

## LM2936 Ultra-Low Quiescent Current LDO Voltage Regulator

### 1 Features

- LM2936 Operating  $V_{IN}$  range of 5.5 V to 40 V
- LM2936HV Operating  $V_{IN}$  range of 5.5 V to 60 V
- Ultra Low Quiescent Current ( $I_Q \leq 15 \mu\text{A}$  for  $I_{OUT} = 100 \mu\text{A}$ )
- Fixed 3-V, 3.3-V or 5-V with 50-mA Output
- $\pm 2\%$  Initial Output Tolerance
- $\pm 3\%$  Output Tolerance Over Line, Load, and Temperature
- Dropout Voltage Typically 200 mV at  $I_{OUT} = 50 \text{ mA}$
- $-24\text{-V}$  Input Voltage Protection
- $-50\text{-V}$  Input Transient Protection
- Internal Short Circuit Current Limit
- Internal Thermal Shutdown Protection
- Shutdown Pin Available with LM2936BM Package

### 2 Applications

- Automotive
- Industrial Controls
- Point of Load

### 3 Description

The LM2936 ultra-low quiescent current regulator features low dropout voltage and low current in the standby mode. With less than  $15\text{-}\mu\text{A}$  quiescent current at a  $100\text{-}\mu\text{A}$  load, the LM2936 is ideally suited for automotive and other battery operated systems. The LM2936 retains all of the features that are common to low dropout regulators including a low dropout PNP pass device, short circuit protection, reverse battery protection, and thermal shutdown. The LM2936 has a  $40\text{-V}$  maximum operating voltage limit, a  $-40^\circ\text{C}$  to  $125^\circ\text{C}$  operating temperature range, and  $\pm 3\%$  output voltage tolerance over the entire output current, input voltage, and temperature range. The LM2936 is available in a TO-92 through-hole package, as well as SOIC-8, VSSOP, SOT-223, and TO-252 surface mount packages.

#### Device Information<sup>(1)</sup>

PART NUMBER	PACKAGE	BODY SIZE (NOM)
LM2936	SOIC (8)	4.90 mm x 3.91 mm
	TO-252 (3)	6.10 mm x 6.58 mm
	VSSOP (8)	3.00 mm x 3.00 mm
	SOT-223 (4)	6.50 mm x 3.50 mm
	TO-92 (3)	4.30 mm x 4.30 mm

(1) For all available packages, see the orderable addendum at the end of the datasheet.

#### Simplified Schematic

\* Required if regulator is located more than 2" from power supply filter capacitor.

\*\* Required for stability. See [Electrical Characteristics for 3-V LM2936](#) for required values. Must be rated over intended operating temperature range. Effective series resistance (ESR) is critical, see [Typical Characteristics](#). Locate capacitor as close as possible to the regulator output and ground pins. Capacitance may be increased without bound.

### Pin Functions

NAME	PIN						I/O	DESCRIPTION
	D (LM2936BM)	D (LM2936M)	NDP	DGK	DCY	LP		
IN	8	8	1	8	1	3	I	Unregulated input voltage.
GND	2, 3, 6, 7	2, 3, 6, 7	4	7	2, 4	2	—	Ground.
OUT	1	1	3	1	3	1	O	Regulated output voltage. Requires a minimum output capacitance, with specific ESR, on this pin to maintain stability.
SD	5	—	—	—	—	—	I	Shutdown. LM2936BM only. Pull this pin HIGH (> 2 V) to turn the output OFF. If this pin is left open, pulled low (< 0.6 V), or connected to GND, the output will be ON by default. Avoid having any voltage between 0.6 V and 2 V on this pin as the output status may not be predictable across the operating range.
NC	4	4, 5	—	2, 3, 4, 5, 6	—	—	—	No internal connection, Connect to GND, or leave open.

## 6 Specifications

### 6.1 Absolute Maximum Ratings <sup>(1)(2)</sup>

	MIN	MAX	UNIT
Input voltage (survival)	-50	60	V
Power dissipation <sup>(3)</sup>	Internally limited		
Junction temperature (T <sub>JMAX</sub> )		150	°C
Storage temperature, T <sub>stg</sub>	-65	150	

- (1) *Absolute Maximum Ratings* indicate limits beyond which damage to the device may occur. DC and AC electrical specifications do not apply when operating the device beyond its specified operating ratings.
- (2) If Military/Aerospace specified devices are required, please contact the TI Sales Office/ Distributors for availability and specifications.
- (3) The maximum power dissipation is a function of T<sub>J(MAX)</sub>, R<sub>θJA</sub>, and T<sub>A</sub>. The maximum allowable power dissipation at any ambient temperature is  $P_D = (T_{J(MAX)} - T_A) / R_{\theta JA}$ . If this dissipation is exceeded, the die temperature can rise above the T<sub>J(MAX)</sub> of 150°C, and the LM2936 may go into thermal shutdown.

### 6.2 ESD Ratings

	VALUE	UNIT
V <sub>(ESD)</sub> Electrostatic discharge Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 <sup>(1)</sup>	±2000	V

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process. .

### 6.3 Recommended Operating Conditions

	MIN	MAX	UNIT
Temperature, T <sub>J</sub>	-40	125	°C
Input voltage, V <sub>IN</sub> , LM2936	5.5	40	V
Input voltage, V <sub>IN</sub> , LM2936HV only	5.5	60	V
Shutdown pin voltage, V <sub>SD</sub> , LM2936BM only	0	40	V

### 6.4 Thermal Information

THERMAL METRIC <sup>(1)</sup>	LM2936					UNIT
	SOIC (D)	TO-252 (NDP)	VSSOP (DGK)	SOT-223 (DCY)	TO-92 (LP)	
	8 PINS	3 PINS	8 PINS	4 PINS	3 PINS	
R <sub>θJA</sub> Junction-to-ambient thermal resistance	111.4	50.5	173.4	62.8	156.8	°C/W
R <sub>θJC(top)</sub> Junction-to-case (top) thermal resistance	56.3	52.6	65.9	44.2	80.4	
R <sub>θJB</sub> Junction-to-board thermal resistance	51.9	29.7	94.9	11.7	n/a	
ψ <sub>JT</sub> Junction-to-top characterization parameter	10.9	4.8	9.6	3.6	24.5	
ψ <sub>JB</sub> Junction-to-board characterization parameter	51.4	29.3	93.3	11.6	136.0	
R <sub>θJC(bot)</sub> Junction-to-case (bottom) thermal resistance	n/a	1.6	n/a	n/a	n/a	

- (1) For more information about traditional and new thermal metrics, see the *IC Package Thermal Metrics* application report, [SPRA953](#).

## 6.5 Electrical Characteristics for 3-V LM2936

 $V_{IN} = 14\text{ V}$ ,  $I_{OUT} = 10\text{ mA}$ ,  $T_J = 25^\circ\text{C}$ , unless otherwise specified.

PARAMETER	TEST CONDITIONS	MIN <sup>(1)</sup>	TYP <sup>(2)</sup>	MAX <sup>(1)</sup>	UNIT

## 7 Detailed Description

### 7.1 Overview

The LM2936 ultra-low quiescent current regulator features low dropout voltage and low current in the standby mode. With less than 15  $\mu\text{A}$  quiescent current at a 100- $\mu\text{A}$  load, the LM2936 is ideally suited for automotive and other battery operated systems. The LM2936 retains all of the features that are common to low dropout regulators including a low dropout PNP pass device, short circuit protection, reverse battery input protection, and thermal shutdown. The LM2936 has a 40-V maximum operating voltage limit, a  $-40^{\circ}\text{C}$  to  $125^{\circ}\text{C}$  operating temperature range, and  $\pm 3\%$  output voltage tolerance over the entire output current, input voltage, and temperature range.

### 7.3 Feature Description

#### 7.3.1 High Input Operating Voltage

Unlike many other PNP low dropout regulators, the LM2936 remains fully operational with  $V_{\text{IN}} = 40\text{ V}$ , and the LM2936HV remains fully operational with  $V_{\text{IN}} = 60\text{ V}$ . Owing to power dissipation characteristics of the available packages, full output current cannot be ensured for all combinations of ambient temperature and input voltage.

While the LM2936HV maintains regulation to 60 V, it will not withstand a short circuit to ground on the output when  $V_{\text{IN}}$  is above 40 V because of safe operating area limitations in the internal PNP pass device. Above 60V the LM2936 will break down with catastrophic effects on the regulator and possibly the load as well. Do not use this device in a design where the input operating voltage may exceed 40 V, or where transients are likely to exceed 60 V.

#### 7.3.2 Thermal Shutdown (TSD)

The TSD circuitry of the LM2936 has been designed to protect the device against temporary thermal overload conditions. The TSD circuitry is not intended to replace proper heat-sinking. Continuously running the LM2936 device at TSD may degrade device reliability as the junction temperature will be exceeding the absolute maximum junction temperature rating. If the LM2936 goes into TSD mode, the output current will be shut off until the junction temperature falls approximately  $10^{\circ}\text{C}$ , then the output current will automatically be restored. The LM2936 will continuously cycle in and out of TSD until the condition is corrected. The LM2936 TSD junction temperature is typically  $160^{\circ}\text{C}$ .

## Feature Description (continued)

### 7.3.3 Short-Circuit Current Limit

The output current limiting circuitry of the LM2936 has been designed to limit the output current in cases where the load impedance is unusually low. This includes situations where the output may be shorted directly to ground. Continuous operation of the LM2936 at the current limit will typically result in the LM2936 transitioning into TSD mode.

### 7.3.4 Shutdown (SD) Pin

The LM2936BM has a pin for shutting down the regulator output. Applying a Logic Level High ( $> 2\text{ V}$ ) to the SD pin will cause the output to turn off. Leaving the SD pin open, connecting it to Ground, or applying a Logic Level Low ( $< 0.6\text{ V}$ ) will allow the regulator output to turn on.

## 7.4 Device Functional Modes

The LM2936 design does not include any undervoltage lockout (UVLO), or overvoltage shutdown (OVSD) functions. Generally, the output voltage will track the input voltage until the input voltage is greater than  $V_{\text{OUT}} + 1\text{ V}$ . When the input voltage is greater than  $V_{\text{OUT}} + 1\text{ V}$  the LM2936 will be in linear operation, and the output voltage will be regulated; however, the device will be sensitive to any small perturbation of the input voltage. Device dynamic performance is improved when the input voltage is at least  $2\text{ V}$  greater than the output voltage.

## 8 Application and Implementation

### NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### 8.1 Application Information

The LM2936 ultra-low quiescent current regulator features low dropout voltage and low current in the standby mode. The LM2936 has a 40-V maximum operating voltage limit, a  $-40^{\circ}\text{C}$  to  $125^{\circ}\text{C}$  operating temperature range,  $-24\text{-V}$  input voltage protection and  $\pm 3\%$  output voltage tolerance over the entire output current, input voltage, and temperature range. This following section presents a simplified discussion of the design process. Also the WEBENCH<sup>®</sup> software may be used to generate complete designs. When generating a design, WEBENCH utilizes iterative design procedure and accesses comprehensive databases of components. Please go to [www.ti.com](http://www.ti.com) for more details.

### 8.2 Typical Application

Figure 21 shows the typical application circuit for the LM2936. For the LM2936 5-V option, the output capacitor,  $C_{\text{OUT}}$ , must have a capacitance value of at least  $10\ \mu\text{F}$  with an equivalent series resistance (ESR) of at least  $300\ \text{m}\Omega$ , but no more than  $8\ \Omega$ . For the LM2936 3.3-V and 3-V options, the output capacitor,  $C_{\text{OUT}}$ , must have a capacitance value of at least  $22\ \mu\text{F}$  with an ESR of at least  $300\ \text{m}\Omega$ , but no more than  $8\ \Omega$ . The minimum capacitance value and the ESR requirements apply across the entire expected operating ambient temperature range.

\*  $C_{\text{IN}}$  is required only if the regulator is located more than 3 inches from the power-supply-filter capacitors.

\*\* Required for stability.  $C_{\text{OUT}}$  must be at least  $10\ \mu\text{F}$  for the LM2936 5-V option, and at least  $22\ \mu\text{F}$  for the 3.3-V and 3-V options. Capacitance must be maintained over entire expected operating temperature range, and located as close as possible to the regulator. The ESR, of the  $C_{\text{OUT}}$  capacitor must at least  $300\ \text{m}\Omega$ , but no more than  $8\ \Omega$ .

Figure 21. LM2936 Typical Application

#### 8.2.1 Design Requirements

Table 1. Design Parameters

DESIGN PARAMETER	EXAMPLE VALUE
Output voltage	5 V
Input voltage	10 V to 26 V
Output current requirement	1 mA to 50 mA
Input capacitor	0.1 $\mu\text{F}$
Output capacitance	10 $\mu\text{F}$ minimum
Output capacitor ESR value	300 $\text{m}\Omega$ to 8 $\Omega$

## 8.2.2 Detailed Design Procedure

### 8.2.2.1 External Capacitors

The output capacitor is critical to maintaining regulator stability, and must meet the required conditions for both ESR and minimum amount of capacitance.

#### 8.2.2.1.1 Minimum Capacitance

The minimum output capacitance required to maintain stability is at least 10  $\mu\text{F}$  for the LM2936 5-V option, and at least 22  $\mu\text{F}$  for the 3.3-V and 3-V options. This value may be increased without limit. Larger values of output capacitance will give improved transient response.

#### 8.2.2.1.2 ESR Limits

The ESR of the output capacitor will cause loop instability if it is too high, or too low. ESR, of the  $C_{\text{OUT}}$  capacitor must at least 300 m $\Omega$ , but no more than 8  $\Omega$ .

### 8.2.2.2 Output Capacitor ESR

It is essential that the output capacitor meet the capacitance and ESR requirements, or oscillations can result. The ESR is used with the output capacitance in

Ceramic capacitors (MLCC) can be used for  $C_{\text{OUT}}$  only if a series resistor is added to simulate the ESR requirement. The ESR is not optional, it is mandatory. Typically, a 500-m $\Omega$  to 1- $\Omega$  series resistor is used for this purpose. When using ceramic capacitors, due diligence must be given to initial tolerances, capacitance derating due to applied DC voltage, and capacitance variations due to temperature. Dielectric types X5R and X7R are preferred.

## 8.2.3 Application Curve

**Figure 22. LM2936  $V_{\text{OUT}}$  vs.  $V_{\text{IN}}$**

## 9 Power Supply Recommendations

This device is designed to operate from an input supply voltage from at least  $V_{\text{OUT}} + 1\text{ V}$  up to a maximum of 40 V. The input supply should be well regulated and free of spurious noise. To ensure that the LM2936 output voltage is well regulated the input supply should be at least  $V_{\text{OUT}} + 2\text{ V}$ . A capacitor at the IN pin may not be specifically required if the bulk input supply filter capacitors are within three inches of the IN pin, but adding one will not be detrimental to operation.

While the LM2936 maintains regulation to  $V_{\text{IN}} = 60\text{ V}$ , it will not withstand a short circuit on the output with  $V_{\text{IN}}$  above 40 V because of safe operating area limitations in the internal PNP pass device. With  $V_{\text{IN}}$  above 60 V the LM2936 will break down with catastrophic effects on the regulator and possibly the load as well. Do not use this device in a design where the input operating voltage, including transients, is likely to exceed 60 V.

## 10 Layout

### 10.1 Layout Guidelines

The dynamic performance of the LM2936 is dependent on the layout of the PCB. PCB layout practices that are adequate for typical LDOs may degrade the PSRR, noise, or transient performance of the LM2936. Best performance is achieved by placing  $C_{IN}$  and  $C_{OUT}$  on the same side of the PCB as the LM2936, and as close as is practical to the package. The ground connections for  $C_{IN}$  and  $C_{OUT}$  should be back to the LM2936 ground pin using as wide, and as short, of a copper trace as is practical.

Connections using long trace lengths, narrow trace widths, and/or connections through vias should be avoided as these will add parasitic inductances and resistances that will give inferior performance, especially during transient conditions

### 10.2 Layout Examples

**Figure 23. LM2936BM SOIC (D) Layout**

**Figure 24. LM2936M SOIC (D) Layout**

**Figure 25. LM2936 TO-252 (NDP) Layout**

### 10.3 Thermal Considerations

Due to the power dissipation characteristics of the available packages ( $R_{\theta JA}$ ), full output current cannot be ensured for all combinations of ambient temperature and input voltage.

Exceeding the maximum allowable power dissipation as defined by the final package  $R_{\theta JA}$  will cause excessive die junction temperature, and the regulator may go into thermal shutdown.

Power dissipation,  $P_D$ , is calculated from the following formula:

$$P_D = ((V_{IN} - V_{OUT}) \times I_{OUT}) + (V_{IN} \times I_{GND}) \quad (1)$$

## Thermal Considerations (continued)

**Figure 26. Current Paths for Power Dissipation Calculation**

Knowing the power dissipation ( $P_D$ ), the thermal resistance of the package ( $R_{\theta JA}$ ), and the ambient temperature ( $T_A$ ), the junction temperature ( $T_J$ ) can be estimated using the following formula:

$$T_J = (P_D \times R_{\theta JA}) + T_A \quad (2)$$

Knowing the thermal resistance of the package ( $R_{\theta JA}$ ), the ambient temperature ( $T_A$ ), and the maximum allowed operating junction temperature ( $T_J$ ) of 125°C, the maximum power dissipation can be estimated using the following formula:

$$P_{D(MAX)} = (125^\circ\text{C} - T_A) / R_{\theta JA} \quad (3)$$

Alternately, solving for the required thermal resistance ( $R_{\theta JA}$ ):

$$R_{\theta JA} = (125^\circ\text{C} - T_A) / P_{D(MAX)} \quad (4)$$

The maximum allowed  $P_D$  information from [Equation 3](#) can be used to estimate the maximum allowed load current ( $I_{OUT}$ ), or the maximum allowed  $V_{IN}$ :

$$V_{IN(MAX)} = (P_{D(MAX)} / I_{OUT}) + V_{OUT} \quad (5)$$

$$I_{OUT(MAX)} = (P_{D(MAX)} / (V_{IN} - V_{OUT})) \quad (6)$$

As an example, an application requires :  $V_{IN} = 14\text{ V}$ ,  $V_{OUT} = 5\text{ V}$ ,  $I_{OUT} = 25\text{ mA}$ , and  $T_A = 85^\circ\text{C}$ . Find the maximum  $R_{\theta JA}$  to keep the junction temperature under 125°C.

$$R_{\theta JA} \leq (125^\circ\text{C} - T_A) / P_{D(MAX)} \quad (7)$$

$$R_{\theta JA} \leq (125^\circ\text{C} - 85^\circ\text{C}) / ((14\text{ V} - 5\text{ V}) \times 0.025\text{ A}) \quad (8)$$

$$R_{\theta JA} \leq 40^\circ\text{C} / 0.225\text{ W} \quad (9)$$

$$R_{\theta JA} \leq 177^\circ\text{C/W} \quad (10)$$

The EIA/JEDEC standard (JESD51-2) provides methodologies to estimate the junction temperature from external measurements ( $\Psi_{JB}$  references the temperature at the PCB, and  $\Psi_{JT}$  references the temperature at the top surface of the package) when operating under steady-state power dissipation conditions. These methodologies have been determined to be relatively independent of the copper thermal spreading area that may be attached to the package DAP when compared to the more typical  $R_{\theta JA}$ . Refer to Texas Instruments Application Report *Semiconductor and IC Package Thermal Metrics* ([SPRA953](#)), for specifics.

On the 8-pin SOIC (D) package, the four ground pins are thermally connected to the backside of the die. Adding approximately 0.04 square inches of 2 oz. copper pad area to these four pins will improve the JEDEC  $R_{\theta JA}$  rating from 111.4°C/W to approximately 100°C/W. If this extra copper area is placed directly beneath the SOIC package there should not be any impact on board density.

The LM2936 has an internally set thermal shutdown point of typically 160°C. Thermal shutdown is outside the ensured operating temperature range and is intended as a safety feature only. Continuous operation near the thermal shutdown temperature should be avoided as it may have a negative affect on the life of the device.

## 11 Device and Documentation Support

### 11.1 Documentation Support

#### 11.1.1 Related Documentation

For related documentation see the following:

Texas Instruments Application Report *Semiconductor and IC Package Thermal Metrics* ([SPRA953](#))

### 11.2 Trademarks

WEBENCH is a registered trademark of Texas Instruments.  
All other trademarks are the property of their respective owners.

### 11.3 Electrostatic Discharge Caution

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

### 11.4 Glossary

[SLYZ022](#) — *TI Glossary*.

This glossary lists and explains terms, acronyms, and definitions.

## 12 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

<sup>(1)</sup> **Status:** For more details on status, see our [product life cycle](#).

<sup>(2)</sup> **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

<sup>(3)</sup> **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

<sup>(4)</sup> **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

<sup>(5)</sup> **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

<sup>(6)</sup> **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative

and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

# PACKAGE OUTLINE

VSSOP - 1.1 mm max height

SMALL OUTLINE PACKAGE

**NOTES:**

PowerPAD is a trademark of Texas Instruments.

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.15 mm per side.
4. This dimension does not include interlead flash. Interlead flash shall not exceed 0.25 mm per side.
5. Reference JEDEC registration MO-187.
