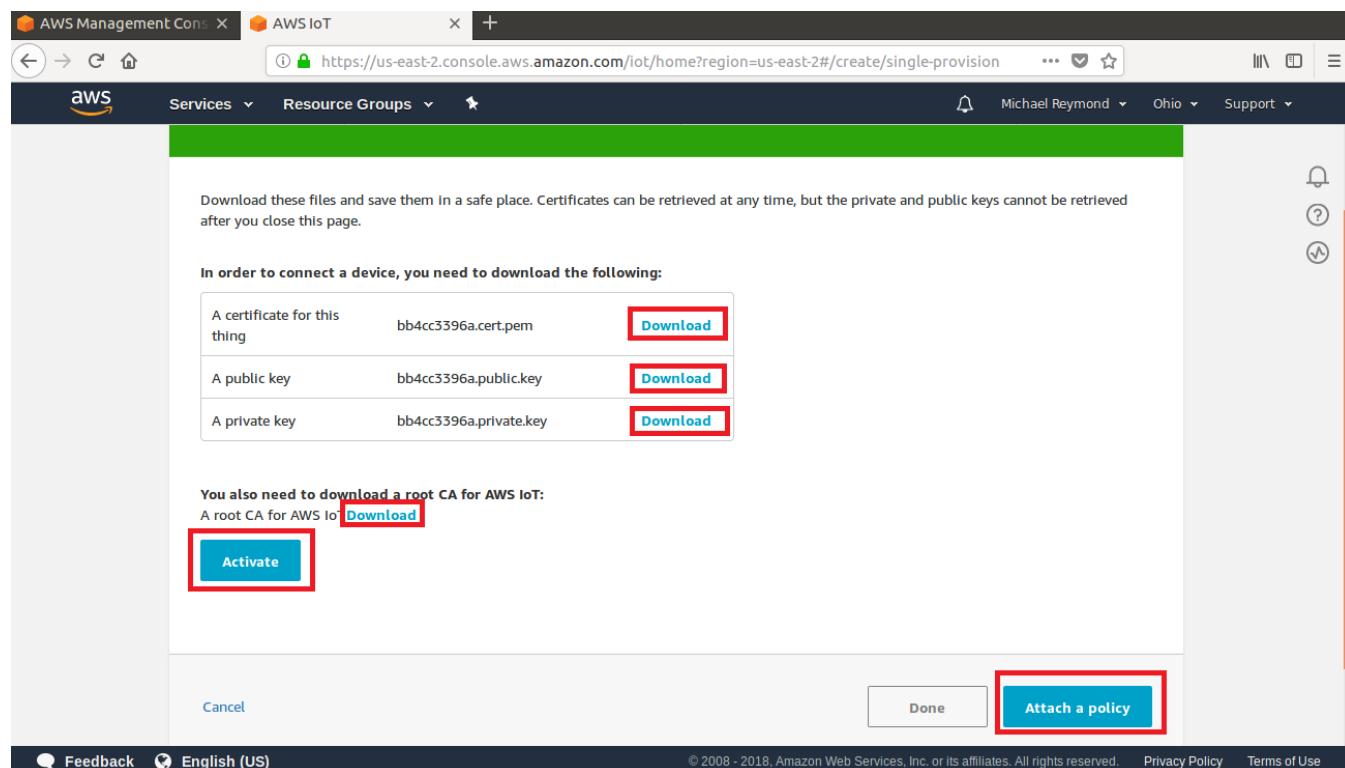

6. In the next menu (図 5), type in a name for your thing, and then click on next. Then, click on “Create Certificate” to create the certificate pair to be associated with your thing. Note down the name of your thing, as it will be needed in later setup steps.

図 5. Creating a One-Click Certificate

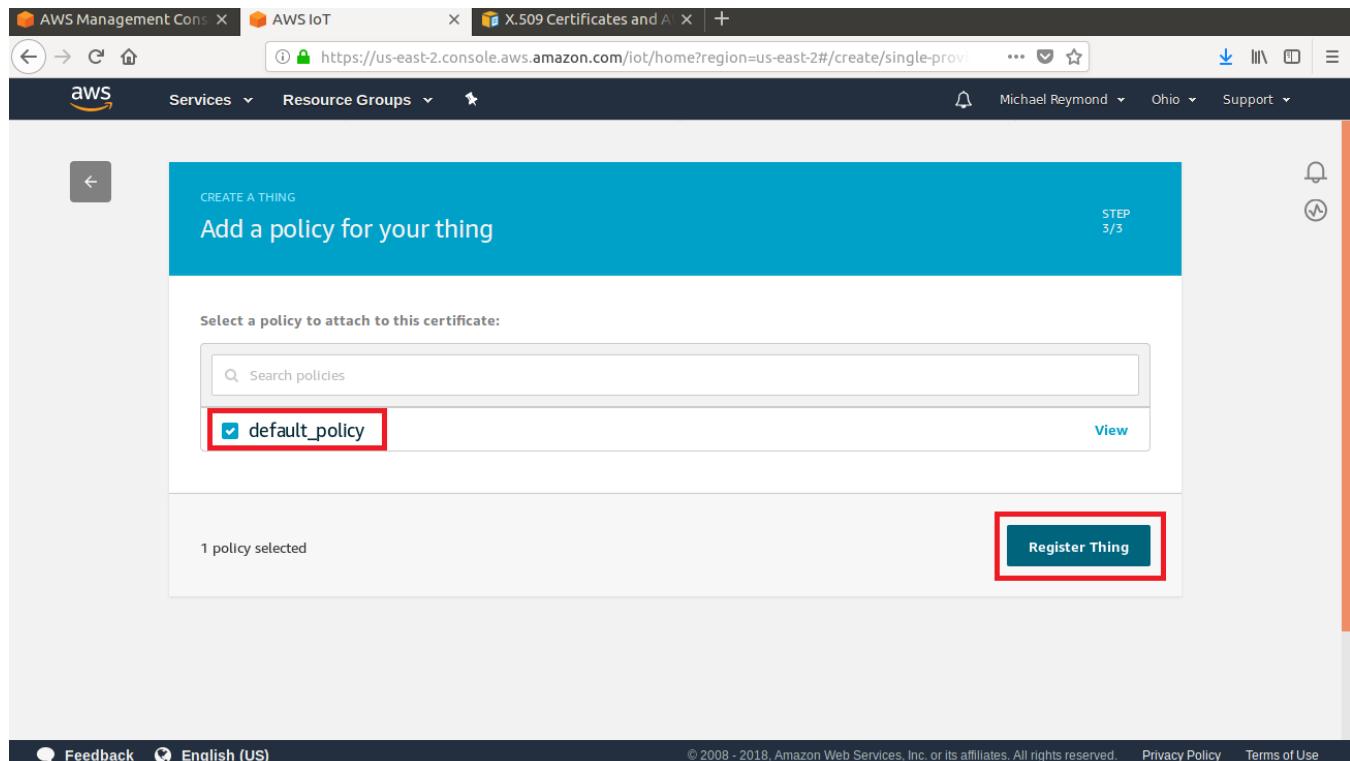

7. In the resulting screen (図 6), download the certificate file, the public and private key, as well as the root CA for AWS IoT (the Verisign Class 3 root CA certificate). Then, click on Activate, and then finally on "Attach a Policy".

図 6. Downloading the Thing and Root CA Certificates

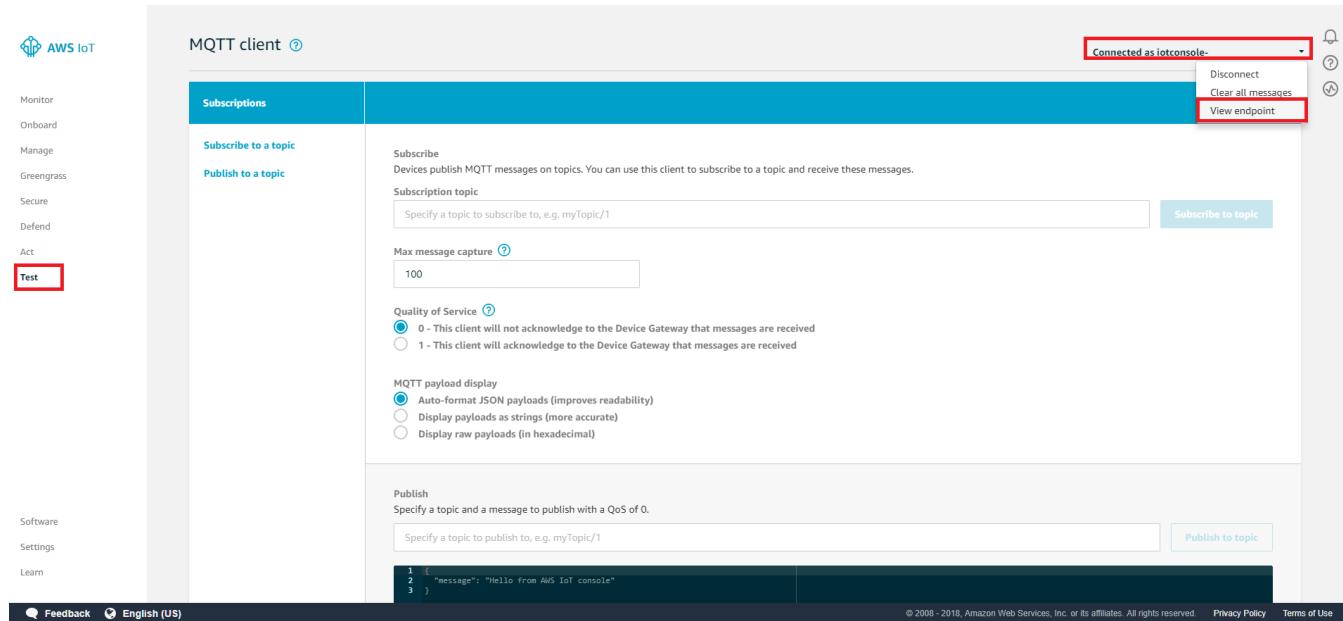

8. In the next screen (図 7), select the policy that you just created, and then click “Register Thing”. At this point, your thing should be fully setup on the cloud, ready for use a the thermostat thing on AWS IoT.

図 7. Attaching an AWS IoT Policy to the Thing

9. Before leaving AWS IoT, click on “Test”, then after your PC connects to AWS using the in-browser MQTT client (図 8), dismiss the green message box in the upper right. Then click on the “Connected as iotconsole-...” message, then on “view endpoint”. In the pane that pops up, copy the URL in the Endpoint text box, and note it for use later.

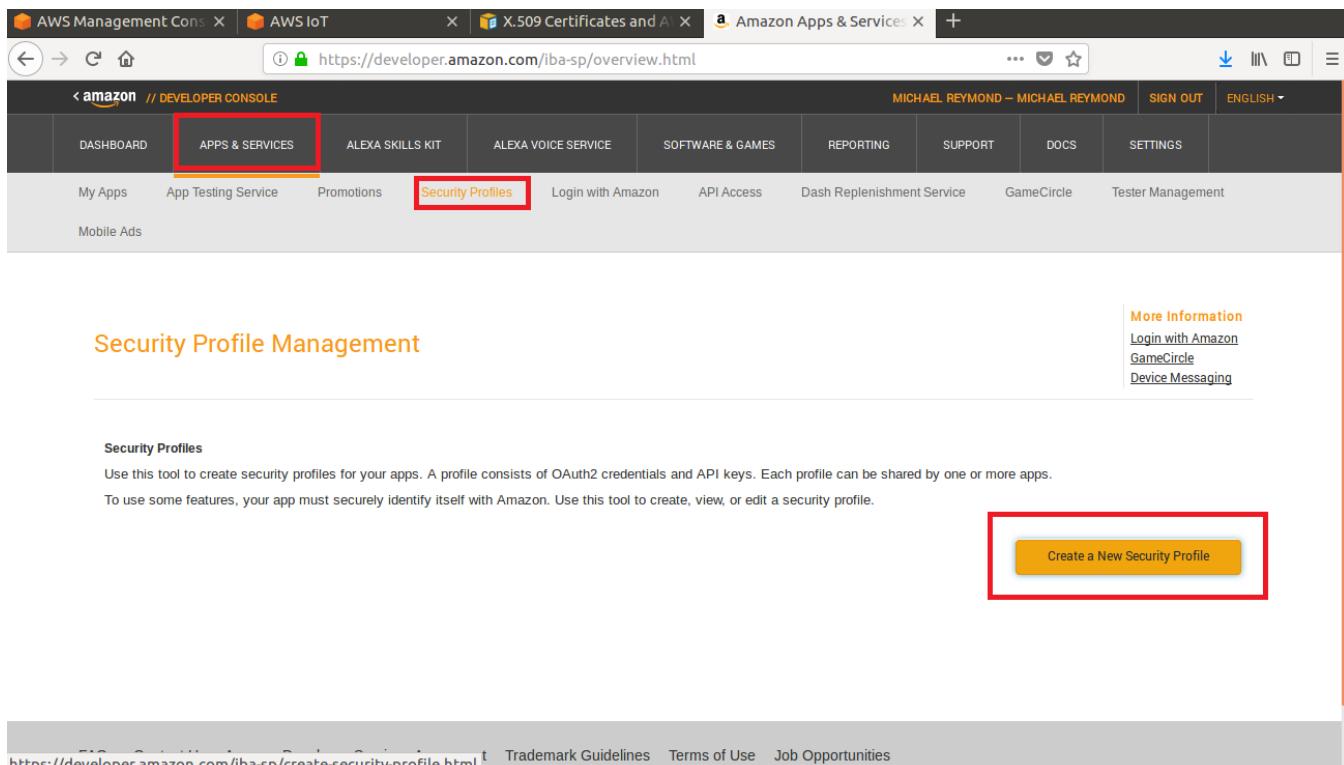

図 8. Accessing the Endpoint URL

3.2.2.2 Configuring Alexa Voice Services

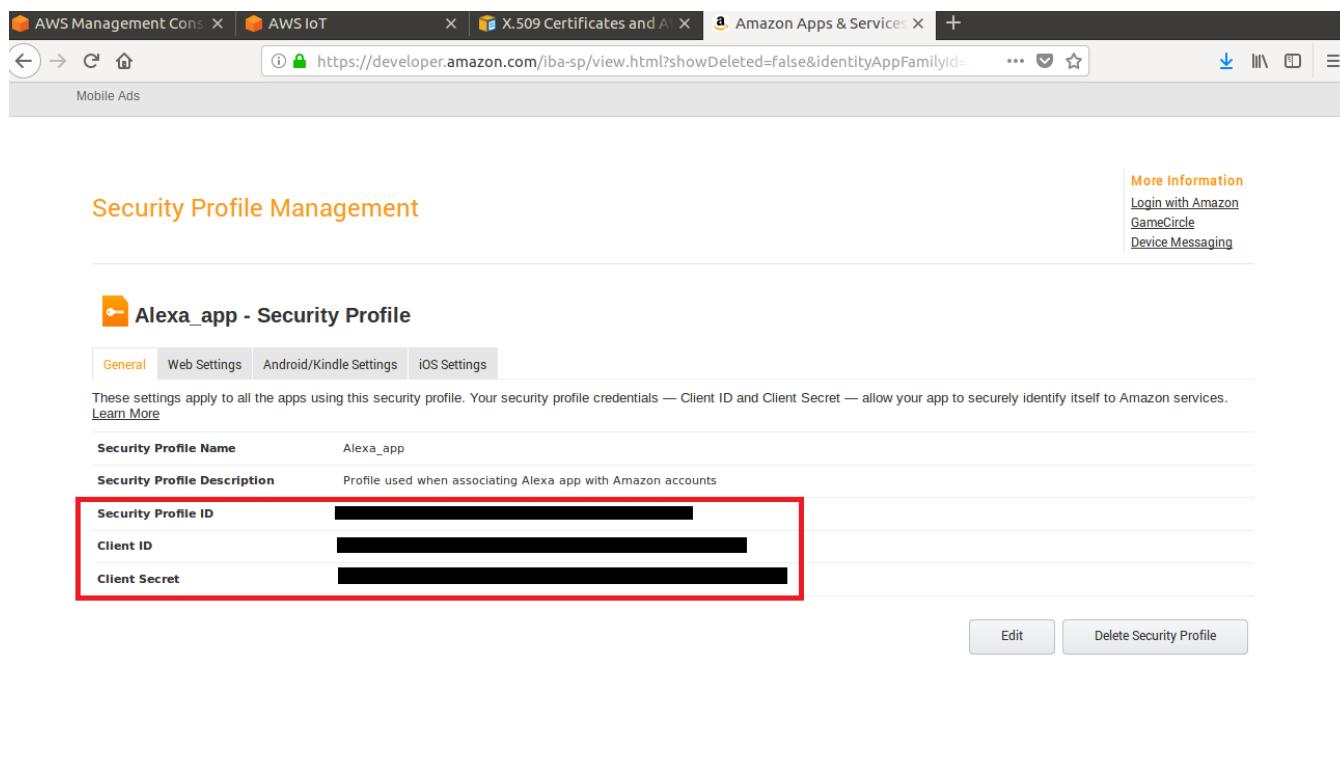

- First, navigate to developer.amazon.com. If you do not have an account yet, sign up for an account. Once you have logged in, click on "Developer Console" in the upper right.
- Next, navigate to the Security Profile menu by clicking on "APPS&SERVICES", then "Security Profiles". Before we can build and configure the Alexa skill, we need to first setup a security profile for your skill, so that the skill will be able to associate your Amazon account info when invoked. To do this, begin by clicking on "Create a New Security Profile" as shown in [図 9](#).

[図 9. Accessing Amazon Security Profiles](#)

3. In the next screen type in a name and description for your new profile, then click on save.
4. After your security profile is created, copy down the security details, specifically the Security Profile ID, the Client ID, and the Client Secret, as shown in [图 10](#). This info will be needed later when creating the Alexa skill. Keep a browser tab on this screen, as we will need to come back and do some more editing as part of the Alexa skill setup.

[图 10. Security Profile Details](#)

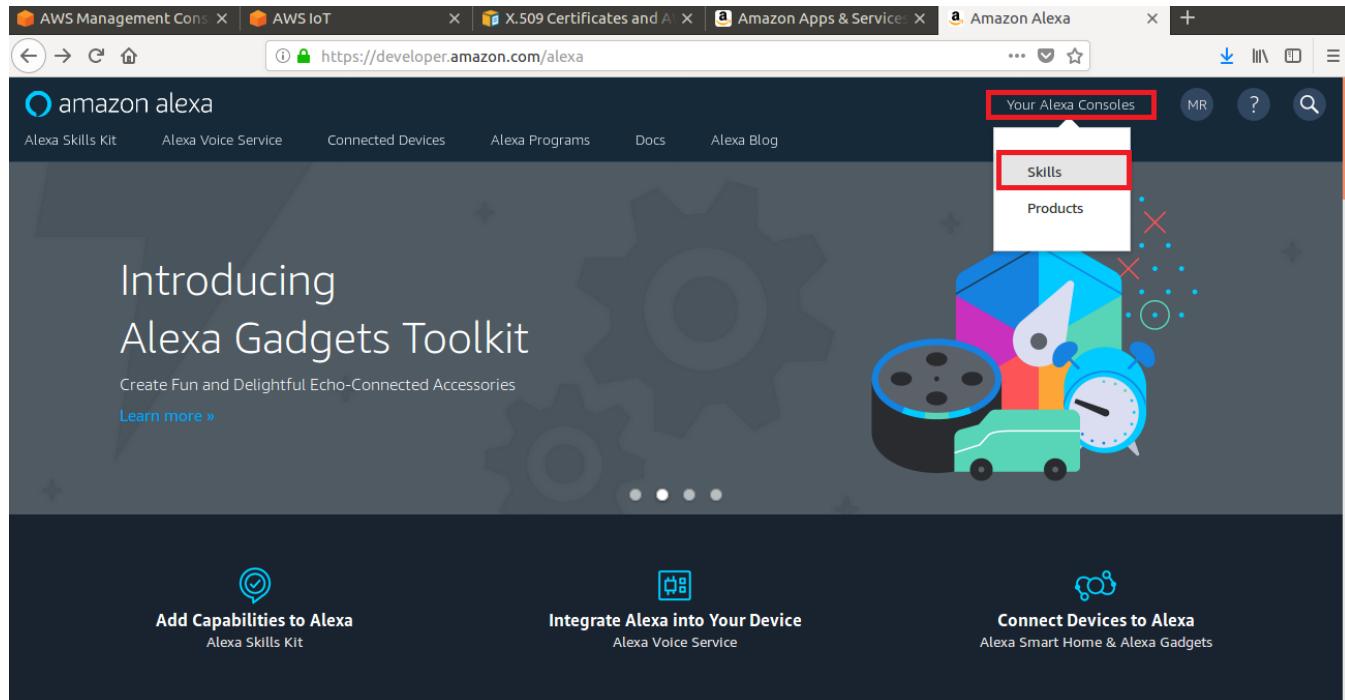

The screenshot shows the AWS Management Console with the URL <https://developer.amazon.com/iba-sp/view.html?showDeleted=false&identityAppFamilyId=...>. The page title is "Security Profile Management". On the right, there's a "More Information" section with links to "Login with Amazon", "GameCircle", and "Device Messaging". The main content area shows a security profile named "Alexa_app" with the following details:

Setting	Value
Security Profile Name	Alexa_app
Security Profile Description	Profile used when associating Alexa app with Amazon accounts
Security Profile ID	[REDACTED]
Client ID	[REDACTED]
Client Secret	[REDACTED]

At the bottom right are "Edit" and "Delete Security Profile" buttons.

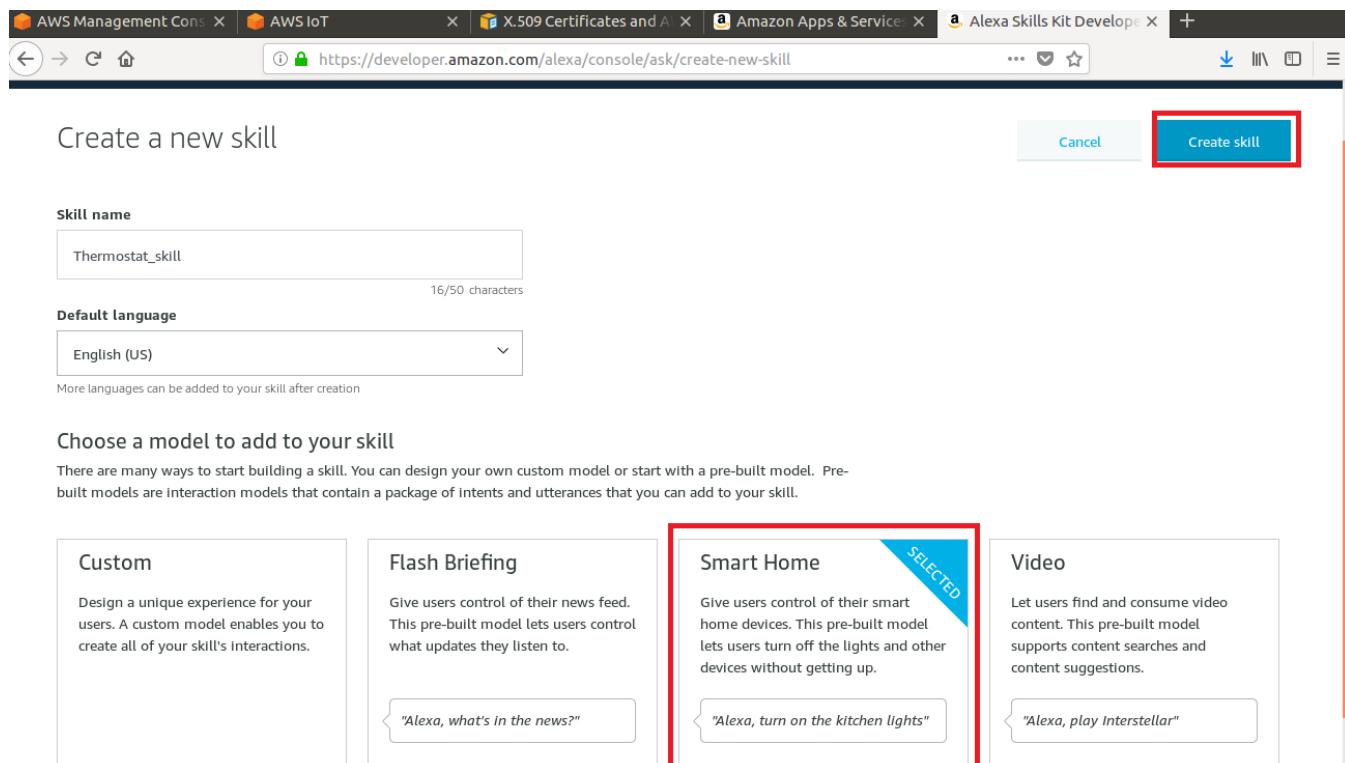

5. Go to [developer.amazon.com/alexा](https://developer.amazon.com/alexa). In the resulting screen (図 11), go to your Alexa console by hovering over “Your Alexa Consoles” in the upper right, then clicking on “Skills”.

図 11. Accessing the Alexa Developer Console

6. Next, click on “Create skill”. After that, type in a name for your skill, and be sure to select the “Smart Home” model before clicking “Create Skill” as shown in 図 12.

図 12. Creating the Alexa Skill

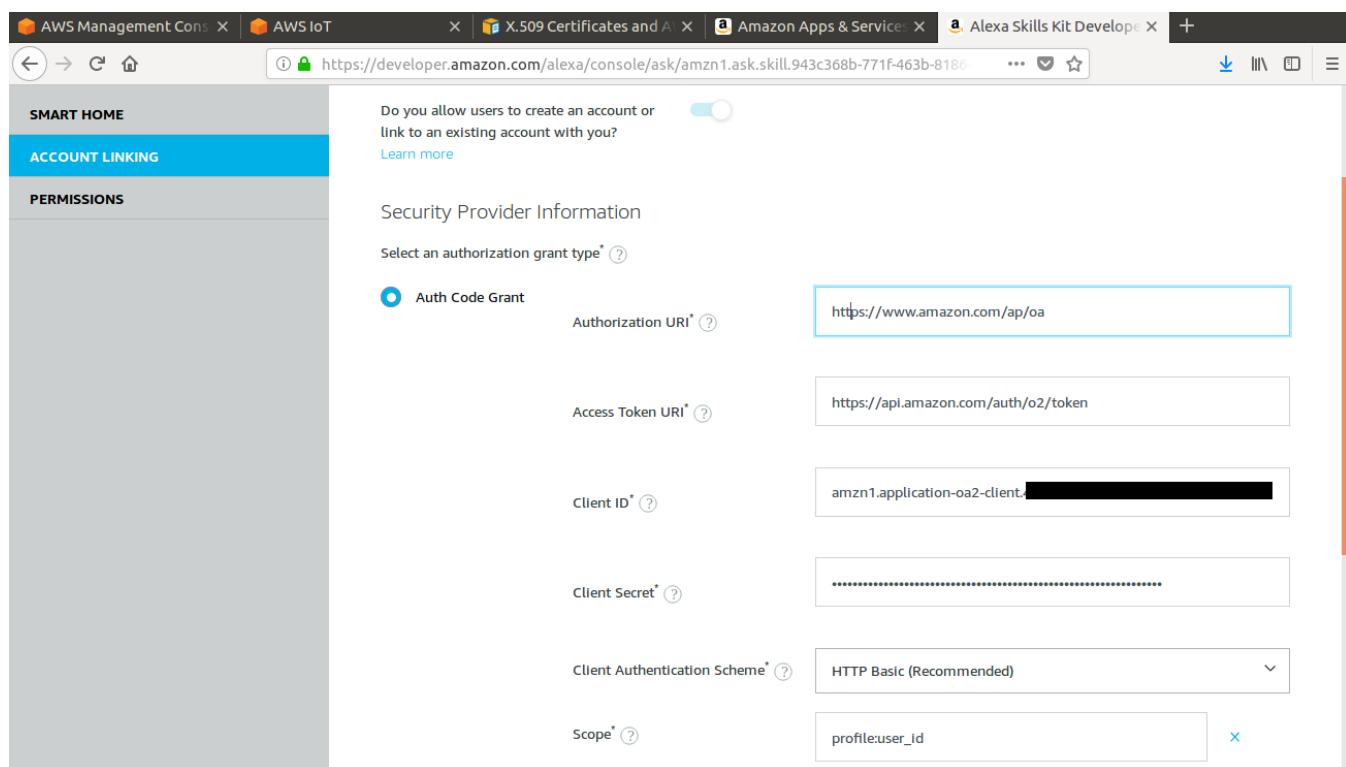

7. In the next screen (図 13), click on the “Account Linking” button on the left pane. This is where you configure your skill to connect to Amazon’s authentication service so that it can associate this skill with the correct Amazon account. Type in the following details:

- Authorization URI: <https://www.amazon.com/ap/oa>
- Access Token URI: <https://api.amazon.com/auth/o2/token>
- Client ID: <Client ID from step 4>
- Client Secret: <Client Secret from step 4>
- Scope: profile:user_id

Leave the rest of the fields as-is. Note that at the bottom of the form are a few redirect URLs. Copy these URLs down, as they will be needed to finish the configuration of the security profile. Then, click “Save” to confirm your account linking settings. Then, click on “Smart Home” on the left pane. You will see a configuration page with sections on Payload version, Smart Home service endpoint, and account linking (which has already been completed). Keep this tab open on this page, as we will need to link the AWS Lambda function to this skill later.

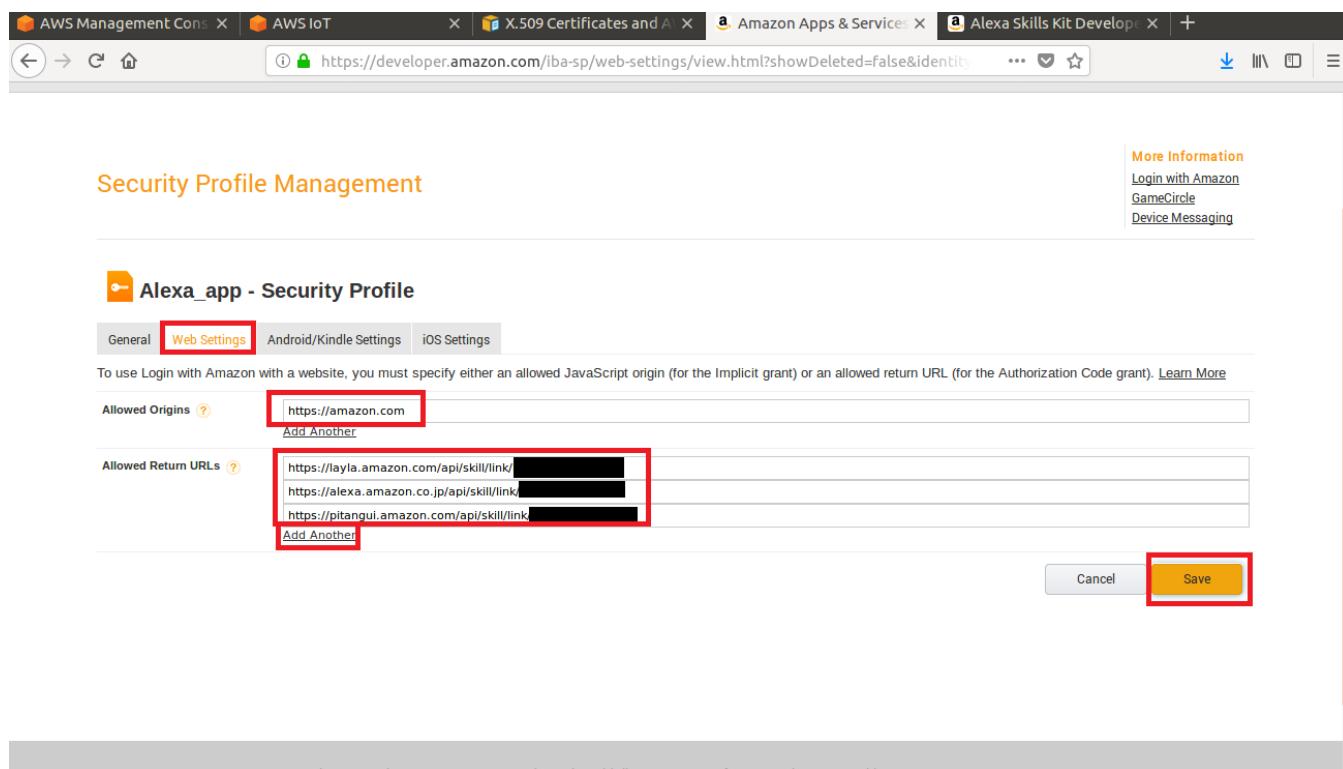

図 13. Filling the Account Linking Details

The screenshot shows the 'Account Linking' configuration page in the Alexa Skills Kit Developer console. The 'Auth Code Grant' grant type is selected. The 'Authorization URI' field contains 'https://www.amazon.com/ap/oa'. The 'Access Token URI' field contains 'https://api.amazon.com/auth/o2/token'. The 'Client ID' field contains 'amzn1.application-oa2-client-[REDACTED]'. The 'Client Secret' field contains '[REDACTED]'. The 'Scope' field contains 'profile:user_id'.

8. Go back to the tab with the security profile that you generated in [step 4 \(図 14\)](#). Click on the “Web Settings” tab, click on edit, then in “Allowed Origins” type in <https://amazon.com> and for the “Allowed Return URLs” paste in each redirect URL that you got in the previous step when setting up account linking for the Alexa Skill. Then click on Save.

図 14. Filling the Web Settings for the Security Profile

3.2.2.3 Configuring the AWS Lambda Function

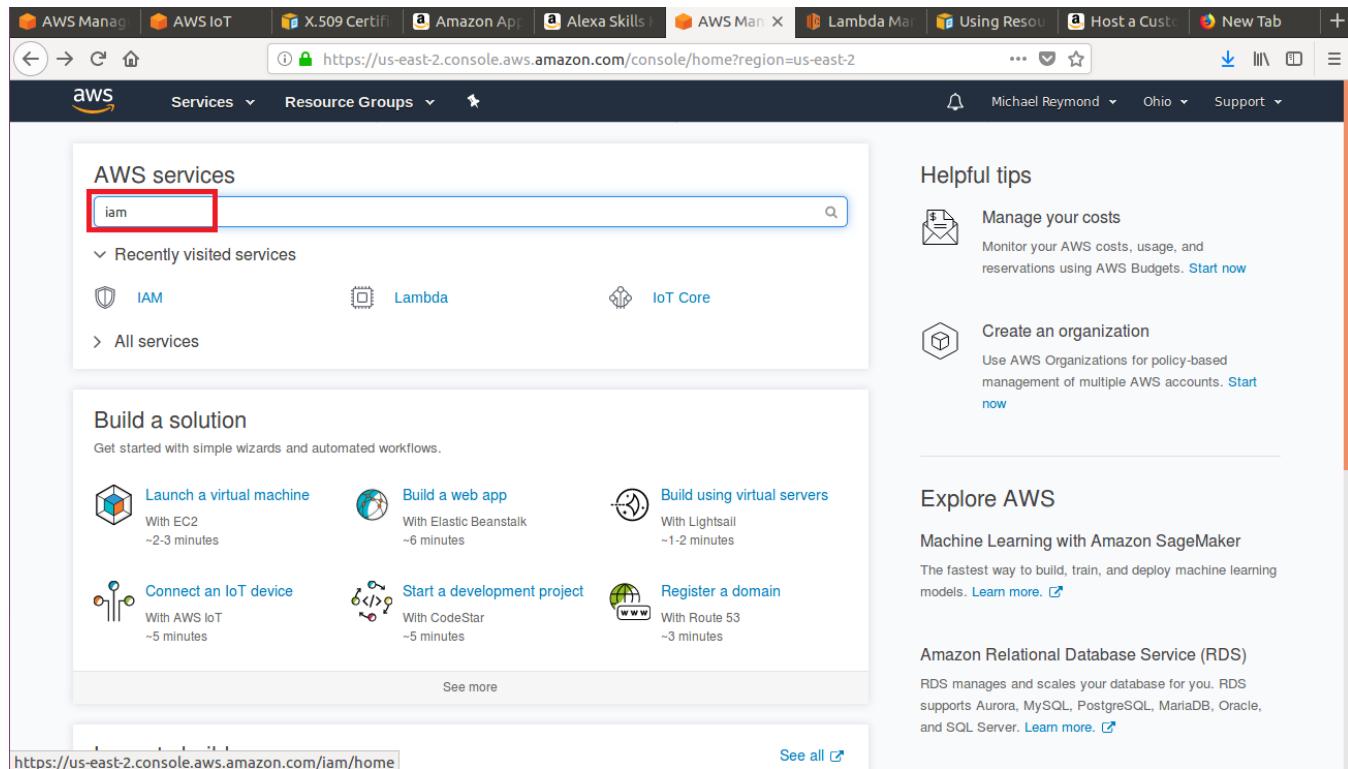

The steps in this section are largely adapted from Amazon's custom skill guide that can be found at:

<https://developer.amazon.com/docs/custom-skills/host-a-custom-skill-as-an-aws-lambda-function.html>

However, this walkthrough will show you how to interface the AWS IoT Thing to the Alexa Smart Home Skill created in the previous steps.

1. Go to console.aws.amazon.com. Then, type in "iam" in the search box (図 15) and click on the IAM service.

図 15. Accessing Amazon IAM

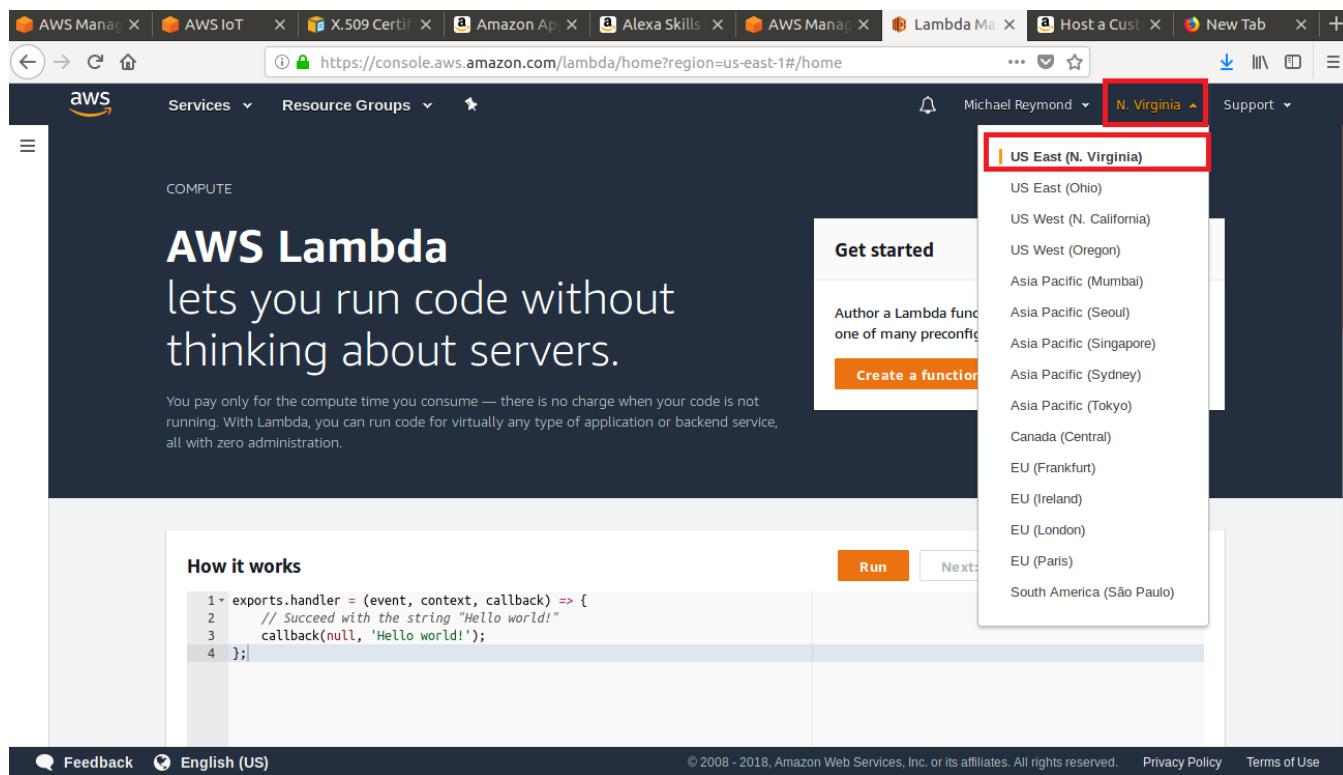

2. Ensure that the AWS region you are currently accessing corresponds to one of the regions that support Alexa Skill integration in AWS Lambda. The current list of supported regions are:

- Asia Pacific (Tokyo)
- EU (Ireland)
- US East (N. Virginia)
- US West (Oregon)

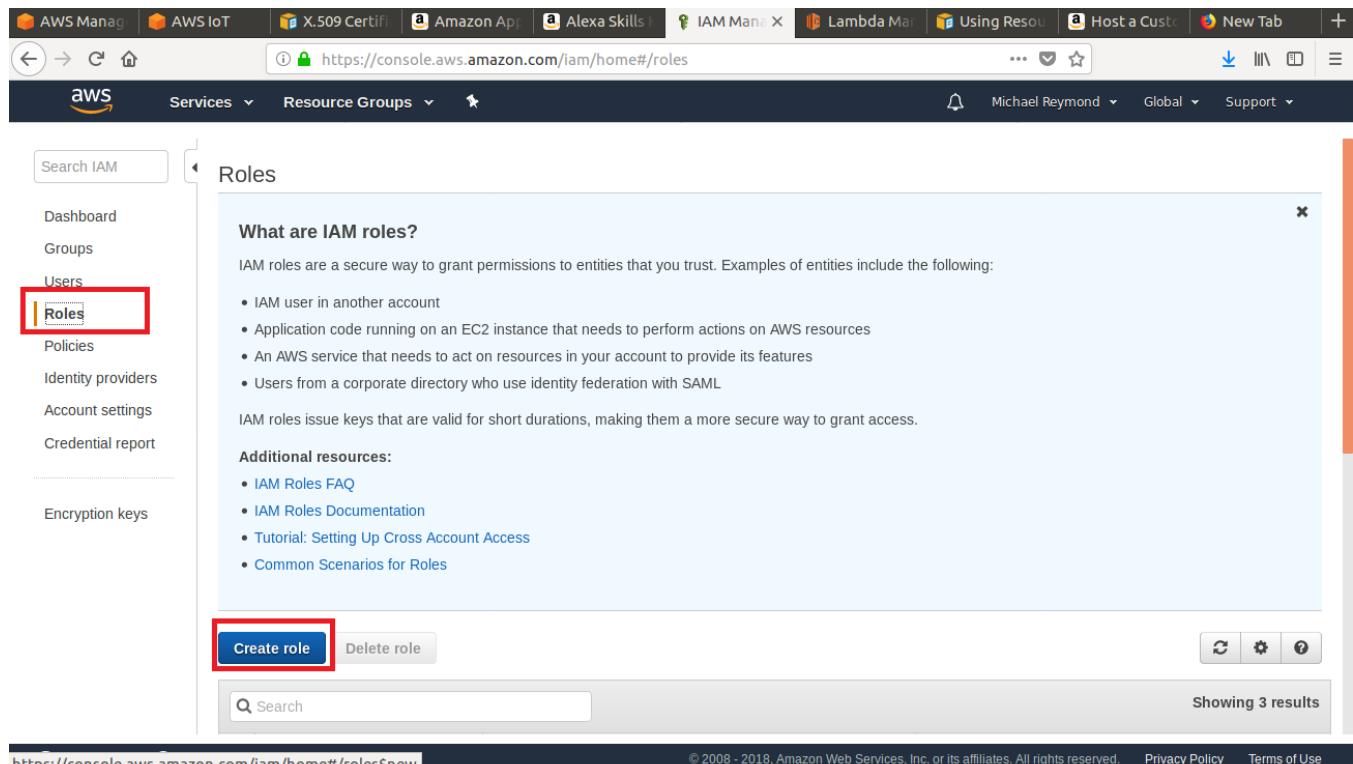

Your region is displayed in the upper right of the dashboard (図 16). If your account is not set to one of the supported regions, you must change to one of the supported region by clicking on your current region, then selecting one of the regions above in the drop-down menu.

図 16. Selecting an AWS Region

3. Then, click on “Roles” in the left pane (図 17), and then click on “Create Role”.

図 17. Creating an IAM Role

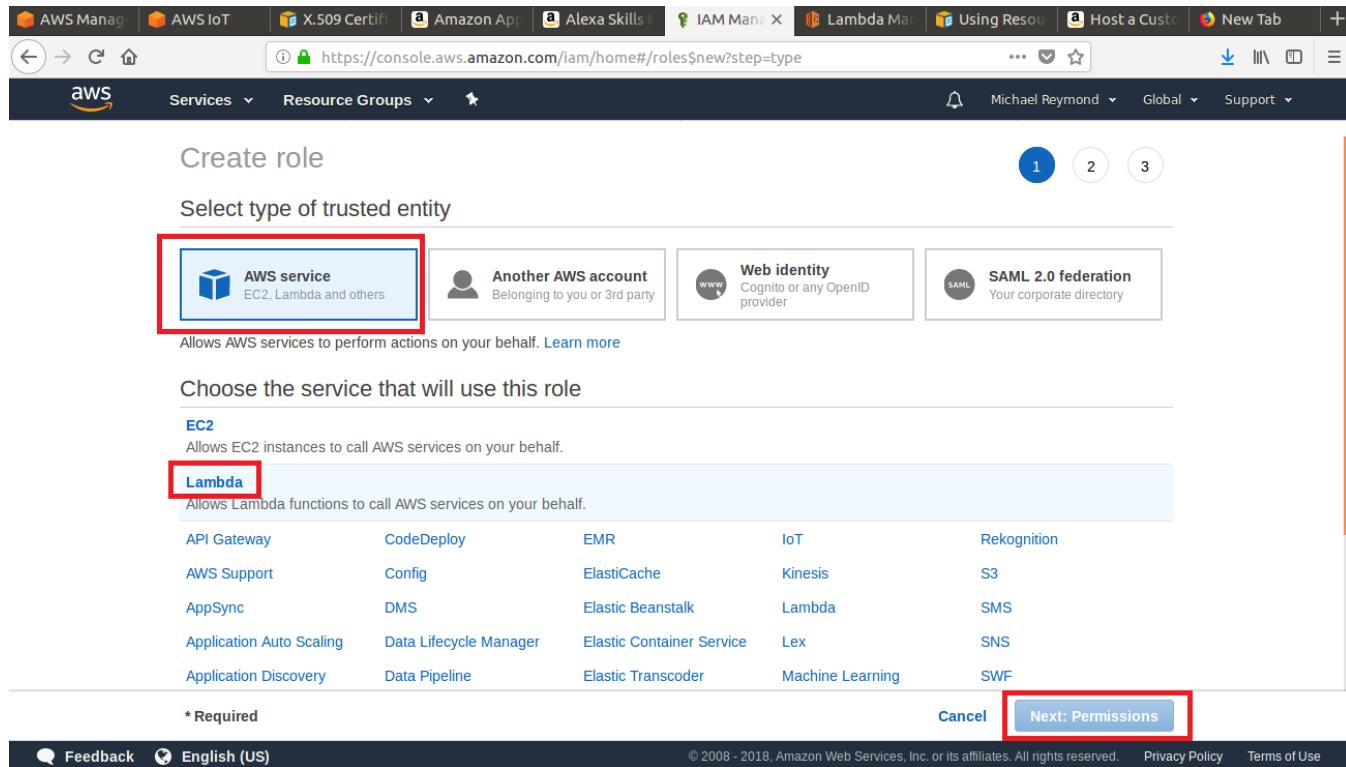

The screenshot shows the AWS IAM Roles page. On the left sidebar, the 'Roles' option is selected and highlighted with a red box. At the bottom of the page, the 'Create role' button is also highlighted with a red box. The main content area contains information about IAM roles and a list of results, with a search bar at the bottom.

[https://console.aws.amazon.com/iam/home#/roles\\$new](https://console.aws.amazon.com/iam/home#/roles$new)

4. In the next menu (図 18), select “AWS service” as the type of trusted entity, then select “Lambda” and click on the Next:Permissions button.

図 18. Selecting AWS Service as a Trusted Entity

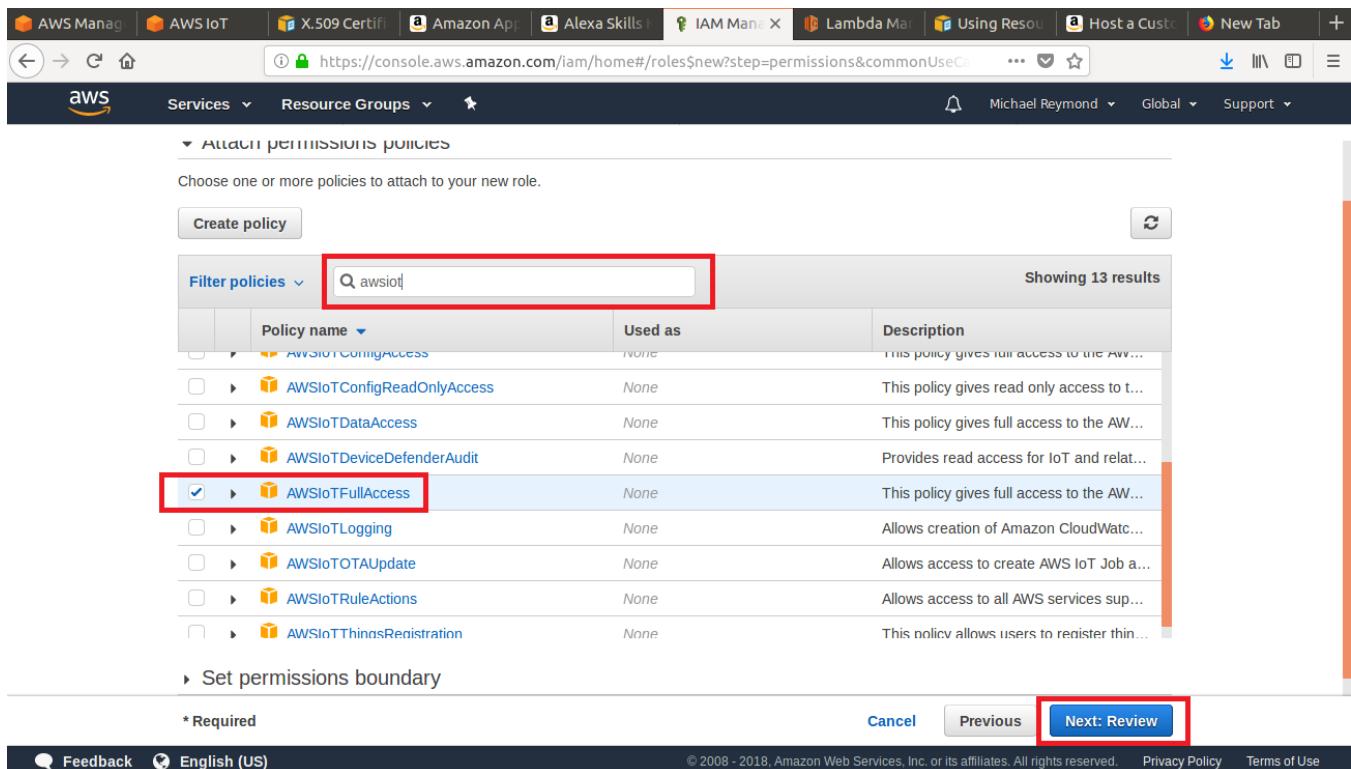

5. Next, you will need to add the correct permissions to your IAM role (図 19). The policies that are needed are the following:

- AWSIoTFullAccess
- CloudWatchFullAccess
- CloudWatchLogsFullAccess

To add policies, enter the policy names into the search box, and then tick the policy in the resulting policy list to add it to the role.

図 19. Assigning Policies to the IAM Role

	Policy name	Used as	Description
<input type="checkbox"/>	AWSIoTCertifyAccess	None	This policy gives full access to the AW...
<input type="checkbox"/>	AWSIoTConfigReadOnlyAccess	None	This policy gives read only access to t...
<input type="checkbox"/>	AWSIoTDataAccess	None	This policy gives full access to the AW...

<input type="checkbox"/>	AWSIoTLogging	None	Allows creation of Amazon CloudWatc...
<input type="checkbox"/>	AWSIoTOTAUUpdate	None	Allows access to create AWS IoT Job a...
<input type="checkbox"/>	AWSIoTRuleActions	None	Allows access to all AWS services sup...
<input type="checkbox"/>	AWSIoTThinnsRegistration	None	This policy allows users to register thin...

6. Once all of the needed policies have been added, click on “Next:Review” in the lower right to continue. Double-check to see that the needed policies have been added, and then type in a name for your role and click “Create role”.

7. Go to console.aws.amazon.com. Then, type in “lambda” in the search box (図 20) and click on the Lambda service to access the Lambda dashboard.

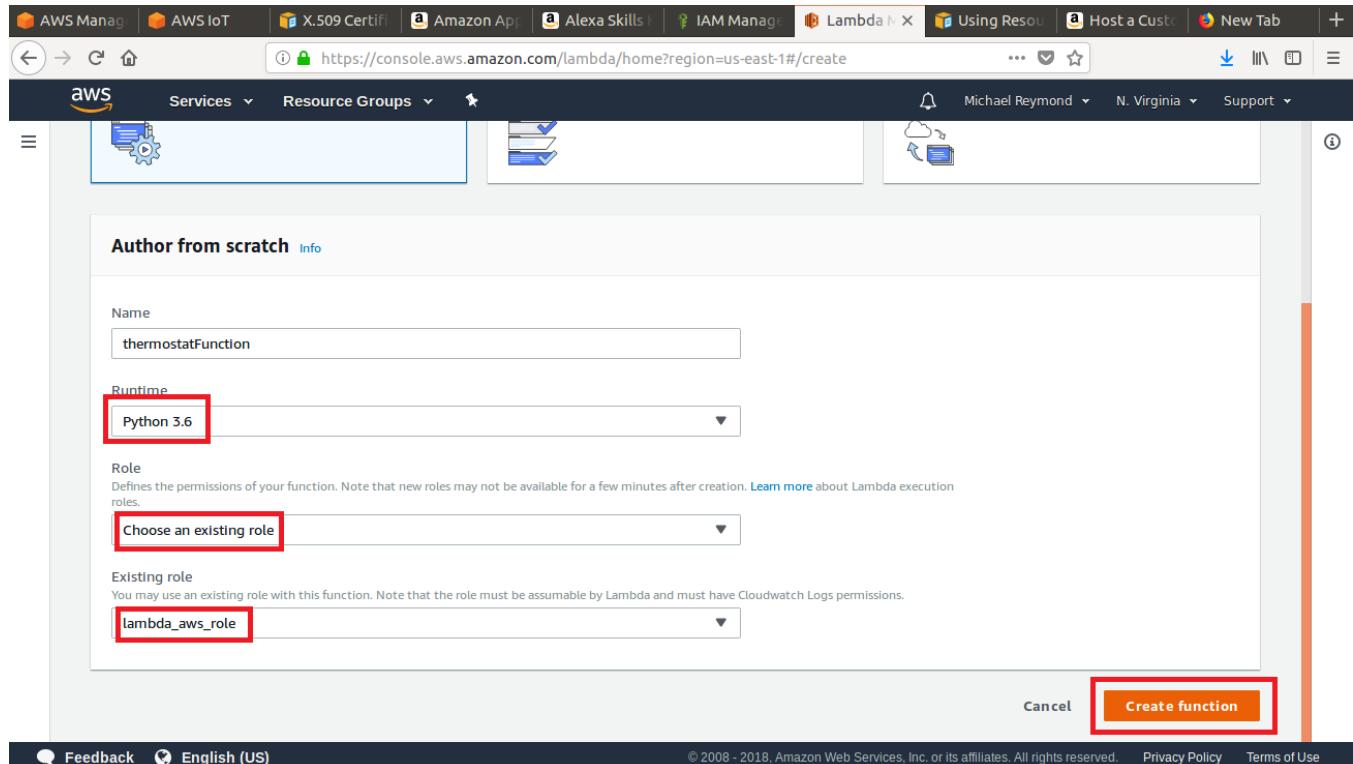

図 20. Accessing AWS Lambda

8. Next, click on “Create function”. In the following prompts (図 21), select “Author from scratch”, and then input the following for the data fields:

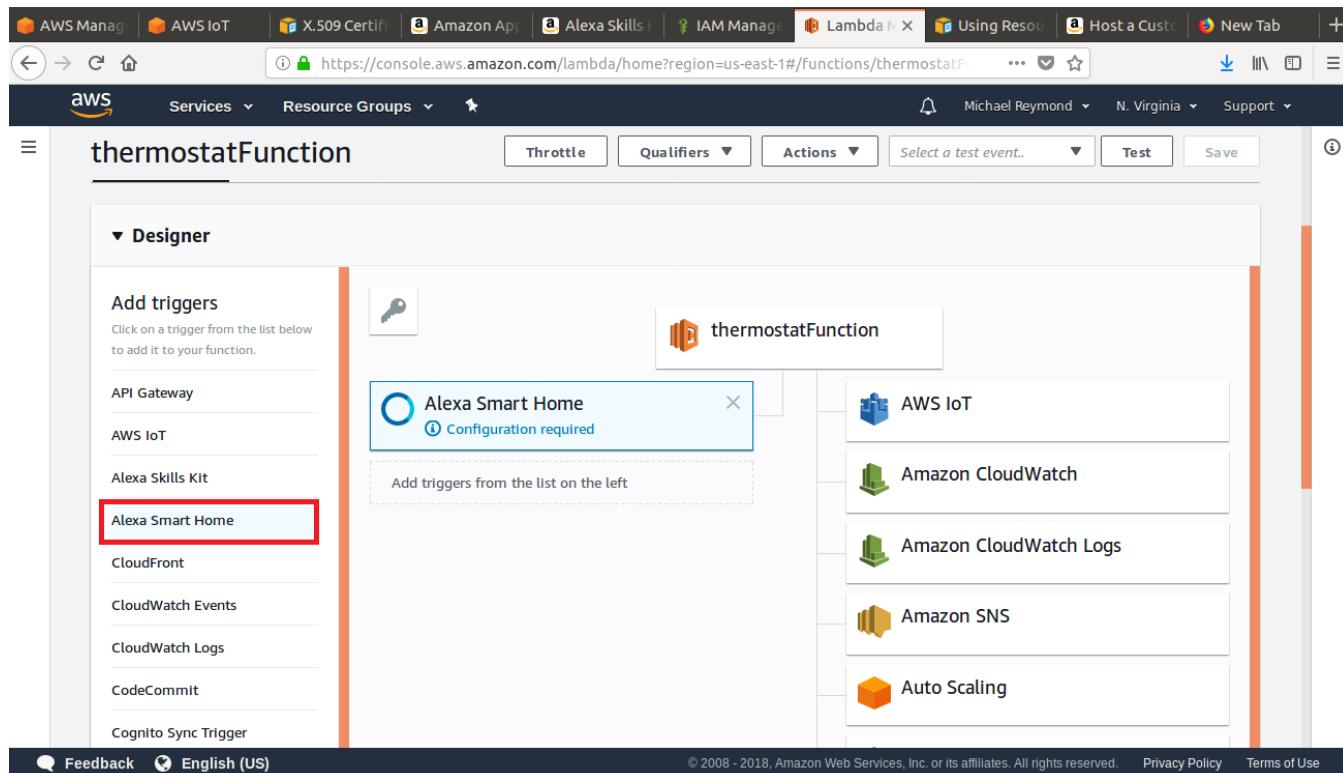

- Name: <your choice>
- Runtime: Python 3.6
- Role: Choose an existing role
- Role name: <the role you made in step 5>

図 21. Creating the AWS Lambda Function

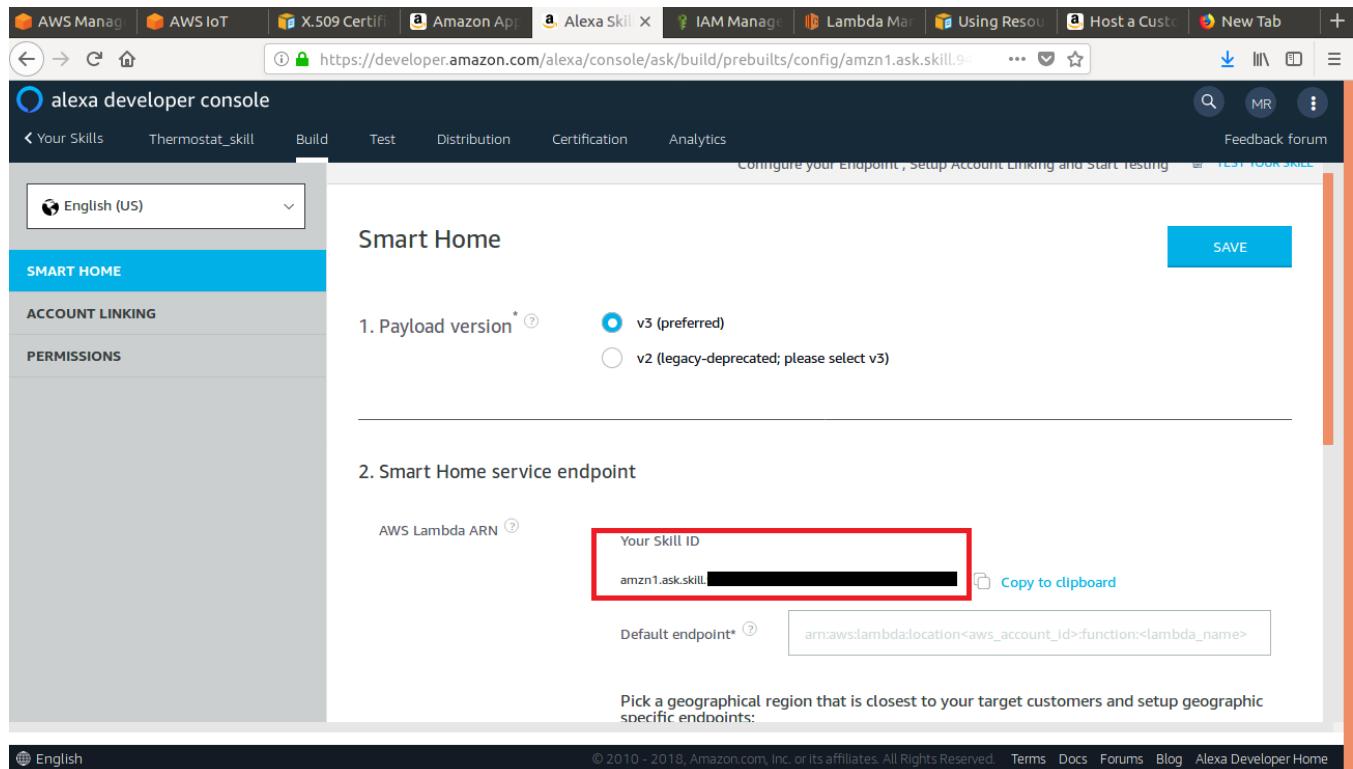

9. After creating the Lambda function, you will be brought to the function's configuration page (図 22). We will need to first add the Alexa integration. To do this, click on "Alexa Smart Home" on the left pane to add it to the function as a trigger.

図 22. Adding Alexa Home Integration to Lambda Function

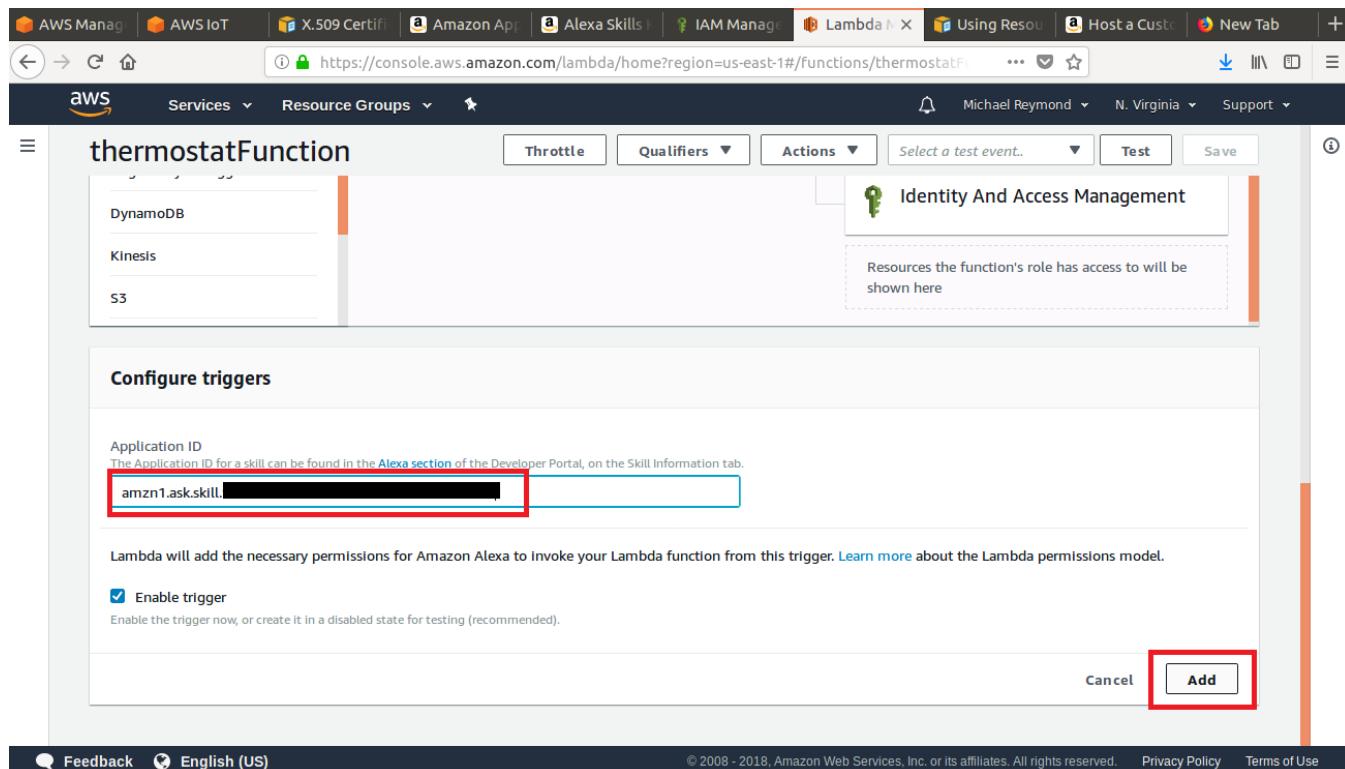

10. The Configure triggers menu for the Alexa Smart Home trigger will appear automatically, with the “Application ID” field blank. In the Alexa Smart Home skill configuration page that was accessed in [Section 3.2.2.2, step 7](#), copy the skill ID ([図 23](#)).

図 23. Copying the Skill ID

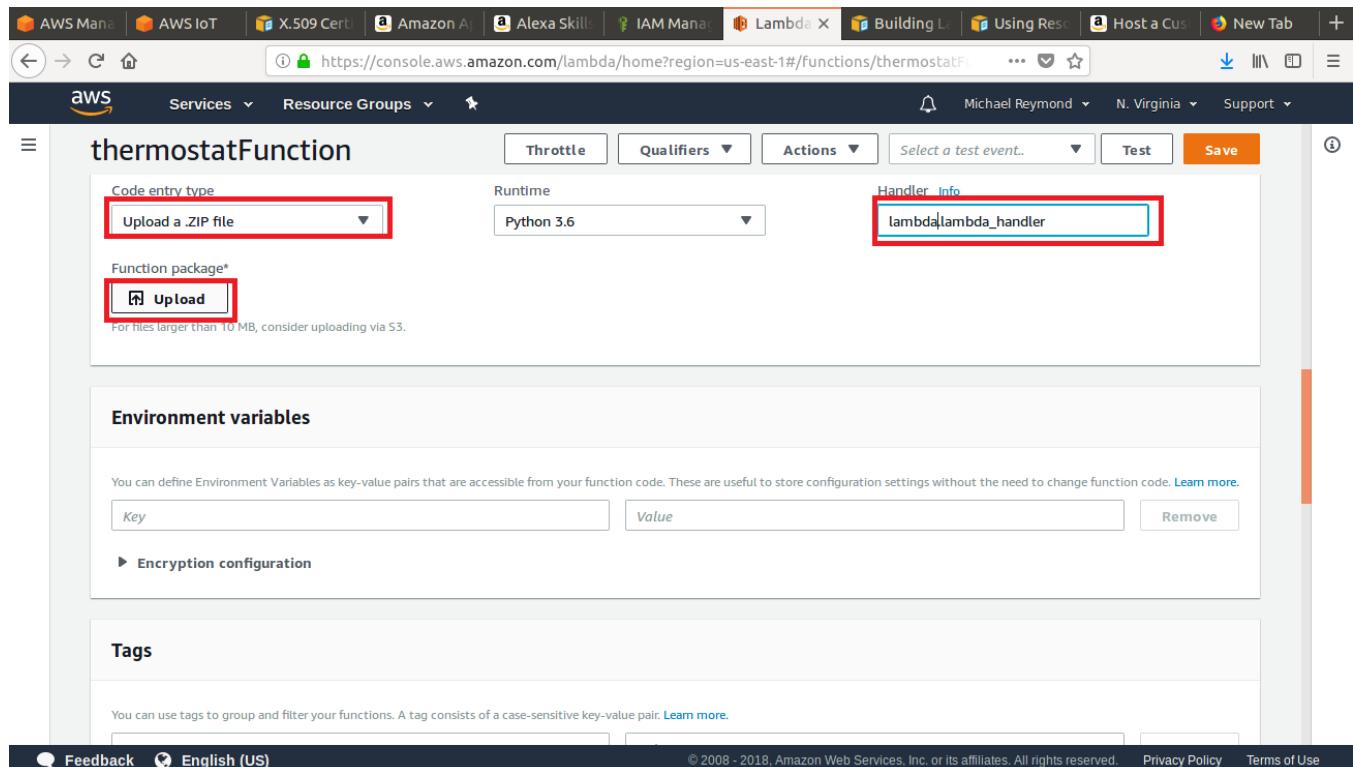

11. Then, paste the skill ID into the Application ID field in the Lambda configuration ([図 24](#)). Click on “Add” to finish configuring the trigger.

図 24. Pasting the Skill ID into Lambda Function

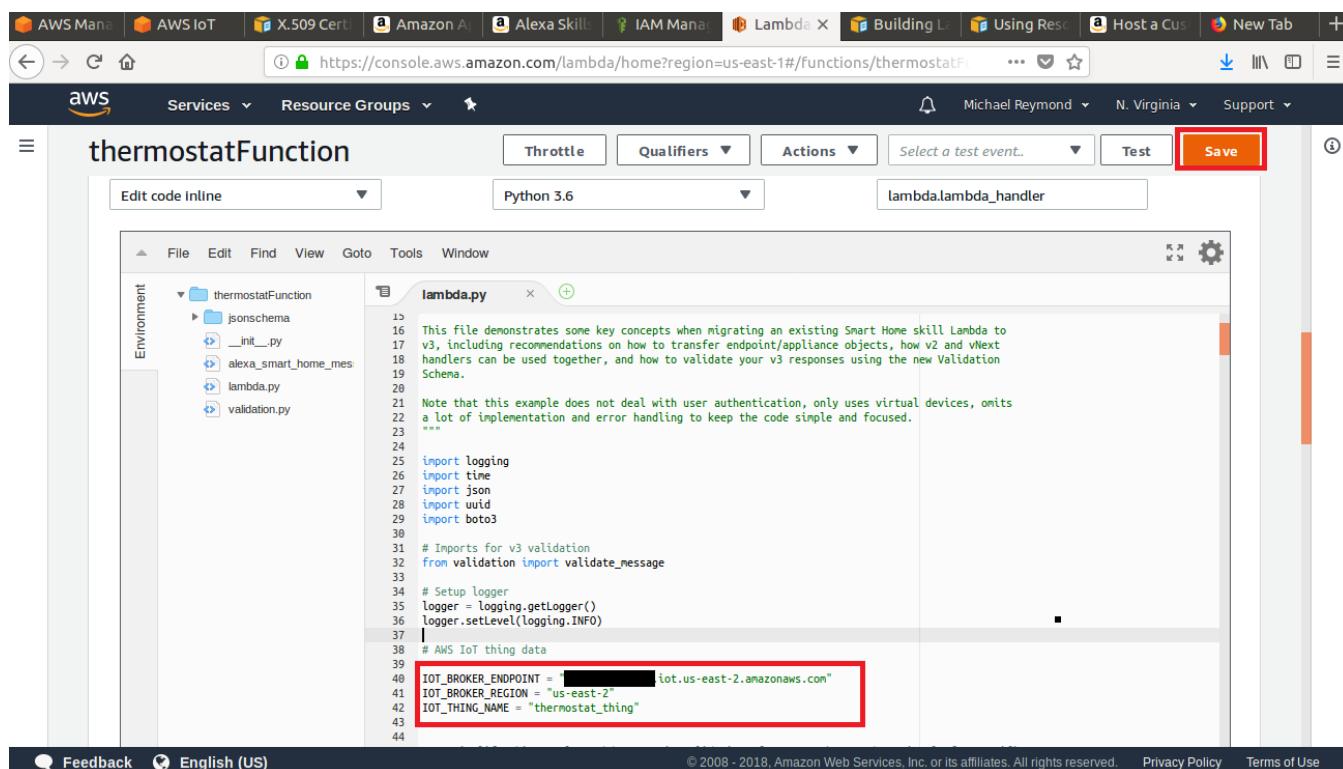

12. Next, we need to configure what the function actually does once it is invoked by the Alexa Smart Home skill. Click on the main Lambda function block labeled with the name of your function (図 25), and you should see the full function configuration appear below. In the Function code section, change the Handler to “lambda.lambda_handler”. Then, click on the Code entry type drop-down menu, and select “Upload a .ZIP file”. Navigate to the thermostatControl.zip file provided in the code distribution, then click on the Save button on the upper right. This should upload the zip file to AWS Lambda and extract it as for code execution.

図 25. Uploading the Lambda Code

13. Once the code is done uploading, open lambda.py in the editor (図 26). In order for the skill to properly link to the AWS thing created, you will need to modify some AWS IoT defines. They are IOT_BROKER_ENDPOINT, IOT_BROKER_REGION, and IOT_THING_NAME. The endpoint URL is the URL obtained from the AWS IoT test console in [Section 3.2.2.1, step 9](#). The IOT_BROKER_REGION is a string describing the region that was used when creating the thermostat thing and can be copied from the broker endpoint URL. Specifically, broker endpoints are formatted as "xxxxx.iot.<region string>.amazonaws.com", and the <region string> part of the URL should be copied directly into IOT_BROKER_REGION. Finally, IOT_THING_NAME should be the name of the thing that was created in [3.2.2.1](#). Once the necessary changes are made, click on "Save" in the upper right.

図 26. Editing the IoT Details

14. Finally, copy the ARN of the Lambda function displayed on the upper right (图 27), above the “Save” button, and paste that into the “Default endpoint” section of the Alexa Smart Home service endpoint configuration (图 28). Then click “Save” on the Smart Home configuration.

图 27. Copying the ARN from Lambda

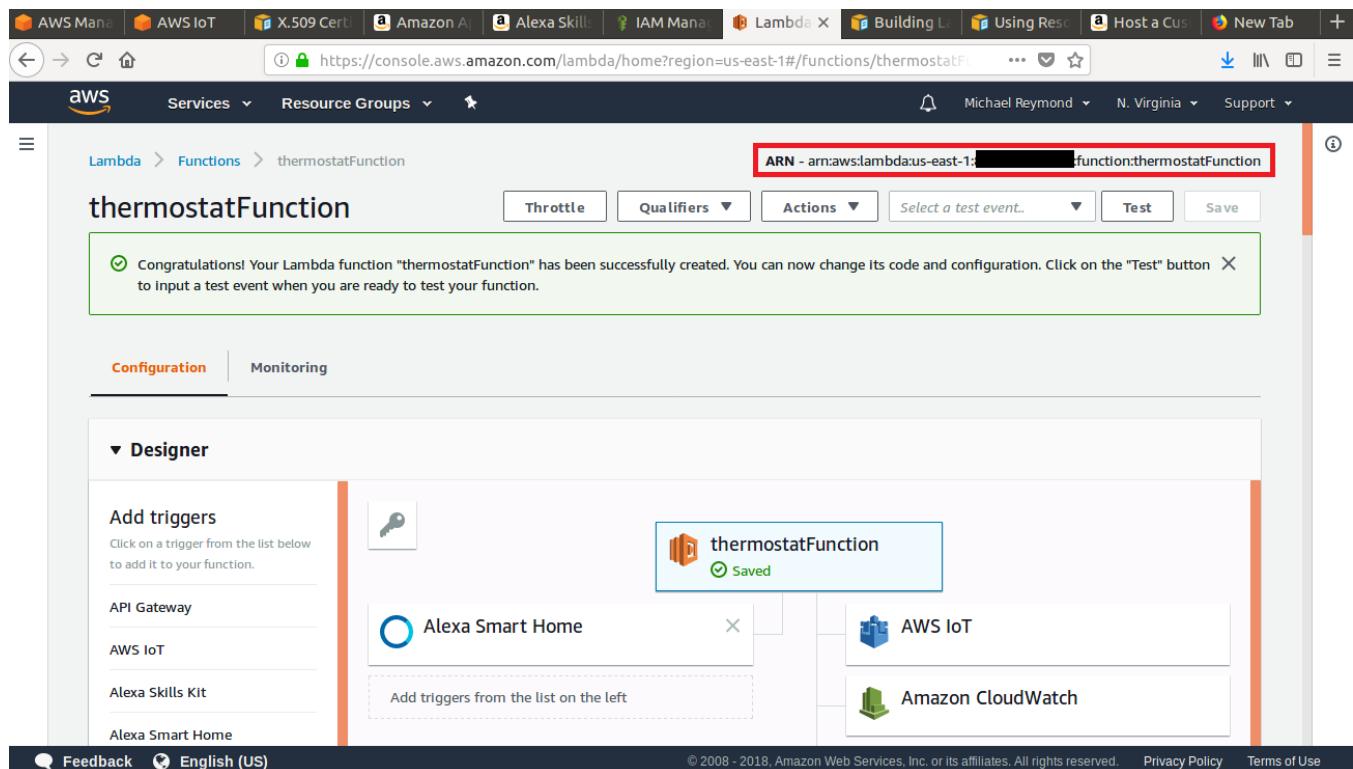

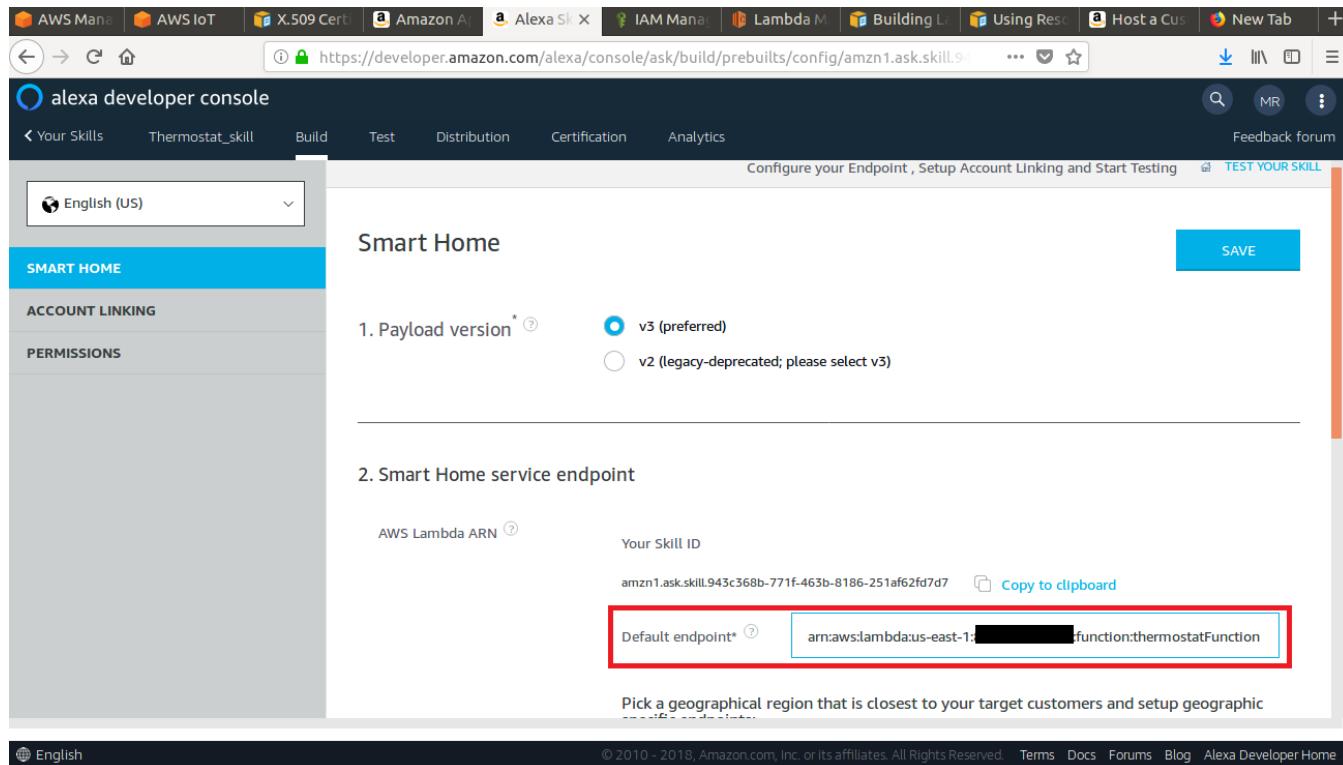

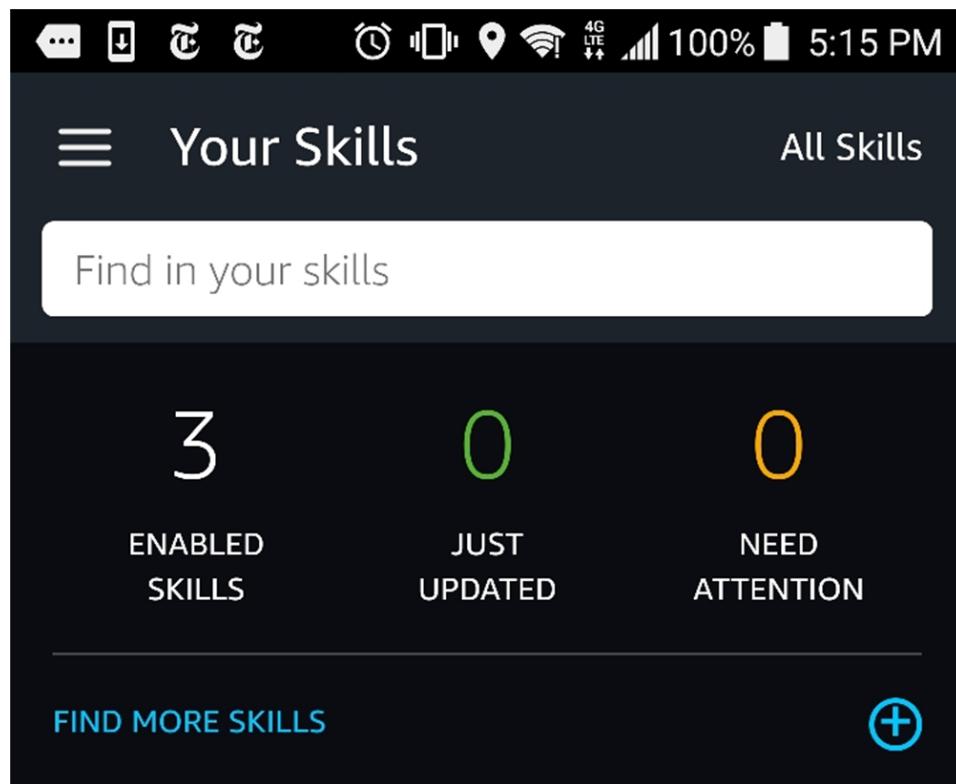

図 28. Pasting the ARN into Alexa

15. At this point, the cloud side Alexa Smart Home skill setup is complete. However, we still need to enable the skill for your Amazon account. This will require you to download the Amazon Alexa app from the appstore/play store. Download the Alexa app from your platform's store.
 16. Once you have downloaded the Alexa app, open it and sign in with your Amazon developer account. Then, open the menu, and tap on "Skills & Games" to access the skills store. At the store (图 29), click on the "Your skills" link in the upper right, then tap on "Dev Skill" in the center. You should see your thermostat skill that you created here. Tap on that to select it, and then hit "Enable".
 17. You will be redirected to an Amazon authentication page, login with the same account you have been using in Amazon Developer and provide its password. You should see a successfully linked message, similar to the one in 图 30, if you have setup the account linking of your skill correctly. Close the page by pressing on the x in the upper left. And tap on discover device in the prompt that appears. Alexa should discover the thermostat you have setup, if the Lambda skill has been configured correctly. With account linking and device discovery complete, the skill has been enabled and you can speak directly into the app to invoke your skill as you would any Alexa request.

図 29. Selecting the Alexa Smart Home Skill

RECENTLY ADDED ALL SKILLS DEV SKILL

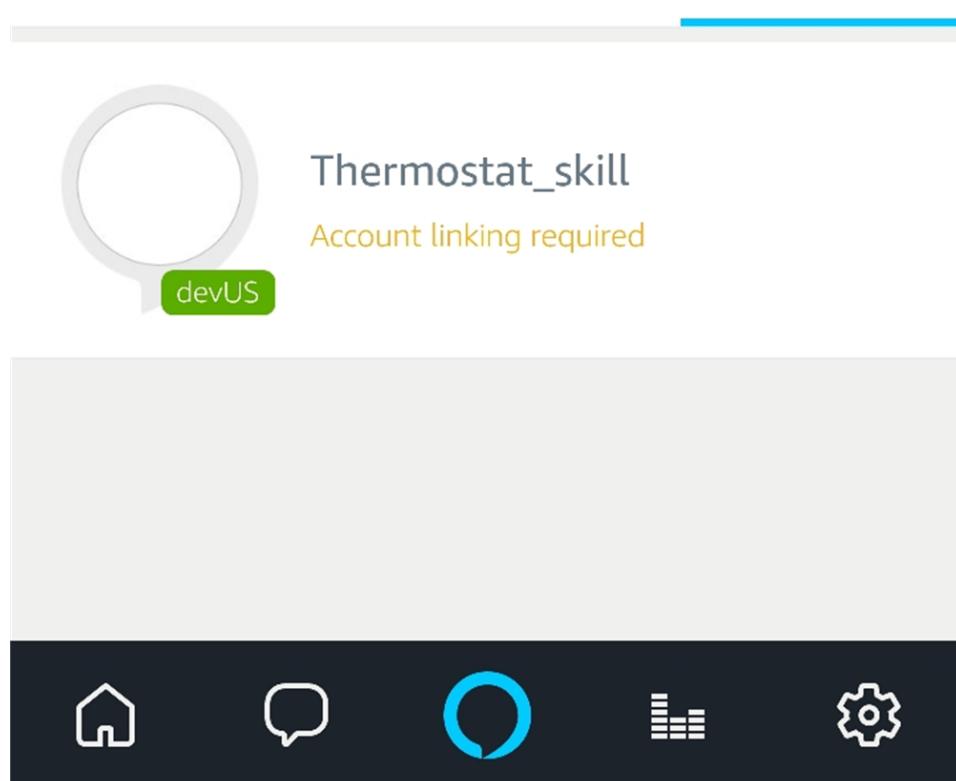

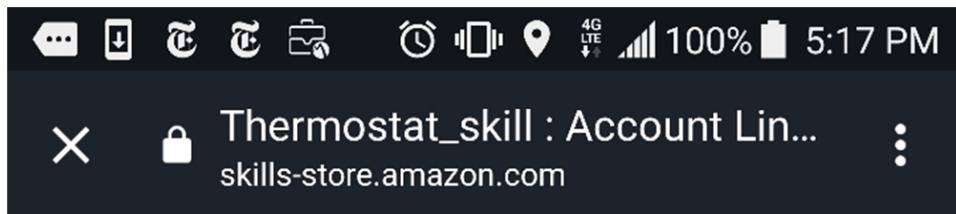

図 30. Successful Account Linking Result Screen

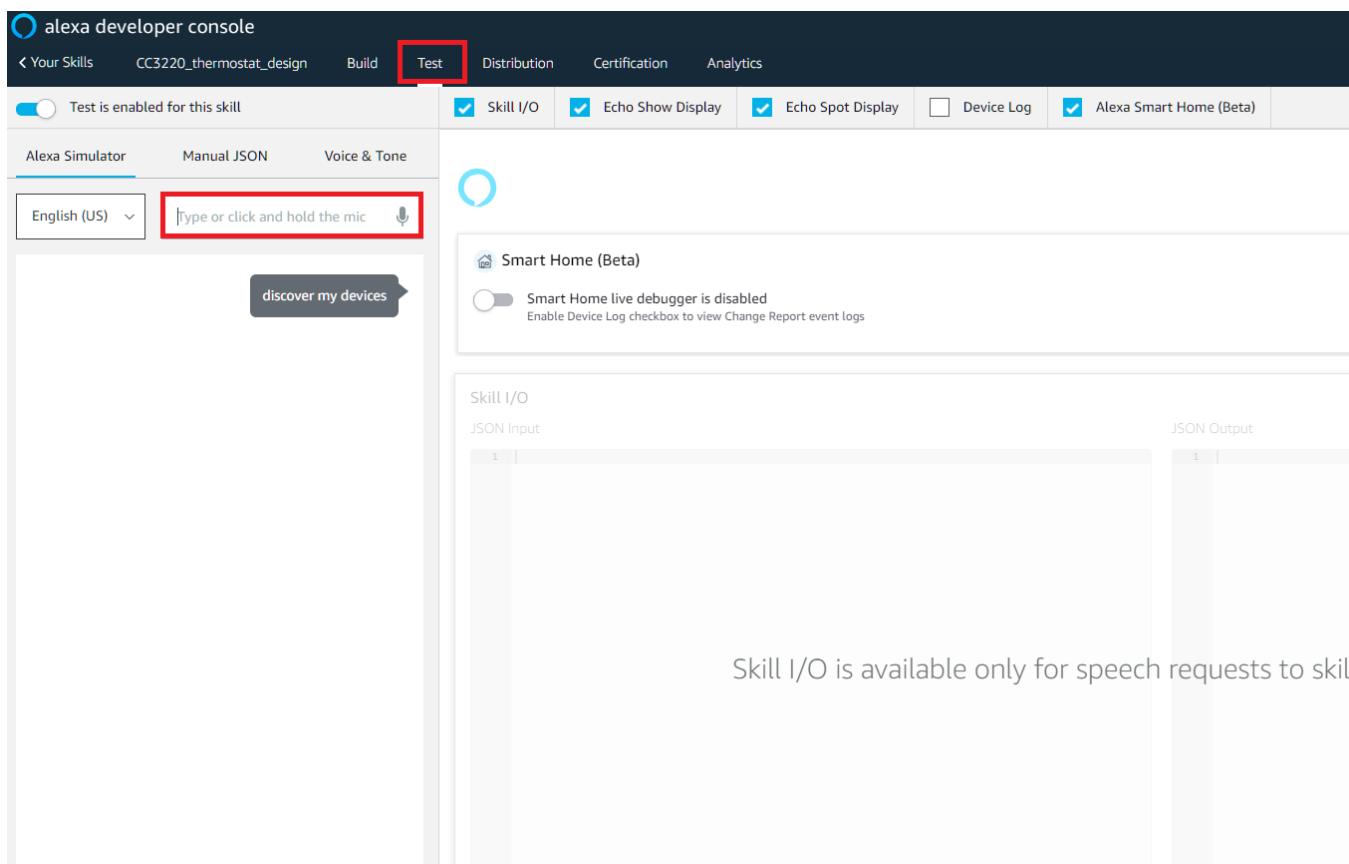

Thermostat_skill has been
successfully linked.

What to do next:

- Close this window to discover smart-home devices you can control with Alexa.

18. If device discovery fails in the app, try performing discovery through the Alexa test console. To access the console, go to the configuration page of your Alexa skill. This is the page that you had open in [Section 3.2.2.2, step 7](#). Next, click on 'Test' in the upper menu bar ([図 31](#)). You should see a console-like screen. This console can be used to test any Alexa interaction, including the thermostat skill that we just created. To initiate device discovery, type in "discover my devices" and then press Enter. You should have the thermostat device appear in your Alexa app linked to your account within a minute.

図 31. Discovering Devices Using the Alexa Developer Console

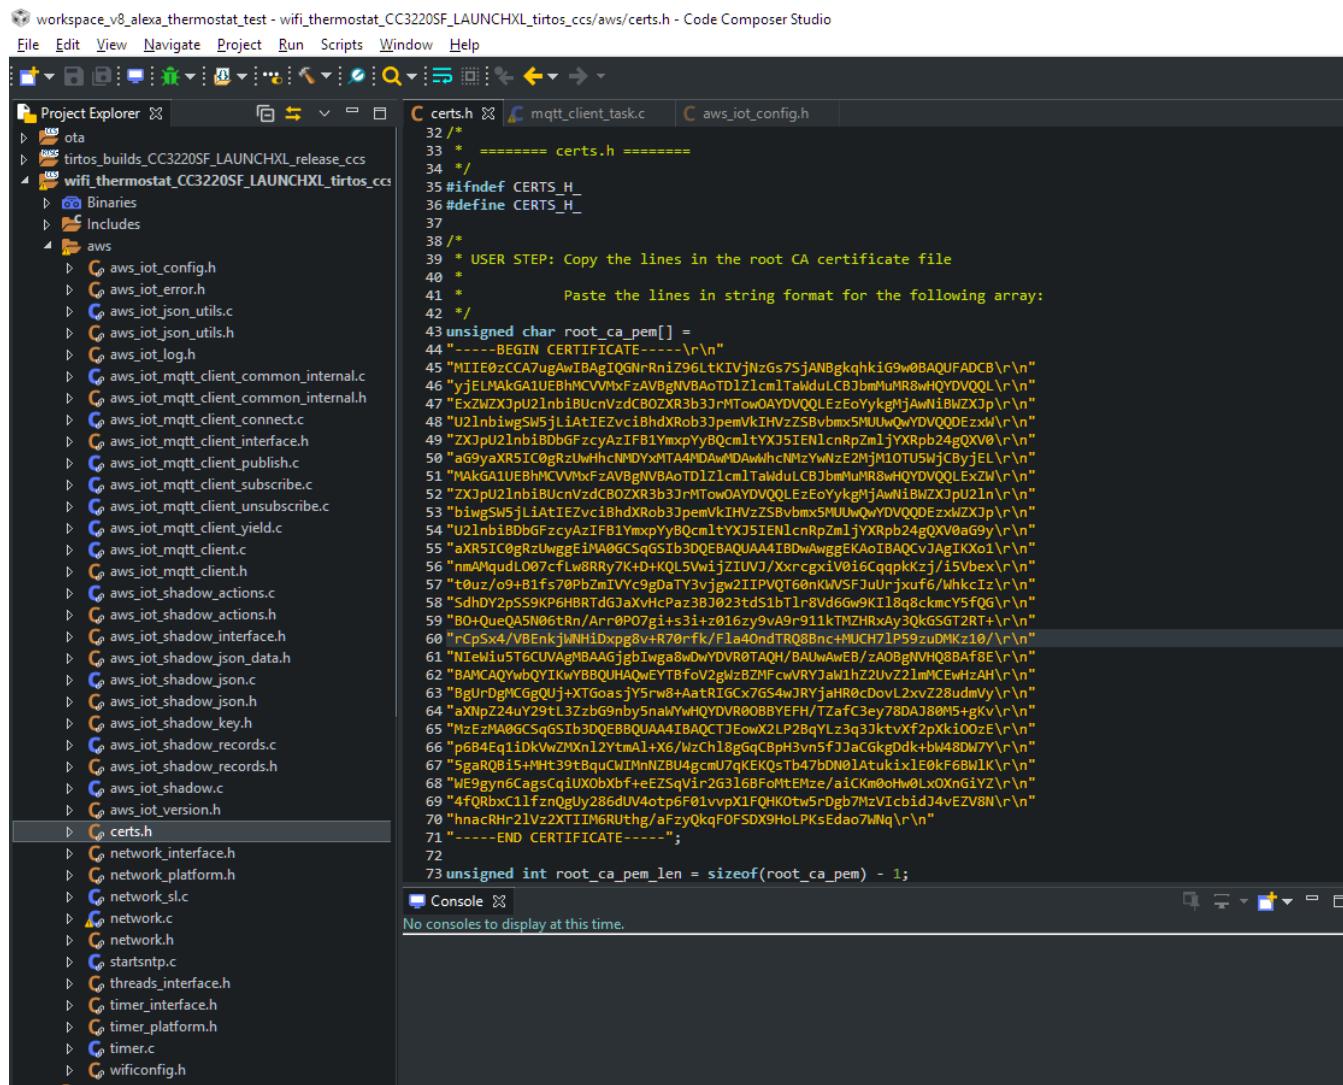

3.2.3 Setting Up Cloud Application

The cloud application setup is not applicable with the AWS + Alexa configuration option, as the cloud-based control is demonstrated through the use of voice commands through Alexa Voice Services.

3.2.4 Configuring Wi-Fi® Thermostat Project

1. Open CCS and select Project → Import CCS Projects.
2. Browse to the *wifi_thermostat* folder in the design software and select the project (if this returns an error, ensure the SAIL, AWS IoT, and BLE plugins are installed).
3. In *wifi_thermostat_app.h*, change DEMO_CITY and DEMO_TIME_ZONE to the desired city and time zone for weather forecast and clock display. The city must be a string containing "City, Country" (do not include a U.S. state in this string). For the full list of supported time-zone definitions in the CC3220 SDK utilities library, see source/ti/net/utils/clock_sync.h.
4. Next, take the certificates linked to the AWS thing created in section 3.2.2.1 and copy them into *aws/certs.h*. The files needed are client certificate (xxxxxx-certificate.pem.crt), the client private key (xxxxxx-private.pem.key), as well as the AWS IoT root CA certificate. To do this, open the certificate files in a text editor such as notepad++. Then, copy each line starting from "----BEGIN CERTIFICATE----" with a "\r\n" break at the end of each line, except for the last line with "----END CERTIFICATE----". As an example, the resulting character array for the AWS IoT root CA certificate should look as shown in [图 32](#).

图 32. Copying the Root CA Certificate

- Open `aws/aws_iot_config.h`. The `AWS_IOT_MQTT_HOST` needs to be defined as the endpoint as provided in the AWS thing test menu, obtained in [Section 3.2.2.1, step 9](#). The `AWS_IOT_MY_THING_NAME` needs to be defined as the Thing name created in [3.2.2.1](#). Once those edits are complete, the `aws/aws_iot_config.h` file should look like [图 33](#).

Problems Advice

0 errors, 13 warnings, 0 others

Description

> ! Warnings (13 items)

6. The design by default is configured for BLE Provisioning. Users can recompile the application to use AP Provisioning or SmartConfig by removing the BLE module. This can be done by changing the `BLE_PROVISIONING` define in `wifi_thermostat_app.h` to 0. If AP Provisioning is used, the dummy-`rootca-cert-key` (`/simplelink_cc32xx_sdk_2_10_00_04/tools/cc32xx_tools/certificateplayground/dummy-root-ca-cert-key`) must also be added as a user file to the serial flash. For detailed instructions on adding a user file to the SimpleLink™ Wi-Fi® external serial flash, see the [UniFlash ImageCreator Basics SimpleLink Academy module](#).
 7. To demonstrate OTA functionality, import and configure the OTA library from the CC3220 SDK. For detailed instructions on preparing and loading an OTA image, see the [Wi-Fi OTA SimpleLink Academy Lab](#).
 8. Rebuild the Wi-Fi® thermostat project. Run a debug session in Code Composer Studio™ or load the MCU image to the serial flash with UniFlash ImageCreator. For detailed instructions on programming an image to the SimpleLink™ Wi-Fi® external serial flash, see the [UniFlash ImageCreator Basics SimpleLink Academy module](#).

3.2.5 Build simple_np Application and Flash CC2640R2F

This section is omitted as the content of this section is the same as that of the [SimpleLink™ CC3220 Wireless MCU-Based Thermostat Reference Design with BLE Provisioning](#) design guide.

3.2.6 Running Wi-Fi® Thermostat Demo

1. The first screen on start-up is the calibration screen. Carefully tap the boxes onscreen to calibrate the resistive-touch functionality.
2. When calibrated, the application stays on the calibration data page until the CC3220 device is connected. If the device cannot connect to a known profile before the timeout, the device enables AP and SmartConfig Provisioning. For detailed instructions on how to use the Wi-Fi® Starter Pro mobile app to provision the CC3220, see the [SimpleLink™ SDK Explorer section of the BLE Wi-Fi® Provisioning README](#).
 - If the application has been configured for AP Provisioning and SmartConfig, this is enabled instead of BLE provisioning. For detailed instructions on how to use the Wi-Fi® Starter Pro mobile app to provision the CC3220 device, see the [Wi-Fi Provisioning SimpleLink Academy Lab](#).
3. After successfully provisioning, the main thermostat screen appears. From here, you can interact with the thermostat locally through use of the touchscreen, or through the use of Alexa commands. These commands can be invoked through the phone app, or through an Amazon Echo or other Alexa-enabled device. A non-exhaustive list of commands include:
 - "Set the thermostat to 20 degrees"
 - "Make the thermostat cooler by 2 degrees"
 - "What is the thermostat temperature?"

3.2.7 Implementation

3.2.7.1 Program Flow

This section is omitted as the content of this section is the same as that of the [SimpleLink™ CC3220 Wireless MCU-Based Thermostat Reference Design with BLE Provisioning](#) design guide.

3.2.7.2 Provisioning Device

This section is omitted as the content of this section is the same as that of the [SimpleLink™ CC3220 Wireless MCU-Based Thermostat Reference Design with BLE Provisioning](#) design guide.

3.2.7.3 Secure OTA

OTA shares `ProvOtaTask` and `gProvOtaTransitionTable` with the provisioning implementation. When the provisioning or network connection is successful, `ProvOtaTask` waits in a pending-OTA command state for a trigger from the user cloud application through the MQTT broker.

The OTA implementation for this design is based on the Cloud OTA example from the CC3220 SDK. For further details on the SDK example or the OTA library, see the [Wi-Fi OTA SimpleLink Academy Lab](#). One key difference between the instructions described in the SimpleLink Academy lab and the Alexa thermostat code is that to trigger the OTA update, the OTA JSON variable should be set to 1 on the device shadow through the AWS IoT cloud interface.

3.2.7.4 Secure Cloud Connectivity

This design leverages the AWS IoT SDK from the SimpleLink SDK Plugin for Amazon Web Services to communicate with the cloud. Within the SDK, this demo uses the AWS IoT Shadow APIs over MQTT for cloud connectivity. In *mqtt_client_task.c*, the CC3220 connects securely to the AWS IoT platform with TLS and certificate authentication. The demo connects to the AWS IoT Device Shadow service and syncs the *thermostatMode*, *targetSetpoint*, *temperature*, *pressure*, *airQuality*, *humidity*, *setPoint*, and *otaUpdate* JSON variables. The AWS IoT client publishes an update to the device shadow stored on the cloud whenever one of these values changes. If the MCU is in LPDS, the cloud application must send an update to wake the MCU to collect new data. Otherwise, the thermostat is configured to wake up the MCU periodically, to read sensor data and sync updates before returning to LPDS. This interval is defined by *SENSOR_SLEEP_MS* and is set to thirty minutes by default. The thermostat also monitors the device shadow for changes made to it on the cloud side, and updates the thermostat locally to match the desired shadow state to match the cloud.

3.2.7.5 Sensor Interface and Measurements

This section is omitted as the content of this section is the same as that of the [SimpleLink™ CC3220 Wireless MCU-Based Thermostat Reference Design with BLE Provisioning](#) design guide.

3.2.7.6 Power Management

This section is omitted as the content of this section is the same as that of the [SimpleLink™ CC3220 Wireless MCU-Based Thermostat Reference Design with BLE Provisioning](#) design guide.

3.3 Average Current Measurement for Thermostat Use Cases for TIDM-1020

This section is omitted as the content of this section is the same as that of the [SimpleLink™ CC3220 Wireless MCU-Based Thermostat Reference Design with BLE Provisioning](#) design guide.

4 Design Files

The TIDM-1020 is based on existing LaunchPads and BoosterPacks. To download the schematics, bill of materials, PCB layout recommendations, Gerber files, assembly drawings, and software files, see the design files.
