RAD-TOLERANT CLASS V, HIGH-SPEED PWM CONTROLLER

Check for Samples: UC1825-SP

FEATURES

- **QML-V Qualified, SMD 5962-87681**
- **Rad-Tolerant: 30 kRad (Si) TID** (1)
- **Compatible With Voltage- or Current-Mode Topologies**
- **Practical Operation Switching Frequencies to 1 MHz**
- **50-ns Propagation Delay-to-Output**
- **High-Current Dual Totem Pole Outputs (1.5 A Peak)**
- **Wide Bandwidth Error Amplifier**
- **Fully Latched Logic With Double-Pulse Suppression**
- **Pulse-by-Pulse Current Limiting**
- **Soft Start/Maximum Duty-Cycle Control**
- **Undervoltage Lockout With Hysteresis**
- **Low Start-Up Current (1.1 mA)**

(1) Radiation tolerance is a typical value based upon initial device qualification with dose rate = 10 mrad/sec. Radiation Lot Acceptance Testing is available - contact factory for details.

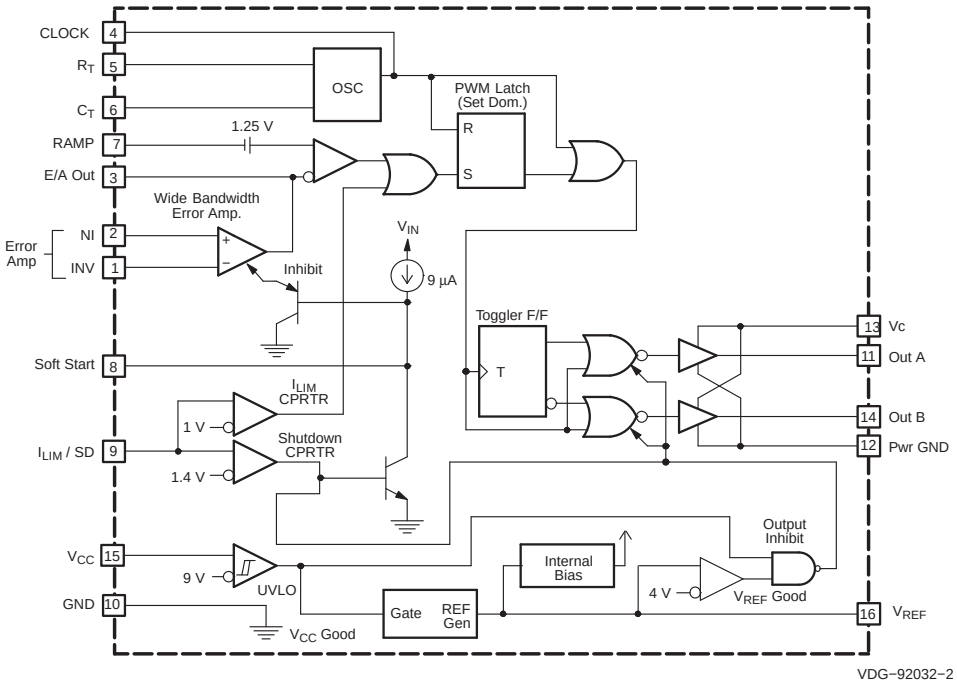
DESCRIPTION

The UC1825 PWM control device is optimized for high-frequency switched mode power supply applications. Particular care was given to minimizing propagation delays through the comparators and logic circuitry while maximizing bandwidth and slew rate of the error amplifier. This controller is designed for use in either current-mode or voltage mode systems with the capability for input voltage feed-forward.

Protection circuitry includes a current limit comparator with a 1-V threshold, a TTL compatible shutdown port, and a soft start pin which will double as a maximum duty-cycle clamp. The logic is fully latched to provide jitter-free operation and prohibit multiple pulses at an output. An undervoltage lockout section with 800 mV of hysteresis assures low start up current. During undervoltage lockout, the outputs are high impedance.

This device features totem pole outputs designed to source and sink high peak currents from capacitive loads, such as the gate of a power MOSFET. The on state is designed as a high level.

Figure 1. BLOCK DIAGRAM



This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

TERMINAL FUNCTIONS

NAME	NO.		I/O	DESCRIPTION
	J	FK		
Clock	4	5	O	Output of the internal oscillator
C_T	6	8	I	Timing capacitor connection pin for oscillator frequency programming. The timing capacitor should be connected to the device ground using minimal trace length.
E/A Out	3	4	O	Output of the error amplifier for compensation
Gnd	10	13	-	Analog ground return pin
ILIM/SD	9	12	I	Input to the current limit comparator and the shutdown comparator
INV	1	2	I	Inverting input to the error amplifier
NC		1, 6, 11, 16	-	No connection
NI	2	3	I	Non-inverting input to the error amplifier
Out A	11	14	O	High-current totem pole output A of the on-chip drive stage
Out B	14	18	O	High-current totem pole output B of the on-chip drive stage
Pwr Gnd	12	15	-	Ground return pin for the output driver stage
Ramp	7	9	I	Non-inverting input to the PWM comparator with 1.25-V internal input offset. In voltage mode operation this serves as the input voltage feed-forward function by using the CT ramp. In peak current mode operation, this serves as the slope compensation input.
R_T	5	7	I	Timing resistor connection pin for oscillator frequency programming
Soft Start	8	10	I	Soft-start input pin which also doubles as the maximum duty cycle clamp
V_C	13	17	-	Power supply pin for the output stage. This pin should be bypassed with a 0.1-µF monolithic ceramic low ESL capacitor with minimal trace lengths.
V_{CC}	15	19	-	Power supply pin for the device. This pin should be bypassed with a 0.1-µF monolithic ceramic low ESL capacitor with minimal trace lengths.
V_{REF}5.1 V	16	20	O	5.1-V reference. For stability, the reference should be bypassed with a 0.1-µF monolithic ceramic low ESL capacitor and minimal trace length to the ground plane.

PRINTED CIRCUIT BOARD LAYOUT CONSIDERATIONS

High speed circuits demand careful attention to layout and component placement. To ensure proper performance of the UC1825 follow these rules:

1. Use a ground plane.
2. Damp or clamp parasitic inductive kick energy from the gate of driven MOSFETs. Do not allow the output pins to ring below ground. A series gate resistor or a shunt 1-A Schottky diode at the output pin serves this purpose.
3. Bypass V_{CC}, V_C, and V_{REF}. Use 0.1-µF monolithic ceramic capacitors with low equivalent series inductance. Allow less than 1-cm of total lead length for each capacitor between the bypassed pin and the ground plane.
4. Treat the timing capacitor, C_T, like a bypass capacitor.

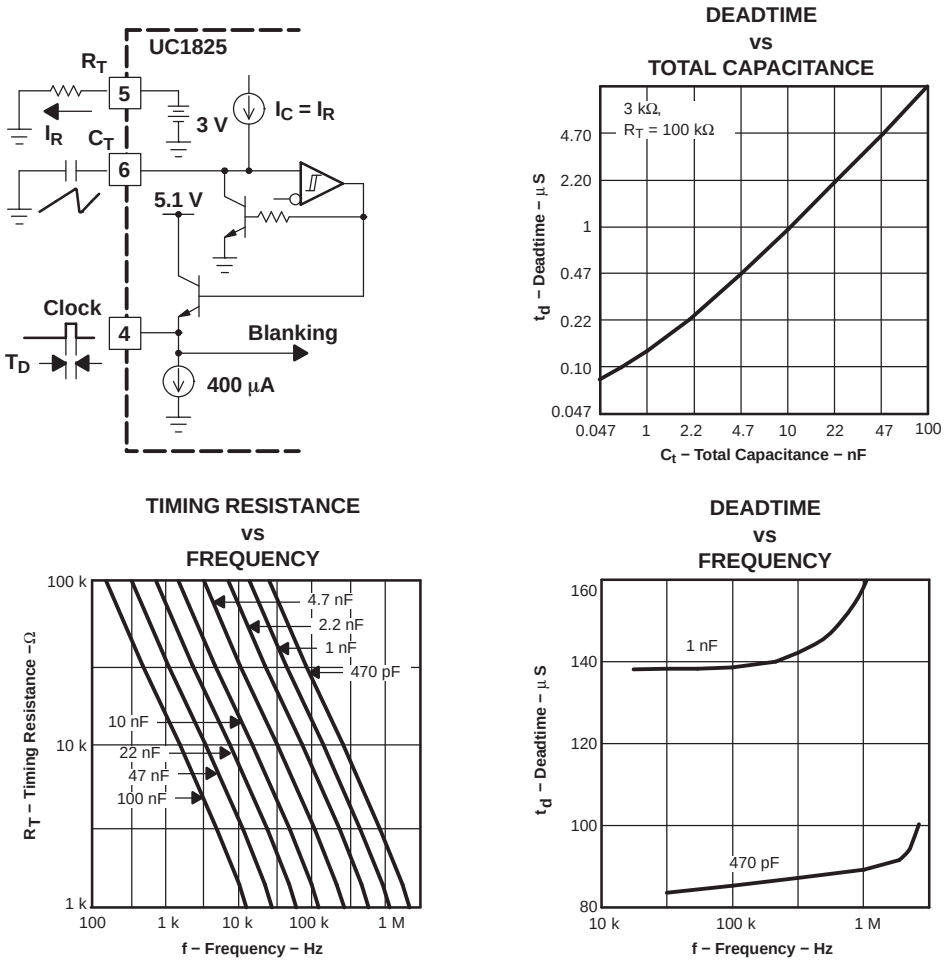

Figure 4. Oscillator Circuit

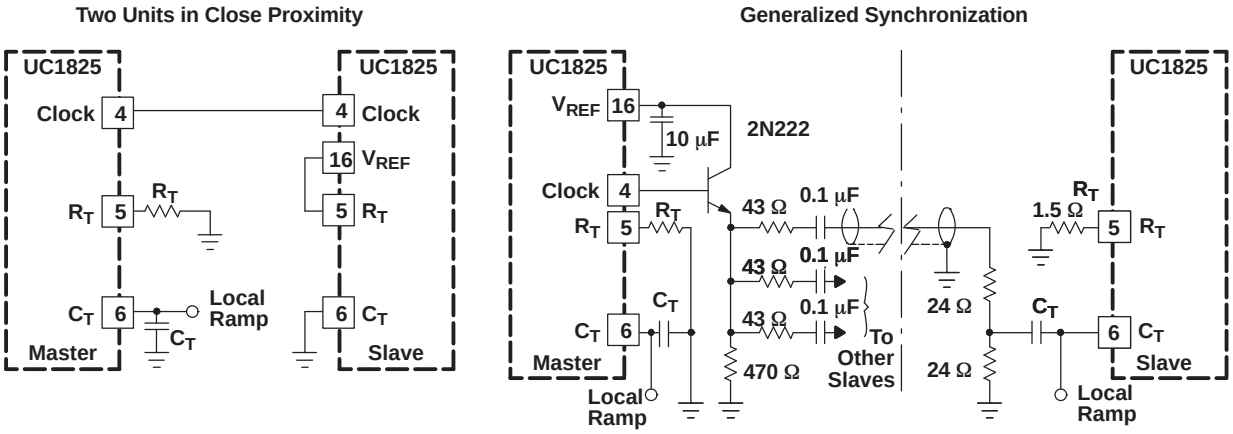

Figure 5. Synchronized Operation

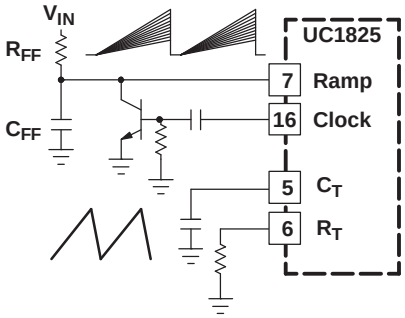

Figure 6. Forward Technique for Off-Line Voltage Mode Application

The circuit shown in Figure 6 will achieve a constant volt-second product clamp over varying input voltages. The ramp generator components, R_T and C_R are chosen so that the ramp at the ILIM/SD pin crosses the 1-V threshold at the same time the desired maximum volt-second product is reached. The delay through the functional nor block must be such that the ramp capacitor can be completely discharged during the minimum deadtime.

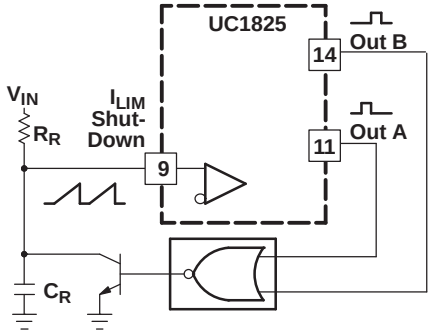

Figure 7. Constant Volt-Second Clamp Circuit

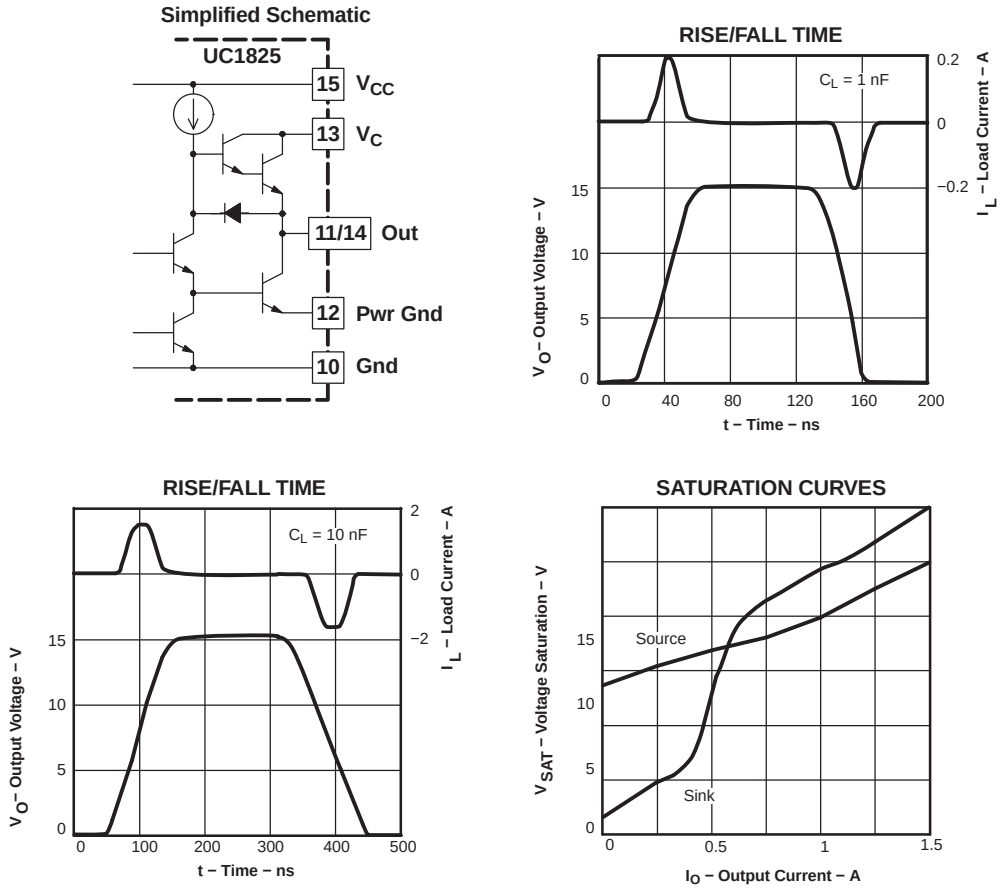

Figure 8. Output Section

The circuit in Figure 8 is useful for exercising many of the UC1825 functions and measuring their specifications.

As with any wideband circuit, careful grounding and bypass procedures should be followed. The use of a ground plane is highly recommended.

(1) **Status:** For more details on status, see our product life cycle.

(2) **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

(3) **RoHS values:** Yes, No, RoHS Exempt. See the TI RoHS Statement for additional information and value definition.

(4) **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

(5) **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.
