

ADS911x 18-Bit, 20MSPS SAR ADC With Fully Differential ADC Input Driver

1 Features

- High-speed and low-power:
 - ADS9119: 20MSPS, 274mW
 - ADS9118: 10MSPS, 83mW
 - ADS9117: 5MSPS, 59mW
- Feature integration:
 - Integrated ADC driver
 - Integrated precision reference
 - Common-mode voltage output buffer
- High performance:
 - 18-bit no missing codes
 - INL: ± 0.8 LSB, DNL: ± 0.4 LSB
 - SNR: 95.5dB
- Wide input bandwidth:
 - ADS9119 and ADS9118: 90MHz (–3dB)
 - ADS9117: 45MHz (–3dB)
- Serial LVDS interface:
 - SDR and DDR output modes
 - Synchronous clock and data output
- Extended operating range: -40°C to $+125^{\circ}\text{C}$

2 Applications

- [Power analyzers](#)
- [Source measurement units \(SMU\)](#)
- [Marine equipment](#)
- [Servo drive position feedback](#)
- [DC power supplies, AC sources, electronic loads](#)

3 Description

The ADS911x is a family of 18-bit, high-speed, analog-to-digital converters (ADCs) with an integrated driver for the ADC inputs. The integrated ADC driver simplifies the signal chain, reduces power consumption for precision applications, and supports high-frequency signals beyond 1MHz. By not requiring an external decoupling capacitor, the integrated ADC reference buffer is optimized for wide bandwidth applications.

The ADS911x uses a serial LVDS (SLVDS) data interface that enables high-speed digital communication while minimizing digital switching noise. Read the dual-channel ADC data using separate SLVDS outputs per ADC channel or one SLVDS output for both ADC channels.

Package Information

PART NUMBER	PACKAGE ⁽¹⁾	PACKAGE SIZE ⁽²⁾
ADS9119, ADS9118, ADS9117	RHA (VQFN, 40)	6mm × 6mm

- (1) For more information, see the [Mechanical, Packaging, and Orderable Information](#).
- (2) The package size (length × width) is a nominal value and includes pins, where applicable.

5 Pin Configuration and Functions

Figure 5-1. RHA Package, 6mm × 6mm, 40-Pin VQFN (Top View)

Pin Functions

PIN		TYPE ⁽¹⁾	DESCRIPTION
NAME	NO.		
AINM	4	I	Negative analog input for ADC.
AINP	3	I	Positive analog input for ADC.
AVDD_5V	1, 10	P	5V analog power-supply pin.
CS	17	I	Chip-select input pin for the interface configuration; active low.
DCLKM	23	O	Negative differential data clock output. Connect a 100Ω resistor between DCLKP and DCLKM close to the receiver.
DCLKP	24	O	Positive differential data clock output. Connect a 100Ω resistor between DCLKP and DCLKM close to the receiver.

Pin Functions (continued)

PIN		TYPE ⁽¹⁾	DESCRIPTION
NAME	NO.		
DOUTM	27	O	Negative differential data output. Connect a 100Ω resistor between DOUTP and DOUTM close to the receiver.
DOUTP	28	O	Positive differential data output. Connect a 100Ω resistor between DOUTP and DOUTM close to the receiver.
FCLKM	29	O	Negative differential data frame clock output. Connect a 100Ω resistor between FCLKP and FCLKM close to the receiver.
FCLKP	30	O	Positive differential data frame clock output. Connect a 100Ω resistor between FCLKP and FCLKM close to the receiver.
GND	2, 7, 8, 9, 11, 12, 15, 34, 38	P	Ground.
NC	25, 26	–	No external connection. Leave floating.
PWDN	22	I	Power-down control; active low. Connect to VDD_1V8 if unused.
REFIO	39	I/O	Internal reference voltage output. External reference voltage input. Connect a 10μF decoupling capacitor to REFM.
REFM	6, 40	P	Reference ground. Connect to GND.
RESET	21	I	Reset input; active low. Connect to VDD_1V8 if unused.
SCLK	18	I	Serial clock input for the interface configuration.
SDI/EXTREF	19	I	SDI is a multifunction logic input; pin function is determined by the SPI_EN pin. SDI has an internal 100kΩ pulldown resistor to GND. SPI_EN = 0b: SDI is the logic input to select between the internal or external reference. Connect SDI to GND for the external reference. Connect SDI to IOVDD for the internal reference. SPI_EN = 1b: Serial data input for the interface configuration.
SDO	20	O	Serial data output for the configuration interface.
SMPL_CLKM	31	I	ADC sampling clock input. Negative differential input for the LVDS sampling clock. Connect this pin to GND for the CMOS sampling clock.
SMPL_CLKP	32	I	ADC sampling clock input. Positive differential input for the LVDS sampling clock. Clock input for the CMOS sampling clock.
SMPL_SYNC	33	I	Synchronization input for internal averaging filter. Connect to GND if unused. See the Synchronizing Multiple ADCs section on how to use the SMPL_SYNC pin.
SPI_EN	16	I	Control to enable the SPI configuration; active high. Connect a pullup resistor to VDD_1V8 to keep the configuration interface enabled. Connect to GND if the SPI configuration is unused.
Thermal Pad	—	P	Exposed thermal pad. Connect to GND.
VCMOUT	5	O	Common-mode voltage output. Use VCMOUT to set the common-mode voltage at the ADC inputs. Connect a 1μF decoupling capacitor to GND.
VDD_1V8	13, 14, 35, 36, 37	P	1.8V power-supply. Connect 1μF and 0.1μF decoupling capacitors to GND.

(1) I = input, O = output, I/O = input or output, G = ground, P = power.

6 Specifications

6.1 Absolute Maximum Ratings

over operating ambient temperature range (unless otherwise noted)⁽¹⁾

	MIN	MAX	UNIT
VDD_1V8 to GND	-0.3	2.1	V
AVDD_5V to GND	-0.3	5.5	V
AINP and AINM to GND	-0.3	AVDD_5V + 0.3	V
REFIO to REFM	REFM - 0.3	AVDD_5V + 0.3	V
Digital inputs to GND	-0.3	VDD_1V8 + 0.3	V
REFM to GND	-0.3	0.3	V
Input current to any pin except supply pins ⁽²⁾	-10	10	mA
Junction temperature, T _J	-40	150	°C
Storage temperature, T _{stg}	-60	150	°C

- (1) Operation outside the *Absolute Maximum Ratings* may cause permanent device damage. *Absolute Maximum Ratings* do not imply functional operation of the device at these or any other conditions beyond those listed under *Recommended Operating Conditions*. If used outside the *Recommended Operating Conditions* but within the *Absolute Maximum Ratings*, the device may not be fully functional, and this may affect device reliability, functionality, performance, and shorten the device lifetime.
- (2) Pin current must be limited to 10mA or less.

6.2 ESD Ratings

			VALUE	UNIT
V _(ESD)	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/ JEDEC JS-001, analog input pins AINP and AINM ⁽¹⁾	±2000	V
		Human body model (HBM), per ANSI/ESDA/ JEDEC JS-001, all other pins ⁽¹⁾	±1000	
		Charged device model (CDM), per ANSI/ESDA/ JEDEC JS-002, all pins ⁽²⁾	±500	

- (1) JEDEC document JEP155 states that 500V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250V CDM allows safe manufacturing with a standard ESD control process.

6.3 Thermal Information

THERMAL METRIC ⁽¹⁾		ADS911x	UNIT
		RHA (VQFN)	
		40 PINS	
R _{θJA}	Junction-to-ambient thermal resistance	25.8	°C/W
R _{θJC(top)}	Junction-to-case (top) thermal resistance	13.3	°C/W
R _{θJB}	Junction-to-board thermal resistance	7.5	°C/W
Ψ _{JT}	Junction-to-top characterization parameter	0.1	°C/W
Ψ _{JB}	Junction-to-board characterization parameter	7.4	°C/W
R _{θJC(bot)}	Junction-to-case (bottom) thermal resistance	1.1	°C/W

- (1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application note.

6.4 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
POWER SUPPLY						
AVDD_5V	Power supply	AVDD_5V to GND	4.75	5	5.25	V
VDD_1V8	Power supply	VDD_1V8 to GND	1.75	1.8	1.85	V
REFERENCE VOLTAGE						
V _{REF}	Reference voltage to the ADC	External reference	4.076	4.096	4.116	V
ANALOG INPUTS						
V _{IN}	Absolute input voltage	AINx ⁽¹⁾ to GND	V _{CM} – 1.6		V _{CM} + 1.6	V
FSR	Full-scale input range	AINP – AINM	–3.2		3.2	V
V _{CM}	Common-mode input range ⁽²⁾	(AINP + AINM) / 2	V _{CMOUT} – 0.07		V _{CMOUT} + 0.07	V
TEMPERATURE RANGE						
T _A	Ambient temperature		–40	25	125	°C

- (1) AINx refers to analog inputs AINAP, AINAM, AINBP, and AINBM.
 (2) ADC channel is powered down if the input common-mode voltage exceeds specifications.

6.5 Electrical Characteristics

at AVDD_5V = 4.75V to 5.25V, VDD_1V8 = 1.75V to 1.85V, internal V_{REF} = 4.096V, and maximum throughput (unless otherwise noted); minimum and maximum values at T_A = –40°C to +125°C; typical values at T_A = 25°C

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
ANALOG INPUTS						
I _B	Input bias current			0.1		nA
	Input bias current thermal drift	T _A = 0°C to 70°C		0.02		nA/°C
		T _A = –40°C to 125°C		0.1		
DC PERFORMANCE						
	Resolution	No missing codes		18		Bits
DNL	Differential nonlinearity		–0.9	±0.4	0.9	LSB
INL	Integral nonlinearity	T _A = 0°C to 70°C, all devices	–1.125	±0.8	1.125	LSB
		T _A = –40°C to 125°C, all devices	–1.9	±0.8	1.9	LSB
V _(OS)	Input offset error ⁽¹⁾			±40		LSB
dV _{OS} /dT	Input offset error thermal drift ⁽¹⁾			0.25	1	ppm/°C
G _E	Gain error ⁽¹⁾		–0.05	±0.01	0.05	%FSR
dG _E /dT	Gain error thermal drift ⁽¹⁾			0.5	2	ppm/°C
AC PERFORMANCE						
SINAD	Signal-to-noise + distortion ratio	f _{IN} = 2kHz	93	95.4		dB
		f _{IN} = 1MHz		94.3		
SNR	Signal-to-noise ratio	f _{IN} = 2kHz	93.3	95.5		dBFS
		f _{IN} = 1MHz		94.9		
THD	Total harmonic distortion	f _{IN} = 2kHz, ADS9117 and ADS9118		–120		dB
		f _{IN} = 2kHz, ADS9119 at 20MSPS		–118		
		f _{IN} = 1MHz, all devices		–104		
SFDR	Spurious-free dynamic range	f _{IN} = 2kHz		118		dB
		f _{IN} = 1MHz		104		
	Isolation crosstalk	f _{IN} = 2kHz		120		dB
	Aperture jitter	Single-ended CMOS clock on SMPL_CLKP		0.3		pSRMS
		Differential LVDS sampling clock		0.8		
BW	Input Bandwidth (–3dB)	ADS9119		90		MHz
		ADS9118		90		
		ADS9117		45		
INTERNAL REFERENCE						
V _{REF} ⁽²⁾	Voltage on REFIO pin (configured as output)	1μF capacitor on REFIO pin, T _A = 25°C	4.092	4.096	4.1	V
	Reference temperature drift			6	20	ppm/°C
COMMON-MODE OUTPUT BUFFER						
V _{CMOUT}	Common-mode output voltage	ADS9119	2.2	2.460	2.65	V
		ADS9118	2.2	2.410	2.65	
		ADS9117	2.2	2.385	2.65	
	Output current drive		0		5	μA

6.5 Electrical Characteristics (continued)

at AVDD_5V = 4.75V to 5.25V, VDD_1V8 = 1.75V to 1.85V, internal V_{REF} = 4.096V, and maximum throughput (unless otherwise noted); minimum and maximum values at T_A = –40°C to +125°C; typical values at T_A = 25°C

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
LVDS RECEIVER (SMPL_CLK)						
V _{TH}	High-level input voltage (P – M)	AC coupled	100			mV
		DC coupled	300			
V _{TL}	Low-level input voltage (P – M)	AC coupled			–100	mV
		DC coupled			–300

7 Detailed Description

7.1 Overview

The ADS911x is an 18-bit, 20MSPS analog-to-digital converter (ADC). The ADS911x integrates a high-impedance buffer at the ADC inputs, voltage reference, reference buffer, and common-mode voltage output buffer. The ADS9119 supports unipolar differential analog input signals. The buffer at the ADC inputs is optimized for low-distortion and low-power operation.

For DC level shifting of the analog input signals, the device has a common-mode voltage output buffer. The common-mode voltage is derived from the output of the integrated reference buffer. When a conversion is initiated, the differential input between the (AINAP – AINAM) pins is sampled. The ADS911x uses a clock input on the SMPL_CLK pin to initiate conversions.

The ADS911x consumes only 274mW of power when operating at 20MSPS. This value includes the buffer power dissipation at the ADC inputs. The serial LVDS (SLVDS) digital interface simplifies board layout, timing, firmware, and supports full throughput at lower clock speeds.

7.2 Functional Block Diagram

7.3 Feature Description

7.3.1 Analog Inputs

The ADS911x supports both AC-coupled and DC-coupled differential analog inputs. Make sure the input common-mode voltage of the analog inputs matches the voltage level on the VCMOUT pin. [Figure 7-1](#) shows the equivalent input network diagram of the device.

Figure 7-1. Equivalent Input Network

7.3.2 Analog Input Bandwidth

[Figure 6-7](#) illustrates the analog full-power input bandwidth of the ADS911x. The -3dB bandwidth is 90MHz for the ADS9119 and ADS9118, and 45MHz for the ADS9117.

7.3.3 ADC Transfer Function

The ADS911x supports a $\pm 3.2\text{V}$ differential input range. The device outputs 18-bit conversion data in either straight-binary or binary two's-complement format. As shown in [Table 7-1](#), the format for the output codes is the same across all analog channels. Configure the format for the output codes with the DATA_FORMAT field in register address 0x0D. The least significant bit (LSB) for the ADC is given by $1\text{LSB} = 6.4\text{V} / 2^{18}$.

Table 7-1. Transfer Characteristics

INPUT VOLTAGE	DESCRIPTION	ADC OUTPUT IN 2's-COMPLEMENT FORMAT	ADC OUTPUT IN STRAIGHT-BINARY FORMAT
$\leq -3.2\text{V} + 1\text{LSB}$	Negative full-scale code	0x20000	0x00000
$0\text{V} + 1\text{LSB}$	Mid-code	0x00000	0x1FFFF
$\geq 3.2\text{V} - 1\text{LSB}$	Positive full-scale code	0x1FFFF	0x3FFFF

7.3.4 Reference Voltage

The ADS911x has a precision, low-drift voltage reference internal to the device. For best performance, filter the internal reference noise (as shown in Figure 7-2) by connecting a 10µF ceramic bypass capacitor to the REFIO pin. As shown in Figure 7-3, connect an external reference at the REFIO pin. When using an external reference, disable the internal reference voltage by writing PD_REF = 1b in address 0xC1 of register bank 1.

Figure 7-2. Internal Reference Voltage

Figure 7-3. External Reference Voltage

7.3.5 Temperature Sensor

The ADS911x features a 10-bit temperature sensor for measuring temperature inside the device. Follow the sequence listed in Table 7-2 to read the temperature sensor output with the SPI. Read the temperature sensor data at anytime independent of the ADC data interface.

Equation 1 calculates the transfer function for the temperature sensor.

$$\text{Temperature} = -85.0172 + (10 \text{ bit output} \times 0.24918) \text{ } ^\circ\text{C} \quad (1)$$

Table 7-2. Sequence to Read Temperature Sensor Output

REGISTER ADDRESS	REGISTER BANK	VALUE	COMMENT
0x90	1	0x4000	Write register to load temperature sensor output in address 0x91
0x91	1	10-bit temperature sensor data	Read register for temperature sensor output
0x90	1	0x0000	Write register

7.3.6 Data Averaging

The ADS911x features a built-in decimation filter that averages the conversion results from the ADC. The output data rate is reduced with higher data averaging. Table 7-3 shows the register settings corresponding to oversampling ratios.

As shown in Figure 7-4, a pulse on the SMPL_SYNC pin resets the decimation filter. A pulse on SMPL_SYNC synchronizes multiple ADS911x devices when using the decimation filter.

Table 7-3. Register Map Settings for OSR

DECIMATION	REGISTER	VALUE
OSR initialization	CLK3 (0xC5[9])	1
	OSR_INIT1 (0xC0[11:10])	1
	OSR_INIT2 (0xC4[5:4])	2
	OSR_INIT3 (0xC4[1])	1
	OSR_EN (0x0D[6])	1
2	OSR (0x0D[5:2])	0
	OSR_CLK (0xC0[9:7])	0
4	OSR (0x0D[5:2])	1
	OSR_CLK (0xC0[9:7])	4
8	OSR (0x0D[5:2])	2
	OSR_CLK (0xC0[9:7])	5
16	OSR (0x0D[5:2])	3
	OSR_CLK (0xC0[9:7])	6

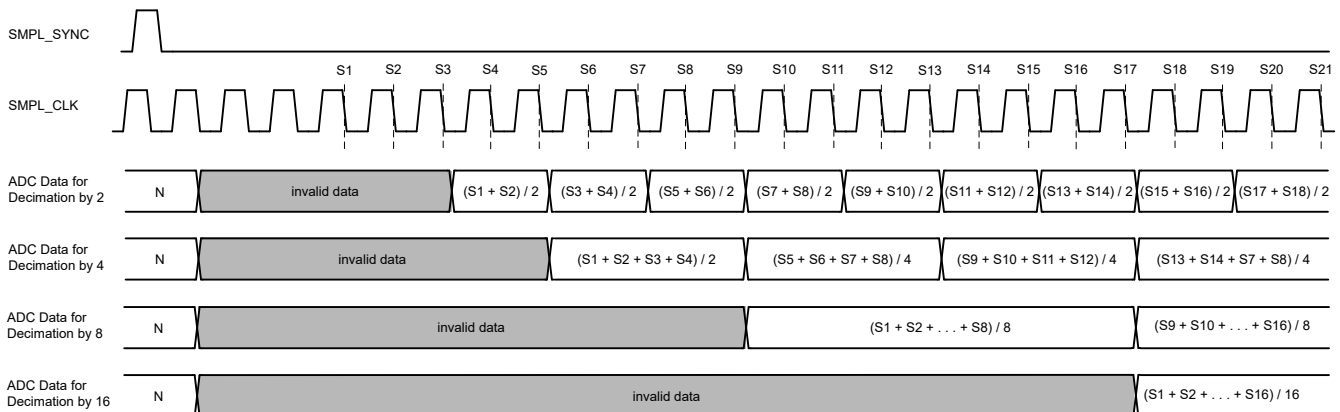

Figure 7-4. Data Output With Decimation

7.3.7 Digital Down Converter

The ADS911x includes an optional on-chip digital down conversion (DDC) that is enabled by SPI register settings. As shown in Figure 7-5, the DDC includes a digital mixer and a 24-bit, numerically controlled oscillator (NCO). The digital mixer generates 24-bit I and Q outputs that represent complex mixing of ADC output data with the NCO output frequency. The ADC generates a 48-bit output corresponding to the 24-bit I and Q outputs, respectively, from the digital mixer.

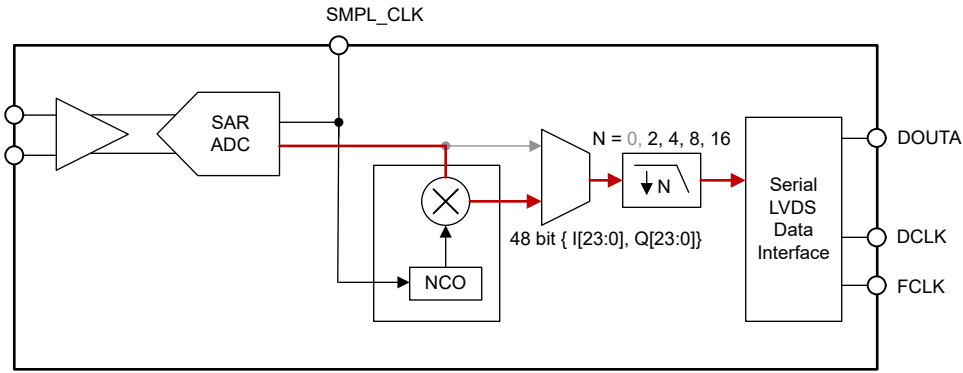

Figure 7-5. Data Path When Using a Digital Down Converter

The output frequency of the NCO, given by Equation 2, is configured using the NCO_FREQUENCY register (address 0xFD and 0xFE).

$$f_{\text{NCO}} = \frac{f_{\text{SMPL_CLK}}}{2^{24}} \times (\text{NCO_FREQUENCY}[23:0] \& 0\text{FFFFFF0}) \text{ Hz} \quad (2)$$

The output phase of the NCO is reset by applying a pulse on the SMPL_SYNC pin, see Figure 6-5. As shown in Equation 3 and Table 7-4, the initial phase of the NCO output is configured using the NCO_PHASE register (address 0xFC and 0xFD).

$$\text{NCO_PHASE}[23:0] = \left(\frac{\text{Initial phase}}{2\pi} \times 2^{24} \right) \& 0\text{FFFFFF0} \quad (3)$$

Table 7-4. Initial NCO Phase

NCO_PHASE[23:0]	INITIAL PHASE
0x000000	0
0x7FFFFFF0	π
0xFFFFF0	2π

Use a decimation factor of either 2, 4, 8, or 16 with the DDC. [Table 7-5](#) shows the register configuration for decimating the DDC output.

Table 7-5. Decimation Settings for the DDC

DECIMATION	REGISTER	VALUE
2	OSR_EN (0x0D[6])	1
	OSR (0x0D[5:2])	0
	OSR_CLK (0xC0[9:7])	0
Common settings for decimation factors 4, 8, and 16	CLK3 (0xC5[9])	1
	OSR_INIT1 (0xC0[11:10])	1
	OSR_INIT2 (0xC4[5:4])	2
	OSR_INIT3 (0xC4[1])	1
	OSR_EN (0x0D[6])	1
4	OSR (0x0D[5:2])	1
	OSR_CLK (0xC0[9:7])	0
8	OSR (0x0D[5:2])	2
	OSR_CLK (0xC0[9:7])	4
16	OSR (0x0D[5:2])	3
	OSR_CLK (0xC0[9:7])	5

7.3.8 Data Interface

The ADS911x features a high-speed, serial LVDS data interface with output data frame width to 20 bits or 24 bits with the single-data rate (SDR) and double-data rate (DDR) modes.

Configure the INIT_1 register field before writing to other register fields, as described in [Table 7-6](#) and [Table 7-7](#).

Table 7-6. Register Map Settings for Output Data Interface for the ADS9117

DATA FRAME WIDTH (Bits)	DATA RATE	INIT_1 0x04[3:0]	DATA_LANES 0x12[2:0]	DATA_RATE 0xC1[8]	CLK1 0xC0[12]	CLK2 0xC1[0]	CLK3 0xC5[9]	CLK4 0xC5[3:2]	CLK5 0xFB[1]	CLK6 0x1C[7:6]
20	SDR	0x000B	0	1	0	1	0	3	0	3
20	DDR	0x000B	0	0	0	1	0	3	0	3
24	SDR	0x0000	2	1	0	0	0	0	0	0
24	DDR	0x0000	2	0	0	0	0	0	0	0

Table 7-7. Register Map Settings for Output Data Interface for the ADS9119 and ADS9118

DATA FRAME WIDTH (Bits)	DATA RATE	INIT_1 0x04[3:0]	DATA_LANES 0x12[2:0]	DATA_RATE 0xC1[8]	CLK1 0xC0[12]	CLK2 0xC1[0]	CLK3 0xC5[9]	CLK4 0xC5[3:2]	CLK5 0xFB[1]	CLK6 0x1C[7:6]
20	SDR	—								Not supported
20	DDR	—								Not supported
24	SDR	—	2	1	0	0	0	0	0	0
24	DDR	—	2	0	0	0	0	0	0	0

The ADS911x generates a data clock DCLK that is a multiple of the ADC sampling clock SMPL_CLK. The data clock frequency depends on the data frame width and data rate. The data frame width is 20 or 24 bits and the data rate is SDR or DDR. The following equation calculates the DCLK speed. [Table 7-8](#) lists the possible values for the output data clock frequency.

$$\text{DCLK speed} = \frac{\text{Data Frame Width (24 bit or 20 bit)}}{\text{Data Rate (SDR = 1, DDR = 2)}} \times \text{SMPL_CLK} \quad (4)$$

Table 7-8. Data Clock (DCLK) Speed

DATA FRAME WIDTH (Bits)	DATA RATE (1 = SDR, 2 = DDR)	SMPL_CLK MULTIPLIER	DCLK (SMPL_CLK = 5MHz)	DCLK (SMPL_CLK = 10MHz)	DCLK (SMPL_CLK = 20MHz)
24	1	24	120MHz	—	—
	2	12	60MHz	120MHz	240MHz
20	1	20	100MHz	— ⁽¹⁾	— ⁽¹⁾
	2	10	50MHz	— ⁽¹⁾	— ⁽¹⁾

(1) A 20-bit data frame width is not supported for the ADS9119 or ADS9118.

7.3.8.1 Data Frame Width

As shown in Figure 7-6, the ADS911x supports 24-bit and 20-bit data frame width options. Configure the DATA_WIDTH field in address 0x12 to select the data frame width. The default output data frame width is 24 bits. The ADC resolution is 18 bits, represented by 20 bits.

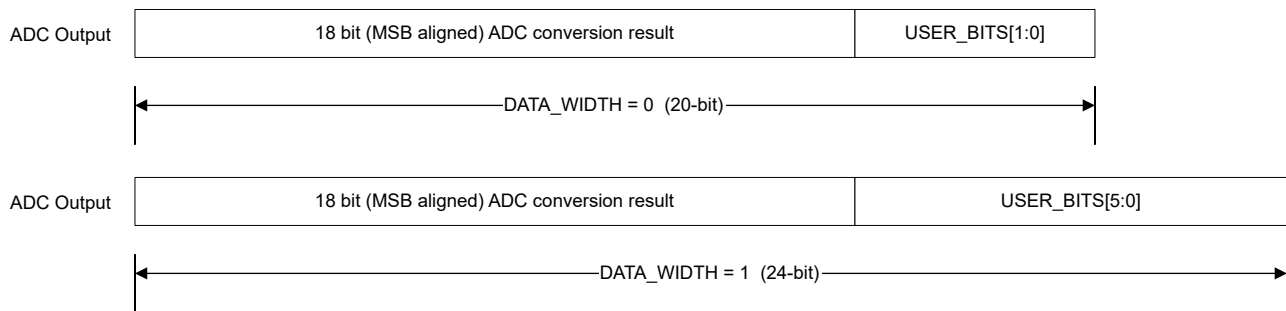

Figure 7-6. Data Frame Width Composition

7.3.8.2 ADC Output Data Randomizer

The ADS911x features a data output randomizer. When enabled, the ADC conversion result is bit-wise exclusive-ORed (XOR). Figure 7-7 illustrates a diagram of such an XOR operation. Either the LSB of the conversion result (Figure 7-8) or the XOR_PRBS bit (default) is appended to the ADC data output (Figure 7-9). The LSB of the ADC conversion result and XOR_PRBS have equal probability of being either 1 or 0. As a result of the XOR operation, the data output from the ADS911x is randomized. The ground bounce created by the transmission of this randomized result over the data interface is uncorrelated with the analog input voltage. This uncorrelated transmission helps minimize interference between data transmission and analog performance of the ADC when the PCB layout does not minimize ground bounce.

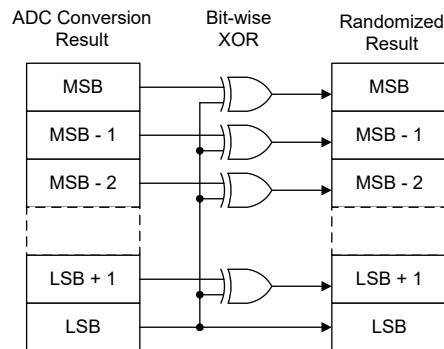

Figure 7-7. Bit-Wise XOR Operation

Figure 7-8. Data Frame Width Composition With LSB XOR Enabled

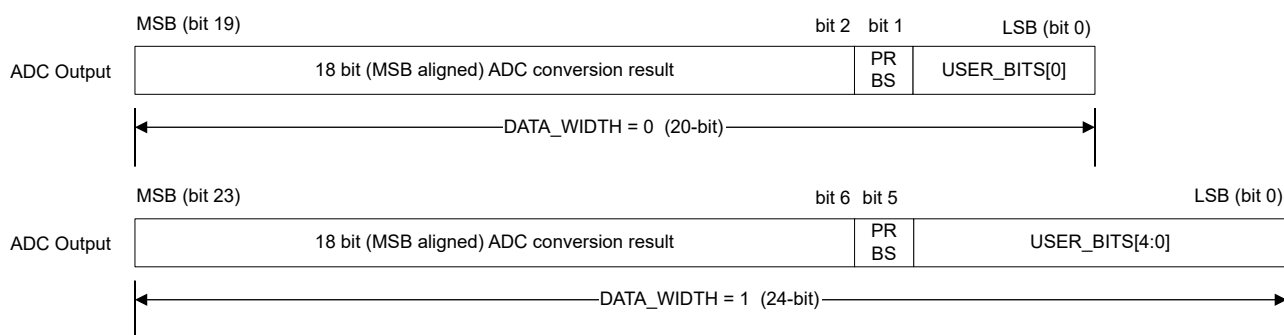

Figure 7-9. Data Frame Width Composition With PRBS XOR Enabled

7.3.8.3 Synchronizing Multiple ADCs

Drive the SMPL_CLK pins of the respective ADS911x devices with a common sampling clock. Match the timing delay on the clock path external to the ADCs by using identical PCB trace lengths for SMPL_CLK for the respective ADCs.

Use the SMPL_SYNC pin to synchronize multiple ADCs when using the internal decimation filter. The SMPL_SYNC pin is latched by the falling edge of the sampling clock. A pulse on SMPL_SYNC resets the internal decimation filter.

7.3.8.4 Test Patterns for Data Interface

The ADS911x features test patterns (Figure 7-10) used by the host for debugging and verifying the data interface. The test patterns replace the ADC output data with predefined digital data. Enable the test patterns by configuring the corresponding register addresses 0x13 through 0x16 in bank 1.

Table 7-9 lists the test patterns supported by the ADS911x.

Figure 7-10. Register Bank for Test Patterns

Table 7-9. Test Pattern Configurations

ADC OUTPUT	TP_EN	TP_MODE	SECTION	RESULT
ADC conversion result	0			
Fixed pattern	1	0 or 1	<i>Fixed Pattern</i>	ADC output = TP0
Digital ramp	1	2	<i>Digital Ramp</i>	ADC output = Digital ramp
Alternating test patterns	1	3	<i>Alternating Test Pattern</i>	ADC output = TP0, TP1

7.3.8.4.1 Fixed Pattern

The ADC outputs fixed patterns defined in the TP0 register in place of the ADC data.

- Configure the test patterns in TP0
- Set TP_EN = 1 and TP_MODE = 0 (address = 0x13)

7.3.8.4.2 Alternating Test Pattern

The ADC outputs alternating test patterns defined in the TP0 and TP1 registers in place of the ADC data.

- Configure the test patterns in TP0 and TP1
- Set TP_EN = 1 and TP_MODE = 3 (address = 0x13)

7.3.8.4.3 Digital Ramp

The ADC outputs digital ramp values with increments specified in the RAMP_INC register in place of the ADC data.

- Configure the increment value between two successive steps of the digital ramp in the RAMP_INC (address = 0x13) register. The digital ramp increments by N + 1, where N is the value configured in the RAMP_INC register.
- Set TP_EN = 1 and TP_MODE = 2 (address = 0x13).

7.3.9 ADC Sampling Clock Input

Use a low-jitter external clock with a high slew rate to maximize SNR performance. Operate the ADS911x with a differential or single-ended clock input. Clock amplitude impacts the ADC aperture jitter and, consequently, SNR. For maximum SNR performance, provide a clock signal with fast slew rates that maximizes swing between VDD_1V8 and GND levels.

Make sure the sampling clock is a free-running continuous clock. The ADC generates a valid output data, data clock, and frame clock $t_{PU_SMPL_CLK}$, as specified in the [Switching Characteristics](#) after a free-running sampling clock is applied. When the sampling clock is stopped, the ADC is in power-down and the output data, data clock, and frame clock are invalid.

Figure 7-11 shows a diagram of the differential sampling clock input. For this configuration, connect the differential sampling clock input to the SMPL_CLKP and SMPL_CLKM pins. Figure 7-12 shows a diagram of the single-ended sampling clock input. In this configuration, connect the single-ended sampling clock to SMPL_CLKP and connect SMPL_CLKM to ground.

Figure 7-11. AC-Coupled Differential Sampling Clock

Figure 7-12. Single-Ended Sampling Clock

Figure 6-6 shows the latency from analog input sampling instant to corresponding data MSB output marked by the FCLK rising edge. The equations for data output latency depend on the output data frame width and are given in Table 7-10.

Table 7-10. Data Output Latency

DEVICE	24-BIT DATA FRAME	20-BIT DATA FRAME
ADS9119	$2 \times t_{SMPL_CLK} + t_{LAT}$	Not supported
ADS9118	$1.83 \times t_{SMPL_CLK} + t_{LAT}$	Not supported
ADS9117	$1.83 \times t_{SMPL_CLK} + t_{LAT}$	$2 \times t_{SMPL_CLK} + t_{LAT}$

1. For t_{LAT} , see the [Switching Characteristics](#) table.

7.4 Device Functional Modes

7.4.1 Reset

Power down the ADS911x with a logic 0 on the $\overline{\text{RESET}}$ pin or write 1b to the RESET field (address 0x00, register bank 0). The device registers are initialized to the default values after reset. Initialize the device with a sequence of register write operations; see the [Initialization Sequence](#) section.

7.4.2 Power-Down Options

Power down the ADS911x with a logic 0 on the $\overline{\text{PWDN}}$ pin or write 11b to the PD_CH field (address 0xC0, register bank 1). The device registers are initialized to the default values after power-up. Initialize the device with a sequence of register write operations; see the [Initialization Sequence](#) section.

7.4.3 Normal Operation

In normal operating mode, the ADS911x powers up and digitizes the analog inputs at the sampling clock falling edge. The ADC outputs the data clock, frame clock, and MSB-aligned, 18-bit conversion result.

7.4.4 Initialization Sequence

The ADS911x register map is initialized with default values on power-up. [Table 7-11](#) lists the steps to enable gain error calibration (recommended) and change the output data interface. For the ADS9119 only, follow the initialization steps in [Table 7-12](#).

Table 7-11. User-Defined Configuration for the ADS9119, ADS9118, and ADS9117

STEP NUMBER	REGISTER			COMMENT
	BANK	ADDRESS	VALUE[15:0]	
1	1	0x0D	User defined	Enable gain error calibration and select ADC output data format
2	1	0x33	0x2040	Enable gain error calibration
3	0	0x04	0x0000 for data frame width = 24 bits 0x000B for data frame width = 20	

Table 7-12. Initialization Configuration for the ADS9119 Only

STEP NUMBER	REGISTER		
	BANK	ADDRESS	VALUE[15:0]
1	1	0x0D [9:8]	0x3
2	1	0x34 [1]	0x1

7.5 Programming

7.5.1 Register Write

Register write access is enabled by setting `SPI_RD_EN = 0b`. The 16-bit configuration registers are grouped in three register banks and are addressable with an 8-bit register address. Register bank 1 and register bank 2 are selected for read or write operation by configuring the `PAGE_SEL0` and `PAGE_SEL1` bits, respectively. Registers in bank 0 are always accessible, irrespective of the `PAGE_SELx` bits. The register addresses in bank 0 are unique and are not used in register banks 1 and 2.

As shown in [Figure 7-13](#), steps to write to a register are:

1. Frame 1: Write to register address 0x03 in register bank 0 to select either register bank 1 or bank 2 for a subsequent register write. This frame has no effect when writing to registers in bank 0.
2. Frame 2: Write to a register in the bank selected in frame 1. Repeat this step for writing to multiple registers in the same register bank.

Figure 7-13. Register Write

7.5.2 Register Read

Select the desired register bank by writing to register address 0x03 in register bank 0. Set `SPI_RD_EN = 1b` and `SPI_MODE = 1b` in register bank 0 to enable register read access. As illustrated in [Figure 7-14](#), read registers with two 24-bit SPI frames after setting `SPI_RD_EN` and `SPI_MODE`. The first SPI frame selects the register bank. The ADC returns the 16-bit register value in the second SPI frame corresponding to the 8-bit register address.

As illustrated in [Figure 7-14](#), steps to read a register are:

1. Frame 1: With `SPI_RD_EN = 0b`, write to register address 0x03 in register bank 0 to select the desired register bank 0 for reading.
2. Frame 2: Set `SPI_RD_EN = 1b` and `SPI_MODE = 1b` in register address 0x00 in register bank 0.
3. Frame 3: Read any register in the selected bank using a 24-bit SPI frame containing the desired register address. Repeat this step with the address of any register in the selected bank to read the corresponding register.
4. Frame 4: Set `SPI_RD_EN = 0` to disable register reads and re-enable register writes.
5. Repeat steps 1 through 4 to read registers in a different bank.

Figure 7-14. Register Read

7.5.3 Multiple Devices: Daisy-Chain Topology for SPI Configuration

Figure 7-15 shows a typical connection diagram showing multiple devices in a daisy-chain topology.

Figure 7-15. Daisy-Chain Connections for SPI Configuration

The \overline{CS} and SCLK inputs of all ADCs are connected together and controlled by a single \overline{CS} and SCLK pin of the controller, respectively. The SDI input pin of the first ADC in the chain (ADC1) is connected to the peripheral IN controller OUT (PICO) pin of the controller. The SDO output pin of ADC1 is connected to the SDI input pin of ADC2, and so on. The SDO output pin of the last ADC in the chain (ADC4) is connected to the peripheral OUT controller IN (POCI) pin of the controller. The data on the PICO pin passes through ADC1 with a 24-SCLK delay, as long as \overline{CS} is active.

Enable daisy-chain mode after power-up or after the device is reset. Set the daisy-chain length in the DAISY_CHAIN_LENGTH register to enable daisy-chain mode. The daisy-chain length is the number of ADCs in the chain, excluding ADC1. In Figure 7-15, the DAISY_CHAIN_LENGTH is 3.

7.5.3.1 Register Write With Daisy-Chain

Writing to registers in daisy-chain configuration requires $N \times 24$ SCLKs in one SPI frame. Register writes in a daisy-chain configuration containing four ADCs, as illustrated in Figure 7-15, requires 96 SCLKs.

Daisy-chain mode is enabled on power-up or after device reset. Configure the DAISY_CHAIN_LENGTH field to enable daisy-chain mode. Repeat the waveform in Figure 7-16 N times, where N is the number of ADCs in the daisy chain. Figure 7-17 provides the SPI waveform, containing N SPI frames, for enabling daisy-chain mode for N ADCs.

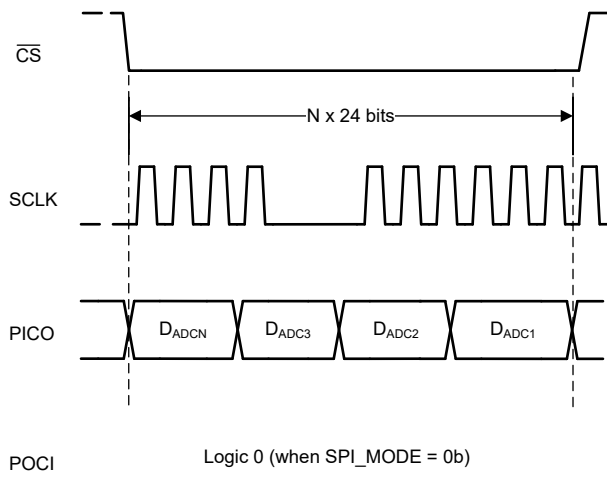

Figure 7-16. Register Write With Daisy-Chain

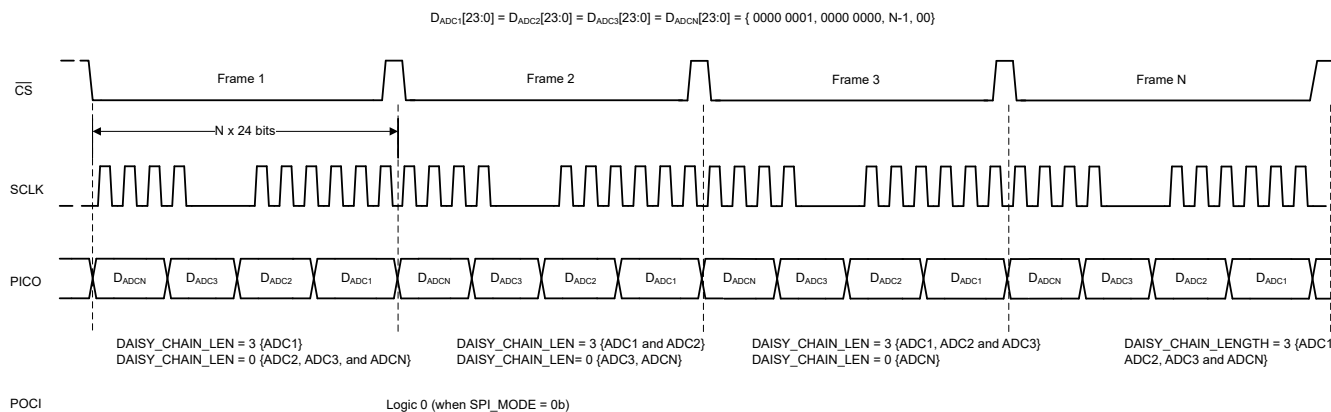

Figure 7-17. Register Write to Configure Daisy-Chain Length

7.5.3.2 Register Read With Daisy-Chain

Figure 7-18 illustrates an SPI waveform for reading registers in daisy-chain configuration. Steps for reading registers from N ADCs connected in a daisy-chain are:

1. Register read is enabled by writing to the following registers:
 - a. Write to PAGE_SEL to select the desired register bank
 - b. Enable register reads by writing SPI_RD_EN = 0b (default on power-up)
2. With the register bank selected and SPI_RD_EN = 0b, the controller reads register data by:
 - a. N × 24-bit SPI frame containing the 8-bit register address to be read: N times (0xFE, 0x00, 8-bit register address)
 - b. N × 24-bit SPI frame to read out register data: N times (0xFF, 0xFF, 0xFF)

The 0xFE in step 2a configures the ADC for register read from the specified 8-bit address. At the end of step 2a, the output shift register in the ADC is loaded with register data. The ADC returns the 8-bit register address and corresponding 16-bit register data in step 2b.

9 Application and Implementation

Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

9.1 Application Information

The ADS911x features an integrated ADC driver, low latency, high speed, low AC and DC errors, and low temperature drift. These features make the ADS911x a high-performance signal-chain for applications requiring precision measurements with low latency. The following section provides example circuits and recommendations for using the ADS911x device family in a data acquisition (DAQ) system.

9.2 Typical Applications

9.2.1 Data Acquisition (DAQ) Circuit for a $\leq 20\text{kHz}$ Input Signal Bandwidth

Figure 9-1 shows a signal-chain with minimum external components. This signal-chain significantly reduces solution size by driving the ADS911x with the fully differential amplifier (FDA) THS4551.

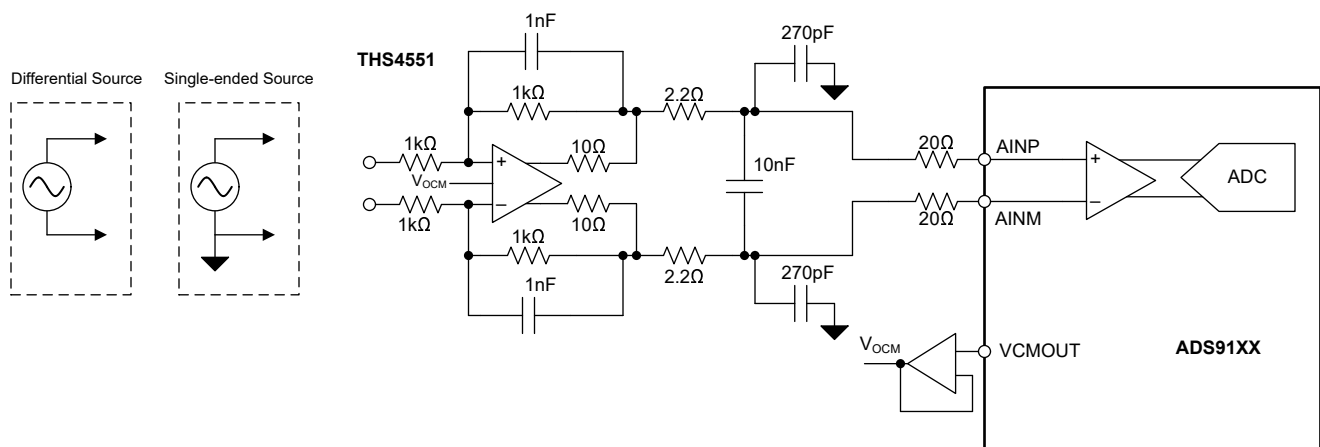

Figure 9-1. Data Acquisition (DAQ) Circuit for a $\leq 20\text{kHz}$ Input Signal Bandwidth

9.2.1.1 Design Requirements

Table 9-1 lists the parameters for this typical application.

Table 9-1. Design Parameters

PARAMETER	VALUE
SNR	$\geq 92\text{dB}$
THD	$\leq -110\text{dB}$
Input signal frequency	$\leq 20\text{kHz}$

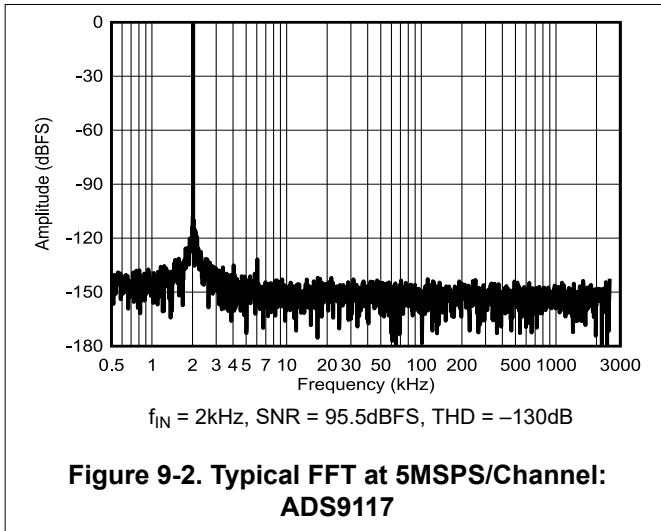

9.2.1.2 Detailed Design Procedure

Use the procedure discussed in this section for any ADS911x application circuit.

- All ADS911x applications require supply decoupling, as provided in the [Power Supply Recommendations](#) section.
- Make sure the values provided in the [Typical Applications](#) section meet the maximum throughput and input signal frequency design requirements. Use a lower bandwidth signal chain when lower noise performance is required.

9.2.1.3 Application Curves

Figure 9-2 and Figure 9-3 show the SNR and INL performance for the circuit in Figure 9-1, respectively.

9.2.2 Data Acquisition (DAQ) Circuit for a $\leq 100\text{kHz}$ Input Signal Bandwidth

Figure 9-4 shows a signal-chain with minimum external components. This signal-chain significantly reduces solution size by driving the ADS911x with the fully differential amplifier (FDA) THS4551.

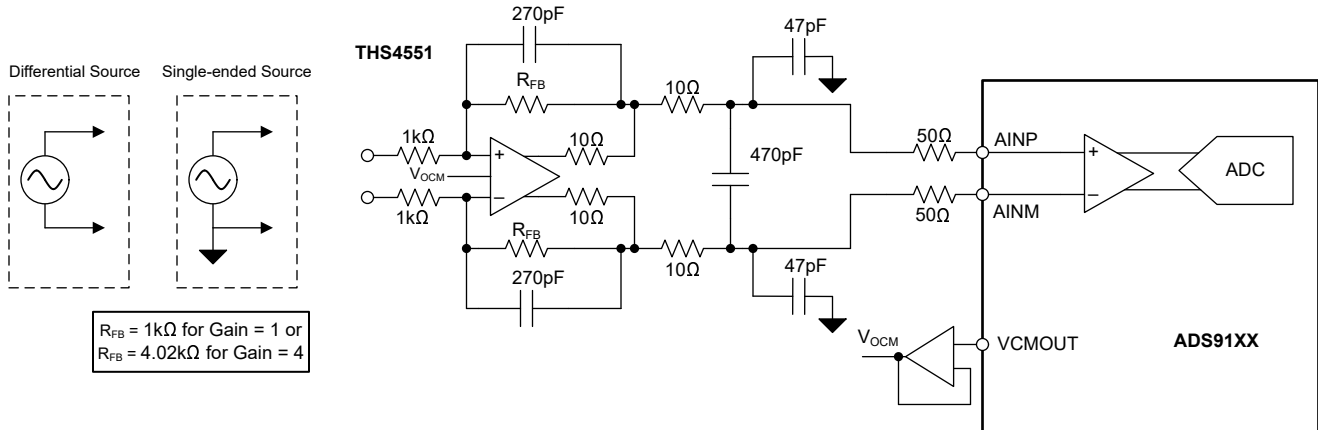

Figure 9-4. Data Acquisition (DAQ) Circuit for a $\leq 100\text{kHz}$ Input Signal Bandwidth

9.2.2.1 Design Requirements

Table 9-2 lists the parameters for this typical application.

Table 9-2. Design Parameters

PARAMETER	VALUE
SNR	$\geq 91\text{dB}$
THD	$\leq -110\text{dB}$
Input signal frequency	$\leq 100\text{kHz}$

9.2.2.2 Application Curves

Figure 9-5 and Figure 9-6 show the FFT plots for the circuit in Figure 9-4.

Figure 9-5. Typical FFT at 10MSPS/Channel:
ADS9118

Figure 9-6. Typical FFT at 5MSPS/Channel:
ADS9117

9.2.3 Data Acquisition (DAQ) Circuit for a $\leq 1\text{MHz}$ Input Signal Bandwidth

Figure 9-7 shows a solution with minimum external components. This signal-chain significantly reduces signal-chain size by driving the ADS9119 with the **THS4541**, which enables low-distortion performance with low power over wide signal bandwidth.

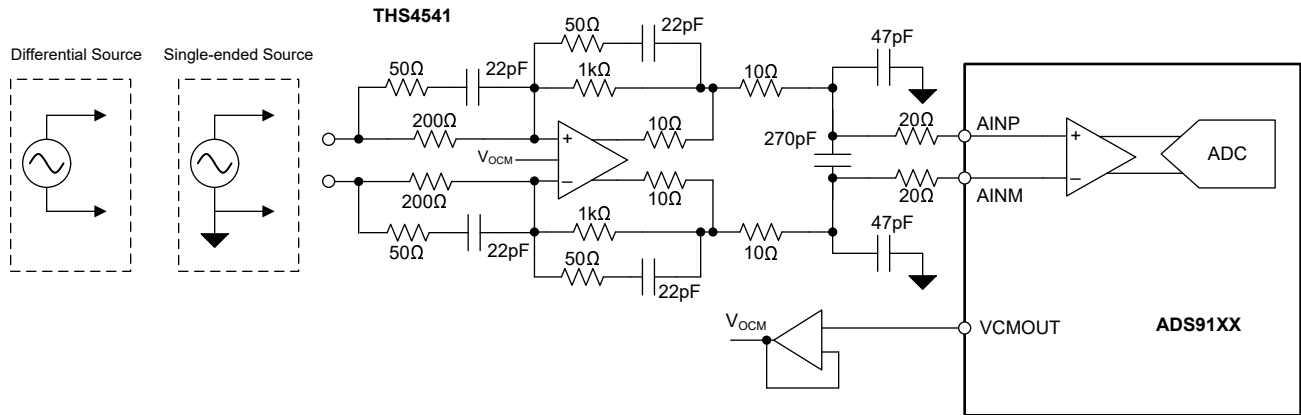

Figure 9-7. Data Acquisition (DAQ) Circuit for a $\leq 1\text{MHz}$ Input Signal Bandwidth

9.2.3.1 Design Requirements

Table 9-3 lists the parameters for this typical application.

Table 9-3. Design Parameters

PARAMETER	VALUE
SNR	$\geq 80\text{dB}$
THD	$\leq -100\text{dB}$
Input signal frequency	$\leq 1\text{MHz}$

9.2.3.2 Application Curves

Figure 9-8 and Figure 9-9 show the FFT plots for the circuit in Figure 9-7.

Figure 9-8. Typical FFT at 10MSPS/Channel:
ADS9118

Figure 9-9. Typical FFT at 5MSPS/Channel:
ADS9117

9.3 Power Supply Recommendations

The ADS911x has two independent power supplies, AVDD_5V and VDD_1V8. The AVDD_5V supply provides power to the ADC driver. The VDD_1V8 supply provides power to the analog circuits and the digital interface. Set the AVDD_5 and VDD_1V8 supplies independently to voltages within the permissible range. [Figure 9-10](#) shows how to decouple the power supplies.

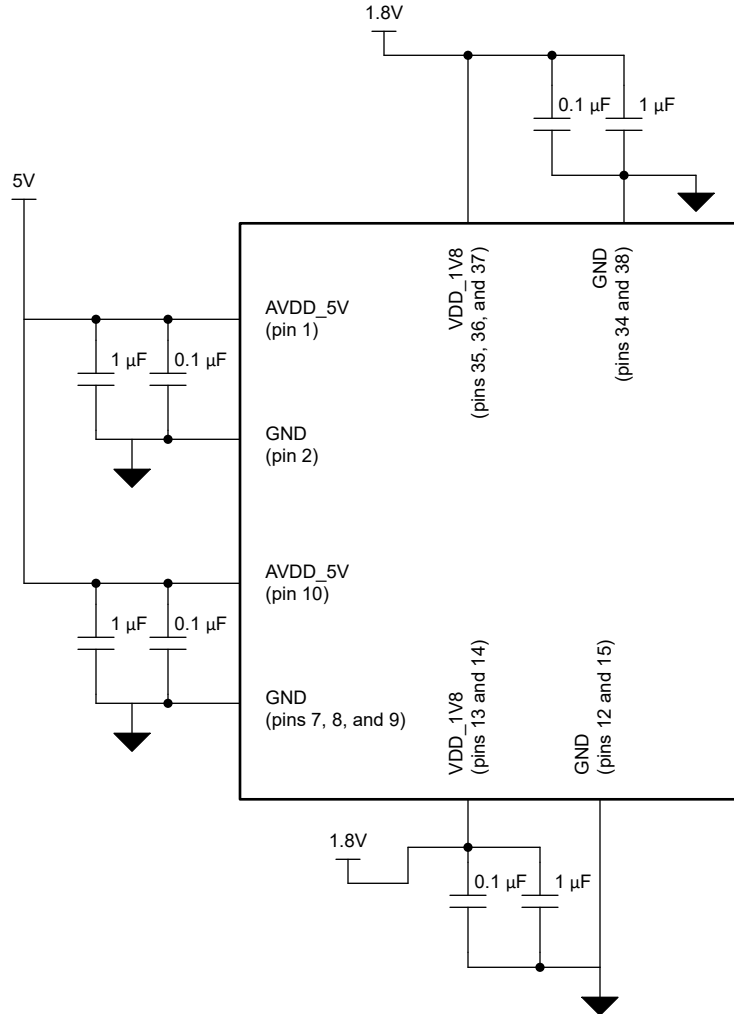

Figure 9-10. Power-Supply Decoupling

9.4 Layout

9.4.1 Layout Guidelines

Figure 9-11 shows a board layout example for the ADS911x. Avoid crossing digital lines with the analog signal path and keep the analog input signals and the reference signals away from noise sources. Use 0.1 μ F ceramic bypass capacitors in close proximity to the analog (AVDD_5V and VDD_1V8) and digital (VDD_1V8) power-supply pins. Avoid placing vias between the power-supply pins and the bypass capacitors. Place the reference decoupling capacitor close to the device REFIO and REFM pins. Avoid placing vias between the REFIO pin and the bypass capacitors. Connect the GND and REFM pins to a ground plane using short, low-impedance paths.

9.4.2 Layout Example

Figure 9-11. Example Layout

10 Device and Documentation Support

TI offers an extensive line of development tools. Tools and software to evaluate the performance of the device, generate code, and develop solutions are listed below.

10.1 Documentation Support

10.1.1 Related Documentation

For related documentation, see the following:

10.2 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on ti.com. Click on *Notifications* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

10.3 Support Resources

TI E2E™ [support forums](#) are an engineer's go-to source for fast, verified answers and design help — straight from the experts. Search existing answers or ask your own question to get the quick design help you need.

Linked content is provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

10.4 Trademarks

TI E2E™ is a trademark of Texas Instruments.
All trademarks are the property of their respective owners.

10.5 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

10.6 Glossary

[TI Glossary](#) This glossary lists and explains terms, acronyms, and definitions.

11 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

DATE	REVISION	NOTES
May 2025	*	Initial Release

12 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

12.1 Mechanical Data

PACKAGE OUTLINE

RHA0040C

VQFN - 1 mm max height

PLASTIC QUAD FLATPACK - NO LEAD

NOTES:

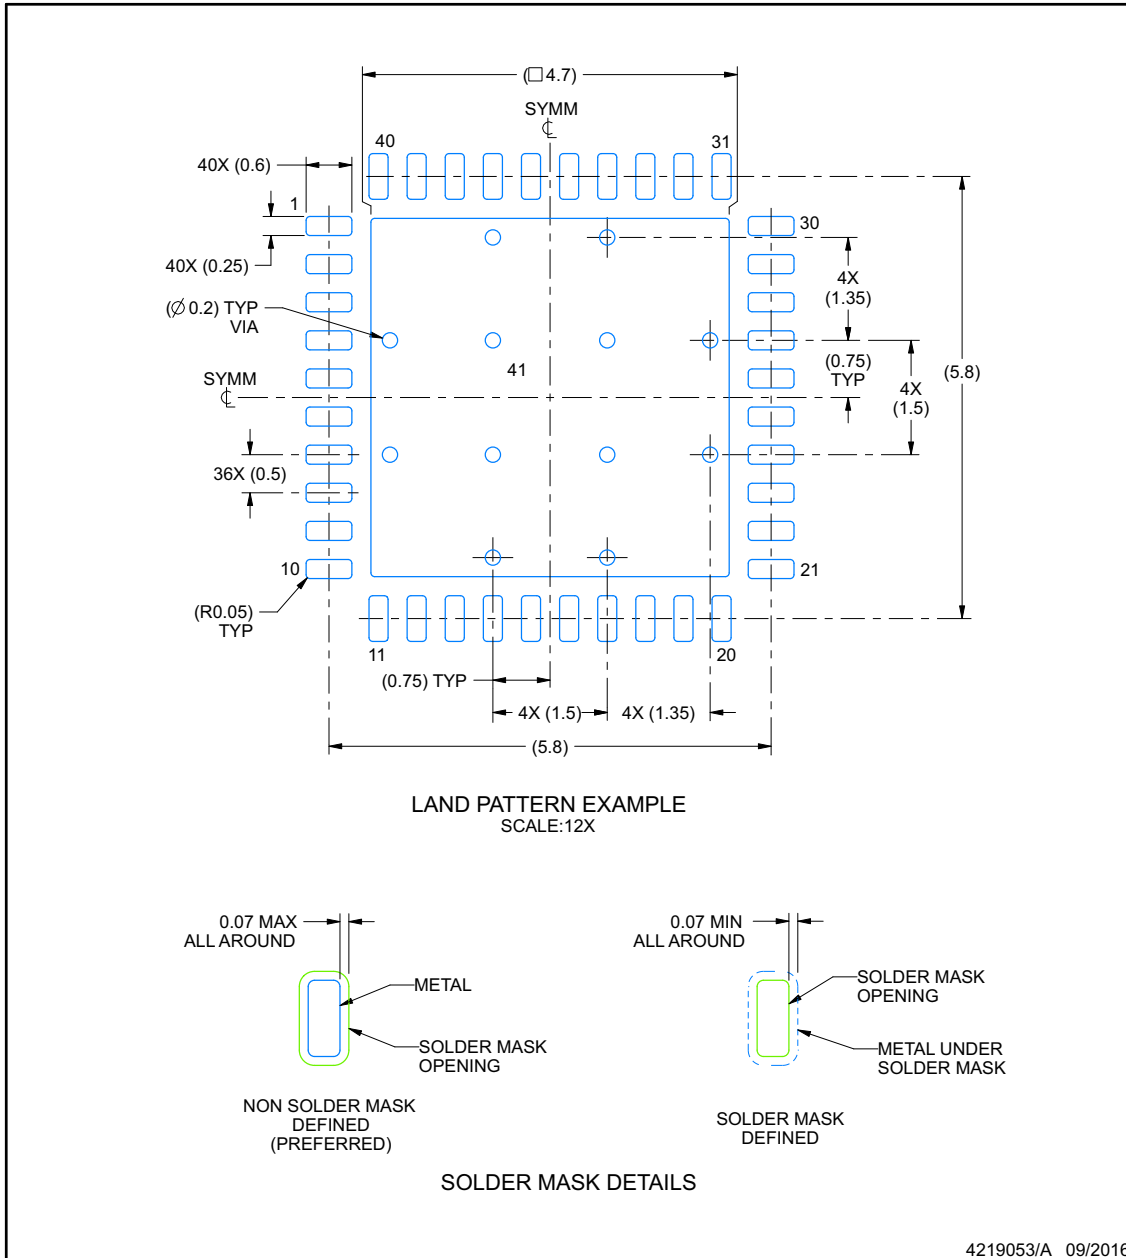

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. The package thermal pad must be soldered to the printed circuit board for thermal and mechanical performance.

EXAMPLE BOARD LAYOUT

RHA0040C

VQFN - 1 mm max height

PLASTIC QUAD FLATPACK - NO LEAD

NOTES: (continued)

- This package is designed to be soldered to a thermal pad on the board. For more information, see Texas Instruments literature number SLUA271 (www.ti.com/lit/sl原因271).
- Vias are optional depending on application, refer to device data sheet. If any vias are implemented, refer to their locations shown on this view. It is recommended that vias under paste be filled, plugged or tented.

www.ti.com

EXAMPLE STENCIL DESIGN

RHA0040C

VQFN - 1 mm max height

PLASTIC QUAD FLATPACK - NO LEAD

NOTES: (continued)

6. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.

PACKAGING INFORMATION

Orderable part number	Status (1)	Material type (2)	Package Pins	Package qty Carrier	RoHS (3)	Lead finish/ Ball material (4)	MSL rating/ Peak reflow (5)	Op temp (°C)	Part marking (6)
ADS9117RHAR	Active	Production	VQFN (RHA) 40	2500 LARGE T&R	Yes	NIPDAU	Level-3-260C-168 HR	-40 to 125	ADS9117
ADS9118RHAR	Active	Production	VQFN (RHA) 40	2500 LARGE T&R	Yes	NIPDAU	Level-3-260C-168 HR	-40 to 125	ADS9118
ADS9119RHAR	Active	Production	VQFN (RHA) 40	2500 LARGE T&R	Yes	NIPDAU	Level-3-260C-168 HR	-40 to 125	ADS9119

(1) **Status:** For more details on status, see our [product life cycle](#).

(2) **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

(3) **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

(4) **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

(5) **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "-" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

TAPE AND REEL INFORMATION

QUADRANT ASSIGNMENTS FOR PIN 1 ORIENTATION IN TAPE

*All dimensions are nominal

Device	Package Type	Package Drawing	Pins	SPQ	Reel Diameter (mm)	Reel Width W1 (mm)	A0 (mm)	B0 (mm)	K0 (mm)	P1 (mm)	W (mm)	Pin1 Quadrant
