

## SN55HVD233-SP 3.3-V Radiation Hardened CAN Transceiver

### 1 Features

- QMLV (QML Class V) Radiation Hardness Assured (RHA) MIL-PRF 38535 Qualified, SMD 5962L1420901VXC
  - Single Event Latch-up (SEL) Immune to 86 MeV-cm<sup>2</sup>/mg at 125°C
  - Total Ionizing Dose (TID) immune up 50 kRad (Si) at Low Dose Rate
  - Qualified over the Military Temperature Range (–55°C to 125°C)
  - High-Performance 8-Pin Ceramic Flat Pack (HKX)
- Compatible With ISO 11898-2
- Bus Pins Fault Protection Exceeds ±16 V
- Bus Pins ESD Protection Exceeds ±16 kV HBM
- Data Rates up to 1 Mbps
- Extended –7-V to 12-V Common Mode Range
- High Input Impedance Allows for 120 Nodes
- LVTTL I/Os are 5-V Tolerant
- Adjustable Driver Transition Times for Improved Signal Quality
- Unpowered Node Does Not Disturb the Bus
- Low Current Standby Mode, 200-µA Typical
- Loopback for Diagnostic Functions
- Thermal Shutdown Protection
- Power Up and Power Down With Glitch-Free Bus Inputs and Outputs
  - High Input Impedance With Low V<sub>CC</sub>
  - Monolithic Output During Power Cycling

### 2 Applications

- Spacecraft Backplane Data Bus Communication and Control
- CAN Bus Standards Such As CANopen, DeviceNet, CAN Kingdom, ISO 11783, NMEA 2000, SAE J1939

### 3 Description

The SN55HVD233-SP is used in spacecraft applications employing the controller area network (CAN) serial communication physical layer in accordance with the ISO 11898 standard. As a CAN transceiver, the device provides transmit and receive capability between the differential CAN bus and a CAN controller, with signaling rates up to 1 Mbps.

Designed for operation in especially harsh radiation environments, the SN55HVD233-SP features cross-wire, overvoltage, and loss of ground protection to ±16 V, overtemperature (thermal shutdown) protection. This device operates over a wide –7-V to 12-V common mode range. This transceiver is the interface between the host CAN controller on the microprocessor, FPGA, or ASIC, and the differential CAN bus used in satellite applications.

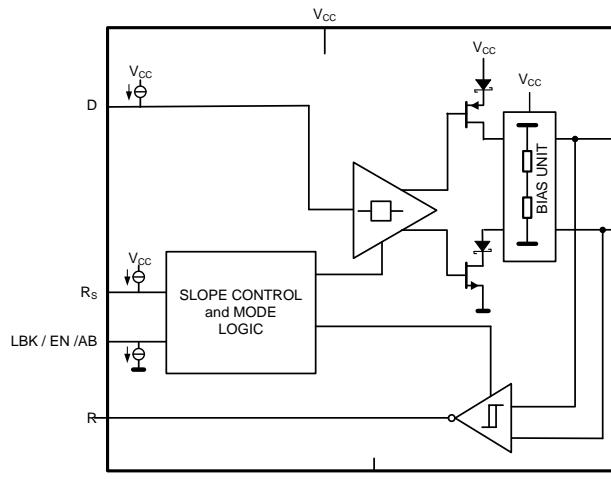

### Device Information<sup>(1)</sup>

PART NUMBER	GRADE	PACKAGE
5962L1420901VXC	QMLV RHA [50 kRad]	8-lead CFP [HKX] 6.48 mm x 6.48 mm
HVD233HKX/EM <sup>(2)</sup>	Engineering Samples	8-lead CFP [HKX] 6.48 mm x 6.48 mm
SN55HVD233EVM-CVAL	Ceramic Evaluation Board	

(1) For all available packages, see the orderable addendum at the end of the data sheet.

(2) These units are intended for engineering evaluation only. They are processed to a noncompliant flow. These units are not suitable for qualification, production, radiation testing or flight use. Parts are not warranted for performance over the full MIL specified temperature range of –55°C to 125°C or operating life.

## 4 Revision History

Changes from Original (September 2017) to Revision A	Page
• Changed the device status from <i>Advance Information</i> to <i>Production Data</i>	1

## 5 Description (continued)

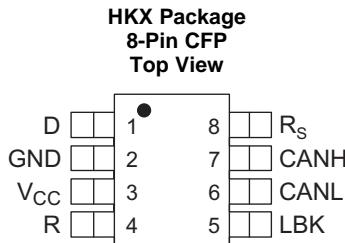

Modes: The  $R_S$ , pin 8 of the SN55HVD233-SP, provides for three modes of operation: high-speed, slope control, or low-power standby mode. The user selects the high-speed mode of operation by connecting pin 8 directly to ground, allowing the driver output transistors to switch on and off as fast as possible with no limitation on the rise and fall slope. The user can adjust the rise and fall slope by connecting a resistor to ground at pin 8, because the slope is proportional to the pin's output current. Slope control is implemented with a resistor values of  $0\ \Omega$  to achieve a single ended slew rate of approximately  $38\ V/\mu s$  up to a value of  $50\ k\Omega$  to achieve approximately  $4\ V/\mu s$  slew rate. For more information about slope control, refer to the [Application and Implementation](#) section.

The SN55HVD233-SP enters a low-current standby (listen-only) mode during which the driver is switched off and the receiver remains active if a high logic level is applied to pin 8. The local protocol controller reverses this low-current standby mode when it needs to transmit to the bus. For more information on the loopback mode, refer to the [Application Information](#) section.

Loopback: A logic high on the loopback LBK pin 5 of the SN55HVD233-SP places the bus output and bus input in a high-impedance state. The remaining circuit remains active and available for driver-to-receiver loopback, self-diagnostic node functions without disturbing the bus.

CAN bus states: The CAN bus has two states during powered operation of the device: dominant and recessive. A dominant bus state is when the bus is driven differentially, corresponding to a logic low on the D and R pin. A recessive bus state is when the bus is biased to  $V_{CC}/2$  through the high-resistance internal input resistors  $R_{IN}$  of the receiver, corresponding to a logic high on the D and R pins (see [Bus States \(Physical Bit Representation\)](#) and [Simplified Recessive Common Mode Bias and Receiver](#)).

## 6 Pin Configuration and Functions

### Pin Functions

PIN		TYPE	DESCRIPTION
NAME	NO.		
D	1	I	CAN transmit data input (LOW for dominant and HIGH for recessive bus states), also called TXD, driver input.
GND	2	GND	Ground connection.
Vcc	3	Supply	Transceiver 3.3-V supply voltage.
R	4	O	CAN receive data output (LOW for dominant and HIGH for recessive bus states), also called RXD, receiver output.
LBK	5	I	Loopback mode input pin.
CANL	6	I/O	Low-level CAN bus line.
CANH	7	I/O	High-level CAN bus line.
$R_S$	8	I	Mode select pin: Tie to GND = high-speed mode, Strong pullup to $V_{CC}$ = low power mode, $0\ \Omega$ to $50\ k\Omega$ pulldown to GND = slope control mode.

## 7 Specifications

### 7.1 Absolute Maximum Ratings

over operating junction temperature unless otherwise noted<sup>(1)(2)</sup>

		MIN	MAX	UNIT
$V_{CC}$	Supply voltage	-0.3	7	V
	Voltage at any bus pin (CANH or CANL)	-16	16	V
	Voltage input, transient pulse, CANH and CANL, through 100 $\Omega$ (see Figure 18)	-100	100	V
$V_I$	Input voltage, (D, RS, LBK)	-0.5	7	V
$V_O$	Output voltage, (R)	-0.5	7	V
$I_O$	Receiver output current	-10	10	mA
$T_J$	Operating junction temperature		150	$^{\circ}\text{C}$
$T_{stg}$	Storage temperature	-65	150	$^{\circ}\text{C}$

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

(2) All voltage values, except differential I/O bus voltages, are with respect to network ground pin.

### 7.2 ESD Ratings

		VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 <sup>(1)</sup>	V
		Other pins	
	Charged-device model (CDM), per JEDEC specification JESD22-C101, all pins <sup>(2)</sup>	$\pm 500$	

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

### 7.3 Recommended Operating Conditions

		MIN	NOM	MAX	UNIT
$V_{CC}$	Supply voltage	3	3.6	3.6	V
	Voltage at any bus pin (separately or common mode)	-7	12	12	V
$V_{IH}$	High-level input voltage	D, LBK	2	5.5	V
$V_{IL}$	Low-level input voltage	D, LBK	0	0.8	V
$V_{ID}$	Differential input voltage		-6	6	V
	Resistance from RS to ground for slope control		0	50	k $\Omega$
$V_{I(RS)}$	Input voltage at RS for standby		0.75 $V_{CC}$	5.5	V
$I_{OH}$	High-level output current	Driver	-50		mA
		Receiver	-10		
$I_{OL}$	Low-level output current	Driver		50	mA
		Receiver		10	
$T_J$	Operating junction temperature <sup>(1)</sup>		-55	125	$^{\circ}\text{C}$

(1) Maximum junction temperature operation is allowed as long as the device maximum junction temperature is not exceeded.

## 7.4 Thermal Information

THERMAL METRIC <sup>(1)(2)</sup>	SN55HVD233-SP	UNIT
	HKX (CFP)	
	8 PINS	
R <sub>θJA</sub>	Junction-to-ambient thermal resistance	97.1
R <sub>θJC(top)</sub>	Junction-to-case (top) thermal resistance	21.5
R <sub>θJB</sub>	Junction-to-board thermal resistance	79.1
Ψ <sub>JT</sub>	Junction-to-top characterization parameter	13.7
Ψ <sub>JB</sub>	Junction-to-board characterization parameter	73.6
R <sub>θJC(bot)</sub>	Junction-to-case (bottom) thermal resistance	7.0

(1) All values except R<sub>θJC</sub> were taken on a JEDEC-51 standard High-K PCB using a nominal lead form. Differences in lead form, component density, or PCB design can affect these values.

(2) For more information about traditional and new thermal metrics, see the *Semiconductor and IC Package Thermal Metrics* application report, [SPRA953](#).

## 7.5 Driver Electrical Characteristics

The specifications shown below are valid across temperature range of  $-55^{\circ}\text{C}$  to  $125^{\circ}\text{C}$  pre-radiation and  $25^{\circ}\text{C}$  post-radiation. When different, the post-radiation values are shown in a separate row specified by the corresponding RHA level ( $L = 50$  krad).

PARAMETER		TEST CONDITIONS	SUBGROUP <sup>(1)</sup>	MIN	TYP <sup>(2)</sup>	MAX	UNIT
$V_{O(D)}$	Bus output voltage (dominant)	$V_{(D)} = 0 \text{ V}$ , $V_{(RS)} = 0 \text{ V}$ , see <a href="#">Figure 12</a> and <a href="#">Figure 13</a>	[1, 2, 3]	2.4	$V_{CC}$	1.25	V
	CANL			0.5			
$V_O$	Bus output voltage (recessive)	$V_{(D)} = 3 \text{ V}$ , $V_{(RS)} = 0 \text{ V}$ , see <a href="#">Figure 12</a> and <a href="#">Figure 13</a>	[1, 2, 3]		2.3	2.3	V
	CANL						
$V_{OD(D)}$	Differential output voltage (dominant)		[1, 2, 3]	1.5	2	3	V
				1.4			
$V_{OD}$	Differential output voltage (recessive)		[1, 2, 3]	1.2	2	3	mV
$V_{OC(pp)}$	Peak-to-peak common-mode output voltage		See <a href="#">Figure 20</a>			1	V
$I_{IH}$	High-level input current	D, LBK	$V_{(D)} = 2 \text{ V}$	[1, 2, 3]	-30	30	$\mu\text{A}$
$I_{IL}$	Low-level input current	D, LBK	$V_{(D)} = 0.8 \text{ V}$	[1, 2, 3]	-30	30	$\mu\text{A}$
$I_{OS}$	Short-circuit output current		$V_{(CANH)} = -7 \text{ V}$ , CANL open, see <a href="#">Figure 23</a>	[1, 2, 3]	-250	1	mA
			$V_{(CANH)} = 12 \text{ V}$ , CANL open, see <a href="#">Figure 23</a>	[1, 2, 3]			
			$V_{(CANL)} = -7 \text{ V}$ , CANH open, see <a href="#">Figure 23</a>	[1, 2, 3]	-1		
			$V_{(CANL)} = 12 \text{ V}$ , CANH open, see <a href="#">Figure 23</a>	[1, 2, 3]		250	
$C_O$	Output capacitance		See receiver input capacitance				
$I_{IRS(s)}$	RS input current for standby		$V_{(RS)} = 0.75 V_{CC}$	[1, 2, 3]	-10		$\mu\text{A}$
$I_{CC}$	Supply current	Standby	$V_{(RS)} = V_{CC}$ , $V_{(D)} = V_{CC}$ , $V_{(LBK)} = 0 \text{ V}$	[1, 2, 3]	200	600	$\mu\text{A}$
		Dominant	$V_{(D)} = 0 \text{ V}$ , no load, $V_{(LBK)} = 0 \text{ V}$ , $RS = 0 \text{ V}$	[1, 2, 3]		6	mA
		Recessive	$V_{(D)} = V_{CC}$ , no load, $V_{(LBK)} = 0 \text{ V}$ , $V_{(RS)} = 0 \text{ V}$	[1, 2, 3]		6	

(1) For subgroup definitions, please see [Table 1](#).

(2) All typical values are at  $25^{\circ}\text{C}$  and with a 3.3-V supply.

## 7.6 Receiver Electrical Characteristics

The specifications shown below are valid across temperature range of  $-55^{\circ}\text{C}$  to  $125^{\circ}\text{C}$  pre-radiation and  $25^{\circ}\text{C}$  post-radiation. When different, the post-radiation values are shown in a separate row specified by the corresponding RHA level ( $L = 50$  krad).

PARAMETER		TEST CONDITIONS	SUBGROUP <sup>(1)</sup>	MIN	TYP <sup>(2)</sup>	MAX	UNIT
$V_{IT+}$	Positive-going input threshold voltage	$V_{(LBK)} = 0 \text{ V}$ , see <a href="#">Table 2</a>	[1, 2, 3]		750	900	mV
$V_{IT-}$	Negative-going input threshold voltage			500	650		mV
$V_{hys}$	Hysteresis voltage ( $V_{IT+} - V_{IT-}$ )				100		mV
$V_{OH}$	High-level output voltage	$I_O = -4 \text{ mA}$ , see <a href="#">Figure 17</a>	[1, 2, 3]	2.4			V
$V_{OL}$	Low-level output voltage	$I_O = 4 \text{ mA}$ , see <a href="#">Figure 17</a>	[1, 2, 3]			0.4	V

(1) For subgroup definitions, please see [Table 1](#).

(2) All typical values are at  $25^{\circ}\text{C}$  and with a 3.3-V supply.

## Receiver Electrical Characteristics (continued)

The specifications shown below are valid across temperature range of  $-55^{\circ}\text{C}$  to  $125^{\circ}\text{C}$  pre-radiation and  $25^{\circ}\text{C}$  post-radiation. When different, the post-radiation values are shown in a separate row specified by the corresponding RHA level (L = 50 krad).

PARAMETER		TEST CONDITIONS	SUBGROUP <sup>(1)</sup>	MIN	TYP <sup>(2)</sup>	MAX	UNIT
I <sub>I</sub>	Bus input current	V <sub>(CANH)</sub> or V <sub>(CANL)</sub> = 12 V	Other bus pin = 0 V, V <sub>(D)</sub> = 3 V, V <sub>(LBK)</sub> = 0 V, V <sub>(RS)</sub> = 0 V	[1, 2, 3]	150	500	μA
		V <sub>(CANH)</sub> or V <sub>(CANL)</sub> = 12 V, V <sub>CC</sub> = 0 V		[1, 2, 3]	150	600	
		CANH or CANL = -7 V		[1, 2, 3]	-610	-100

## 9 Detailed Description

### 9.1 Overview

The SN55HVD233-SP is used in applications employing the CAN serial communication physical layer in accordance with the ISO 11898 standard. As a CAN transceiver, the device provides transmit and receive capability between the differential CAN bus and a CAN controller, with signaling rates up to 1 Mbps.

Designed for operation in especially harsh environments, the SN55HVD233-SP features cross-wire, overvoltage, and loss of ground protection to  $\pm 16$  V, overtemperature (thermal shutdown) protection, and common-mode transient protection of  $\pm 100$  V. This device operates over a wide  $-7$ -V to  $12$ -V common mode range. This transceiver is the interface between the host CAN controller on the microprocessor, FPGA, or ASIC, and the differential CAN bus used in satellite applications.

### 9.3 Feature Description

#### 9.3.1 Modes

The  $R_S$ , pin 8 of the SN55HVD233-SP, provides for three modes of operation: high-speed, slope control, or low-power standby mode. The user selects the high-speed mode of operation by connecting pin 8 directly to ground, allowing the driver output transistors to switch on and off as fast as possible with no limitation on the rise and fall slope. The user can adjust the rise and fall slope by connecting a resistor to ground at pin 8, because the slope is proportional to the pin's output current. Slope control is implemented with a resistor values of  $0\ \Omega$  to achieve a single ended slew rate of approximately  $38\ V/\mu s$  up to a value of  $50\ k\Omega$  to achieve approximately  $4\ V/\mu s$  slew rate. For more information about slope control, refer to [Application and Implementation](#).

The SN55HVD233-SP enters a low-current standby (listen-only) mode during which the driver is switched off and the receiver remains active if a high logic level is applied to pin 8. The local protocol controller reverses this low-current standby mode when it needs to transmit to the bus.

## Feature Description (continued)

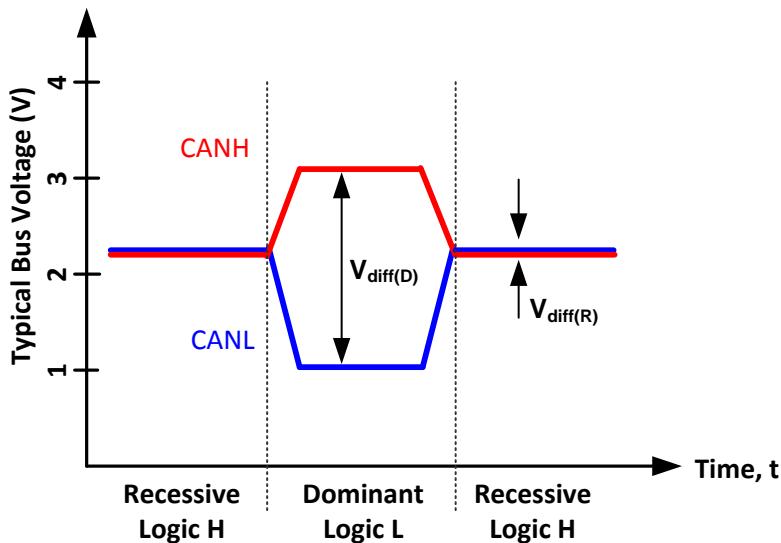

### 9.3.2 Loopback

A logic high on the loopback LBK pin 5 of the SN55HVD233-SP places the bus output and bus input in a high-impedance state. The remaining circuit remains active and available for driver-to-receiver loopback, self-diagnostic node functions without disturbing the bus. For more information on the loopback mode, refer to the [Application Information](#).

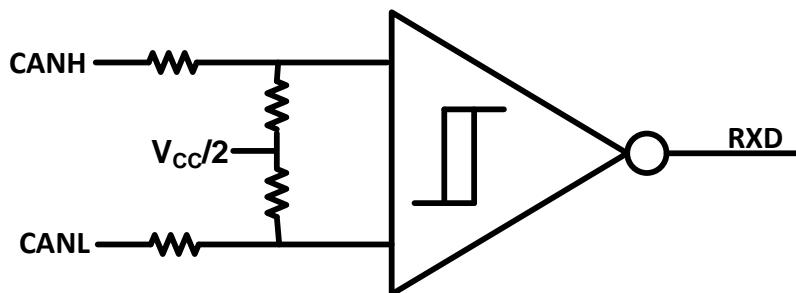

## Feature Description (continued)

### 9.3.3 CAN Bus States

The CAN bus has two states during powered operation of the device: dominant and recessive. A dominant bus state is when the bus is driven differentially, corresponding to a logic low on the D and R pin. A recessive bus state is when the bus is biased to  $V_{CC} / 2$  through the high-resistance internal input resistors  $R_{IN}$  of the receiver, corresponding to a logic high on the D and R pins (see [Figure 25](#) and [Figure 26](#)).

**Figure 25. Bus States (Physical Bit Representation)**

**Figure 26. Simplified Recessive Common Mode Bias and Receiver**

### 9.3.4 ISO 11898 Compliance of SN55HVD233-SP

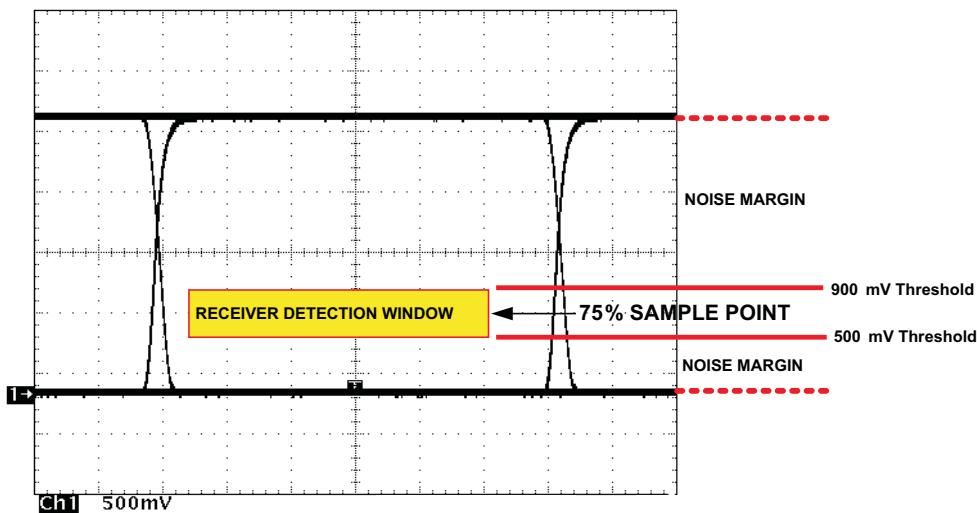

#### 9.3.4.1 Introduction

Many users value the low-power consumption of operating their CAN transceivers from a 3.3-V supply. However, some users are concerned about the interoperability with 5-V supplied transceivers on the same bus. This report analyzes this situation to address those concerns.

#### 9.3.4.2 Differential Signal

CAN is a differential bus where complementary signals are sent over two wires and the voltage difference between the two wires defines the logical state of the bus. The differential CAN receiver monitors this voltage difference and outputs the bus state with a single-ended output signal.

## Feature Description (continued)

**Figure 27. Typical SN55HVD233-SP Differential Output Voltage Waveform**

The CAN driver creates the difference in voltage between CANH and CANL in the dominant state. The dominant differential output of the SN55HVD233-SP is greater than 1.5 V and less than 3 V across a  $60\text{-}\Omega$  load. The minimum required by ISO 11898 is 1.5 V and maximum is 3 V. These are the same limiting values for 5-V supplied CAN transceivers. The bus termination resistors drive the recessive bus state and not the CAN driver.

A CAN receiver is required to output a recessive state with less than 500 mV and a dominant state with more than 900 mV difference voltage on its bus inputs. The CAN receiver must do this with common-mode input voltages from  $-2\text{ V}$  to  $7\text{ V}$ . The SN55HVD233-SP receiver meets these same input specifications as 5-V supplied receivers.

### 9.3.4.2.1 Common-Mode Signal

A common-mode signal is an average voltage of the two signal wires that the differential receiver rejects. The common-mode signal comes from the CAN driver, ground noise, and coupled bus noise. The supply voltage of the CAN transceiver has nothing to do with noise. The SN55HVD233-SP driver lowers the common-mode output in a dominant bit by a couple hundred millivolts from that of most 5-V drivers. While this does not fully comply with ISO 11898, this small variation in the driver common-mode output is rejected by differential receivers and does not effect data, signal noise margins, or error rates.

### 9.3.4.3 Interoperability of 3.3-V CAN in 5-V CAN Systems

The 3.3-V supplied CAN transceivers are electrically interchangeable with 5-V CAN transceivers. The differential output is the same. The recessive common mode output is the same. The dominant common mode output voltage is a couple hundred millivolts lower than 5 V supplied drivers, while the receivers exhibit identical specifications as 5-V devices.

To help ensure the widest interoperability possible, the SN55HVD233-SP successfully passed the internationally recognized GIFT ICT conformance and interoperability testing for CAN transceivers. Electrical interoperability does not always assure interchangeability, however. Most implementers of CAN buses recognize that ISO 11898 does not sufficiently specify the electrical layer and that strict standard compliance alone does not ensure full interchangeability. Interchangeability is ensured with thorough equipment testing.

## Feature Description (continued)

### 9.3.5 Thermal Shutdown

If the junction temperature of the device exceeds the thermal shutdown threshold, the device turns off the CAN driver circuits thus blocking the D pin to bus transmission path. The shutdown condition is cleared when the junction temperature drops below the thermal shutdown temperature of the device. The CAN bus pins are high-impedance biased to recessive level during a thermal shutdown, and the receiver-to-R pin path remains operational.

## 9.4 Device Functional Modes

**Table 3. Driver I/O**

## 10 Application and Implementation

### NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

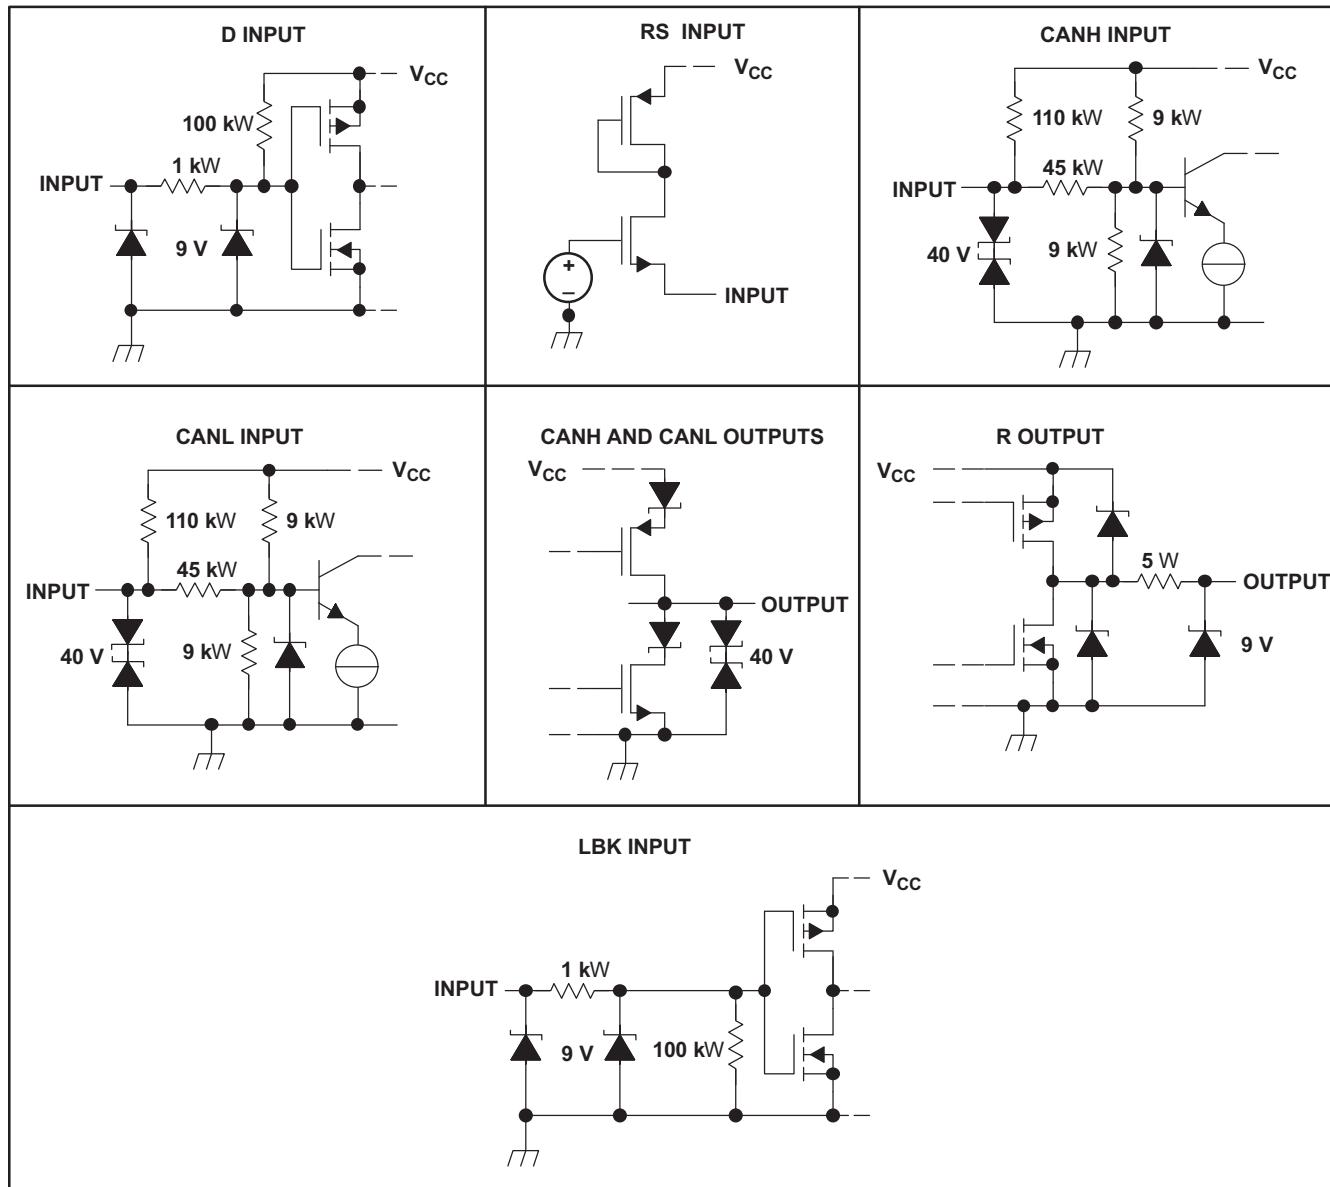

### 10.1 Application Information

#### 10.1.1 Diagnostic Loopback

The diagnostic loopback or internal loopback function of the SN55HVD233-SP is enabled with a high-level input on pin 7, LBK. This mode disables the driver output while keeping the bus pins biased to the recessive state. This mode also redirects the D data input (transmit data) through logic to the received data output (R), thus creating an internal loopback of the transmit-to-receive data path. This mimics the loopback that occurs normally with a CAN transceiver because the receiver loops back the driven output to the R (receive data) pin. This mode allows the host microprocessor to input and read back a bit sequence or CAN messages to perform diagnostic routines without disturbing the CAN bus. [Figure 33](#) shows a typical CAN bus application.

If the LBK pin is not used, it may be tied to ground (GND). However, it is pulled low internally (defaults to a low-level input) and may be left open if not in use.

**Figure 28. Equivalent Input and Output Schematic Diagrams**

## 10.2 Typical Application

Copyright © 2017, Texas Instruments Incorporated

**Figure 29. Typical Application Schematic**

### 10.2.1 Design Requirements

The High-Speed ISO 11898 Standard specifications are given for a maximum signaling rate of 1 Mbps with a bus length of 40 m and a maximum of 30 nodes. It also recommends a maximum unterminated stub length of 0.3 m. The cable is specified to be a shielded or unshielded twisted-pair with a 120-Ω characteristic impedance (Z<sub>0</sub>). The standard defines a single line of twisted-pair cable with the network topology as shown in [Figure 29](#). It is terminated at both ends with 120-Ω resistors, which match the characteristic impedance of the line to prevent signal reflections. According to ISO 11898, placing RL on a node should be avoided because the bus lines lose termination if the node is disconnected from the bus.

### 10.2.2 Detailed Design Procedure

**Table 5. Suggested Cable Length vs Signaling Rate**

BUS LENGTH (m)	SIGNALING RATE (Mbps)
40	1
100	0.5
200	0.25
500	0.1
1000	0.05

Basically, the maximum bus length is determined by, or rather is a trade-off with the selected signaling rate as listed in [Table 5](#).

A signaling rate decreases as transmission distance increases. While steady-state losses may become a factor at the longest transmission distances, the major factors limiting signaling rate as distance is increased are time varying. Cable bandwidth limitations, which degrade the signal transition time and introduce inter-symbol interference (ISI), are primary factors reducing the achievable signaling rate when transmission distance is increased.

For a CAN bus, the signaling rate is also determined from the total system delay – down and back between the two most distant nodes of a system and the sum of the delays into and out of the nodes on a bus with the typical 5 ns/m prop delay of a twisted-pair cable. Also, consideration must be given the signal amplitude loss due to resistance of the cable and the input resistance of the transceivers. Under strict analysis, skin effects, proximity to other circuitry, dielectric loss, and radiation loss effects all act to influence the primary line parameters and degrade the signal.

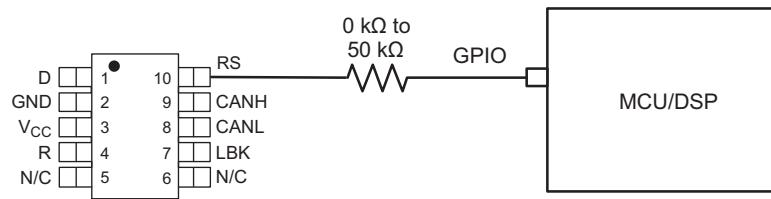

A conservative rule of thumb for bus lengths over 100 m is derived from the product of the signaling rate in Mbps and the bus length in meters, which should be less than or equal to 50.

Signaling Rate (Mbps)  $\times$  Bus Length (m)  $\leq 50$ . Operation at extreme temperatures should employ additional conservatism.

### 10.2.2.1 Slope Control

Adjust the rise and fall slope of the SN55HVD233-SP driver output by connecting a resistor from the RS (pin 8) to ground (GND), or to a low-level input voltage as shown in [Figure 30](#).

The slope of the driver output signal is proportional to the pin's output current. This slope control is implemented with an external resistor value ranging from  $0\ \Omega$  to achieve a  $\approx 38\ \text{V}/\mu\text{s}$  single ended slew rate, and up to  $50\ \text{k}\Omega$  to achieve a  $\approx 4\ \text{V}/\mu\text{s}$  slew rate as displayed in [Figure 31](#). [Figure 32](#) shows typical driver output waveforms with slope control.

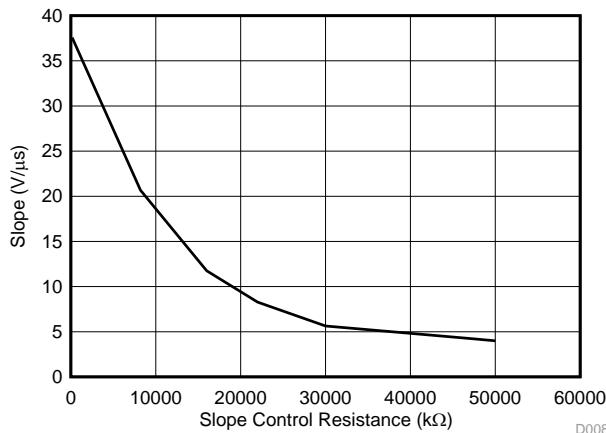

**Figure 30. Slope Control/Standy Connection to a DSP**

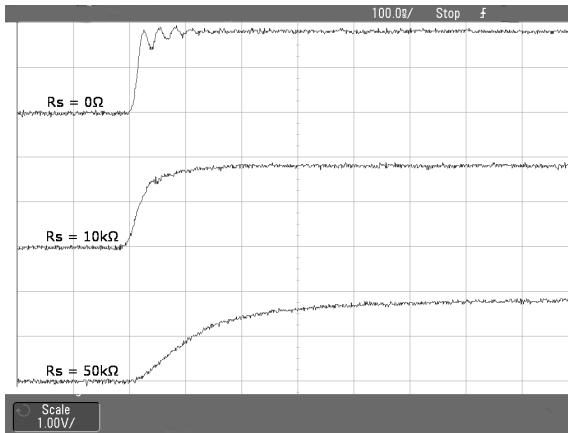

### 10.2.2.2 Standby

If a high-level input ( $> 0.75\ \text{V}_{\text{CC}}$ ) is applied to RS (pin 8), the circuit enters a low-current, listen-only standby mode during which the driver is switched off and the receiver remains active. The local controller can reverse this low-power standby mode when the rising edge of a dominant state (bus differential voltage  $> 900\text{-mV}$  typical) occurs on the bus.

### 10.2.3 Application Curves

**Figure 31. HVD233 Driver Output Signal Slope vs Slope Control Resistance Value**

**Figure 32. Typical SN55HVD233-SP 250-Kbps Output Pulse Waveforms With Slope Control**

## 11 Power Supply Recommendations

TI recommends to have localized capacitive decoupling near device VCC pin to GND. Values of 4.7  $\mu$ F at VCC pin and 10  $\mu$ F, 1  $\mu$ F, and 0.1  $\mu$ F at supply have tested well on evaluation modules.

## 12 Layout

### 12.1 Layout Guidelines

Minimize stub length from node insertion to bus.

#### 12.1.1 Bus Loading, Length, and Number of Nodes

The ISO11898 standard specifies up to 1-Mbps data rate, maximum bus length of 40 m, maximum drop line (stub) length of 0.3 m, and a maximum of 30 nodes. However, with careful network design, the system may have longer cables, longer stub lengths, and many more nodes to a bus. Many CAN organizations and standards have scaled the use of CAN for applications outside the original ISO11898 standard. They made system level trade-offs for data rate, cable length, and parasitic loading of the bus. Examples of some of these specifications are ARINC825, CANopen, CAN Kingdom, DeviceNet, and NMEA200.

A high number of nodes requires a transceiver with high input impedance and wide common mode range such as the SN55HVD233-SP CAN. ISO11898-2 specifies the driver differential output with a 60- $\Omega$  load (two 120- $\Omega$  termination resistors in parallel), and the differential output must be greater than 1.5 V. The SN55HVD233-SP is specified to meet the 1.5-V requirement with a 60- $\Omega$  load, and additionally specified with a differential output voltage minimum of 1.2 V across a common mode range of -2 to 7 V through a 330- $\Omega$  coupling network. This network represents the bus loading of 120 SN55HVD233-SP transceivers based on their minimum differential input resistance of 40 k $\Omega$ . Therefore, the SN55HVD233-SP supports up to 120 transceivers on a single bus segment with margin to the 1.2-V minimum differential input voltage requirement at each node. For CAN network design, margin must be given for signal loss across the system and cabling, parasitic loadings, network imbalances, ground offsets, and signal integrity; thus, a practical maximum number of nodes may be lower. Bus length may also be extended beyond the original ISO11898 standard of 40 m by careful system design and data rate tradeoffs. For example, CANopen network design guidelines allow the network to be up to 1 km with changes in the termination resistance, cabling, less than 64 nodes, and significantly lowered data rate.

This flexibility in CAN network design is one of the key strengths of the various extensions and additional standards that have been built on the original ISO11898 CAN standard. Using this flexibility requires good network design.

#### 12.1.2 CAN Termination

The ISO11898 standard specifies the interconnect to be a twisted pair cable (shielded or unshielded) with 120- $\Omega$  characteristic impedance ( $Z_0$ ). Use resistors equal to the characteristic impedance of the line to terminate both ends of the cable to prevent signal reflections. Keep unterminated drop lines (stubs) connecting nodes to the bus as short as possible to minimize signal reflections. The termination may be on the cable or in a node, but if nodes may be removed from the bus, the termination must be carefully placed so that it is not removed from the bus.

## Layout Guidelines (continued)

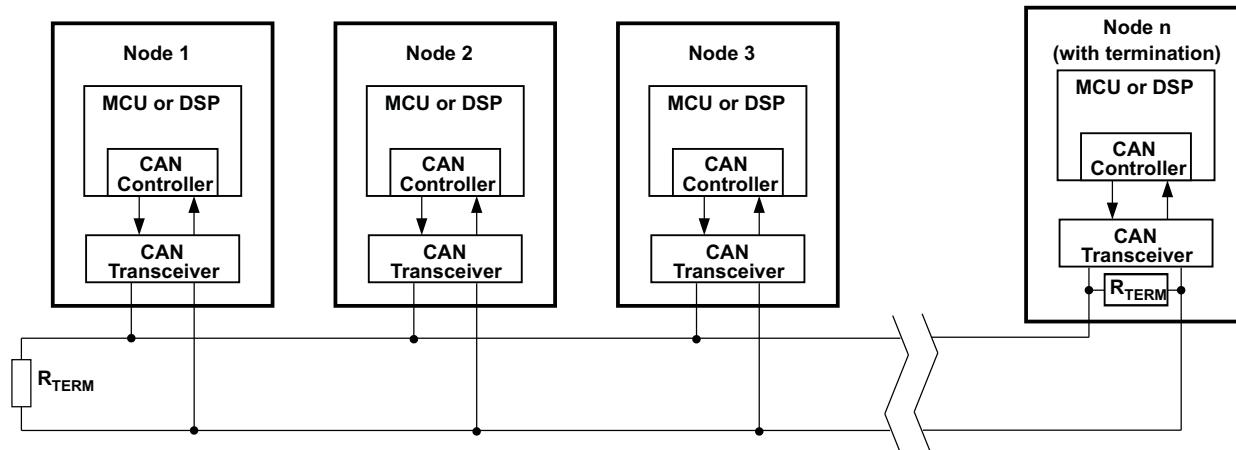

Figure 33. Typical CAN Bus

Termination is typically a  $120\text{-}\Omega$  resistor at each end of the bus. If filtering and stabilization of the common mode voltage of the bus is desired, then the user may use split termination (see Figure 34). Split termination uses two  $60\text{-}\Omega$  resistors with a capacitor in the middle of these resistors to ground. Split termination improves the electromagnetic emissions behavior of the network by eliminating fluctuations in the bus common mode voltages at the start and end of message transmissions.

Take care with the power ratings of the termination resistors used, especially for the worst-case condition (if a system power supply is shorted across the termination resistance to ground). In most cases, under the worst-case condition, much higher current passes through the termination resistance than the CAN transceiver's current limit.

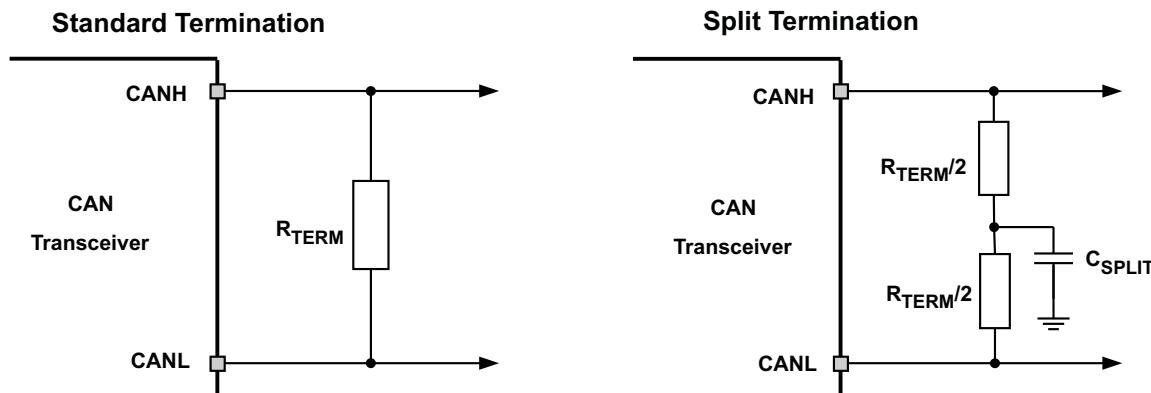

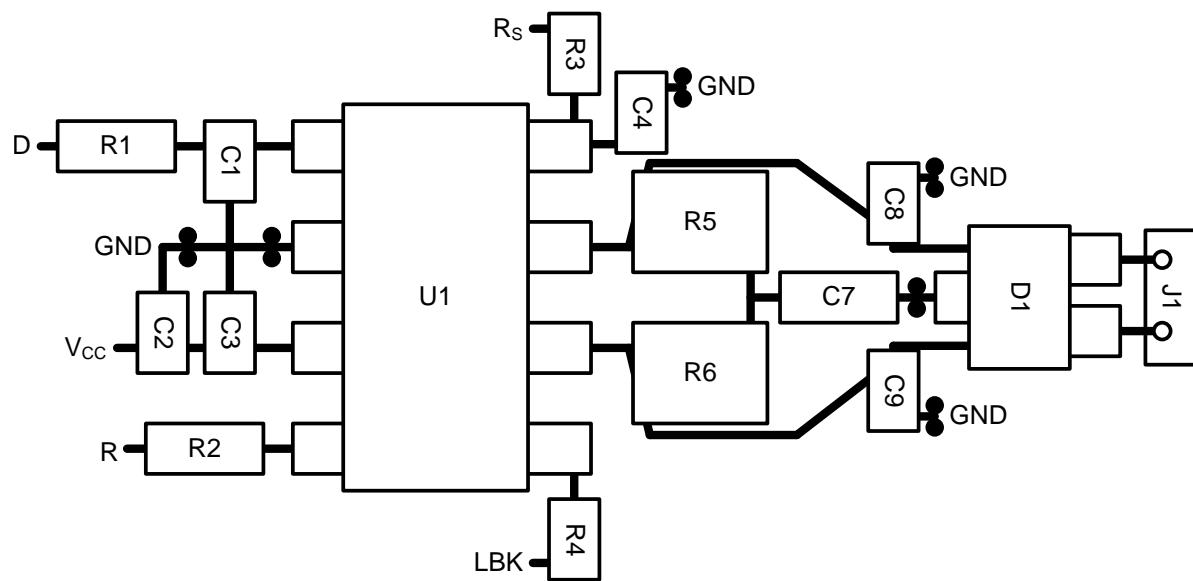

Figure 34. CAN Bus Termination Concepts

HVD233HKX/EM.A	Active	Production	CFP (HKX)   8	25   TUBE	Yes	NIAU	N/A for Pkg Type	25 to 25	HVD233HKX/EM EVAL ONLY

<sup>(1)</sup> **Status:** For more details on status, see our [product life cycle](#).

<sup>(2)</sup> **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

<sup>(3)</sup> **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

<sup>(4)</sup> **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

<sup>(5)</sup> **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

<sup>(6)</sup> **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a " ~ " will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

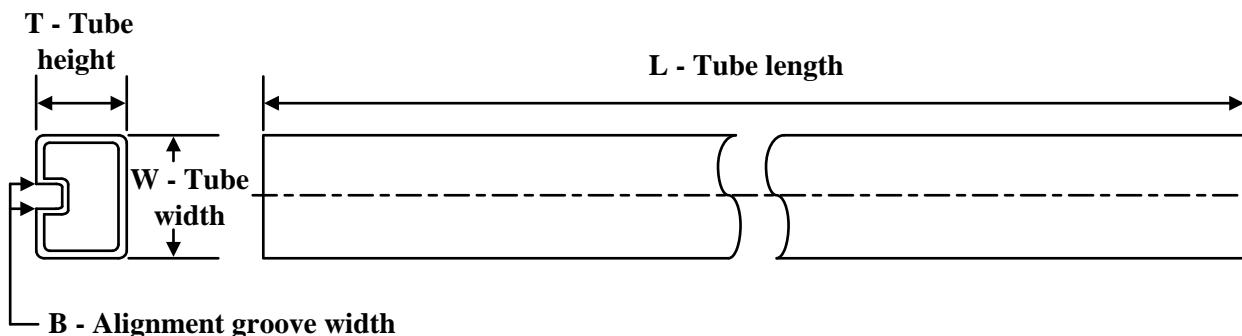

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.
