Table 5-1671. CFG_CCCR Register Field Descriptions

Bit	Field	Type	Reset	Description
31:15	NU18	R/W	0h	Reserved
14	TXP	R/W	0h	Transmit Pause If this bit is set, the MCAN module pauses for two CAN bit times before starting the next transmission after itself has successfully transmitted a frame(see Tx Handling) . 1'b0 = Transmit pause disabled 1'b1 = Transmit pause enabled
13	EFBI	R/W	0h	Edge Filtering durign Bus Integration 1'b0 = Edge filtering disabled 1'b1 = Two consecutive dominant tq required to detect an edge for hard synchronization
12	PXHD	R/W	0h	Protocol Exception Handling Disable 1'b0 = Protocol exception handling enabled 1'b1 = Protocol exception handling disabled Note: When protocol exception handling is disabled, the MCAN module will transmit an error frame when it detects a protocol exception condition.
11:10	NU17	R	0h	Reserved
9	BRSE	R/W	0h	Bit Rate Switch Enable 1'b0 = Bit rate switching for transmissions disabled 1'b1 = Bit rate switching for transmissions enabled Note: When CAN FD operation is disabled the MCAN_CCCR[8] FDOE = 1'b0, the MCAN_CCCR[9] BRSE bit is not evaluated.

Table 5-1671. CFG_CCCR Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
8	FDOE	R/W	0h	FD Operation Enable 1'b0 = FD operation disabled 1'b1 = FD operation enabled
7	TEST	R/W	0h	Test Mode enable 1'b0 = Normal operation. The MCAN_TEST register holds reset values. 1'b1 = Test Mode. Write access to the MCAN_TEST register enabled
6	DAR	R/W	0h	Disable Automatic Regransmission 1'b0 = Automatic retransmission of messages not transmitted successfully enabled 1'b1 = Automatic retransmission disabled
5	MON	R/W	0h	Bus Monitoring Mode The MCAN_CCCR[5] MON bit can only be set by the Host CPU when both MCAN_CCCR[1] CCE and MCAN_CCCR[0] INIT bits are set to 1. The bit can be reset by the Host CPU at any time. 1'b0 = Bus Monitoring Mode is disabled 1'b1 = Bus Monitoring Mode is enabled
4	CSR	R/W	0h	Clock Stop Request 1'b0 = No clock stop is requested 1'b1 = Clock stop requested. When clock stop is requested, first the MCAN_CCCR[0] INIT bit and then the MCAN_CCCR[3] CSA bit will be set after all pending transfer requests have been completed and the CAN bus reached idle.
3	CSA	R	0h	Clock Stop Acknowledge 1'b0 = No clock stop acknowledged 1'b1 = The MCAN module may be set in power down by stopping MCAN interface clock and MCAN functional clock
2	ASM	R/W	0h	Restriced Operation Mode The MCAN_CCCR[2] ASM bit can only be set by the Host CPU when both MCAN_CCCR[1] CCE and MCAN_CCCR[0] INIT bits are set to 1. The bit can be reset by the Host CPU at any time. For a description of the Restricted Operation Mode, see Restricted Operation Mode. 1'b0 = Normal CAN operation 1'b1 = Restricted Operation Mode active
1	CCE	R/W	0h	Configuration Change Enable 1'b0 = The Host CPU has no write access to the protected configuration registers 1'b1 = The Host CPU has write access to the protected configuration registers (while the MCAN_CCCR[0] INIT = 1)
0	INIT	R/W	1h	Initialization 1'b0 = Normal Operation 1'b1 = Initialization is started Note: Due to the synchronization mechanism between the two clock domains, there may be a delay until the value written to the MCAN_CCCR[0] INIT bit can be read back. Therefore the software has to assure that the previous value written to the MCAN_CCCR[0] INIT bit has been accepted by Reading the MCAN_CCCR[0] INIT bit before setting the MCAN_CCCR[0] INIT bit to a new value.

5.15.2.21 CFG_NBTP Register

5.15.2.21.1 CFG_NBTP Register (Offset = 21Ch) [reset = 6000A03h]

Nominal Bit Timing & Prescaler Register. Configuration of arbitration phase bit timing.
This register is only writable if the MCAN_CCCR[1] CCE and MCAN_CCCR[0] INIT bits are set. The CAN bit time may be programed in the range of 4 to 385 time quanta. The CAN time quantum may be programmed in the range of 1 to 512 MCAN functional clock periods. tq = (MCAN_NBTP[24-16] NBRP + 1) mtq. The MCAN_NBTP[15-8] NTSEG1 field is the sum of Prop_Seg and Phase_Seg1. The MCAN_NBTP[6-0] NTSEG2 field is Phase_Seg2.
Therefore the length of the bit time is (programmed values) [MCAN_NBTP[15-8] NTSEG1 + MCAN_NBTP[6-0] NTSEG2 + 3] tq or (functional values) [Sync_Seg + Prop_Seg + Phase_Seg1 + Phase_Seg2] tq.
The Information Processing Time (IPT) is zero, meaning the data for the next bit is available at the first clock edge after the sample point.

0h							

Table 5-1677. CFG_TSCV Register Field Descriptions

Bit	Field	Type	Reset	Description
31:16	NU22	R	0h	Reserved
15:0	TSC	R/W	0h	Timestamp Counter The internal/external Timestamp Counter value is captured on start of frame (both Rx and Tx). When the MCAN_TSCC[1-0] TSS = 2'b01, the Timestamp Counter is incremented in multiples of CAN bit times [1-16] depending on the configuration of the MCAN_TSCC[19-16] TCP field. A wrap around sets interrupt flag MCAN_IR[16] TSW. Write access resets the counter to zero. When the MCAN_TSCC[1-0] TSS = 2'b10, the MCAN_TSCV[15-0] TSC field reflects the external Timestamp Counter value. A write access has no impact. Note: A 'wrap around' is a change of the Timestamp Counter value from non-zero to zero not caused by write access to the MCAN_TSCV register.

5.15.2.24 CFG_TOCC Register

5.15.2.24.1 CFG_TOCC Register (Offset = 228h) [reset = FFFF0000h]

Timeout Counter Configuration
Configuration of timeout period, selection of timeout counter operation mode.

Return to Summary Table

Table 5-1683. CFG_ECR Register Field Descriptions

Bit	Field	Type	Reset	Description
31:24	NU25	R	0h	Reserved
23:16	CEL	R	0h	CAN Error Logging The counter is incremented each time when a CAN protocol error causes the Transmit Error Counter or the Receive Error Counter to be incremented. It is reset by read access to the MCAN_ECR[23-16] CEL field. The counter stops at FFh; the next increment of the MCAN_ECR[7-0] TEC or MCAN_ECR[14-8] REC fields sets interrupt flag MCAN_IR[22] ELO.
15	RP	R	0h	Recieve Error Passive 1'b0 = The Receive Error Counter is below the error passive level of 128 1'b1 = The Receive Error Counter has reached the error passive level of 128
14:8	REC	R	0h	Recieve Error Counter Actual state of the Receive Error Counter, values between 0 and 127.
7:0	TEC	R	0h	Transmit Error Counter Actual state of the Transmit Error Counter, values between 0 and 255. Note: When the MCAN_CCCR[2] ASM bit is set, the CAN protocol controller does not increment the MCAN_ECR[7-0] TEC and MCAN_ECR[14-8] REC fields when a CAN protocol error is detected, but the MCAN_ECR[23-16] CEL field is still incremented.

5.15.2.27 CFG_PSR Register

5.15.2.27.1 CFG_PSR Register (Offset = 244h) [reset = 707h]

Protocol Status Register. CAN protocol controller status, transmitter delay compensation value.

Return to Summary Table

Table 5-1685. CFG_PSR Register Field Descriptions

Bit	Field	Type	Reset	Description
31:23	NU27	R	0h	Reserved
22:16	TDCV	R	0h	Transmitter Delay Compensation Value Position of the secondary sample point, defined by the sum of the measured delay from the MCAN TX to MCAN RX pins and the MCAN_TDCR[14-8] TDCO field. The SSP position is, in the data phase, the number of mtq between the start of the transmitted bit and the secondary sample point. Valid values are 0 to 127 mtq.
15	NU26	R	0h	Reserved
14	PXE	R	0h	Protocol Exception Event 1'b0 = No protocol exception event occurred since last read access 1'b1 = Protocol exception event occurred
13	RFDF	R	0h	Recieved a CAN FD Message This bit is set independent of acceptance filtering. 1'b0 = Since this bit was reset by the Host CPU, no CAN FD message has been received 1'b1 = Message in CAN FD format with FDF flag set has been received
12	RBRS	R	0h	BRS flag of last recieved CAN FD Message This bit is set together with the MCAN_PSR[13] RFDF bit, independent of acceptance filtering. 1'b0 = Last received CAN FD message did not have its BRS flag set 1'b1 = Last received CAN FD message had its BRS flag set

Table 5-1685. CFG_PSR Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
11	RESI	R	0h	ESI flag of last recieved CAN FD Message This bit is set together with the MCAN_PSR[13] RFDF bit, independent of acceptance filtering. 1'b0 = Last received CAN FD message did not have its ESI flag set 1'b1 = Last received CAN FD message had its ESI flag set
10:8	DLEC	R	7h	Data Phase Last Error Code Type of last error that occurred in the data phase of a CAN FD format frame with its BRS flag set. Coding is the same as for the MCAN_PSR[2-0] LEC field. This field will be cleared to zero when a CAN FD format frame with its BRS flag set has been transferred (reception or transmission) without error.
7	BO	R	0h	Bus_Off status 1'b0 = The MCAN module is not Bus_Off 1'b1 = The MCAN module is in Bus_Off state
6	EW	R	0h	Warning Status 1'b0 = Both error counters are below the Error_Warning limit of 96 1'b1 = At least one of error counter has reached the Error_Warning limit of 96
5	EP	R	0h	Error Passive 1'b0 = The MCAN module is in the Error_Active state. It normally takes part in bus communication and sends an active error flag when an error has been detected 1'b1 = The MCAN module is in the Error_Passive state
4:3	ACT	R	0h	Activity Monitors the module's CAN communication state. 2'b00 = Synchronizing - node is synchronizing on CAN communication 2'b01 = Idle - node is neither receiver nor transmitter 2'b10 = Receiver - node is operating as receiver 2'b11 = Transmitter - node is operating as transmitter Note: ACT is set to 0 by a Protocol Exception Event.

Table 5-1685. CFG_PSR Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
2:0	LEC	R	7h	Last Error Code The MCAN_PSR[2-0] LEC field indicates the type of the last error to occur on the CAN bus. This field will be cleared to 0hwhen a message has been transferred (reception or transmission) without error. 3'b000 = No Error: No error occurred since the MCAN_PSR[2-0] LEC field has been reset by successful reception or transmission. 3'b001 = Stuff Error: More than 5 equal bits in a sequence have occurred in a part of a received message where this is not allowed. 3'b010 = Form Error: A fixed format part of a received frame has the wrong format. 3'b011 = AckError: The message transmitted by the MCAN module was not acknowledged by another node. 3'b100 = Bit1Error: During the transmission of a message (with the exception of the arbitration field), the device wanted to send a recessive level (bit of logical value '1'), but the monitored bus value was dominant. 3'b101 = Bit0Error: During the transmission of a message (or acknowledge bit, or active error flag, or overload flag), the device wanted to send a dominant level (data or identifier bit logical value 0), but the monitored bus value was recessive. During Bus_Off recovery this status is set each time a sequence of 11 recessive bits has been monitored. This enables the Host CPU to monitor the proceeding of the Bus_Off recovery sequence (indicating the bus is not stuck at dominant or continuously disturbed). 3'b110 = CRCError: The CRC check sum of a received message was incorrect. The CRC of an incom-ing message does not match with the CRC calculated from the received data. 3'b111 = NoChange: Any read access to the Protocol Status Register re-initializes the MCAN_PSR[2-0] LEC field to 3'b111. When the MCAN_PSR[2-0] LEC field shows the value 3'b111, no CAN bus event was detected since the last Host CPU read access to the Protocol Status Register. Note: When a frame in CAN FD format has reached the data phase with BRS flag set, the next CAN event (error or valid frame) will be shown in the MCAN_PSR[10-8] DLEC field instead of the MCAN_PSR[2-0] LEC field. An error in a fixed stuff bit of a CAN FD CRC sequence will be shown as a Form Error, not Stuff Error.

5.15.2.28 CFG_TDCR Register

5.15.2.28.1 CFG_TDCR Register (Offset = 248h) [reset = 0h]

Transmitter Delay Comensation Register. Configuration of transmitter delay compensation offset and filter window length.

Return to Summary Table

19	DRX	R/W	0h	Message stored to Dedicated Rx Buffer
18	TOO	R/W	0h	Timeout Occurred

Table 5-1689. CFG_IR Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
17	MRAF	R/W	0h	Message RAM Access Failure The flag is set, when the Rx Handler: i. has not completed acceptance filtering or storage of an accepted message until the arbitration field of the following message has been received. In this case acceptance filtering or message storage is aborted and the Rx Handler starts processing of the following message. ii. was not able to write a message to the Message RAM. In this case message storage is aborted. In both cases the FIFO put index is not updated respectively the New Data flag for a dedicated Rx Buffer is not set, a partly stored message is overwritten when the next message is stored to this location. The flag is also set when the Tx Handler was not able to read a message from the Message RAM in time. In this case message transmission is aborted. In case of a Tx Handler access failure the MCAN module is switched into Restricted Operation Mode (see Restricted Operation Mode). To leave Restricted Operation Mode, the Host CPU has to reset the MCAN_CCCR[2] ASM bit. 1'b0 = No Message RAM access failure occurred 1'b1 = Message RAM access failure occurred
16	TSW	R/W	0h	Timestamp Wraparound
15	TEFL	R/W	0h	Tx Event FIFO Element Lost

14:8	FIDX	R	0h	Filter Index Index of matching filter element. Range is 0 to MCAN_SIDFC[23-16] LSS - 1 respectively MCAN_XIDFC[22-16] LSE - 1.
7:6	MSI	R	0h	Message Storeage Indicator 2'b00 = No FIFO selected 2'b01 = FIFO message lost 2'b10 = Message stored in FIFO 0 2'b11 = Message stored in FIFO 1
5:0	BIDX	R	0h	Buffer Index Index of Rx FIFO element to which the message was stored. Only valid when the MCAN_HPMS[7-6] MSI = 1.

5.15.2.38 CFG_NDAT1 Register

5.15.2.38.1 CFG_NDAT1 Register (Offset = 298h) [reset = 0h]

New Data 1 register. NewData flags of dedicated Rx buffers 0-31. The register holds the New Data flags of Rx Buffers 0 to 31. The flags are set when the respective Rx Buffer has been updated from a received frame. The flags remain set until the Host CPU clears them. Aflag is cleared by writing a 1h to the corresponding bit position. Writing a 0h has no effect. A hard reset will clear the register .

5.15.2.51 CFG_TXBRP Register

5.15.2.51.1 CFG_TXBRP Register (Offset = 2CCh) [reset = 0h]

Tx Buffer Request Pending register. PendingTx buffers with pending transmission request. Each Tx Buffer has its own Transmission Request Pending bit. The bits are set via the MCAN_TXBAR register. The bits are reset after a requested transmission has completed or has been cancelled via the MCAN_TXBCR register. The MCAN_TXBRP bits are set only for those Tx Buffers configured via the MCAN_TXBC register. After a MCAN_TXBRP bit has been set, a Tx scan (see Tx Handling) is started to check for the pending Tx request with the highest priority (Tx Buffer with lowest Message ID).

Return to Summary Table

5.15.2.52 CFG_TXBAR Register

5.15.2.52.1 CFG_TXBAR Register (Offset = 2D0h) [reset = 0h]

Tx Buffer Add Request register. Add transmission requests. Each Tx Buffer has its own Add Request bit. Writing 1h will set the corresponding Add Request bit; writing a 0h has no impact. This enables the Host CPU to set transmission requests for multiple Tx Buffers with one write to the MCAN_TXBAR register. The MCAN_TXBAR bits are set only for those Tx Buffers configured via the MCAN_TXBC register. When no Tx scan is running, the bits are reset immediately, else the bits remain set until the Tx scan process has completed. Note: If an add request is applied for a Tx Buffer with pending transmission request (corresponding MCAN_TXBRP bit already set), this add request is ignored.

5.15.2.54 CFG_TXBTO Register

5.15.2.54.1 CFG_TXBTO Register (Offset = 2D8h) [reset = 0h]

Tx Buffer Transmission Occurred register. Signals successful transmissions, set when corresponding MCAN_TXBRP flag is cleared. Each Tx Buffer has its own Transmission Occurred bit. The bits are set when the corresponding MCAN_TXBRP bit is cleared after a successful transmission. The bits are reset when a new transmission is requested by writing a 1h to the corresponding bit of register the MCAN_TXBAR register.

5.15.2.55 CFG_TXBCF Register

5.15.2.55.1 CFG_TXBCF Register (Offset = 2DCh) [reset = 0h]

Tx Buffer Cancellation Finished register. Signals successful transmit cancellation, set when corresponding MCAN_TXBRP flag is cleared after cancellation request. Each Tx Buffer has its own Cancellation Finished bit. The bits are set when the corresponding MCAN_TXBRP bit is cleared after a cancellation was requested via the MCAN_TXBCR register. In case the corresponding MCAN_TXBRP bit was not set at the point of cancellation, MCAN_TXBCF[n] CF bit is set immediately. The bits are reset when a new transmission is requested by writing a 1h to the corresponding bit of the MCAN_TXBAR register.

Table 5-1791. ECC_AGGR_STATUS_SET Register Field Descriptions

Bit	Field	Type	Reset	Description
31:4	NU17	R	0h	Reserved
3:2	TIMEOUT	R/W	0h	2-bit saturating counter of the number of timeout errors that have occurred since last cleared. 2'b00 - No timeout errors have occurred 2'b01 - 1 timeout erro has occurred 2'b10 - 2 timeout error has occurred 2'b11 - 3 or more timeout errors have occurred A write of a non-zero value to this register increments that many from the timeout fields. If the value written is less than the current value of the counter, then the pending level interrupt stays asserted. . If this register goes from 0 ot non zero a level interrupt will be asserted as well as a pulse interrupt. If the value was non zero to non zero then the level interrupt would remain asserted, but no new pulse interrupt would be asserted. You must write the eoi register to get a new pulse interrupt.

Table 5-1791. ECC_AGGR_STATUS_SET Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
1:0	PARITY	R/W	0h	2-bit saturating counter of the number of parity errors that have occurred since last cleared. 2'b00 - No parity errors have occurred 2'b01 - 1 parity error has occurred 2'b10 - 2 parity error has occurred 2'b11 - 3 or more parity error have occurred A write of a non-zero value to this register incrments that many from the parity fields. If the value written is less than the current value of the counter, then the pending level interrupt stays asserted. If this register goes from 0 ot non zero a level interrupt will be asserted as well as a pulse interrupt. If the value was non zero to non zero then the level interrupt would remain asserted, but no new pulse interrupt would be asserted. You must write the eoi register to get a new pulse interrupt.

5.15.2.81 ECC_AGGR_STATUS_CLR Register

Table 5-1816. MSS_MCRC_CRC_CURSEC_REG1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31:16	RESERVED1	R	0h	
15:0	CRC_CURSEC1	R/W	0h	Channel 1 Current Sector ID Register. In AUTO mode, this register contains the current sector number of which the signature verification fails. The sector counter is a free running up counter. When a sector fails, the erroneous sector number is logged into current sector ID register and the CRC fail interrupt is generated The sector ID register is frozen until it is read and the CRC fail status bit is cleared by CPU. While it is frozen, it does not capture another erroneous sector number. When this condition happens, an overrun interrupt is generated instead. Once the register is read and the CRC fail interrupt flag is cleared it can capture new erroneous sector number.

5.16.2.12 MSS_MCRC_CRC_WDTOPLD1 Register

5.16.2.12.1 MSS_MCRC_CRC_WDTOPLD1 Register (Offset = 4Ch) [reset = 0h]

Channel 1 timeout pre-load value to check if within a given time DMA initiates a block transfer.

Table 5-1894. MSS_MCRC_CRC_CURSEC_REG4 Register Field Descriptions

Bit	Field	Type	Reset	Description
31:16	RESERVED1	R	0h	
15:0	CRC_CURSEC4	R/W	0h	Channel 4 Current Sector ID Register. In AUTO mode, this register contains the current sector number of which the signature verification fails. The sector counter is a free running up counter. When a sector fails, the erroneous sector number is logged into current sector ID register and the CRC fail interrupt is generated The sector ID register is frozen until it is read and the CRC fail status bit is cleared by CPU. While it is frozen, it does not capture another erroneous sector number. When this condition happens, an overrun interrupt is generated instead. Once the register is read and the CRC fail interrupt flag is cleared it can capture new erro-neous sector number.

5.16.2.51 MSS_MCRC_CRC_WDTOPLD4 Register

5.16.2.51.1 MSS_MCRC_CRC_WDTOPLD4 Register (Offset = 10Ch) [reset = 0h]

Channel 4 timeout pre-load value to check if within a given time DMA initiates a block transfer.

CUSTOM		Y_MINOR					
R		R					
0h		Bh					

Table 5-1920. MCSPI_HL_REV Register Field Descriptions

Bit	Field	Type	Reset	Description
31:30	SCHEME	R	1h	Used to distinguish between old scheme and current
29:28	RSVD	R	0h	Reserved These bits are initialized to zero, and writes to them are ignored
27:16	FUNC	R	30h	Function indicates a software compatible module family If there is no level of software compatibility a new Func number [and hence REVISION] should be assigned
15:11	R_RTL	R	3h	RTL Version [R], maintained by IP design owner RTL follows a numbering such as XYRZ which are explained in this table R changes ONLY when: [1] PDS uploads occur which may have been due to spec changes [2] Bug fixes occur [3] Resets to '0' when X or Y changes Design team has an internal 'Z' [customer invisible] number which increments on every drop that happens due to DV and RTL updates Z resets to 0 when R increments
10:8	X_MAJOR	R	2h	Major Revision [X], maintained by IP specification owner X changes ONLY when: [1] There is a major feature addition An example would be adding Master Mode to Utopia Level2 The Func field [or Class/ Type in old PID format] will remain the same X does NOT change due to: [1] Bug fixes [2] Change in feature parameters
7:6	CUSTOM	R	0h	Indicates a special version for a particular device Consequence of use may avoid use of standard Chip Support Library [CSL] / Drivers

Table 5-1920. MCSPI_HL_REV Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
5:0	Y_MINOR	R	Bh	Minor Revision [Y], maintained by IP specification owner Y changes ONLY when: [1] Features are scaled [up or down] Flexibility exists in that this feature scalability may either be represented in the Y change or a specific register in the IP that indicates which features are exactly available [2] When feature creeps from Is-Not list to Is list But this may not be the case once it sees silicon; in which case X will change Y does NOT change due to: [1] Bug fixes [2] Typos or clarifications [3] major functional/feature change/addition/ deletion Instead these changes may be reflected via R, S, X as applicable Spec owner maintains a customer-invisible number 'S' which changes due to: [1] Typos/clarifications [2] Bug documentation Note that this bug is not due to a spec change but due to implementation Nevertheless, the spec tracks the IP bugs An RTL release [say for silicon PG11] that occurs due to bug fix should document the corresponding spec number [XYS] in its release notes

5.17.2.2 MCSPI_HL_HWINFO Register

5.17.2.2.1 MCSPI_HL_HWINFO Register (Offset = 4h) [reset = 9h]

Information about the IP module's hardware configuration, i.e. typically the module's HDL generics (if any). Actual field format and encoding is up to the module's designer to decide.

Return to Summary Table

Table 5-1924. MCSPI_HL_SYSCONFIG Register Field Descriptions

Bit	Field	Type	Reset	Description
31:4	RSVD	R	0h	Reserved
3:2	IDLEMODE	R/W	2h	Configuration of the local target state management mode By definition, target can handle read/write transaction as long as it is out of IDLE state 0 Force-idle mode: local target's IDLE state follows (acknowledges) the system's clock stop requests unconditionally, that is, regardless of the IP module's internal requirements. Backup mode, for debug only. 1 No-idle mode: local target never enters IDLE state. Backup mode, for debug only. 2 Smart-idle mode: local target's IDLE state eventually follows (acknowledges) the system's clock stop requests, depending on the IP module's internal requirements. IP module shall not generate (IRQ- or DMA-request-related) wake-up events.
1	FREEEMU	R/W	0h	Sensitivity to emulation [debug] suspend input signal 0 IP module is sensitive to emulation suspend. 1 IP module is not sensitive to emulation suspend.

Table 5-1924. MCSPI_HL_SYSCONFIG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
0	SOFTRESET	R/W	0h	Software reset [Optional] 0 Read 0 - Reset done, no pending action 0 Write 0 - No Action 1 Read 1 - Reset(software or other) ongoing 1 Write 1 - Initiate software reset

5.17.2.4 MCSPI_REVISION Register

5.17.2.4.1 MCSPI_REVISION Register (Offset = 100h) [reset = 2Bh]

This register contains the hard coded RTL revision number.

Table 5-1930. MCSPI_IRQSTATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31:18	RESERVED_8	R	0h	Reads returns 0
17	EOW	R/W1TS	0h	End of word count event when a channel is enabled using the FIFO buffer and the channel had sent the number of SPI word defined by MCSPI_XFERLEVEL[WCNT] 0 Read 0 - Event false 0 Write 0 - Event status bit Unchanged 1 Read 1 - Event is Pending 1 Write 1 - Event status bit is reset
16	WKS	R/W1TS	0h	Wake Up event in target mode when an active control signal is detected on the SVIMN line programmed in the field MCSPI_CH0CONF[SVIMNSLV] 0 Read 0 - Event false 0 Write 0 - Event status bit Unchanged 1 Read 1 - Event is Pending 1 Write 1 - Event status bit is reset
15	RESERVED_7	R	0h	Reads returns 0

Table 5-1930. MCSPI_IRQSTATUS Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
14	RX3_FULL	R/W1TS	0h	Receiver register is full or almost full Only when Channel 3 is enabled 0 Read 0 - Event false 0 Write 0 - Event status bit Unchanged 1 Read 1 - Event is Pending 1 Write 1 - Event status bit is reset
13	TX3_UNDERFLOW	R/W1TS	0h	Transmitter register underflow Only when Channel 3 is enabled The transmitter register is empty [not updated by Host or DMA with new data] before its time slot assignment Exception: No TX_underflow event when no data has been loaded into the transmitter register since channel has been enabled 0 Read 0 - Event false 0 Write 0 - Event status bit Unchanged 1 Read 1 - Event is Pending 1 Write 1 - Event status bit is reset
12	TX3_EMPTY	R/W1TS	0h	Transmitter register is empty or almost empty Note: Enabling the channel automatically rises this event 0 Read 0 - Event false 0 Write 0 - Event status bit Unchanged 1 Read 1 - Event is Pending 1 Write 1 - Event status bit is reset
11	RESERVED_9	R	0h	Reads returns 0
10	RX2_FULL	R/W1TS	0h	Receiver register full or almost full Channel 2 0 Read 0 - Event false 0 Write 0 - Event status bit Unchanged 1 Read 1 - Event is Pending 1 Write 1 - Event status bit is reset
9	TX2_UNDERFLOW	R/W1TS	0h	Transmitter register underflow Channel 2 0 Read 0 - Event false 0 Write 0 - Event status bit Unchanged 1 Read 1 - Event is Pending 1 Write 1 - Event status bit is reset
8	TX2_EMPTY	R/W1TS	0h	Transmitter register empty or almost empty Channel 2 0 Read 0 - Event false 0 Write 0 - Event status bit Unchanged 1 Read 1 - Event is Pending 1 Write 1 - Event status bit is reset
7	RESERVED_10	R	0h	Reads returns 0
6	RX1_FULL	R/W1TS	0h	Receiver register full or almost full Channel 1 0 Read 0 - Event false 0 Write 0 - Event status bit Unchanged 1 Read 1 - Event is Pending 1 Write 1 - Event status bit is reset
5	TX1_UNDERFLOW	R/W1TS	0h	Transmitter register underflow Channel 1 0 Read 0 - Event false 0 Write 0 - Event status bit Unchanged 1 Read 1 - Event is Pending 1 Write 1 - Event status bit is reset
4	TX1_EMPTY	R/W1TS	0h	Transmitter register empty or almost empty Channel 1 0 Read 0 - Event false 0 Write 0 - Event status bit Unchanged 1 Read 1 - Event is Pending 1 Write 1 - Event status bit is reset
3	RX0_OVERFLOW	R/W1TS	0h	Receiver register overflow [target mode only] Channel 0 0 Event status bit unchanged 1 Event is pending

Table 5-1930. MCSPI_IRQSTATUS Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
2	RX0_FULL	R/W1TS	0h	Receiver register full or almost full Channel 0 0 Read 0 - Event false 0 Write 0 - Event status bit Unchanged 1 Read 1 - Event is Pending 1 Write 1 - Event status bit is reset
1	TX0_UNDERFLOW	R/W1TS	0h	Transmitter register underflow Channel 0 0 Read 0 - Event false 0 Write 0 - Event status bit Unchanged 1 Read 1 - Event is Pending 1 Write 1 - Event status bit is reset
0	TX0_EMPTY	R/W1TS	0h	Transmitter register empty or almost empty Channel 0 0 Read 0 - Event false 0 Write 0 - Event status bit Unchanged 1 Read 1 - Event is Pending 1 Write 1 - Event status bit is reset

5.17.2.7 MCSPI_IRQENABLE Register

5.17.2.7.1 MCSPI_IRQENABLE Register (Offset = 11Ch) [reset = 0h]

This register allows to enable/disable the module internal sources of interrupt, on an event-by-event basis.

Table 5-1936. MCSPI_SYST Register Field Descriptions

Bit	Field	Type	Reset	Description
31:12	RESERVED_17	R	0h	Reads returns 0
11	SSB	R/W	0h	Set status bit 0 No action. Writing 0 does not clear already set status bits. This bit must be cleared before trying to clear a status bit of the MCSPI_IRQSTATUS register. 1 Force to 1 all status bits of MCSPI_IRQSTATUS register. Writing 1 into this bit sets to 1 all status bits in the MCSPI_IRQSTATUS register.
10	SPIENDIR	R/W	0h	Set the direction of the SVIMN[3:0] lines and SPICLK line 0 Output (as in controller mode) 1 Input (as in peripheral mode)
9	SPIDATDIR1	R/W	0h	Set the direction of the SPIDAT[1] 0 Output 1 Input
8	SPIDATDIR0	R/W	0h	Set the direction of the SPIDAT[0] 0 Output 1 Input

Table 5-1936. MCSPI_SYST Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
7	WAKD	R/W	0h	SWAKEUP output [signal data value of internal signal to system] The signal is driven high or low according to the value written into this register bit 0 The pin is driven low. 1 The pin is driven high.
6	SPICLK	R/W	0h	SPICLK line [signal data value] If MCSPI_SYST[SVIMNDIR] = 1 [input mode direction], this bit returns the value on the CLKSPI line [high or low], and a write into this bit has no effect If MCSPI_SYST[SVIMNDIR] = 0 [output mode direction], the CLKSPI line is driven high or low according to the value written into this register
5	SPIDAT_1	R/W	0h	SPIDAT[1] line [signal data value] If MCSPI_SYST[SPIDATDIR1] = 0 [output mode direction], the SPIDAT[1] line is driven high or low according to the value written into this register If MCSPI_SYST[SPIDATDIR1] = 1 [input mode direction], this bit returns the value on the SPIDAT[1] line [high or low], and a write into this bit has no effect
4	SPIDAT_0	R/W	0h	SPIDAT[0] line [signal data value] If MCSPI_SYST[SPIDATDIR0] = 0 [output mode direction], the SPIDAT[0] line is driven high or low according to the value written into this register If MCSPI_SYST[SPIDATDIR0] = 1 [input mode direction], this bit returns the value on the SPIDAT[0] line [high or low], and a write into this bit has no effect
3	SPIEN_3	R/W	0h	SVIMN[3] line [signal data value] If MCSPI_SYST[SVIMNDIR] = 0 [output mode direction], the SVIMNT[3] line is driven high or low according to the value written into this register If MCSPI_SYST[SVIMNDIR] = 1 [input mode direction], this bit returns the value on the SVIMN[3] line [high or low], and a write into this bit has no effect
2	SPIEN_2	R/W	0h	SVIMN[2] line [signal data value] If MCSPI_SYST[SVIMNDIR] = 0 [output mode direction], the SVIMNT[2] line is driven high or low according to the value written into this register If MCSPI_SYST[SVIMNDIR] = 1 [input mode direction], this bit returns the value on the SVIMN[2] line [high or low], and a write into this bit has no effect
1	SPIEN_1	R/W	0h	SVIMN[1] line [signal data value] If MCSPI_SYST[SVIMNDIR] = 0 [output mode direction], the SVIMNT[1] line is driven high or low according to the value written into this register If MCSPI_SYST[SVIMNDIR] = 1 [input mode direction], this bit returns the value on the SVIMN[1] line [high or low], and a write into this bit has no effect
0	SPIEN_0	R/W	0h	SVIMN[0] line [signal data value] If MCSPI_SYST[SVIMNDIR] = 0 [output mode direction], the SVIMNT[0] line is driven high or low according to the value written into this register If MCSPI_SYST[SVIMNDIR] = 1 [input mode direction], this bit returns the value on the SVIMN[0] line [high or low], and a write into this bit has no effect

5.17.2.10 MCSPI_MODULCTRL Register

5.17.2.10.1 MCSPI_MODULCTRL Register (Offset = 128h) [reset = 4h]

This register is dedicated to the configuration of the serial port interface.

Table 5-1938. MCSPI_MODULCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31:9	RESERVED_11	R	0h	Reads returns 0
8	FDAA	R/W	0h	FIFO DMA Address 256-bit aligned This register is used when a FIFO is managed by the module and DMA connected to the controller provides only 256 bit aligned address If this bit is set the enabled channel which uses the FIFO has its datas managed through MCSPI_DAFTX and MCSPI_DAFRX registers instead of MCSPI_TX[i] and MCSPI_RX[i] registers 0 FIFO data managed by MCSPI_TX(i) and MCSPI_RX(i) registers. 1 FIFO data managed by MCSPI_DAFTX and MCSPI_DAFRX registers.
7	MOA	R/W	0h	Multiple word ocp access: This register can only be used when a channel is enabled using a FIFO It allows the system to perform multiple SPI word access for a single 32-bit OCP word access This is possible for WL < 16 0 Multiple word access disabled 1 Multiple word access enabled with FIFO

Table 5-1938. MCSPI_MODULCTRL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
6:4	INITDLY	R/W	0h	Initial spi delay for first transfer: This register is an option only available in SINGLE master mode, The controller waits for a delay to transmit the first spi word after channel enabled and corresponding TX register filled This Delay is based on SPI output frequency clock, No clock output provided to the boundary and chip select is not active in 4 pin mode within this period 0 No delay for first MCSPI transfer. 1 The controller wait 4 MCSPI bus clock 2 The controller wait 8 MCSPI bus clock 3 The controller wait 16 MCSPI bus clock 4 The controller wait 32 MCSPI bus clock
3	SYSTEM_TEST	R/W	0h	Enables the system test mode 0 Functional mode 1 System test mode (SYSTEST)
2	MS	R/W	1h	Master/ Target 0 Controller - The module generates the SPICLK and SPIEN[3:0]. 1 Peripheral - The module receives the SPICLK and SPIEN[3:0].
1	PIN34	R/W	0h	Pin mode selection: This register is used to configure the SPI pin mode, in master or target mode If asserted the controller only use SIMO,SOMI and SPICLK clock pin for spi transfers 0 SPIEN is used as a chip-select. 1 SPIEN is not used. In this mode all related options to chip-select have no meaning.
0	SINGLE	R/W	0h	Single channel / Multi Channel [master mode only] 0 More than one channel will be used in controller mode. 1 Only one channel will be used in controller mode. This bit must be set in Force SPIEN[i] mode.

5.17.2.11 MCSPI_CH0CONF Register

5.17.2.11.1 MCSPI_CH0CONF Register (Offset = 12Ch) [reset = 60000h]

This register is dedicated to the configuration of the channel 0

Bit	Field	Type	Reset	Description
31:30	RESERVED_0	R	0h	Read returns 0
29	CLKG	R/W	0h	Clock divider granularity This register defines the granularity of channel clock divider: power of two or one clock cycle granularity When this bit is set the register MCSPI_CHCTRL[EXTCLK] must be configured to reach a maximum of 4096clock divider ratio Then The clock divider ratio is a concatenation of MCSPI_CHCONF[CLKD] and MCSPI_CHCTRL[EXTCLK] values 0 Clock granularity of power of 2 1 One clock cycle granularity
28	FFER	R/W	0h	FIFO enabled for receive:Only one channel can have this bit field set 0 The buffer is not used to receive data. 1 The buffer is used to receive data.
27	FFEW	R/W	0h	FIFO enabled for Transmit:Only one channel can have this bit field set 0 The buffer is not used to transmit data. 1 The buffer is used to transmit data.

Table 5-1960. MCSPI_CH2CONF Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
26:25	TCS2	R/W	0h	Chip Select Time Control This 2-bits field defines the number of interface clock cycles between CS toggling and first or last edge of SPI clock 0 0.5 clock cycle 1 1.5 clock cycles 2 2.5 clock cycles 3 3.5 clock cycles
24	SBPOL	R/W	0h	Start bit polarity 0 SPICLK is held low during the INACTIVE state 1 SPICLK is held high during the INACTIVE state
23	SBE	R/W	0h	Start bit enable for SPI transfer 0 Default MCSPI transfer length as specified by WL bit field 1 Start bit D/CX added before MCSPI transfer polarity is defined by MCSPI_CHCONF_0[24] SBPOL
22:21	RESERVED_1	R	0h	Read returns 0
20	FORCE	R/W	0h	Manual SVIMN assertion to keep SVIMN active between SPI words [single channel master mode only] 0 Writing 0 into this bit drives low the SPIEN line when MCSPI_CHCONF_2[6] EPOL=0, and drives it high when MCSPI_CHCONF_2[6] EPOL=1. 1 Writing 1 into this bit drives high the SPIEN line when MCSPI_CHCONF_2[6] EPOL=0, and drives it low when MCSPI_CHCONF_2[6] EPOL=1.
19	TURBO	R/W	0h	Turbo mode 0 Turbo is deactivated (recommended for single MCSPI word transfer). 1 Turbo is activated to maximize the throughput for multiple MCSPI words transfer.
18	IS	R/W	1h	Input Select 0 Data line 0 (SPIDAT[0]) selected for reception 1 Data line 1 (SPIDAT[1]) selected for reception
17	DPE1	R/W	1h	Transmission Enable for data line 1 [SPIDATAGZEN[1]] 0 Data line 1 (SPIDAT[1]) selected for transmission 1 No transmission on Data Line1 (SPIDAT[1])
16	DPE0	R/W	0h	Transmission Enable for data line 0 [SPIDATAGZEN[0]] 0 Data Line0 (SPIDAT[0]) selected for transmission 1 No transmission on data line 0 (SPIDAT[0])
15	DMAR	R/W	0h	DMA Read request The DMA Read request line is asserted when the channel is enabled and a new data is available in the receive register of the channel The DMA Read request line is deasserted on read completion of the receive register of the channel 0 DMA read request disabled 1 DMA read request enabled
14	DMAW	R/W	0h	DMA Write request The DMA Write request line is asserted when The channel is enabled and the transmitter register of the channel is empty The DMA Write request line is deasserted on load completion of the transmitter register of the channel 0 DMA write request disabled 1 DMA write request enabled

5.17.2.30 MCSPI_RX3 Register

5.17.2.30.1 MCSPI_RX3 Register (Offset = 178h) [reset = 0h]

This register contains a single SPI word received through the serial link, what ever SPI word length is.

Return to Summary Table

Table 5-1977. Instance Table

31:1	RESERVED	R	0h	
0	RESETDONE	R	0h	Internal Reset Monitoring Note: the debounce clock , the system clock [OCP] and the functional clock shall be provided to the MMC/SD/SDIO host controller to allow the internal reset monitoring. 0 Internal module reset is on-going 1 Reset completed.

5.18.2.4 MMC_CSRE Register

5.18.2.4.1 MMC_CSRE Register (Offset = 124h) [reset = 0h]

Card Status Response Error
This register enables the host controller to detect card status errors of response type R1, R1b for all cards and of R5, R5b and R6 response for cards types SD or SDIO.
When a bit MMCHS_CSRE[i] is set to 1, if the corresponding bit at the same position in the response MMCHS_RSP0[i] is set to 1, the host controller indicates a card error (MMCHS_STAT[CERR]) interrupt status to avoid the host driver reading the response register (MMCHS_RSP0).
Note: No automatic card error detection for autoCMD12 is implemented; the host system has to check autoCMD12 response register (MMCHS_RESP76) for possible card errors.

5.18.2.5 MMC_SYSTEST Register

5.18.2.5.1 MMC_SYSTEST Register (Offset = 128h) [reset = 0h]

System Test Register
This register is used to control the signals that connect to I/O pins when the module is configured in system test (SYSTEST) mode for boundary connectivity verification.
Note: In SYSTEST mode, a write into MMCHS_CMD register will not start a transfer. The buffer behaves as a stack accessible only by the local host (push and pop operations). In this mode, the Transfer Block Size (MMCHS_BLK[BLEN]) and the Blocks count for current transfer (MMCHS_BLK[NBLK]) are needed to generate a Buffer write ready interrupt (MMCHS_STAT[BWR]) or a Buffer read ready interrupt (MMCHS_STAT[BRR]) and DMA requests if enabled.

If SYSTEST[DDIR] = 1 (input mode direction), no effect. 0 If SYSTEST[DDIR] = 1 (input mode direction), returns the value on the DAT1 line (low). If SYSTEST[DDIR] = 0 (output mode direction), returns 0 1 If SYSTEST[DDIR] = 0 (output mode direction), the DAT1 line is driven high. If SYSTEST[DDIR] = 1 (input mode direction), no effect. 1 If SYSTEST[DDIR] = 1 (input mode direction), returns the value on the DAT1 line (high) If SYSTEST[DDIR] = 0 (output mode direction), returns 1

Table 5-1995. MMC_SYSTEST Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
4	D0D	R/W	0h	DAT0 input/output signal data value 0 If SYSTEST[DDIR] = 1 (input mode direction), returns the value on the DAT0 line (low). If SYSTEST[DDIR] = 0 (output mode direction), returns 0 0 If SYSTEST[DDIR] = 0 (output mode direction), the DAT0 line is driven low. If SYSTEST[DDIR] = 1 (input mode direction), no effect. 1 If SYSTEST[DDIR] = 0 (output mode direction), the DAT0 line is driven high. If SYSTEST[DDIR] = 1 (input mode direction), no effect. 1 If SYSTEST[DDIR] = 1 (input mode direction), returns the value on the DAT0 line (high) If SYSTEST[DDIR] = 0 (output mode direction), returns 1
3	DDIR	R/W	0h	Control of the DAT[7:0] pins direction. 0 The DAT lines are outputs (host to card) 0 No action. Returns 0. 1 The DAT lines are inputs (card to host) 1 No action. Returns 1.
2	CDAT	R/W	0h	CMD input/output signal data value 0 If SYSTEST[CDIR] = 0 (output mode direction), the CMD line is driven low. If SYSTEST[CDIR] = 1 (input mode direction), no effect. 0 If SYSTEST[CDIR] = 1 (input mode direction), returns the value on the CMD line (low). If SYSTEST[CDIR] = 0 (output mode direction), returns 0 1 If SYSTEST[CDIR] = 0 (output mode direction), the CMD line is driven high. If SYSTEST[CDIR] = 1 (input mode direction), no effect. 1 If SYSTEST[CDIR] = 1 (input mode direction), returns the value on the CMD line (high) If SYSTEST[CDIR] = 0 (output mode direction), returns 1
1	CDIR	R/W	0h	Control of the CMD pin direction. 0 The CMD line is an output (host to card) 0 No action. Returns 0. 1 The CMD line is an input (card to host) 1 No action. Returns 1.
0	MCKD	R/W	0h	MMC clock output signal data value 0 The output clock is driven low. 0 No action. Returns 0. 1 The output clock is driven high. 1 No action. Returns 1.

5.18.2.6 MMC_CON Register

5.18.2.6.1 MMC_CON Register (Offset = 12Ch) [reset = 600h]

Configuration Register
This register is used:
- to select the functional mode or the SYSTEST mode for any card.
- to send an initialization sequence to any card.
- to enable the detection on DAT[1] of a card interrupt for SDIO cards only.

and also to configure :
- specific data and command transfers for MMC cards only.
- the parameters related to the card detect and write protect input signals.

Bit	Field	Type	Reset	Description
31:22	RESERVED	R	0h	
21	SDMA_LNE	R/W	0h	Target DMA Level/Edge Request: The waveform of the DMA request can be configured either edge sensitive with early de-assertion on first access to MMCSD_DATA register or late de-assertion, request remains active until last allowed data written into MMCSD_DATA. 0 Slave DMA edge sensitive, Early DMA de-assertion 1 Slave DMA level sensitive, Late DMA de-assertion

Table 5-1997. MMC_CON Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
20	DMA_MNS	R/W	0h	DMA Master or Target selection: When this bit is set and the controller is configured to use the DMA, Ocp master interface is used to get datas from system using ADMA2 procedure [direct access to the memory].This option is only available if generic parameter MADMA_EN is asserted to '1'. 0 The controller is slave on data transfers with system. 1 The controller is master on data exchange with system, controller must be configured as using DMA.
19	DDR	R/W	0h	Dual Data Rate mode: When this register is set, the controller uses both clock edge to emit or receive data. Odd bytes are transmitted on falling edges and even bytes are transmitted on rise edges. It only applies on Data bytes and CRC, Start, end bits and CRC status are kept full cycle. This bit field is only meaningful and active for even clock divider ratio of MMCSD_SYSCTL[CLKD], it is insensitive to MMCSD_HCTL[HSPE] setting. 0 Standard mode : data are transmitted on a single edge depending on MMCHS_HCTRL[HSPE]. 1 Data Bytes and CRC are transmitted on both edge.
18	BOOT_CF0	R/W	0h	Boot status supported: This register is set when the CMD line need to be forced to '0' for a boot sequence. CMD line is driven to '0' after Writing in MMCSD_CMD. The line is released when this bit field is de-asserted and abort data transfer in case of a pending transaction. 0 CMD line is released when it was previously forced to '0' by a boot sequence. 0 CMD line not forced 1 CMD line forced to '0' is enabled and will be active after writing into MMCHS_CMD 1 CMD line forced to '0' is enabled
17	BOOT_ACK	R/W	0h	Book acknowledge received: When this bit is set the controller should receive a boot status on DAT0 line after next command issued. If no status is received a data timeout will be generated. 0 No acknowledge to be received 1 A boot status will be received on DAT0 line after issuing a command.
16	CLKEXTFREE	R/W	0h	External clock free running: This register is used to maintain card clock out of transfer transaction to enable target module for example to generate a synchronous interrupt on DAT[1]. The Clock will be maintain only if MMCSD_SYSCTL[CEN] is set. 0 External card clock is cut off outside active transaction period. 1 External card clock is maintain even out of active transaction period only if MMCHS_SYSCTL[CEN] is set.
15	PADEN	R/W	0h	Control Power for MMC Lines: This register is only useful when MMC PADs contain power saving mechanism to minimize its leakage power. It works as a GPIO that directly control the ACTIVE pin of PADs. Excepted for DAT[1], the signal is also combine outside the module with the dedicated power control MMCSD_CON[CTPL] bit. 0 ADPIDLE module pin is not forced, it is automatically generated by the MMC fsms. 1 ADPIDLE module pin is forced to active state.

Table 5-1997. MMC_CON Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
14	OBIE	R/W	0h	Out-of-Band Interrupt Enable MMC cards only: This bit enables the detection of Out-of-Band Interrupt on MMCOBI input pin. The usage of the Out-of-Band signal [OBI] is optional and depends on the system integration. 0 Out-of-Band interrupt detection disabled 1 Out-of-Band interrupt detection enabled
13	OBIP	R/W	0h	Out-of-Band Interrupt Polarity MMC cards only: This bit selects the active level of the out-of-band interrupt coming from MMC cards. The usage of the Out-of-Band signal [OBI] is optional and depends on the system integration. 0 Active high level 1 Active low level
12	CEATA	R/W	0h	CE-ATA control mode MMC cards compliant with CE-ATA:By default, this bit is set to 0. It is use to indicate that next commands are considered as specific CE-ATA commands that potentially use 'command completion' features. 0 Standard MMC/SD/SDIO mode. 1 CE-ATA mode next commands are considered as CE-ATA commands.
11	CTPL	R/W	0h	Control Power for DAT[1] line MMC and SD cards: By default, this bit is set to 0 and the host controller automatically disables all the input buffers outside of a transaction to minimize the leakage current. SDIO cards: When this bit is set to 1, the host controller automatically disables all the input buffers except the buffer of DAT[1] outside of a transaction in order to detect asynchronous card interrupt on DAT[1] line and minimize the leakage current of the buffers. 0 Disable all the input buffers outside of a transaction. 1 Disable all the input buffers except the buffer of DAT[1] outside of a transaction.
10:9	DVAL	R/W	3h	Debounce filter value All cards This register is used to define a debounce period to filter the card detect input signal [SDCD]. The usage of the card detect input signal [SDCD] is optional and depends on the system integration and the type of the connector housing that accommodates the card. 0 33 us debounce period 1 231 us debounce period 2 1 ms debounce period 3 8,4 ms debounce period
8	WPP	R/W	0h	Write protect polarity For SD and SDIO cards only This bit selects the active level of the write protect input signal [SDWP]. The usage of the write protect input signal [SDWP] is optional and depends on the system integration and the type of the connector housing that accommodates the card. 0 Active high level 1 Active low level

Table 5-1997. MMC_CON Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
7	CDP	R/W	0h	Card detect polarity All cards This bit selects the active level of the card detect input signal [SDCD]. The usage of the card detect input signal [SDCD] is optional and depends on the system integration and the type of the connector housing that accommodates the card. 0 Active low level 1 Active high level
6	MIT	R/W	0h	MMC interrupt command Only for MMC cards. This bit must be set to 1, when the next write access to the command register [MMCSD_CMD] is for Writing a MMC interrupt command [CMD40] requiring the command timeout detection to be disabled for the command response. 0 Command timeout enabled 1 Command timeout disabled
5	DW8	R/W	0h	8-bit mode MMC select For SD/SDIO cards, this bit must be set to 0. For MMC card, this bit must be set following a valid SWITCH command [CMD6] with the correct value and extend CSD index written in the argument. Prior to this command, the MMC card configuration register [CSD and EXT_CSD] must be verified for compliancy with MMC standard specification 4.x [see section 3.6]. 0 1-bit or 4-bit Data width (DAT[0] used, MMC, SD cards) 1 8-bit Data width (DAT[7:0] used, MMC cards)
4	MODE	R/W	0h	Mode select All cards These bits select between Functional mode and SYSTEST mode. 0 Functional mode. Transfers to the MMC/SD/SDIO cards follow the card protocol. MMC clock is enabled. MMC/SD transfers are operated under the control of the CMD register. 1 SYSTEST mode The signal pins are configured as general-purpose input/output and the 1024-byte buffer is configured as a stack memory accessible only by the local host or system DMA. The pins retain their default type (input, output or in-out). SYSTEST mode is operated under the control of the SYSTEST register.
3	STR	R/W	0h	Stream command Only for MMC cards. This bit must be set to 1 only for the stream data transfers [read or write] of the adtc commands. Stream read is a class 1 command [CMD11: READ_DAT_UNTIL_STOP]. Stream write is a class 3 command [CMD20: WRITE_DAT_UNTIL_STOP]. 0 Block oriented data transfer 1 Stream oriented data transfer

Table 5-1997. MMC_CON Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
2	HR	R/W	0h	Broadcast host response Only for MMC cards. This register is used to force the host to generate a 48-bit response for bc command type. It can be used to terminate the interrupt mode by generating a CMD40 response by the core [see section 4.3, "Interrupt Mode", in the MMC [1] specification]. In order to have the host response to be generated in open drain mode, the register MMCSD_CON[OD] must be set to 1. When MMCSD_CON[CEATA] is set to 1 and MMCSD_ARG set to 0x00000000 when Writing 0x00000000 into MMCSD_CMD register, the host controller performs a 'command completion signal disable' token i.e. CMD line held to '0' during 47 cycles followed by a 1. 0 The host does not generate a 48-bit response instead of a command. 1 The host generates a 48-bit response instead of a command or a command completion signal disable token.
1	INIT	R/W	0h	Send initialization stream All cards. When this bit is set to 1, and the card is idle, an initialization sequence is sent to the card. An initialization sequence consists of setting the CMD line to 1 during 80 clock cycles. The initialization sequence is mandatory - but it is not required to do it through this bit - this bit makes it easier. Clock divider [MMCSD_SYSCTL[CLKD]] should be set to ensure that 80 clock periods are greater than 1ms. [see section 9.3, "Power-Up", in the MMC card specification [1], or section 6.4 in the SD card specification [2]]. Note: in this mode, there is no command sent to the card and no response is expected 0 The host does not send an initialization sequence. 1 The host sends an initialization sequence.
0	OD	R/W	0h	Card open drain mode. Only for MMC cards. This bit must be set to 1 for MMC card commands 1, 2, 3 and 40, and if the MMC card bus is operating in open-drain mode during the response phase to the command sent. Typically, during card identification mode when the card is either in idle, ready or ident state. It is also necessary to set this bit to 1, for a broadcast host response [see Broadcast host response register MMCSD_CON[HR]] 0 No Open Drain 1 Open Drain or Broadcast host response

5.18.2.7 MMC_PWCNT Register

5.18.2.7.1 MMC_PWCNT Register (Offset = 130h) [reset = 0h]

Power Counter Register
This register is used to program a mmc counter to delay command transfers after activating the PAD power, this value depends on PAD characteristics and voltage.

Table 5-2003. MMC_SDMASA Register Field Descriptions

Bit	Field	Type	Reset	Description
31:0	SDMA_ARG2	R/W	0h	SDMA System Address / Argument 2 This register contains the physical system memory address used for DMA transfers or the second argument for the Auto CMD23. [1] SDMA System Address This register contains the system memory address for a SDMA transfer. When the Host Controller stops a SDMA transfer, this register shall point to the system address of the next contiguous data position. It can be accessed only if no transaction is executing [i.e., after a transaction has stopped]. Read operations during transfers may return an invalid value. The Host Driver shall initialize this register before starting a SDMA transaction. After SDMA has stopped, the next system address of the next contiguous data position can be read from this register. The SDMA transfer waits at the every boundary specified by the Host SDMA Buffer Boundary in the Block Size register. The Host Controller generates DMA Interrupt to request the Host Driver to update this register. The Host Driver sets the next system address of the next data position to this register. When the most upper byte of this register 003h is written, the Host Controller restarts the SDMA transfer. When restarting SDMA by the Resume command or by setting Continue Request in the Block Gap Control register, the Host Controller shall start at the next contiguous address stored here in the SDMA System Address register. ADMA does not use this register. [2] Argument 2 This register is used with the Auto CMD23 to set a 32-bit block count value to the argument of the CMD23 while executing Auto CMD23. If Auto CMD23 is used with ADMA, the full 32-bit block count value can be used. If Auto CMD23 is used without AMDA, the available block count value is limited by the Block Count register. 65535 blocks is the maximum value in this case.

5.18.2.10 MMC_BLK Register

5.18.2.10.1 MMC_BLK Register (Offset = 204h) [reset = 0h]

Transfer Length Configuration Register
MMCHS_BLK[BLEN] is the block size register.
MMCHS_BLK[NBLK] is the block count register.
This register shall be used for any card.

Return to Summary Table

29:24	INDX	R/W	0h	Command index Binary encoded value from 0 to 63 specifying the command number send to card 0 CMD0 or ACMD0 1 CMD1 or ACMD1 2 CMD2 or ACMD2 3 CMD3 or ACMD3 4 CMD4 or ACMD4 5 CMD5 or ACMD5 6 CMD6 or ACMD6 7 CMD7 or ACMD7 8 CMD8 or ACMD8 9 CMD9 or ACMD9 10 CMD10 or ACMD10 11 CMD11 or ACMD11 12 CMD12 or ACMD12 13 CMD13 or ACMD13 14 CMD14 or ACMD14 15 CMD15 or ACMD15 16 CMD16 or ACMD16 17 CMD17 or ACMD17 18 CMD18 or ACMD18 19 CMD19 or ACMD19 20 CMD20 or ACMD20 21 CMD21 or ACMD21 22 CMD22 or ACMD22 23 CMD23 or ACMD23 24 CMD24 or ACMD24 25 CMD25 or ACMD25 26 CMD26 or ACMD26 27 CMD27 or ACMD27 28 CMD28 or ACMD28 29 CMD29 or ACMD29 30 CMD30 or ACMD30 31 CMD31 or ACMD31 32 CMD32 or ACMD32 33 CMD33 or ACMD33 34 CMD34 or ACMD34 35 CMD35 or ACMD35 36 CMD36 or ACMD36 37 CMD37 or ACMD37 38 CMD38 or ACMD38 39 CMD39 or ACMD39 40 CMD40 or ACMD40 41 CMD41 or ACMD41 42 CMD42 or ACMD42 43 CMD43 or ACMD43 44 CMD44 or ACMD44 45 CMD45 or ACMD45 46 CMD46 or ACMD46 47 CMD47 or ACMD47 48 CMD48 or ACMD48 49 CMD49 or ACMD49 50 CMD50 or ACMD50 51 CMD51 or ACMD51 52 CMD52 or ACMD52 53 CMD53 or ACMD53 54 CMD54 or ACMD54 55 CMD55 or ACMD55 56 CMD56 or ACMD56 57 CMD57 or ACMD57 58 CMD58 or ACMD58 59 CMD59 or ACMD59 60 CMD60 or ACMD60 61 CMD61 or ACMD61 62 CMD62 or ACMD62 63 CMD63 or ACMD63

Table 5-2009. MMC_CMD Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
23:22	CMD_TYPE	R/W	0h	Command type This register specifies three types of special command: Suspend, Resume and Abort. These bits shall be set to 00bfor all other commands. 0 Others Commands 1 CMD52 for writing "Bus Suspend" in CCCR 2 CMD52 for writing "Function Select" in CCCR 3 Abort command CMD12, CMD52 for writing " I/O Abort" in CCCR
21	DP	R/W	0h	Data present select This register indicates that data is present and DAT line shall be used. It must be set to 0 in the following conditions: - command using only CMD line - command with no data transfer but using busy signal on DAT[0] - Resume command 0 Command with no data transfer 1 Command with data transfer
20	CICE	R/W	0h	Command Index check enable This bit must be set to 1 to enable index check on command response to compare the index field in the response against the index of the command. If the index is not the same in the response as in the command, it is reported as a command index error [MMCSD_STAT[CIE] set to1] Note: The register CICE cannot be configured for an Auto CMD12, then index check is automatically checked when this command is issued. 0 Index check disable 1 Index check enable
19	CCCE	R/W	0h	Command CRC check enable This bit must be set to 1 to enable CRC7 check on command response to protect the response against transmission errors on the bus. If an error is detected, it is reported as a command CRC error [MMCSD_STAT[CCRC] set to 1]. Note: The register CCCE cannot be configured for an Auto CMD12, and then CRC check is automatically checked when this command is issued. 0 CRC7 check disable 1 CRC7 check enable
18	RESERVED1	R	0h	
17:16	RSP_TYPE	R/W	0h	Response type This bits defines the response type of the command 0 No response 1 Response Length 136 bits 2 Response Length 48 bits 3 Response Length 48 bits with busy after response
15:6	RESERVED	R	0h	
5	MSBS	R/W	0h	Multi/Single block select This bit must be set to 1 for data transfer in case of multi block command. For any others command this bit shall be set to 0. 0 Single block. If this bit is 0, it is not necessary to set the register MMCHS_BLK[NBLK]. 1 Multi block. When Block Count is disabled (MMCHS_CMD[BCE] is set to 0) in Multiple block transfers (MMCHS_CMD[MSBS] is set to 1), the module can perform infinite transfer.

Table 5-2009. MMC_CMD Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
4	DDIR	R/W	0h	Data transfer Direction Select This bit defines either data transfer will be a read or a write. 0 Data Write (host to card) 1 Data Read (card to host)
3:2	ACEN	R/W	0h	Auto CMD Enable - SD card only. This field determines use of auto command functions. There are two methods to stop Multiple-block read and write operation [1] Auto CMD12 Enable When this field is set to 01b the Host Controller issues CMD12 automatically when last block transfer is completed. Auto CMD12 error is indicated to the Auto CMD Error Status register. The Host Driver shall not set this bit if the command does not require CMD12. In particular, secure commands defined in the Part 3 File Security specification do not require CMD12. [2] Auto CMD23 Enable When this bit field is set to 10b the Host Controller issues a CMD23 automatically before issuing a command specified in the Command Register. The Host Controller Version 3.00 and later shall support this function. The following conditions are required to use the Auto CMD23. Auto CMD23 Supported [Host Controller Version is 3.00 or later] A memory card that supports CMD23 [SCR[33]=1] If DMA is used, it shall be ADMA. Only when CMD18 or CMD25 is issued [Note, the Host Controller does not check command index.] Auto CMD23 can be used with or without ADMA. By Writing the Command register, the Host Controller issues a CMD23 first and then issues a command specified by the Command Index in Command register. If response errors of CMD23 are detected, the second command is not issued. A CMD23 error is indicated in the Auto CMD Error Status register. 32-bit block count value for CMD23 is set to SDMA System Address / Argument 2 register. 0 Auto Command Disabled 1 Auto CMD12 enable or CCS detection enabled. 2 Auto CMD23 Enable 3 Reserved
1	BCE	R/W	0h	Block Count Enable Multiple block transfers only. This bit is used to enable the block count register [MMCSD_BLK[NBLK]]. When Block Count is disabled [MMCSD_CMD[BCE] is set to 0] in Multiple block transfers [MMCSD_CMD[MSBS] is set to 1], the module can perform infinite transfer. 0 Block count disabled for infinite transfer. 1 Block count enabled for multiple block transfer with known number of blocks
0	DE	R/W	0h	DMA Enable This bit is used to enable DMA mode for host data access. 0 DMA mode disable 1 DMA mode enable

5.18.2.13 MMC_RSP10 Register

5.18.2.13.1 MMC_RSP10 Register (Offset = 210h) [reset = 0h]

Command Response[31:0] Register
This 32-bit register holds bits positions [31:0] of command response type R1/R1b/R2/R3/R4/R5/R5b/R6.

5.18.2.17 MMC_DATA Register

5.18.2.17.1 MMC_DATA Register (Offset = 220h) [reset = 0h]

Data Register
This register is the 32-bit entry point of the buffer for read or write data transfers.
The buffer size is 32bits x256(1024 bytes). Bytes within a word are stored and read in little endian format. This buffer can be used as two 512 byte buffers to transfer data efficiently without reducing the throughput.
Sequential and contiguous access is necessary to increment the pointer correctly. Random or skipped access is not allowed. In little endian, if the local host accesses this register byte-wise or 16bit-wise, the least significant byte (bits [7:0]) must always be written/read first. The update of the buffer address is done on the most significant byte write for full 32-bit DATA register or on the most significant byte of the last word of block transfer.
Example 1: Byte or 16-bit access
Mbyteen[3:0]=0001 (1-byte) => Mbyteen[3:0]=0010 (1-byte) => Mbyteen[3:0]=1100 (2-bytes) OK
Mbyteen[3:0]=0001 (1-byte) => Mbyteen[3:0]=0010 (1-byte) => Mbyteen[3:0]=0100 (1-byte) OK
Mbyteen[3:0]=0001 (1-byte) => Mbyteen[3:0]=0010 (1-byte) => Mbyteen[3:0]=1000 (1-byte) Bad .

Table 5-2021. MMC_PSTATE Register Field Descriptions

Bit	Field	Type	Reset	Description
31:25	RESERVED2	R	0h	
24	CLEV	R	0h	CMD line signal level This status is used to check the CMD line level to recover from errors, and for debugging. The value of this register after reset depends on the CMD line level at that time. 0 The CMD line level is 0. 1 The CMD line level is 1.
23:20	DLEV	R	0h	DAT[3:0] line signal level DAT[3] => bit 23 DAT[2] => bit 22 DAT[1] => bit 21 DAT[0] => bit 20 This status is used to check DAT line level to recover from errors, and for debugging. This is especially useful in detecting the busy signal level from DAT[0]. The value of these registers after reset depends on the DAT lines level at that time.

Table 5-2021. MMC_PSTATE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
19	WP	R	0h	Write protect switch pin level For SDIO cards only. This bit reflects the write protect input pin [SDWP] level. The value of this register after reset depends on the protect input pin [SDWP] level at that time. 0 If MMCHS_CON[WPP] is set to 0 (default), the card is write protected, otherwise the card is not protected. 1 If MMCHS_CON[WPP] is set to 0 (default), the card is not write protected, otherwise the card is protected.
18	CDPL	R	1h	Card detect pin level This bit reflects the inverse value of the card detect input pin [SDCD], debouncing is not performed on this bit and bit is valid only when Card State Stable [MMCSD_PSTAE[CSS]] is set to 1. Use of this bit is limited to testing since it must be debounced y software. The value of this register after reset depends on the card detect input pin [SDCD] level at that time. 0 The value of the card detect input pin (SDCD) is 1 1 The value of the card detect input pin (SDCD) is 0
17	CSS	R	0h	Card State Stable This bit is used for testing. It is set to 1 only when Card Detect Pin Level is stable [MMCSD_PSTATE[CDPL]]. Debouncing is performed on the card detect input pin [SDCD] to detect card stability. This bit is not affected by a software reset. 0 Reset or Debouncing 1 No card or card inserted
16	CINS	R	0h	Card inserted This bit is the debounced value of the card detect input pin [SDCD]. An inactive to active transition of the card detect input pin [SDCD] will generate a card insertion interrupt [MMCSD_STAT[CINS]]. A active to inactive transition of the card detect input pin [SDCD] will generate a card removal interrupt [MMCSD_STAT[REM]]. This bit is not affected by a software reset. 0 If MMCHS_CON[CDP] is set to 1, no card is detected. The card may have been removed from the card slot. If MMCHS_CON[CDP] is set to 0, the card has been inserted. 1 If MMCHS_CON[CDP] is set to 1, the card has been inserted from the card slot. If MMCHS_CON[CDP] is set to 0 no card is detected. The card may have been removed from the card slot.
15:12	RESERVED1	R	0h	
11	BRE	R	0h	Buffer read enable This bit is used for non-DMA read transfers. It indicates that a complete block specified by MMCSD_BLK[BLEN] has been written in the buffer and is ready to be read. It is set to 0 when the entire block is read from the buffer. It is set to 1 when a block data is ready in the buffer and generates the Buffer read ready status of interrupt [MMCSD_STAT[BRR]]. 0 Read BLEN bytes disable 1 Read BLEN bytes enable. Readable data exists in the buffer.

Table 5-2021. MMC_PSTATE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
10	BWE	R	0h	Buffer Write enable This status is used for non-DMA write transfers. It indicates if space is available for write data. 0 There is no room left in the buffer to write BLEN bytes of data. 1 There is enough space in the buffer to write BLEN bytes of data.
9	RTA	R	0h	Read transfer active This status is used for detecting completion of a read transfer. It is set to 1 after the end bit of read command or by activating a continue request [MMCSD_HCTL[CR]] following a stop at block gap request. This bit is set to 0 when all data have been read by the local host after last block or after a stop at block gap request. 0 No valid data on the DAT lines. 1 read data transfer on going.
8	WTA	R	0h	Write transfer active This status indicates a write transfer active. It is set to 1 after the end bit of write command or by activating a continue request [MMCSD_HCTL[CR]] following a stop at block gap request. This bit is set to 0 when CRC status has been received after last block or after a stop at block gap request. 0 No valid data on the DAT lines. 1 Write data transfer on going.
7:4	RESERVED	R	0h	
3	RTR	R	0h	Re-Tuning Request Host Controller may request Host Driver to execute re-tuning sequence by setting this bit when the data window is shifted by temperature drift and a tuned sampling point does not have a good margin to receive correct data. This bit is cleared when a command is issued with setting Execute Tuning in the Host Control 2 register. Changing of this bit from 0 to 1 generates Re-Tuning Event. Refer to Normal Interrupt Status registers for more detail. This bit isn't set to 1 if Sampling Clock Select in the Host Control 2 register is set to 0 [using fixed sampling clock]. Refer to Re-Tuning Modes in the Capabilities register for more detail. 0 Fixed or well tuned sampling clock 1 Sampling clock needs re-tuning
2	DLA	R	0h	DAT line active This status bit indicates whether one of the DAT line is in use. In the case of read transactions [card to host]: This bit is set to 1 after the end bit of read command or by activating continue request MMCSD_HCTL[CR]. This bit is set to 0 when the host controller received the end bit of the last data block or at the beginning of the read wait mode. In the case of write transactions [host to card]: This bit is set to 1 after the end bit of write command or by activating continue request MMCSD_HCTL[CR]. This bit is set to 0 on the end of busy event for the last block; host controller must wait 8 clock cycles with line not busy to really consider not "busy state" or after the busy block as a result of a stop at gap request. 0 DAT Line inactive 1 DAT Line active

Table 5-2021. MMC_PSTATE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
1	DATI	R	0h	Command inhibit[DAT] This status bit is generated if either DAT line is active [MMCSD_PSTATE[DLA]] or Read transfer is active [MMCSD_PSTATE[RTA]] or when a command with busy is issued. This bit prevents the local host to issue a command. A change of this bit from 1 to 0 generates a transfer complete interrupt [MMCSD_STAT[TC]]. 0 Issuing of command using the DAT lines is allowed 1 Issuing of command using DAT lines is not allowed
0	CMDI	R	0h	Command inhibit[CMD] This status bit indicates that the CMD line is in use. This bit is set to 0 when the most significant byte is written into the command register. This bit is not set when Auto CMD12 is transmitted. This bit is set to 0 in either the following cases: - After the end bit of the command response, excepted if there is a command conflict error [MMCSD_STAT[CCRC] or MMCSD_STAT[CEB] set to 1] or a Auto CMD12 is not executed [MMCSD_AC12[ACNE]]. - After the end bit of the command without response [MMCSD_CMD[RSP_TYPE] set to "00"] In case of a command data error is detected [MMCSD_STAT[CTO] set to 1], this register is not automatically cleared. 0 Issuing of command using CMD line is allowed 1 Issuing of command using CMD line is not allowed

5.18.2.19 MMC_HCTL Register

5.18.2.19.1 MMC_HCTL Register (Offset = 228h) [reset = 0h]

Host Control Register
This register defines the host controls to set power, wakeup and transfer parameters.
MMCHS_HCTL[31:24] = Wakeup control
MMCHS_HCTL[23:16] = Block gap control
MMCHS_HCTL[15:8] = Power control
MMCHS_HCTL[7:0] = Host control.

Bit	Field	Type	Reset	Description
31:28	RESERVED3	R	0h	
27	OBWE	R/W	0h	Wakeup event enable for 'Out-of-Band' Interrupt. This bit enables wakeup events for 'Out-of-Band' assertion. Wakeup is generated if the wakeup feature is enabled [MMCSD_SYSCONFIG[ENAWAKEUP]]. The write to this register is ignored when MMCSD_CON[OBIE] is not set. 0 Disable wakeup on 'Out-of-Band' Interrupt 1 Enable wakeup on 'Out-of-Band' Interrupt
26	REM	R/W	0h	Wakeup event enable on SD card removal This bit enables wakeup events for card removal assertion. Wakeup is generated if the wakeup feature is enabled [MMCSD_SYSCONFIG[ENAWAKEUP]]. 0 Disable wakeup on card removal 1 Enable wakeup on card removal

Table 5-2023. MMC_HCTL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
25	INS	R/W	0h	Wakeup event enable on SD card insertion This bit enables wakeup events for card insertion assertion. Wakeup is generated if the wakeup feature is enabled [MMCSD_SYSCONFIG[ENAWAKEUP]]. 0 Disable wakeup on card insertion 1 Enable wakeup on card insertion
24	IWE	R/W	0h	Wakeup event enable on SD card interrupt This bit enables wakeup events for card interrupt assertion. Wakeup is generated if the wakeup feature is enabled [MMCSD_SYSCONFIG[ENAWAKEUP]]. 0 Disable wakeup on card interrupt 1 Enable wakeup on card interrupt
23:20	RESERVED2	R	0h	
19	IBG	R/W	0h	Interrupt block at gap This bit is valid only in 4-bit mode of SDIO card to enable interrupt detection in the interrupt cycle at block gap for a multiple block transfer. For MMC cards and for SD card this bit should be set to 0. 0 Disable interrupt detection at the block gap in 4-bit mode 1 Enable interrupt detection at the block gap in 4-bit mode
18	RWC	R/W	0h	Read wait control The read wait function is optional only for SDIO cards. If the card supports read wait, this bit must be enabled, then requesting a stop at block gap [MMCSD_HCTL[SBGR]] generates a read wait period after the current end of block. Be careful, if read wait is not supported it may cause a conflict on DAT line. 0 Disable Read Wait Control. Suspend/Resume cannot be supported. 1 Enable Read Wait Control
17	CR	R/W	0h	Continue request This bit is used to restart a transaction that was stopped by requesting a stop at block gap [MMCSD_HCTL[SBGR]]. Set this bit to 1 restarts the transfer. The bit is automatically set to 0 by the host controller when transfer has restarted i.e DAT line is active [MMCSD_PSTATE[DLA]] or transferring data [MMCSD_PSTATE[WTA]]. The Stop at block gap request must be disabled [MMCSD_HCTL[SBGR]=0] before setting this bit. 0 No affect 1 transfer restart
16	SBGR	R/W	0h	Stop at block gap request This bit is used to stop executing a transaction at the next block gap. The transfer can restart with a continue request [MMHS_HCTL[CR]] or during a suspend/resume sequence. In case of read transfer, the card must support read wait control. In case of write transfer, the host driver shall set this bit after all block data written. Until the transfer completion [MMCSD_STAT[TC] set to 1], the host driver shall leave this bit set to 1. If this bit is set, the local host shall not write to the data register [MMCSD_DATA]. 0 Transfer mode 1 Stop at block gap
15:12	RESERVED1	R	0h	

Table 5-2023. MMC_HCTL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
11:9	SDVS	R/W	0h	SD bus voltage select All cards. The host driver should set to these bits to select the voltage level for the card according to the voltage supported by the system [MMCSD_CAPA[VS18,VS30,VS33]] before starting a transfer. 5 1.8V (Typical) 6 3.0V (Typical) 7 3.3V (Typical)
8	SDBP	R/W	0h	SD bus power Before setting this bit, the host driver shall select the SD bus voltage [MMCSD_HCTL[SDVS]]. If the host controller detects the No card state, this bit is automatically set to 0. If the module is power off, a write in the command register [MMCSD_CMD] will not start the transfer. A write to this bit has no effect if the selected SD bus voltage MMCSD_HCTL[SDVS] is not supported according to capability register [MMCSD_CAPA[VS*]]. 0 Power off 1 Power on
7	CDSS	R/W	0h	Card Detect Signal Selection This bit selects source for the card detection.When the source for the card detection is switched, the interrupt should be disabled during the switching period by clearing the Interrupt Status/Signal Enable register in order to mask unexpected interrupt being caused by the glitch. The Interrupt Status/Signal Enable should be disabled during over the period of debouncing. 0 SDCD# is selected (for normal use) 1 The Card Detect Test Level is selected (for test purpose)
6	CDTL	R/W	0h	Card Detect Test Level: This bit is enabled while the Card Detect Signal Selection is set to 1 and it indicates card inserted or not. 0 No Card 1 Card Inserted
5	RESERVED	R	0h	
4:3	DMAS	R/W	0h	DMA Select Mode: One of supported DMA modes can be selected. The host driver shall check support of DMA modes by referring the Capabilities register. Use of selected DMA is determined by DMA Enable of the Transfer Mode register. This register is only meaningful when MADMA_EN is set to 1. When MADMA_EN is set to 0 the bit field is read only and returned value is 0. 0 Reserved 1 Reserved 2 32-bit Address ADMA2 is selected 3 Reserved
2	HSPE	R/W	0h	High Speed Enable: Before setting this bit, the Host Driver shall check the High Speed Support in the Capabilities register. If this bit is set to 0 [default], the Host Controller outputs CMD line and DAT lines at the falling edge of the SD Clock. If this bit is set to 1, the Host Controller outputs CMD line and DAT lines at the rising edge of the SD Clock.This bit shall not be set when dual data rate mode is activated in MMCSD_CON[DDR]. 0 Normal speed mode 1 High speed mode

Table 5-2023. MMC_HCTL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
1	DTW	R/W	0h	Data transfer width For MMC card, this bit must be set following a valid SWITCH command [CMD6] with the correct value and extend CSD index written in the argument. Prior to this command, the MMC card configuration register [CSD and EXT_CSD] must be verified for compliance with MMC standard specification 4.x [see section 3.6]. This register has no effect when the MMC 8-bit mode is selected [register MMCSD_CON[DW8] set to1], For SD/SDIO cards, this bit must be set following a valid SET_BUS_WIDTH command [ACMD6] with the value written in bit 1 of the argument. Prior to this command, the SD card configuration register [SCR] must be verified for the supported bus width by the SD card. 0 1-bit Data width (DAT[0] used) 1 4-bit Data width (DAT[3:0] used)
0	LED	R	0h	Reserved bit. LED control feature is not supported This bit is initialized to zero, and writes to it are ignored.

5.18.2.20 MMC_SYSCTL Register

5.18.2.20.1 MMC_SYSCTL Register (Offset = 22Ch) [reset = 0h]

SD System Control Register
This register defines the system controls to set software resets, clock frequency management and data timeout.
MMCHS_SYSCTL[31:24] = Software resets
MMCHS_SYSCTL[23:16] = Timeout control
MMCHS_SYSCTL[15:0] = Clock control.

Bit	Field	Type	Reset	Description
31:27	RESERVED2	R	0h	
26	SRD	R/W	0h	Software reset for DAT line This bit is set to 1 for reset and released to 0 when completed. DAT finite state machine in both clock domain are also reset. Here below are the registers cleared by MMCSD_SYSCTL[SRD]: - MMCSD_DATA - MMCSD_PSTATE: BRE, BWE, RTA, WTA, DLA and DATI - MMCSD_HCTL: SBGR and CR - MMCSD_STAT: BRR, BWR, BGE and TC OCP and MMC buffer data management is reinitialized. 0 Reset completed 1 Software reset for DAT line
25	SRC	R/W	0h	Software reset for CMD line This bit is set to 1 for reset and released to 0 when completed. CMD finite state machine in both clock domain are also reset. Here below the registers cleared by MMCSD_SYSCTL[SRC]: - MMCSD_PSTATE: CMDI - MMCSD_STAT: CC OCP and MMC command status management is reinitialized. 0 Reset completed 1 Software reset for CMD line

Table 5-2025. MMC_SYSCTL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
24	SRA	R/W	0h	Software reset for all This bit is set to 1 for reset , and released to 0 when completed. This reset affects the entire host controller except for the card detection circuit and capabilities registers. 0 Reset completed 1 Software reset for all the design
23:20	RESERVED1	R	0h	
19:16	DTO	R/W	0h	Data timeout counter value and busy timeout. This value determines the interval by which DAT lines timeouts are detected. The host driver needs to set this bitfield based on - the maximum read access time [NAC] [Refer to the SD Specification Part1 Physical Layer], - the data read access time values [TAAC and NSAC] in the card specific data register [CSD] of the card, - the timeout clock base frequency [MMCSD_CAPA[TCF]]. If the card does not respond within the specified number of cycles, a data timeout error occurs [MMCSD_STA[DTO]]. The MMCSD_SYSCTL[DTO] register is also used to check busy duration, to generate busy timeout for commands with busy response or for busy programming during a write command. Timeout on CRC status is generated if no CRC token is present after a block write. 0 TCF x 2^13 1 TCF x 2^14 14 TCF x 2^27 15 Reserved
15:6	CLKD	R/W	0h	Clock frequency select These bits define the ratio between a reference clock frequency [system dependant] and the output clock frequency on the CLK pin of either the memory card [MMC, SD or SDIO]. 0 Clock Ref bypass 1 Clock Ref bypass 2 Clock Ref / 2 3 Clock Ref / 3 1023 Clock Ref / 1023
5	CGS	R	0h	Clock Generator Select - For SD cards Host Controller Version 3.00 supports this bit. This bit is used to select the clock generator mode in SDCLK Frequency Select. If the Programmable Clock Mode is supported [non-zero value is set to Clock Multiplier in the Capabilities register], this bit attribute is RW, and if not supported, this bit attribute is RO and zero is read. This bit depends on the setting of Preset Value Enable in the Host Control 2 register. If the Preset Value Enable = 0, this bit is set by Host Driver. If the Preset Value Enable = 1, this bit is automatically set to a value specified in one of Preset Value registers.
4:3	RESERVED	R	0h	
2	CEN	R/W	0h	Clock enable This bit controls if the clock is provided to the card or not. 0 The clock is not provided to the card . Clock frequency can be changed . 1 The clock is provided to the card and can be automatically gated when MMCHS_SYSCONFIG[AUTOIDLE] is set to 1 (default value) . The host driver shall wait to set this bit to 1 until the Internal clock is stable (MMCHS_SYSCTL[ICS]).

Table 5-2025. MMC_SYSCTL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
1	ICS	R	0h	Internal clock stable [status] This bit indicates either the internal clock is stable or not. 0 The internal clock is not stable. 1 The internal clock is stable after enabling the clock (MMCHS_SYSCTL[ICE]) or after changing the clock ratio (MMCHS_SYSCTL[CLKD]).
0	ICE	R/W	0h	Internal clock enable This register controls the internal clock activity. In very low power state, the internal clock is stopped. Note: The activity of the debounce clock [used for wakeup events] and the OCP clock [used for reads and writes to the module register map] are not affected by this register. 0 The internal clock is stopped (very low power state). 1 The internal clock oscillates and can be automatically gated when MMCHS_SYSCONFIG[AUTOIDLE] is set to 1 (default value) .

5.18.2.21 MMC_STAT Register

5.18.2.21.1 MMC_STAT Register (Offset = 230h) [reset = 0h]

Interrupt Status Register
The interrupt status regroups all the status of the module internal events that can generate an interrupt.
MMCHS_STAT[31:16] = Error Interrupt Status
MMCHS_STAT[15:0] = Normal Interrupt Status.

Return to Summary Table

Table 5-2027. MMC_STAT Register Field Descriptions

Bit	Field	Type	Reset	Description
31:30	RESERVED3	R	0h	
29	BADA	R/W	0h	Bad access to data space This bit is set automatically to indicate a bad access to buffer when not allowed: -This bit is set during a read access to the data register [MMCSD_DATA] while buffer reads are not allowed [MMCSD_PSTATE[BRE] =0] -This bit is set during a write access to the data register [MMCSD_DATA] while buffer writes are not allowed [MMCSD_STATE[BWE] =0] 0 No Interrupt. 0 Status bit unchanged 1 Bad Access 1 Status is cleared

Table 5-2027. MMC_STAT Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
28	CERR	R/W	0h	Card error This bit is set automatically when there is at least one error in a response of type R1, R1b, R6, R5 or R5b. Only bits referenced as type E[error] in status field in the response can set a card status error. An error bit in the response is flagged only if corresponding bit in card status response error MMCSD_CSRE in set. There is no card error detection for autoCMD12 command. The host driver shall read MMCSD_RSP76 register to detect error bits in the command response. 0 No Error 0 Status bit unchanged 1 Card error 1 Status is cleared
27	RESERVED2	R	0h	
26	TE	R/W	0h	Tuning Error This bit is set when an unrecoverable error is detected in a tuning circuit except during tuning procedure [Occurrence of an error during tuning procedure is indicated by Sampling Select]. By detecting Tuning Error, Host Driver needs to abort a command executing and perform tuning. To reset tuning circuit, Sampling Clock shall be set to 0 before executing tuning procedure. The Tuning Error is higher priority than the other error interrupts generated during data transfer. By detecting Tuning Error, the Host Driver should discard data transferred by a current read/write command and retry data transfer after the Host Controller retrieved from tuning circuit error. The bit is set if the lock is lost [but not during the tuning process] or if the lock counter expires without the lock being asserted. If the latter happens, the SW can decide to ignore the interrupt and wait some more for the lock to be set. 0 No Error 1 Error
25	ADMAE	R/W	0h	ADMA Error: This bit is set when the Host Controller detects errors during ADMA based data transfer. The state of the ADMA at an error occurrence is saved in the ADMA Error Status Register.In addition, the Host Controller generates this interrupt when it detects invalid descriptor data [Valid=0] at the ST_FDS state. ADMA Error State in the ADMA Error Status indicates that an error occurs in ST_FDS state. The Host Driver may find that Valid bit is not set at the error descriptor. 0 No Interrupt. 0 Status bit unchanged 1 ADMA error 1 Status is cleared
24	ACE	R/W	0h	Auto CMD error Auto CMD12 and Auto CMD23 use this error status. This bit is set when detecting that one of the bits D00-D04 in Auto CMD Error Status register has changed from 0 to 1. In case of Auto CMD12, this bit is set to 1, not only when the errors in Auto CMD12 occur but also when Auto CMD12 is not executed due to the previous command error. 0 No Error. 0 Status bit unchanged 1 Auto CMD error 1 Status is cleared
23	CLE	R	0h	Reserved. Current limit error is not supported. These bits are initialized to zero, and writes to them are ignored.

Table 5-2027. MMC_STAT Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
22	DEB	R/W	0h	Data End Bit error This bit is set automatically when detecting a 0 at the end bit position of read data on DAT line or at the end position of the CRC status in write mode. 0 No Error 0 Status bit unchanged 1 Data end bit error 1 Status is cleared
21	DCRC	R/W	0h	Data CRC Error This bit is set automatically when there is a CRC16 error in the data phase response following a block read command or if there is a 3-bit CRC status different of a position "010" token during a block write command. 0 No Error. 0 Status bit unchanged 1 Data CRC error 1 Status is cleared
20	DTO	R/W	0h	Data timeout error This bit is set automatically according to the following conditions: - busy timeout for R1b, R5b response type - busy timeout after write CRC status - write CRC status timeout - read data timeout 0 No error. 0 Status bit unchanged 1 Time out 1 Status is cleared
19	CIE	R/W	0h	Command index error This bit is set automatically when response index differs from corresponding command index previously emitted. It depends on the enable in MMCSD_CMD[CICE] register. 0 No error. 0 Status bit unchanged 1 Command index error 1 Status is cleared
18	CEB	R/W	0h	Command end bit error This bit is set automatically when detecting a 0 at the end bit position of a command response. 0 No error. 0 Status bit unchanged 1 Command end bit error 1 Status is cleared
17	CCRC	R/W	0h	Command CRC Error This bit is set automatically when there is a CRC7 error in the command response depending on the enable in MMCSD_CMD[CCCE] register. 0 No Error. 0 Status bit unchanged 1 Command CRC error 1 Status is cleared
16	CTO	R/W	0h	Command Timeout Error This bit is set automatically when no response is received within 64 clock cycles from the end bit of the command. For commands that reply within 5 clock cycles - the timeout is still detected at 64 clock cycles. 0 No error 0 Status bit unchanged 1 Time Out 1 Status is cleared

Table 5-2027. MMC_STAT Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
15	ERRI	R	0h	Error Interrupt If any of the bits in the Error Interrupt Status register [MMCSD_STAT[24:15]] are set, then this bit is set to 1. Therefore the host driver can efficiently test for an error by checking this bit first. Writes to this bit are ignored. 0 No Interrupt. 1 Error interrupt event(s) occurred
14:11	RESERVED	R	0h	
10	BSR	R/W	0h	Boot status received interrupt This bit is set automatically when MMCSD_CON[BOOT] is set 0x1 or 0x2 and a boot status is received on DAT[0] line. This interrupt is only useful for MMC card. 0 No Interrupt. 0 Status bit unchanged 1 Boot status received interrupt. 1 Status is cleared
9	OBI	R/W	0h	Out-Of-Band interrupt This bit is set automatically when MMCSD_CON[OBIE] is set and an Out-of-Band interrupt occurs on OBI pin. The interrupt detection depends on polarity controlled by MMCSD_CON[OBIP]. This interrupt is only useful for MMC card. The Out-of-Band interrupt signal is a system specific feature for future use, this signal is not required for existing specification implementation. 0 No Out-Of-Band interrupt. 0 Status bit unchanged 1 Interrupt Out-Of-Band occurs 1 Status is cleared
8	CIRQ	R	0h	Card interrupt This bit is only used for SD and SDIO and CE-ATA cards. In 1-bit mode, interrupt source is asynchronous [can be a source of asynchronous wakeup]. In 4-bit mode, interrupt source is sampled during the interrupt cycle. In CE-ATA mode, interrupt source is detected when the card drives CMD line to zero during one cycle after data transmission end.All modes above are fully exclusive. The controller interrupt must be clear by setting MMCSD_IE[CIRQ] to 0, then the host driver must start the interrupt service with card [clearing card interrupt status] to remove card interrupt source. Otherwise the Controller interrupt will be reasserted as soon as MMCSD_IE[CIRQ] is set to 1. Writes to this bit are ignored. 0 No card interrupt 1 Generate card interrupt
7	CREM	R/W	0h	Card removal This bit is set automatically when MMCSD_PSTATE[CINS] changes from 1 to 0. A clear of this bit doesn't effect Card inserted present state [MMCSD_PSTATE[CINS]]. 0 Card state stable or Debouncing 0 Status bit unchanged 1 Card removed 1 Status is cleared

Table 5-2027. MMC_STAT Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
6	CINS	R/W	0h	Card insertion This bit is set automatically when MMCSD_PSTATE[CINS] changes from 0 to 1. A clear of this bit doesn't effect Card inserted present state [MMCSD_PSTATE[CINS]]. 0 Card state stable or debouncing 0 Status bit unchanged 1 Card inserted 1 Status is cleared
5	BRR	R/W	0h	Buffer read ready This bit is set automatically during a read operation to the card [see class 2 - block oriented read commands] when one block specified by MMCSD_BLK[BLEN] is completely written in the buffer. It indicates that the memory card has filled out the buffer and that the local host needs to empty the buffer by Reading it. Note: If the DMA receive-mode is enabled, this bit is never set; instead a DMA receive request to the main DMA controller of the system is generated. 0 Not Ready to read buffer 0 Status bit unchanged 1 Ready to read buffer 1 Status is cleared
4	BWR	R/W	0h	Buffer write ready This bit is set automatically during a write operation to the card [see class 4 - block oriented write command] when the host can write a complete block as specified by MMCSD_BLK[BLEN]. It indicates that the memory card has emptied one block from the buffer and that the local host is able to write one block of data into the buffer. Note: If the DMA transmit mode is enabled, this bit is never set; instead, a DMA transmit request to the main DMA controller of the system is generated. 0 Not Ready to write buffer 0 Status bit unchanged 1 Ready to write buffer 1 Status is cleared
3	DMA	R/W	0h	DMA interrupt : This status is set when an interrupt is required in the ADMA instruction and after the data transfer completion. 0 Dma interrupt detected 0 Status bit unchanged 1 No dma interrupt 1 Status is cleared
2	BGE	R/W	0h	Block gap event When a stop at block gap is requested [MMCSD_HCTL[SBGR]], this bit is automatically set when transaction is stopped at the block gap during a read or write operation. This event does not occur when the stop at block gap is requested on the last block. In read mode, a 1-to-0 transition of the DAT Line active status [MMCSD_PSTATE[DLA]] between data blocks generates a Block gap event interrupt. 0 No block gap event 0 Status bit unchanged 1 Transaction stopped at block gap 1 Status is cleared

Table 5-2027. MMC_STAT Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
1	TC	R/W	0h	Transfer completed This bit is always set when a read/write transfer is completed or between two blocks when the transfer is stopped due to a stop at block gap request [MMCSD_HCTL[SBGR]]. In Read mode: This bit is automatically set on completion of a read transfer [MMCSD_PSTATE[RTA]]. In write mode: This bit is set automatically on completion of the DAT line use [MMCSD_PSTATE[DLA]]. 0 No transfer complete 0 Status bit unchanged 1 Data transfer complete 1 Status is cleared
0	CC	R/W	0h	Command complete This bit is set when a 1-to-0 transition occurs in the register command inhibit [MMCSD_PSTATE[CMDI]] If the command is a type for which no response is expected, then the command complete interrupt is generated at the end of the command. A command timeout error [MMCSD_STAT[CTO]] has higher priority than command complete [MMCSD_STAT[CC]]. If a response is expected but none is received, then a command timeout error is detected and signaled instead of the command complete interrupt. 0 No Command complete 0 Status bit unchanged 1 Command complete 1 Status is cleared

5.18.2.22 MMC_IE Register

5.18.2.22.1 MMC_IE Register (Offset = 234h) [reset = 0h]

Interrupt Status Enable Register
This register allows to enable/disable the module to set status bits, on an event-by-event basis.
MMCHS_IE[31:16] = Error Interrupt Status Enable
MMCHS_IE[15:0] = Normal Interrupt Status Enable.

5.18.2.23 MMC_ISE Register

5.18.2.23.1 MMC_ISE Register (Offset = 238h) [reset = 0h]

Interrupt Signal Enable Register
This register allows to enable/disable the module internal sources of status, on an event-by-event basis.
MMCHS_ISE[31:16] = Error Interrupt Signal Enable
MMCHS_ISE[15:0] = Normal Interrupt Signal Enable.

5.18.2.24 MMC_AC12 Register

5.18.2.24.1 MMC_AC12 Register (Offset = 23Ch) [reset = 0h]

Host Control 2 Register and Auto CMD Error Status Register
This register is used to indicate CMD12 response error of Auto CMD12 and CMD23 response error of Auto CMD23. The Host driver can determine what kind of Auto CMD12 / CMD23 errors occur by this register. Auto CMD23 errors are indicated in bit 04-01.This register is valid only when the Auto CMD Error is set.

Table 5-2033. MMC_AC12 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	PV_ENABLE	R/W	0h	Preset Value Enable Host Controller Version 3.00 supports this bit. As the operating SDCLK frequency and I/O driver strength depend on the Host System implementation, it is difficult to determine these parameters in the Standard Host Driver. When Preset Value Enable is set, automatic SDCLK frequency generation and driver strength selection is performed without considering system specific conditions. This bit enables the functions defined in the Preset Value registers. If this bit is set to 0, SDCLK Frequency Select, Clock Generator Select in the Clock Control register and Driver Strength Select in Host Control 2 register are set by Host Driver. If this bit is set to 1, SDCLK Frequency Select, Clock Generator Select in the Clock Control register and Driver Strength Select in Host Control 2 register are set by Host Controller as specified in the Preset Value registers. 0 SDCLK and Driver Strength are controlled by Host Driver. 1 Automatic Selection by Preset Value are Enabled.

Table 5-2033. MMC_AC12 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
30	AI_ENABLE	R/W	0h	Asynchronous Interrupt Enable This bit can be set to 1 if a card supports asynchronous interrupts and Asynchronous Interrupt Support is set to 1 in the Capabilities register. Asynchronous interrupt is effective when DAT[1] interrupt is used in 4-bit SD mode [and zero is set to Interrupt Pin Select in the Shared Bus Control register]. If this bit is set to 1, the Host Driver can stop the SDCLK during asynchronous interrupt period to save power. During this period, the Host Controller continues to deliver the Card Interrupt to the host when it is asserted by the Card. 0 Disabled 1 Enabled
29:24	RESERVED2	R	0h	
23	SCLK_SEL	R/W	0h	Sampling Clock Select Host Controller uses this bit to select sampling clock to receive CMD and DAT. This bit is set by tuning procedure and valid after the completion of tuning [when Execute Tuning is cleared]. Setting 1 means that tuning is completed successfully and setting 0 means that tuning is failed. Writing 1 to this bit is meaningless and ignored. A tuning circuit is reset by Writing to 0. This bit can be cleared with setting Execute Tuning. Once the tuning circuit is reset, it will take time to complete tuning sequence. Therefore, Host Driver should keep this bit to 1 to perform re-tuning sequence to compete re-tuning sequence in a short time. Change of this bit is not allowed while the Host Controller is receiving response or a read data block. 0 Fixed clock is used to sample data 1 Tuned clock is used to sample data
22	ET	R/W	0h	Execute Tuning This bit is set to 1 to start tuning procedure and automatically cleared when tuning procedure is completed. The result of tuning is indicated to Sampling Clock Select. Tuning procedure is aborted by Writing 0. This is Read-Write with automatic clear register 0 Not Tuned or Tuning Completed 1 Execute Tuning
21:20	DS_SEL	R/W	0h	Driver Strength Select Host Controller output driver in 1.8V signaling is selected by this bit. In 3.3V signaling, this field is not effective. This field can be set depends on Driver Type A, C and D support bits in the Capabilities register. This bit depends on setting of Preset Value Enable. If Preset Value Enable = 0, this field is set by Host Driver. If Preset Value Enable = 1, this field is automatically set by a value specified in the one of Preset Value registers. 0 Driver Type B is selected (Default) 1 Driver Type A is selected 2 Driver Type C is selected 3 Driver Type D is selected
19	V1V8_SIGEN	R/W	0h	1.8V Signaling Enable This bit controls voltage regulator for I/O cell. 3.3V is supplied to the card regardless of signaling voltage. Setting this bit from 0 to 1 starts changing signal voltage from 3.3V to 1.8V. 1.8V regulator output shall be stable within 5ms. Host Controller clears this bit if switching to 1.8V signaling fails. Clearing this bit from 1 to 0 starts changing signal voltage from 1.8V to 3.3V. 3.3V regulator output shall be stable within 5ms. Host Driver can set this bit to 1 when Host Controller supports 1.8V signaling [One of support bits is set to 1:SDR50, SDR104 or DDR50 in the Capabilities register] and the card or device supports UHS-I [S18A=1. Refer to Bus Signal Voltage Switch Sequence in the Physical Layer Specification Version 3.0x]. 0 3.3V Signaling 1 1.8V Signaling

Table 5-2033. MMC_AC12 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
18:16	UHSMS	R/W	0h	UHS Mode Select This field is used to select one of UHS-I modes and effective when 1.8V Signaling Enable is set to 1. If Preset Value Enable in the Host Control 2 register is set to 1, Host Controller sets SDCLK Frequency Select, Clock Generator Select in the Clock Control register and Driver Strength Select according to Preset Value registers. In this case, one of preset value registers is selected by this field. Host Driver needs to reset SD Clock Enable before changing this field to avoid generating clock glitch. After setting this field, Host Driver sets SD Clock Enable again. When SDR50, SDR104 or DDR50 is selected for SDIO card, interrupt detection at the block gap shall not be used. Read Wait timing is changed for these modes. Refer to the SDIO Specification Version 3.00 for more detail. 0 SDR12 1 SDR25 2 SDR50 3 SDR104 4 DDR50 5 Reserved 6 Reserved 7 Reserved
15:8	RESERVED1	R	0h	
7	CNI	R	0h	Command Not Issued By Auto CMD12 Error Setting this bit to 1 means CMD_wo_DAT is not executed due to an Auto CMD12 Error [D04-D01] in this register. This bit is set to 0 when Auto CMD Error is generated by Auto CMD23. 0 Not error 1 Command not issued
6:5	RESERVED	R	0h	
4	ACIE	R	0h	Auto CMD Index Error This bit is set if the Command Index error occurs in response to a command. 0 No error 1 Error
3	ACEB	R	0h	Auto CMD End Bit Error This bit is set when detecting that the end bit of command response is 0. 0 No error 1 End bit Error Generated
2	ACCE	R	0h	Auto CMD CRC Error This bit is set when detecting a CRC error in the command response. 0 No error 1 CRC Error Generated
1	ACTO	R	0h	Auto CMD Timeout Error This bit is set if no response is returned within 64 SDCLK cycles from the end bit of command. If this bit is set to1, the other error status bits [D04-D02] are meaningless. 0 No error 1 Auto CMD Time Out

Table 5-2033. MMC_AC12 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
0	ACNE	R	0h	Auto CMD12 Not Executed If memory multiple block data transfer is not started due to command error, this bit is not set because it is not necessary to issue Auto CMD12. Setting this bit to 1 means the Host Controller cannot issue Auto CMD12 to stop memory multiple block data transfer due to some error. If this bit is set to 1, other error status bits [D04-D01] are meaningless. This bit is set to 0 when Auto CMD Error is generated by Auto CMD23. 0 Auto CMD12 Executed 1 Auto CMD12 Not Executed

5.18.2.25 MMC_CAPA Register

5.18.2.25.1 MMC_CAPA Register (Offset = 240h) [reset = E10080h]

Capabilities Register
This register lists the capabilities of the MMC/SD/SDIO host controller.

FFh : Clock Multiplier M = 256

Table 5-2037. MMC_CAPA2 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
15:14	RTM	R	0h	Re-Tuning Modes This field selects re-tuning method and limits the maximum data length. Bit47-46 Re-Tuning Mode Re-Tuning Method Data Length There are two re-tuning timings: Re-Tuning Request controlled by the Host Controller and expiration of a Re-Tuning Timer controlled by the Host Driver. By receiving either timing, the Host Driver executes the re-tuning procedure just before a next command issue. The maximum data length per read/write command is restricted so that re-tuning procedures can be inserted during data transfers. [1] Re-Tuning Mode 1 The host controller does not have any internal logic to detect when the re-tuning needs to be performed. In this case, the Host Driver should maintain all re-tuning timings by using a Re-Tuning Timer. To enable inserting the re-tuning procedure during data transfers, the data length per read/write command shall be limited up to 4MB. [2] Re-Tuning Mode 2 The host controller has the capability to indicate the re-tuning timing by Re-Tuning Request during data transfers. Then the data length per read/write command shall be limited up to 4MB. During non data transfer, re-tuning timing is determined by either Re-Tuning Request or Re-Tuning Timer. If Re-Tuning Request is used, Re-Tuning Timer should be disabled. [3] Re-Tuning Mode 3 The host controller has the capability to take care of the re-tuning during data transfer [Auto Re-Tuning]. Re-Tuning Request shall not be generated during data transfers and there is no limitation to data length per read/write command. During non data transfer, re-tuning timing is determined by either Re-Tuning Request or Re-Tuning Timer. If Re-Tuning Request is used, Re-Tuning Timer should be disabled. Re-Tuning Timer Control Example for Re-Tuning Mode 1 The initial value of re-tuning timer is provided by Timer Count for Re-Tuning field in this register. The timer starts counting by loading the initial value. When the timer expires, the Host Driver marks an expiration flag. On receiving a command request, the Host driver checks the expiration flag. If the expiration flag is set, then the Host Driver should perform the re-tuning procedure before issuing a command. If the expiration flag is not set, then the Host Driver issues a command without performing the re-tuning procedure. Every time the re-tuning procedure is performed, the timer loads the new initial value and the expiration flag is cleared. Re-Tuning Timer Control Example for Re-Tuning Mode 2 and Mode 3 The timer control is almost the same as Re-Tuning Mode 1 except the timer loads the new initial value after data transfer [when receiving Transfer Complete]. In case of Mode 3, Timer Count for Re-Tuning is set either smaller value: Tuning effective time after re-tuning procedure or after data transfer. If a Host System goes into power down mode, the Host Driver should stop the re-tuning timer and set the expiration flag to 1 when the Host System resumes from power down mode. 0 Timer - Max data length 4MB 1 Timer and Re-Tuning Request - Max data length 4MB 2 Auto Re-Tuning (for transfer) - Timer and Re-Tuning Request 3 Reserved
13	TSDR50	R	0h	Use Tuning for SDR50 If this bit is set to 1, this Host Controller requires tuning to operate SDR50. [Tuning is always required to operate SDR104.] 0 SDR50 does not require tuning. 1 SDR50 requires tuning.
12	RESERVED2	R	0h

5.18.2.28 MMC_FE Register

5.18.2.28.1 MMC_FE Register (Offset = 250h) [reset = 0h]

Force Event Register for Auto CMD Error Status and Error Interrupt status
The Force Event Register is not a physically implemented register. Rather, it is an address at which the Auto CMD Error Status Register can be written.
Writing 1 : set each bit of the Auto CMD Error Status Register
Writing 0 : no effect
Rather, it is an address at which the Error Interrupt Status register can be written. The effect of a write to this address will be reflected in the Error Interrupt Status Register if the corresponding bit of the Error Interrupt Status Enable Register is set.
Writing 1 : set each bit of the Error Interrupt Status Register
Writing 0 : no effect
Note: By setting this register, the Error Interrupt can be set in the Error Interrupt Status register. In order to generate interrupt signal, both the Error Interrupt Status Enable and Error Interrupt Signal Enable shall be set.

5.18.2.29 MMC_ADMAES Register

5.18.2.29.1 MMC_ADMAES Register (Offset = 254h) [reset = 0h]

ADMA Error Status Register
When ADMA Error Interrupt is occurred, the ADMA Error States field in this register holds the ADMA state and the ADMA System Address Register holds the address around the error descriptor. For recovering the error, the Host Driver requires the ADMA state to identify the error descriptor address as follows:
ST_STOP: Previous location set in the ADMA System Address register is the error descriptor address
ST_FDS: Current location set in the ADMA System Address register is the error descriptor address
ST_CADR: This sate is never set because do not generate ADMA error in this state.
ST_TFR: Previous location set in the ADMA System Address register is the error descriptor address
In case of write operation, the Host Driver should use ACMD22 to get the number of written block rather than using this information, since unwritten data may exist in the Host Controller. The Host Controller generates the ADMA Error Interrupt when it detects invalid descriptor data (Valid=0) at the ST_FDS state. In this case, ADMA Error State indicates that an error occurs at ST_FDS state. The Host Driver may find that the Valid bit is not set in the error descriptor.

Bit	Field	Type	Reset	Description
7:0	ALGO0	R/W	FFh	This register is used to indicate the algorithm[s] to be used for the memory self-test routine. Each bit corresponds to a specific algorithm. Writing a value 1 to the particular bit, enables the corresponding algorithm. Writing a value 0 to the particular bit, disables the corresponding algorithm.

Table 5-2155. PBIST_RINFOL Register Field Descriptions

Bit	Field	Type	Reset	Description
31:24	RINFOL3	R/W	FFh	This register is to select memory groups to run the algorithms selected in the PBIST_ALGO register. For an algorithmto be executed on a particular memory group, the corresponding bit in this register must be set to 1. The default value of this register is all 1s, which means all the memory groups are selected. Writing a value 0 to the particular bit, disables the corresponding memory group.
23:16	RINFOL2	R/W	FFh	This register is to select memory groups to run the algorithms selected in the PBIST_ALGO register. For an algorithmto be executed on a particular memory group, the corresponding bit in this register must be set to 1. The default value of this register is all 1s, which means all the memory groups are selected. Writing a value 0 to the particular bit, disables the corresponding memory group.
15:8	RINFOL1	R/W	FFh	This register is to select memory groups to run the algorithms selected in the PBIST_ALGO register. For an algorithmto be executed on a particular memory group, the corresponding bit in this register must be set to 1. The default value of this register is all 1s, which means all the memory groups are selected. Writing a value 0 to the particular bit, disables the corresponding memory group.
7:0	RINFOL0	R/W	FFh	This register is to select memory groups to run the algorithms selected in the PBIST_ALGO register. For an algorithmto be executed on a particular memory group, the corresponding bit in this register must be set to 1. The default value of this register is all 1s, which means all the memory groups are selected. Writing a value 0 to the particular bit, disables the corresponding memory group.

Table 5-2161. RTI_RTIGCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31:20	RESERVED2	R/W	0h	Reserved. Reads return 0 and writes have no effect
19:16	NTUSEL	R/W	0h	NTUSEL: Select NTU signal. These bits determine which NTU input signal is used as external timebase. There are up to four inputs supported with four valid selection combinations. Any invalid selection value written to the NTUSEL bit-field will result in a TIED LOW being used as the NTU signal. The NTU signal will also be TIED LOW in case of a single-bit flip as it will result in an invalid combination of NTUSEL. User and privilege mode [read]: 0000= NTU0 0101= NTU1 1010= NTU2 1111= NTU3 other = tied to 0 Privilege mode [write]: 0000= NTU0 0101= NTU1 1010= NTU2 1111= NTU3 other = tied to 0

Table 5-2161. RTI_RTIGCTRL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
15	COS	R/W	0h	COS: Continue On Suspend. This bit determines if both counters are stopped when the device goes into debug mode or if they continue counting. User and privilege mode [read]: 0 = counters are stopped while in debug mode 1 = counters are running while in debug mode Privilege mode [write]: 0 = stop counters in debug mode 1 = continue counting in debug mode
14:2	RESERVED1	R/W	0h	Reserved. Reads return 0 and writes have no effect
1	CNT1EN	R/W	0h	CNT1EN: Counter 1 Enable. The CNT1EN bit starts and stops the operation of counter block 1 [UC1 and FRC1]. User and privilege mode [read]: 0 = counters are stopped 1 = counters are running Privilege mode [write]: 0 = stop counters 1 = start counters Gives the absolute 32 bit destination address [physical].
0	CNT0EN	R/W	0h	CNT0EN: Counter 0 Enable.The CNT0EN bit starts and stops the operation of counter block 0 [UC0 and FRC0]. User and privilege mode [read]: 0 = counters are stopped 1 = counters are running Privilege mode [write]: 0 = stop counters 1 = start counters Gives the absolute 32 bits source address [physical].

5.21.2.2 RTI_RTITBCTRL Register

5.21.2.2.1 RTI_RTITBCTRL Register (Offset = 4h) [reset = 0h]

Timebase Control selection which source triggers free running counter 0 .

Return to Summary Table

Table 5-2163. RTI_RTITBCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31:2	RESERVED3	R/W	0h	Reserved
1	INC	R/W	0h	INC: Increment Free Running Counter 0. This bit determines wether the Free Running Counter 0 is automatically incremented if a failing clock on the NTUx signal is detected. User and privilege mode [read]: 0 = FRC0 will not be incremented 1 = FRC0 will be incremented Privilege mode [write]: 0 = Do not increment FRC0 on failing external clock 1 = Increment FRC0 on failing external clock

Table 5-2163. RTI_RTITBCTRL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
0	TBEXT	R/W	0h	TBEXT: Timebase External. The Timebase External bit selects whether the Free Running Counter 0 is clocked by the internal Up Counter 0 or from the external signal NTUx. Since setting the TBEXT bit to 1 resets Up Counter 0, Free Running Counter 0 will not be incremented in this occurence. The only source which is able to increment Free Running Counter 0 is NTUx. When the Timebase Supervisor circuit detects a missing clockedge, then the TBEXT bit is reset. The selection if the external signal should be used, can only be done by software. User and privilege mode [read]: 0 = UC0 clocks FRC0 1 = NTUx clocks FRC0 Privilege mode [write]: 0 = MUX is switched to internal UC0 clocking scheme 1 = MUX is switched to external NTUx clocking scheme

5.21.2.3 RTI_RTICAPCTRL Register

5.21.2.3.1 RTI_RTICAPCTRL Register (Offset = 8h) [reset = 0h]

Capture Control controls the capture source for the counters.

Table 5-2171. RTI_RTIUC0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31:0	UC0	R/W	0h	UC0: Up Counter 0. This registers holds the current value of the Up Counter 0 and prescales the RTI clock. It will be only updated by a previous read of Free Running Counter 0. This gives effectively a 64 bit read of both counters, without having the problem of a counter being updated between two consecutive reads on Up Counter 0 and Free Running Counter 0. User and privilege mode [read]: value of the counter when the Free Running Counter 0 was read Privilege mode [write]: the counter can be preset by Writing to this register. The counter increments then from this written value upwards. Note: Presetting counters If counters have to be preset, they have to be stopped from counting in the RTIGCTRL register in order to ensure consistency between RTIUC0 and RTIFRC0. Note: Preset value concern If the preset value is bigger than the compare value stored in register RTICPUC0 then it can take a long time until a compare matches, since RTIUC0 has to count up until it overflows.

5.21.2.7 RTI_RTICPUC0 Register

5.21.2.7.1 RTI_RTICPUC0 Register (Offset = 18h) [reset = 0h]

Compare Up Counter 0 compare value compared with prescale counter 0

Table 5-2199. RTI_RTIUDCP2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31:0	UDCP2	R/W	0h	UDCP2: Update compare 2 Register. This registers holds a value, which is added to the value in the compare 2 register each time a compare matches. This gives the possibility to generate periodic interrupts without software intervention. User and privilege mode [read]: value to be added to the compare 2 register on the next compare match Privilege mode [write]: new update value

5.21.2.21 RTI_RTICOMP3 Register

5.21.2.21.1 RTI_RTICOMP3 Register (Offset = 68h) [reset = 0h]

Compare 3 compare value to be compared with the counters.

Return to Summary Table

Table 5-2201. RTI_RTICOMP3 Register Field Descriptions

Bit	Field	Type	Reset	Description
31:0	COMP3	R/W	0h	COMP3: compare 3. This registers holds a compare value, which is compared with the counter selected in the compare control logic. If the Free Running Counter matches the compare value, an interrupt is flagged. With this register it is also possible to initiate a DMA request. User and privilege mode [read]: current compare value Privilege mode [write]: update of the compare register with a new compare value Note: Reset behavior A reset does not generate a compare match, since the compare logic will only be active, when the associated counter block is enabled.

5.21.2.22 RTI_RTIUDCP3 Register

5.21.2.22.1 RTI_RTIUDCP3 Register (Offset = 6Ch) [reset = 0h]

Update Compare 3 value to be added to the compare register 3 value on compare match.

Table 5-2207. RTI_RTITBHCOMP Register Field Descriptions

Bit	Field	Type	Reset	Description
31:0	TBHCOMP	R/W	0h	TBHCOMP: Timebase High Compare Value. This value determines when the edge detection circuit will stop monitoring the NTUx signal. It will be compared with Up Counter 0. RTITBHCOMP has to be less than RTICPUC0, since RTIUC0 will be reset when RTICPUC0 is reached. Example: The NTUx edge detection circuit should be active +/- 10 RTICLK cycles around RTICPUC0. RTICPUC0 = 0x00000050 RTITBLCOMP = 0x000046 RTITBHCOMP = 0x00000009 User and privilege mode [read]: current compare value Privilege mode [write when TBEXT = 0]: the compare value is updated Privilege mode [write when TBEXT = 1]: the compare value is not changed Note: Reset behavior A reset does not generate a compare match.

5.21.2.25 RTI_RTISETINT Register

Table 5-2217. RTI_RTIDWDPRLD Register Field Descriptions

Bit	Field	Type	Reset	Description
31:12	RESERVED17	R/W	0h	Reserved. Reads return 0 and writes have no effect
11:0	DWDPRLD	R/W	0h	DWDPRLD: Digital Watchdog Preload Value. User and priviledge mode [read]: A read from this register in any CPU mode returns the current preload value. Priviledge mode [write]: If the DWD is always enabled after reset is released: The DWD starts counting down from the reset value of the counter, that is, 0x002DFFFF. The application can configure the DWD preload register any time before this down counter expires. When the application services the DWD, the preload register contents are copied left-justified into the DWD down counter and it starts counting down from that value. If the DWD is implemented such that the down counter is enabled by software: The DWD preload register can be configured only when the DWD is disabled. Therefore, the application can only configure the DWD preload register before it enables the DWD down counter. The expiration time of the DWD Down Counter can be determined with following equation: texp = [RTIDWDPRLD+1] x 2 ^ 13 / RTICLK1 where: RTIDWDPRLD = 0...4095

5.21.2.30 RTI_RTIWDSTATUS Register

5.21.2.30.1 RTI_RTIWDSTATUS Register (Offset = 98h) [reset = 0h]

Watchdog Status reflects the status of Analog and Digital Watchdog.

Table 5-2219. RTI_RTIWDSTATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31:6	RESERVED18	R/W	0h	Reserved. Reads return 0 and writes have no effect
5	DWWD_ST	R/W	0h	DWWD ST: Windowed Watchdog Status. This bit denotes whether the time-window defined by the windowed watchdog configuration has been violated, or if a wrong key or key sequence was written to service the watchdog. User and priviledge mode [read]: 0 = no time-window violation has occurred. 1 = a time-window violation has occurred. The watchdog will generate either a system reset or a non-maskable interrupt to the CPU in this case. Priviledge mode [write]: 0 = leaves the current value unchanged. 1 = clears the bit to 0. This will also clear all other status flags in the RTIWDSTATUS register except for the AWD ST flag. Clearing of the status flags will deassert the non-maskable interrupt generated due to violation of the DWWD.

Table 5-2219. RTI_RTIWDSTATUS Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
4	ENDTIMEVIOL	R/W	0h	END TIME VIOL: Windowed Watchdog End Time Violation Status. This bit denotes whether the end-time defined by the windowed watchdog configuration has been violated. This bit is effectively a copy of the DWD ST status flag. User and priviledge mode [read]: 0 = no end-time window violation has occurred. 1 = the end-time defined by the windowed watchdog configuration has been violated. Priviledge mode [write]: 0 = leaves the current value unchanged. 1 = clears the bit to 0.
3	STARTTIMEVIOL	R/W	0h	START TIME VIOL: Windowed Watchdog Start Time Violation Status. This bit denotes whether the start-time defined by the windowed watchdog configuration has been violated. This indicates that the WWD was serviced before the service window was opened. User and priviledge mode [read]: 0 = no start-time window violation has occurred. 1 = the start-time defined by the windowed watchdog configuration has been violated. Priviledge mode [write]: 0 = leaves the current value unchanged. 1 = clears the bit to 0.
2	KEYST	R/W	0h	KEYST: Watchdog KeyStatus. This bit denotes a reset generated by a wrong key or a wrong key-sequence written to the RTIWDKEY register. User and priviledge mode [read]: 0 = no wrong key or key-sequence written 1 = wrong key or key-sequence written to RTIWDKEY register Priviledge mode [write]: 0 = leaves the current value unchanged 1 = clears the bit to 0
1	DWDST	R/W	0h	DWDST: Digital Watchdog Status. This bit is effectively a copy of the END TIME VIOL status flag and is maintained for compatibility reasons. User and priviledge mode [read]: 0 = DWD timeout period not expired 1 = DWD timeout period has expired Priviledge mode [write]: 0 = leaves the current value unchanged 1 = clears the bit to 0
0	AWDST	R/W	0h	AWDST: Analog Watchdog Status. User and priviledge mode [read]: 0 = AWD pin 0 > 1 threshold not exceeded 1 = AWD pin 0 > 1 threshold exceeded Priviledge mode [write]: 0 = leaves the current value unchanged 1 = clears the bit to 0

5.21.2.31 RTI_RTIWDKEY Register

5.21.2.31.1 RTI_RTIWDKEY Register (Offset = 9Ch) [reset = 0h]

Watchdog Key correct written key values discharge the external capacitor.

Return to Summary Table

Table 5-2220. Instance Table

Table 5-2221. RTI_RTIWDKEY Register Field Descriptions

Bit	Field	Type	Reset	Description
31:16	RESERVED19	R/W	0h	Reserved. Reads return 0 and writes have no effect
15:0	WDKEY	R/W	0h	WDKEY: Watchdog Key. User and privilege mode reads are indeterminate. Privilege mode [write]: A write of 0xE51A followed by 0xA35C in two separate write operations defines the Key Sequence and discharges the watchdog capacitor. This also causes the upper 12 bits of the DWD down counter to be reloaded with the contents of the DWD preload register and the lower 13 bits to become all 1s. Writing any other value causes a digital watchdog reset, as shown in Table 1-3. Note: Register write access time precaution The user has to take into account that the write to the register takes 3 VCLK cycle. This needs to be considered for the AWD/DWD expiration calculation.

5.21.2.32 RTI_RTIDWDCNTR Register

5.21.2.32.1 RTI_RTIDWDCNTR Register (Offset = A0h) [reset = 0h]

Digital Watchdog Down Counter current value of DWD down counter.

Table 5-2225. RTI_RTIWWDRXNCTRL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3:0	WWDRXN	R/W	0h	WWDRXN: Digital Windowed Watchdog Reaction. User and privilege mode [read], privileged mode [write]: 0x5 = This is the default value. The windowed watchdog will cause a reset if the watchdog is serviced outside the time window defined by the configuration, or if the watchdog is not serviced at all. 0xA = The windowed watchdog will generate a non-maskable interrupt to the CPU if the watchdog is serviced outside the time window defined by the configuration, or if the watchdog is not serviced at all. Writing any other value will cause a system reset if the watchdog is serviced outside the time window defined by the configuration, or if the watchdog is not serviced at all. Note: Configuration of DWWD Reaction The DWWD reaction can be selected by the application even when the DWWD counter is already enabled. If a change to the WWDRXN is made before the watchdog service window is opened, then the change in the configuration takes effect immediately. If a change to the WWDRXN is made when the watchdog service window is already open, then the change in configuration takes effect only after the watchdog is serviced.

5.21.2.34 RTI_RTIWWDSIZECTRL Register

5.21.2.34.1 RTI_RTIWWDSIZECTRL Register (Offset = A8h) [reset = 0h]

Windowed Watchdog Size Control configures the size of the window for the digital windowed watchdog.

Return to Summary Table

Bit	Field	Type	Reset	Description
31:20	RESERVED2	R/W	0h	Reserved. Reads return 0 and writes have no effect
19:16	NTUSEL	R/W	0h	NTUSEL: Select NTU signal. These bits determine which NTU input signal is used as external timebase. There are up to four inputs supported with four valid selection combinations. Any invalid selection value written to the NTUSEL bit-field will result in a TIED LOW being used as the NTU signal. The NTU signal will also be TIED LOW in case of a single-bit flip as it will result in an invalid combination of NTUSEL. User and privilege mode [read]: 0000= NTU0 0101= NTU1 1010= NTU2 1111= NTU3 other = tied to 0 Privilege mode [write]: 0000= NTU0 0101= NTU1 1010= NTU2 1111= NTU3 other = tied to 0

Table 5-2240. WDT_RTIGCTRL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
15	COS	R/W	0h	COS: Continue On Suspend. This bit determines if both counters are stopped when the device goes into debug mode or if they continue counting. User and privilege mode [read]: 0 = counters are stopped while in debug mode 1 = counters are running while in debug mode Privilege mode [write]: 0 = stop counters in debug mode 1 = continue counting in debug mode
14:2	RESERVED1	R/W	0h	Reserved. Reads return 0 and writes have no effect
1	CNT1EN	R/W	0h	CNT1EN: Counter 1 Enable. The CNT1EN bit starts and stops the operation of counter block 1 [UC1 and FRC1]. User and privilege mode [read]: 0 = counters are stopped 1 = counters are running Privilege mode [write]: 0 = stop counters 1 = start counters Gives the absolute 32 bit destination address [physical].
0	CNT0EN	R/W	0h	CNT0EN: Counter 0 Enable.The CNT0EN bit starts and stops the operation of counter block 0 [UC0 and FRC0]. User and privilege mode [read]: 0 = counters are stopped 1 = counters are running Privilege mode [write]: 0 = stop counters 1 = start counters Gives the absolute 32 bits source address [physical].

5.22.2.2 WDT_RTITBCTRL Register

5.22.2.2.1 WDT_RTITBCTRL Register (Offset = 4h) [reset = 0h]

Timebase Control selection which source triggers free running counter 0 .

Return to Summary Table

Bit	Field	Type	Reset	Description
31:2	RESERVED3	R/W	0h	Reserved
1	INC	R/W	0h	INC: Increment Free Running Counter 0. This bit determines wether the Free Running Counter 0 is automatically incremented if a failing clock on the NTUx signal is detected. User and privilege mode [read]: 0 = FRC0 will not be incremented 1 = FRC0 will be incremented Privilege mode [write]: 0 = Do not increment FRC0 on failing external clock 1 = Increment FRC0 on failing external clock

Table 5-2242. WDT_RTITBCTRL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
0	TBEXT	R/W	0h	TBEXT: Timebase External. The Timebase External bit selects whether the Free Running Counter 0 is clocked by the internal Up Counter 0 or from the external signal NTUx. Since setting the TBEXT bit to 1 resets Up Counter 0, Free Running Counter 0 will not be incremented in this occurence. The only source which is able to increment Free Running Counter 0 is NTUx. When the Timebase Supervisor circuit detects a missing clockedge, then the TBEXT bit is reset. The selection if the external signal should be used, can only be done by software. User and privilege mode [read]: 0 = UC0 clocks FRC0 1 = NTUx clocks FRC0 Privilege mode [write]: 0 = MUX is switched to internal UC0 clocking scheme 1 = MUX is switched to external NTUx clocking scheme

5.22.2.3 WDT_RTICAPCTRL Register

Table 5-2268. WDT_RTICOMP0 Register Field Descriptions

Bit	Field	Type	Reset	Description
31:0	COMP0	R/W	0h	COMP0: Compare 0. This registers holds a compare value, which is compared with the counter selected in the compare control logic. If the Free Running Counter matches the compare value, an interrupt is flagged. With this register it is also possible to initiate a DMA request. User and privilege mode [read]: current compare value Privilege mode [write]: update of the compare register with a new compare value Note: Reset behavior A reset does not generate a compare match, since the compare logic will only be active, when the associated counter block is enabled.

5.22.2.16 WDT_RTIUDCP0 Register

5.22.2.16.1 WDT_RTIUDCP0 Register (Offset = 54h) [reset = 0h]

Update Compare 0 value to be added to the compare register 0 value on compare match.

Return to Summary Table

31:0	DWDCTRL	R/W	0h	DWDCTRL: Digital Watchdog Control. User and priviledge mode [read]: 0x5312ACED = DWD counter is disabled. This is the default value. 0xA98559DA = DWD counter is enabled Any other value = DWD counter state is unchanged [enabled or disabled] Priviledge mode [write]: 0xA98559DA = DWD counter is enabled Any other value = State of DWD counter is unchanged [stays enabled or disabled] Note: One-Write Functionality of DWDCTRL Register The RTIDWDCTRL register implements a one-write functionality, such that the application cannot write to this registermore than once. Writing the default value will not enable the watchdog as described above. Writing the enable value will start the watchdog counters. A write to RTIDWDCTRL will only be enabled after a system reset again.

5.22.2.29 WDT_RTIDWDPRLD Register

5.22.2.29.1 WDT_RTIDWDPRLD Register (Offset = 94h) [reset = 0h]

Digital Watchdog Preload sets the experation time of the Digital Watchdog.

Return to Summary Table

Table 5-2296. WDT_RTIDWDPRLD Register Field Descriptions

Bit	Field	Type	Reset	Description
31:12	RESERVED17	R/W	0h	Reserved. Reads return 0 and writes have no effect
11:0	DWDPRLD	R/W	0h	DWDPRLD: Digital Watchdog Preload Value. User and priviledge mode [read]: A read from this register in any CPU mode returns the current preload value. Priviledge mode [write]: If the DWD is always enabled after reset is released: The DWD starts counting down from the reset value of the counter, that is, 0x002DFFFF. The application can configure the DWD preload register any time before this down counter expires. When the application services the DWD, the preload register contents are copied left-justified into the DWD down counter and it starts counting down from that value. If the DWD is implemented such that the down counter is enabled by software: The DWD preload register can be configured only when the DWD is disabled. Therefore, the application can only configure the DWD preload register before it enables the DWD down counter. The expiration time of the DWD Down Counter can be determined with following equation: texp = [RTIDWDPRLD+1] x 2 ^ 13 / RTICLK1 where: RTIDWDPRLD = 0...4095

5.22.2.30 WDT_RTIWDSTATUS Register

5.22.2.30.1 WDT_RTIWDSTATUS Register (Offset = 98h) [reset = 0h]

Watchdog Status reflects the status of Analog and Digital Watchdog.

Return to Summary Table

Table 5-2298. WDT_RTIWDSTATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31:6	RESERVED18	R/W	0h	Reserved. Reads return 0 and writes have no effect
5	DWWD_ST	R/W	0h	DWWD ST: Windowed Watchdog Status. This bit denotes whether the time-window defined by the windowed watchdog configuration has been violated, or if a wrong key or key sequence was written to service the watchdog. User and priviledge mode [read]: 0 = no time-window violation has occurred. 1 = a time-window violation has occurred. The watchdog will generate either a system reset or a non-maskable interrupt to the CPU in this case. Priviledge mode [write]: 0 = leaves the current value unchanged. 1 = clears the bit to 0. This will also clear all other status flags in the RTIWDSTATUS register except for the AWD ST flag. Clearing of the status flags will deassert the non-maskable interrupt generated due to violation of the DWWD.

Table 5-2298. WDT_RTIWDSTATUS Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
4	ENDTIMEVIOL	R/W	0h	END TIME VIOL: Windowed Watchdog End Time Violation Status. This bit denotes whether the end-time defined by the windowed watchdog configuration has been violated. This bit is effectively a copy of the DWD ST status flag. User and priviledge mode [read]: 0 = no end-time window violation has occurred. 1 = the end-time defined by the windowed watchdog configuration has been violated. Priviledge mode [write]: 0 = leaves the current value unchanged. 1 = clears the bit to 0.
3	STARTTIMEVIOL	R/W	0h	START TIME VIOL: Windowed Watchdog Start Time Violation Status. This bit denotes whether the start-time defined by the windowed watchdog configuration has been violated. This indicates that the WWD was serviced before the service window was opened. User and priviledge mode [read]: 0 = no start-time window violation has occurred. 1 = the start-time defined by the windowed watchdog configuration has been violated. Priviledge mode [write]: 0 = leaves the current value unchanged. 1 = clears the bit to 0.
2	KEYST	R/W	0h	KEYST: Watchdog KeyStatus. This bit denotes a reset generated by a wrong key or a wrong key-sequence written to the RTIWDKEY register. User and priviledge mode [read]: 0 = no wrong key or key-sequence written 1 = wrong key or key-sequence written to RTIWDKEY register Priviledge mode [write]: 0 = leaves the current value unchanged 1 = clears the bit to 0
1	DWDST	R/W	0h	DWDST: Digital Watchdog Status. This bit is effectively a copy of the END TIME VIOL status flag and is maintained for compatibility reasons. User and priviledge mode [read]: 0 = DWD timeout period not expired 1 = DWD timeout period has expired Priviledge mode [write]: 0 = leaves the current value unchanged 1 = clears the bit to 0
0	AWDST	R/W	0h	AWDST: Analog Watchdog Status. User and priviledge mode [read]: 0 = AWD pin 0 > 1 threshold not exceeded 1 = AWD pin 0 > 1 threshold exceeded Priviledge mode [write]: 0 = leaves the current value unchanged 1 = clears the bit to 0

5.22.2.31 WDT_RTIWDKEY Register

5.22.2.31.1 WDT_RTIWDKEY Register (Offset = 9Ch) [reset = 0h]

Watchdog Key correct written key values discharge the external capacitor.

Return to Summary Table

Table 5-2300. WDT_RTIWDKEY Register Field Descriptions

Bit	Field	Type	Reset	Description
31:16	RESERVED19	R/W	0h	Reserved. Reads return 0 and writes have no effect
15:0	WDKEY	R/W	0h	WDKEY: Watchdog Key. User and privilege mode reads are indeterminate. Privilege mode [write]: A write of 0xE51A followed by 0xA35C in two separate write operations defines the Key Sequence and discharges the watchdog capacitor. This also causes the upper 12 bits of the DWD down counter to be reloaded with the contents of the DWD preload register and the lower 13 bits to become all 1s. Writing any other value causes a digital watchdog reset, as shown in Table 1-3. Note: Register write access time precaution The user has to take into account that the write to the register takes 3 VCLK cycle. This needs to be considered for the AWD/DWD expiration calculation.

5.22.2.32 WDT_RTIDWDCNTR Register

5.22.2.32.1 WDT_RTIDWDCNTR Register (Offset = A0h) [reset = 0h]

Digital Watchdog Down Counter current value of DWD down counter.

Return to Summary Table

5.23.1 SPINLOCK Summaries

SPINLOCK Summaries

Table 5-2317. SPINLOCK Registers, Base Address=50E0 0000h, Length=32768

Offset	Length	Register Name	SPINLOCK0 Physical Address
0h	32	SPINLOCK_REVISION	50E0 0000h
10h	32	SPINLOCK_SYSCONFIG	50E0 0010h
14h	32	SPINLOCK_SYSTATUS	50E0 0014h
800h	32	SPINLOCK_LOCK_REG_J	50E0 0800h + formula

5.23.2 SPINLOCK Registers

SPINLOCK Registers

5.23.2.1 SPINLOCK_REVISION Register

5.23.2.1.1 SPINLOCK_REVISION Register (Offset = 0h) [reset = 66FA6900h]

This is the standard TI peripheral ID register that exists at address 0 in the peripheral space.

Return to Summary Table

Table 5-2319. SPINLOCK_REVISION Register Field Descriptions

Bit	Field	Type	Reset	Description
31:30	SCHEME	R	1h	Used to distinguish which ID numbering scheme is used.
29:28	BU	R	2h	BU identifier
27:16	FUNCTION	R	6FAh	Module family.
15:11	RTL_VER	R	Dh	RTL version. R of X.Y.R.Z
10:8	MAJOR_REV	R	1h	Major revision. X of X.Y.R.Z
7:6	CUSTOM	R	0h	Special version number
5:0	MINOR_REV	R	0h	Minor revision. Y of X.Y.R.Z

5.23.2.2 SPINLOCK_SYSCONFIG Register

5.23.2.2.1 SPINLOCK_SYSCONFIG Register (Offset = 10h) [reset = 0h]

Provides the SOFTRESET register for backwards compatibility with OMAP Spinlock.

Return to Summary Table

Table 5-2320. Instance Table

Instance Name	Physical Address
SPINLOCK0	50E0 0010h

Table 5-2321. SPINLOCK_SYSCONFIG Register Field Descriptions

Bit	Field	Type	Reset	Description
31:2	RESERVED	NONE	0h	Reserved
1	SOFT_RESET	R/W	0h	Module Software Reset The bit is automatically reset by the hardware. During reads, it always returns 0 It has the same effect as the hardware reset Writing a 0 has no effect. Writing a 1 will start a soft reset sequence and free all of the locks
0	RESERVED	NONE	0h	Reserved

5.23.2.3 SPINLOCK_SYSTATUS Register

5.23.2.3.1 SPINLOCK_SYSTATUS Register (Offset = 14h) [reset = 8000000h]

Provides information about the Spinlock module.

Return to Summary Table

Table 5-2323. SPINLOCK_SYSTATUS Register Field Descriptions

Bit	Field	Type	Reset	Description
31:24	NUM_LOCKS	R	8h	Module configuration parameter n, the total number of spinlocks divided by 32. e.g. For 256 spin locks, this will return the number 0x08
23:8	RESERVED	NONE	0h	Reserved
7	IN_USE7	R	0h	In-Use flag 7 covering lock registers 224 - 255. If no lock registers are implemented in this range, then this flag always reads as 0 Read 0 : All lock registers 224 - 255 are in the Not Taken state Read 1 : At least one of the lock registers 224 - 255 are in the Taken state
6	IN_USE6	R	0h	In-Use flag 6 covering lock registers 192 - 223. If no lock registers are implemented in this range, then this flag always reads as 0 Read 0 : All lock registers 192 - 223 are in the Not Taken state Read 1 : At least one of the lock registers 192 - 223 are in the Taken state
5	IN_USE5	R	0h	In-Use flag 5 covering lock registers 160 - 191. If no lock registers are implemented in this range, then this flag always reads as 0 Read 0 : All lock registers 160 - 191 are in the Not Taken state Read 1 : At least one of the lock registers 160 - 191 are in the Taken state

Table 5-2323. SPINLOCK_SYSTATUS Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
4	IN_USE4	R	0h	In-Use flag 4 covering lock registers 128 - 159. If no lock registers are implemented in this range, then this flag always reads as 0 Read 0 : All lock registers 128 - 159 are in the Not Taken state Read 1 : At least one of the lock registers 128 - 159 are in the Taken state
3	IN_USE3	R	0h	In-Use flag 3 covering lock registers 96 - 127. If no lock registers are implemented in this range, then this flag always reads as 0 Read 0 : All lock registers 96 - 127 are in the Not Taken state Read 1 : At least one of the lock registers 96 - 127 are in the Taken state
2	IN_USE2	R	0h	In-Use flag 2 covering lock registers 64 - 95. If no lock registers are implemented in this range, then this flag always reads as 0 Read 0 : All lock registers 64 - 95 are in the Not Taken state Read 1 : At least one of the lock registers 64 - 95 are in the Taken state
1	IN_USE1	R	0h	In-Use flag 1 covering lock registers 32 - 63. If no lock registers are implemented in this range, then this flag always reads as 0 Read 0 : All lock registers 32 - 63 are in the Not Taken state Read 1 : At least one of the lock registers 32 - 63 are in the Taken state
0	IN_USE0	R	0h	In-Use flag 0 covering lock registers 0 - 31. If no lock registers are implemented in this range, then this flag always reads as 0 Read 0 : All lock registers 0 - 31 are in the Not Taken state Read 1 : At least one of the lock registers 0 - 31 are in the Taken state

5.23.2.4 SPINLOCK_LOCK_REG_J Register

5.23.2.4.1 SPINLOCK_LOCK_REG_J Register (Offset = 800h) [reset = 0h]

The Lock[a] register is read and written to perform lock and unlock operations on lock 'a'.

Return to Summary Table

5.26.2.2 UART_RHR Register

5.26.2.2.1 UART_RHR Register (Offset = 0h) [reset = 0h]

The receiver section consists of the receiver holding register (RHR) and the receiver shift register. The RHR is actually a 64-byte FIFO. The receiver shift register receives serial data from RX input. The data is converted to parallel data and moved to the RHR. If the FIFO is disabled location zero of the FIFO is used to store the single data character.
Note: If an overflow occurs the data in the RHR is not overwritten.

5.26.2.3 UART_THR Register

5.26.2.3.1 UART_THR Register (Offset = 0h) [reset = 0h]

The transmitter section consists of the transmit holding register (THR) and the transmit shift register. The transmit holding register is actually a 64-byte FIFO. The LH writes data to the THR. The data is placed into the transmit shift register where it is shifted out serially on the TX output. If the FIFO is disabled location zero of the FIFO is used to store the data.

5.26.2.7 UART_IER_UART Register

5.26.2.7.1 UART_IER_UART Register (Offset = 4h) [reset = 0h]

The interrupt enable register (IER) can be programmed to enable/disable any interrupt. There are seven types of interrupt in this mode: receiver error, RHR interrupt, THR interrupt, XOFF received and CTS*/RTS* change of state from low to high. Each interrupt can be enabled/disabled individually. There is also a sleep mode enable bit.

5.26.2.26 UART_MDR1 Register

5.26.2.26.1 UART_MDR1 Register (Offset = 20h) [reset = 7h]

The mode of operation can be programmed by writing to MDR1[2:0] and therefore the MDR1 must be programmed on start-up after configuration of the configuration registers (DLL, DLH, LCR). The value of MDR1[2:0] must not be changed again during normal operation.
Note: If the module is disabled by setting the MODE_SELECT field to.

5.26.2.27 UART_MDR2 Register

5.26.2.27.1 UART_MDR2 Register (Offset = 24h) [reset = 0h]

IR-IrDA and IR-CIR modes only.
MDR2[0] describes the status of the interrupt in IIR[5]. The IRTX_UNDERRUN bit should be read after an IIR[5] TX_STATUS_IT interrupt has occurred. The bits [2:1] of this register sets the trigger level for the frame status FIFO (8 entries) and must be programmed before the mode is programmed in MDR1[2:0].
Note: The MDR2[6] gives the flexibility to invert the RX pin inside the UART module to ensure that the protocol at the input of the transceiver module has the same polarity at module level. By default, the RX pin is inverted because most of transceiver invert the IR receive pin.

0h	0h	0h	0h	0h	0h	0h	0h

Table 5-2413. UART_ACREG Register Field Descriptions

Bit	Field	Type	Reset	Description
31:8	RESERVED_24	R	0h	Reserved
7	PULSE_TYPE	R/W	0h	SIR pulse width select: 0 3/16 of baud-rate pulse width 1 1.6us
6	SD_MOD	R/W	0h	Primary output used to configure transceivers. Connected to the SD/MODE input pin of IrDA transceivers. 0 SD pin is set to high 1 SD pin is set to low
5	DIS_IR_RX	R/W	0h	0 Normal operation (RX input automatically disabled during transmit but enabled outside of transmit operation). 1 Disables RX input (permanent state - independent of transmit).

Table 5-2413. UART_ACREG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
4	DIS_TX_UNDERRUN	R/W	0h	It is recommended to disable TX FIFO underrun capability by masking corresponding underrun interrupt. When disabling underrun by setting ACREG[4]=1, garbage data is sent over TX line. 0 Long stop bits cannot be transmitted, TX underrun is enabled 1 Long stop bits can be transmitted, TX underrun is disabled
3	SEND_SIP	R/W1TS	0h	MIR/FIR Modes only.Send Serial Infrared Interaction Pulse [SIP] If this bit is set during a MIR/FIR transmission, the SIP will be send at the end of it.This bit automatically gets cleared at the end of the SIP transmission. 0 No action 1 Send SIP pulse.
2	SCTX_EN	R/W1TS	0h	Store and controlled TX start. When MDR1[5] = 1 and the LH writes 1 to this bit the TX state machine starts frame transmission. This bit is self-clearing.
1	ABORT_EN	R/W	0h	Frame Abort. The LH can intentionally abort transmission of a frame by Writing 1 to this bit. Neither the end flag nor the CRC bits are appended to the frame. If transmit FIFO is not empty and MDR1[5]=1, UART IrDA will start a new transfer with data of previous frame as soon as abort frame has been sent. Therefore, TX FIFO must be reset before sending an abort frame.
0	EOT_EN	R/W1TS	0h	EOT [end of transmission] bit. The LH writes 1 to this bit just before it writes the last byte to the TX FIFO in set-EOT bit frame closing method. This bit automatically gets cleared when the LH writes to the THR [TX FIFO].

5.26.2.39 UART_SCR Register

5.26.2.39.1 UART_SCR Register (Offset = 40h) [reset = 0h]

Note: Bit 4 enables the wake-up interrupt, but this interrupt is not mapped into the IIR register. Therefore, when an interrupt occurs and there is no interrupt pending in the IIR register, the SSR[1] bit must be checked. To clear the wake-up interrupt, bit SCR[4] must be reset to 0.

5.26.2.41 UART_EBLR Register

5.26.2.41.1 UART_EBLR Register (Offset = 48h) [reset = 0h]

IR-IrDA and IR-CIR modes only.
In IR-IrDA SIR operation, this register specifies the number of BOF + xBOFs to transmit. Value set into this register must take into account the BOF character, therefore to only sent one BOF with no XBOF this register must be set to 1. To send one BOF with N XBOF this register must be set to N+1. Furthermore, the value 0 will send 1 BOF plus 255 XBOF.
In IR-IrDA MIR mode, this register specifies the number of additional start flags (MIR protocol mandates a minimum of 2 start flags).
In IR-CIR mode, this register specifies the number of consecutive zeros to be received before generating the RX_STOP interrupt (IIR[2]). All the received zeros are stored in the RX FIFO. When the register is set to 0, this feature is de-activated and always in reception state which can be disabled by setting the ACREG[5] to.

IR-CIR mode: This register specifies the number of consecutive zeros to be received before generating the RX_STOP interrupt [IIR[2]]. 0x00: feature disabled. 0x01: generate RX_STOP interrupt after receiving one zero bit. ... 0xFF: generate RX_STOP interrupt after receiving 255 zero bits.

5.26.2.42 UART_MVR Register

5.26.2.42.1 UART_MVR Register (Offset = 50h) [reset = 47424E03h]

The reset value is fixed by hardware and corresponds to the RTL revision of this module. A reset has no effect on the value returned
Notes:
UART / IRDA SIR only module is revision 1.x (WMU_012_1 specification).
UART / IRDA with SIR, MIR and FIR support is revision 2.x (WMU_012_2 specification).
UART / IRDA with SIR, MIR and FIR / CIR support is revision 3.x (this specification).
For example: MVR = 0x30 => Version 3.0 MVR = 0x38 => Version 3.8

5.26.2.43 UART_SYSC Register

5.26.2.43.1 UART_SYSC Register (Offset = 54h) [reset = 0h]

The auto idle bit controls a power saving technique to reduce the logic power consumption of the OCP interface. That is to say when the feature is enabled, the clock will be gated off until an OCP command for this device has been detected. When the software reset bit is set high it causes a full device reset.

5.26.2.45 UART_WER Register

5.26.2.45.1 UART_WER Register (Offset = 5Ch) [reset = FFh]

The UART wakeup enable register is used to mask and unmask a UART event that would subsequently notify the system. The events are any activity in the logic that could cause an interrupt and/ or an activity that would require the system to wakeup. It should be noted that even if the wakeup is disabled for certain events, if these events are also an interrupt to the UART, then the UART will still register the interrupt as such.

5.26.2.46 UART_CFPS Register

5.26.2.46.1 UART_CFPS Register (Offset = 60h) [reset = 69h]

Since the Consumer IR works at modulation rates of 30 56.8 KHz, the 48 MHz clock must be pre scaled before the clock can drive the IR logic. This register sets the divisor rate to give a range to accommodate the remote control requirements in BAUD multiples of 12x. The value of the CFPS at reset is 0105 decimal which equates to a 38.1 KHz output from starting conditions. The 48 MHz carrier is prescaled by the CFPS which is then divided by the 12x BAUD multiple.

5.27.2 USB Registers

USB Registers

5.27.2.1 USB_OTGSSC2_REVISION Register

5.27.2.1.1 USB_OTGSSC2_REVISION Register (Offset = 0h) [reset = 500A0200h]

IP Revision Identifier (X.Y.R)
Used by software to track features, bugs, and compatibility.

Return to Summary Table

Table 5-2479. USB_OTGSSC2_REVISION Register Field Descriptions

Bit	Field	Type	Reset	Description
31:30	SCHEME	R	1h	Old vs. current REVISION encoding scheme. Read 0x0 = LEGACY, Legacy ASP or WBU scheme Read 0x1 = H08, Highlander 0.8 scheme
29:28	BU	R	1h	Business Unit Read 0x0 = DSPS Read 0x1 = WBU
27:16	FUNC	R	Ah	Function indicates a software compatible module family. If there is no level of software compatibility a new Func number [and hence REVISION] should be assigned.
15:11	R_RTL	R	0h	RTL Version [R], maintained by IP design owner.
10:8	X_MAJOR	R	2h	Major Revision [X], maintained by IP specification owner. Read 0x1 V10, USBOTGSSMMAV10GS80 Read 0x2 V20, USBOTGSSMMAV20GS80
7:6	CUSTOM	R	0h	Indicates a special version for a particular device. Consequence of use may avoid use of standard Chip Support Library [CSL] / Drivers. Read 0x0 STANDARD, Non custom [standard] revision
5:0	Y_MINOR	R	0h	Minor Revision [Y], maintained by IP specification owner..

5.27.2.2 USB_OTGSSC2_SYSCONFIG Register

5.27.2.2.1 USB_OTGSSC2_SYSCONFIG Register (Offset = 10h) [reset = 10028h]

Controls various parameters of the master and slave interfaces.

Table 5-2481. USB_OTGSSC2_SYSCONFIG Register Field Descriptions

Bit	Field	Type	Reset	Description
31:18	RESERVED2	R	0h	Reserved
17	WRAPRESET	R/W	0h	Software reset for the wrapper-MMR set. Self-clearing. Does not effect the core-MMR set. Read 0 = DONE, Wrapper reset is done / inactive Write 0 = NOOP, No action Write 1 = DORST, Request wrapper reset Read 1 = ACTIVE, Wrapper reset is ongoing
16	DMADISABLE	R/W	1h	Disable/Enable control of the DMA master [initiator] to block read/write accesses. Bit is auto-cleared [to 0] by HW in case of outgoing access, but must be set [to 1] manually. Write 0 = ENABLE, Enable the DMA. The enabling can also be done by the hardware, i.e. bit it auto-cleared. Read 0 = ENABLED, DMA is enabled, outgoing read/write accesses are possible. When in smart-standby mode, standby exit is requested. Read 1 = DISABLED, DMA is disabled, outgoing read/write accesses are blocked. When in smart-standby mode, standby is requested. Write 1 = DISABLE, Disable the DMA. SW must ensure that there are no ongoing transactions before setting this bit. The disabling can only be done by software.
15:6	RESERVED1	R	0h	Reserved

Table 5-2481. USB_OTGSSC2_SYSCONFIG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
5:4	STANDBYMODE	R/W	2h	PM mode of local initiator [master]. Initiator may generate read/write transaction as long as it is out of STANDBY state. 0x0 = FORCE, Force-standby: initiator is unconditionally placed in standby state. 0x1 = NO, No-standby: initiator is unconditionally placed out of standby state. 0x2 = SMART, Smart-standby: initiator's standby state depends on internal conditions, i.e. the module's functional requirements. Asynchronous wakeup events cannot be generated. 0x3 = SMART_WAKEUP, Smart-Standby, wakeup-capable: initiator's standby state depends on internal conditions, i.e. the module's functional requirements. Asynchronous wakeup events can be generated.
3:2	IDLEMODE	R/W	2h	PM mode of local target [target]. Target shall be capable of handling read/write transaction as long as it is out of IDLE state. 0x0 = FORCE, Force-idle mode: local target's idle state follows [acknowledges] the system's idle requests unconditionally, regardless of the IP module's internal requirements. 0x1 = NO, No-idle mode: local target never enters idle state. 0x2 = SMART, Smart-idle mode: local target's idle state eventually follows [acknowledges] the system's idle requests, depending on the IP module's internal requirements. Module shall not generate [IRQ- or DMA-request-related] wakeup events. 0x3 = SMART_WAKEUP, Smart-idle wakeup-capable mode: local target's idle state eventually follows [acknowledges] the system's idle requests, depending on the IP module's internal requirements. IP module may generate [IRQ- or DMA-request-related] wakeup events when in idle state.
1:0	RESERVED	R	0h	Reserved

5.27.2.3 USB_OTGSSC2_IRQ_EOI_MAIN Register

5.27.2.3.1 USB_OTGSSC2_IRQ_EOI_MAIN Register (Offset = 18h) [reset = 0h]

Software End-Of-Interrupt, MAIN lines: Flag the end current event to allow the generation of further pulses on the line.
Write 1 to a bit to EOI the corresponding line.
Unused when using the level interrupt line (depending on module integration).

5.27.2.20.1 USB_OTGSSC2_IRQ_EOI_MISC Register (Offset = 42Ch) [reset = 0h]

Software End-Of-Interrupt, MISC line: Flag the end current event to allow the generation of further pulses on the line.
Write 1 to a bit to EOI the corresponding line.
Unused when using the level interrupt line (depending on module integration).

Table 5-2551. USB_TRBB_CONTROL Register Field Descriptions

Bit	Field	Type	Reset	Description
31:30	RESERVED1	R	0h	RESERVED
29:14	SID_SOFN	R/W	0h	Stream ID / SOF Number. Stream-based bulk EP: The Stream ID of the transfer. Isochronous EP: [micro]frame number in which the last packet of the buffer was transmitted [debug].
13:12	RESERVED	R	0h	RESERVED
11	IOC	R	0h	Interrupt on Complete. Applicable only when LST=0, for a] IN EP or b] OUT EP when CSP=1. Read-only for the USB controller's DMA [HW].
10	ISP_IMI	R	0h	Interrupt on Short Packet / Interrupt on Missed ISOC. Controls the generation of the XferInProgress event. Read-only for the USB controller's DMA [HW].
9:4	TRBCTL	R	0h	TRB Control. Type of TRB. Read-only for the USB controller's DMA [HW].
3	CSP	R	0h	Continue on Short Packet. Reaction of an OUT endpoint upon reception of a short packet. Read-only for the USB controller's DMA [HW].
2	CHN	R	0h	Chain Buffers. Associates this TRB with the next in the same Buffer Descriptor. Always 0 in the last TRB of a Buffer Descriptor. Read-only for the USB controller's DMA [HW].
1	LST	R	0h	Last TRB. Indicates the last TRB in a list, i.e. in a transfer for the endpoint / bulk-stream. Read-only for the USB controller's DMA [HW].

Table 5-2551. USB_TRBB_CONTROL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
0	HWO	R/W	0h	Hardware Owner. TRB ownership. Set to 1 by SW when creating the TRB. SW cannot modify the TRB again until cleared to 0 by HW. There are exceptions for short packets on OUT endpoints and Link TRBs.

Table 5-2845. USB_DWC3_GRXTHRCFG Register Field Descriptions

Bit	Field	Type	Reset	Description
31:30	RESERVED5	R	0h	Reserved
29	USBRXPKTCNTSEL	R/W	0h	USB ReceivePacket Count Enable. Enables/disables USB reception multi-packet thresholding
28	RESERVED4	R	0h	Reserved
27:24	USBRXPKTCNT	R/W	0h	USB Receive Packet Count: Number of packets that must be available in the RX FIFO before the core can start the corresponding USB RX transaction [burst].Don't care if USBRxPktCntSel=0.
23:19	USBMAXRXBURSTSIZE	R/W	0h	USB Maximum Receive Burst Size. Maxi IN burst size, when USBRxPktCntSel = 1. When the system bus is slower than the USB, RX FIFO can overrun during a long burst. User can program a smaller value to this field to limit the RX burst size that the core can do. Only applies to SS Bulk / Iso / Int IN endpoints in host mode. Don't care if USBRxPktCntSel=0.
18:16	RESERVED3	R	0h	Reserved
15	RESERVED2	R	0h	Always write 0, result of Writing of a non-zero value is undetermined.
14:11	RESERVED1	R	0h	Reserved
10:0	RESERVED	R	0h	Always write 0, result of Writing of a non-zero value is undetermined.

5.27.2.185 USB_DWC3_GCTL Register

5.27.2.185.1 USB_DWC3_GCTL Register (Offset = C110h) [reset = 25803004h]

Global Control Register.

Return to Summary Table

0h		0h		0h	1h	0h	0h

Table 5-2847. USB_DWC3_GCTL Register Field Descriptions

Bit	Field	Type	Reset	Description
31:19	PWRDNSCALE	R/W	4B0h	Power Down Scale: In P3 state, pipe clock stops and is replaced internally by the suspend clock to create a 16kHz reference. Set field to Fs/16k, rounded up, with Fp suspend clock frequency. Required accuracy is 0-50%
18	MASTERFILTBYPASS	R/W	0h	Master Filter Bypass. Bypasses the double-synchronizers and the 5 ms debounce filters on UTMI+ inputs [the latter are not implemented].
17	BYPSSETADDR	R/W	0h	Override of the device address, bypassing the SET ADDRESS control transfer. For simulation only.
16	U2RSTECN	R/W	0h	If the super speed connection fails during POLL or LMP exchange, the device connects at non-SS mode. If this bit is set, then device attempts three more times to connect at SS, even if it previously failed to operate in SS mode.
15:14	FRMSCLDWN	R/W	0h	Frame scale-down. This field scales down device view of a SOF [FS/LS] / uSOF [HS] / ITP [SS] duration.
13:12	PRTCAPDIR	R/W	3h	Port Capability Direction
11	CORESOFTRESET	R/W	0h	Core Soft Reset. When you reset PHYs [using GUBS3PHYCFG or GUSB3PIPECTL registers], you must keep the core in reset state until PHY clocks are stable.
10	SOFITPSYNC	R/W	0h	Not supported: always write 0
9	DISU1U2TIMERSCALEDOWN	R/W	0h	Disable scaledown on U1/U2 timer [when general scaledown is enabled in GCTL[5:4]]. For simulation only.

Table 5-2847. USB_DWC3_GCTL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
8	DEBUGATTACH	R/W	0h	Debug Attach. When this bit is set: a] SS Link proceeds directly to the Polling link state [after RUN/STOP in the DCTL register is asserted] without checking remote termination. b] Link LFPS polling timeout is infinite c] Polling timeout during TS1 is infinite [in case link is waiting for TXEQ to finish].
7:6	RAMCLKSEL	R/W	0h	RAM Clock Select. No action, hardware always uses bus clock [config 2'b00]
5:4	SCALEDOWN	R/W	0h	Scale-Down Mode Enable. Switches to shorter, non-standard protocol time intervals to speed up simulation. DO NOT MODIFY ON ACTUAL HARDWARE.
3	DISSCRAMBLE	R/W	0h	Disable Scrambling. Transmit request to Link Partner on next transition to Recovery or Polling.
2	U2EXIT_LFPS	R/W	1h	U2 exit LFPS timer threshold setup
1	L1HIBERNATIONEN	R	0h	HIBERNATION / SAR FEATURE NOT IMPLEMENTED
0	DSBLCLKGTNG	R/W	0h	Disable Clock Gating. When this bit is set to 1 and the core is in Low Power mode, internal clock gating is disabled.

5.27.2.186 USB_DWC3_GSTS Register

5.27.2.186.1 USB_DWC3_GSTS Register (Offset = C118h) [reset = 3E800002h]

Global Status Register.

Table 5-2857. USB_DWC3_GUCTL Register Field Descriptions

Bit	Field	Type	Reset	Description
31:22	REFCLKPER	R/W	8h	Feature not implemented, do not change reset value.
21	NOEXTRDL	R/W	0h	No Extra Delay between SOF and the 1st packet [when host]
20:18	PSQEXTRRESSP	R/W	0h	Protocol Status Queue Extra Reserved Space [Debug only]. Additional space in the PSQ reserved before the USB3 protocl transaction layer [U3PTL] initiates a new USB transaction and burst beats.
17	SPRSCTRLTRANSEN	R/W	0h	Sparse Control Transaction Enable. Valid in host mode only [any speed].
16	RESBWHSEPS	R/W	0h	Reserving [more] Bandwidth for HS Periodic EPs. Valid in host mode only.
15	CMDEVADDR	R/W	1h	Compliance Mode for Device Address. Valid in host mode only.
14	USBHSTINAUTORETRYEN	R/W	0h	Host IN Auto Retry Enable: host core behaviour upon data packet CRC errors or internal overrun scenarios in non-isochronous IN transfers.
13	ENOVERLAPCHK	R/W	0h	Enable Check for LFPS Overlap During Remote U1/U2/U3 Exit
12	EXTCAPSUPTEN	R/W	0h	External Extended Capability Support Enable
11	INSRTEXTRFSBODL	R/W	0h	Insert Extra Delay Between FS Bulk OUT Transactions
10:9	DTCT	R/W	0h	Device Timeout Coarse Tuning: time the host waits for a response from device before timeout. Coarse setting.

Table 5-2857. USB_DWC3_GUCTL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
8:0	DTFT	R/W	10h	Device Timeout Fine Tuning: time the host waits for a response from device before timeout. Fine setting. Timer runs on the 125 MHz clock [8 ns period], timeout is DTFT * 256 * 8 ns ~= DTFT * 2 us. Don't care unless DTCT=0

5.27.2.191 USB_DWC3_GBUSERRADDRLO Register

5.27.2.191.1 USB_DWC3_GBUSERRADDRLO Register (Offset = C130h) [reset = 0h]

Global Bus Error (non-precise) Address, LSbits: Base address of the first system bus DMA transfer that got a bus error. Note that each DMA transfer can contain several bursts, each spanning several addresses. Valid when GSTS.BusErrAddrVld=1. Cleared upon core reset.

Table 5-2907. USB_DWC3_GUSB2PHYCFG Register Field Descriptions

Bit	Field	Type	Reset	Description
31	PHYSOFTRST	R/W	0h	PHY Soft Reset. Active-high, fully static software reset for UTMI USB2 transceiver.
30:19	RESERVED2	R	0h	Reserved
18:15	RESERVEDNG	R	0h	Reserved
14	RESERVED1	R	0h	Reserved
13:10	USBTRDTIM	R/W	9h	USB 2.0 Turnaround Time, in PHY clock cycles. Specifies the response time for a MAC request to the Packet FIFO Controller [PFC] to fetch data from the DFIFO [SPRAM].
9	RESERVED	R	0h	Reserved
8	ENBLSLPM	R/W	1h	Enable UTMI Sleep. Controls assertion of utmi_sleep_n, utmi_l1_suspend_n outputs to the PHY when in the L1 state.
7	PHYSEL	R	0h	PHY Select. [HS vs. serial]: Unused, since serial PHY is not supported.
6	SUSPHY	R/W	0h	Suspend enable for USB2.0 HS/FS/LS PHY [ULPI or UTMI]. Set to 1 only after core initialization is complete.
5	FSINTF	R	0h	Full-Speed Serial Interface Select. UNUSED.
4	ULPI_UTMI_SEL	R	0h	ULPI vs. UTMI+ Select
3	PHYIF	R/W	0h	PHY Interface. DO NOT USE. If UTMI+ is selected, configures 8- or 16-bit interface. If ULPI is selected, configures SDR or DDR mode.

Table 5-2907. USB_DWC3_GUSB2PHYCFG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
2:0	TOUTCAL	R/W	0h	HS/FS Timeout Calibration. The number of PHY clocks, as indicated by the application in this field, is multiplied by a bit-time factor. This factor is added to the high- speed/full-speed interpacket timeout duration in the core to account for additional delays introduced by the PHY. This may be required, since the delay introduced by the PHY in generating the linestate condition may vary among PHYs. The USB standard timeout value for high-speed operation is 736 to 816 [inclusive] bit times. The USB standard timeout value for full-speed operation is 16 to 18 [inclusive] bit times. The application must program this field based on the speed of connection. The number of bit times added per PHY clock are: High-speed operation: 8 bit times per 60-MHz PHY clock cycle Full-speed operation: [depending on clock speed] 0.2 bit times per 60-MHz PHY clock cycle 0.25 bit times per 48-MHz PHY clock cycle

5.27.2.216 USB_DWC3_GUSB2PHYACC Register

5.27.2.216.1 USB_DWC3_GUSB2PHYACC Register (Offset = C280h) [reset = 0h]

Global USB2 PHY Access.

Table 5-2911. USB_DWC3_GUSB3PIPECTL Register Field Descriptions

Bit	Field	Type	Reset	Description
31	PHYSOFTRST	R/W	0h	PHY Soft Reset. Active-high, fully static software reset for PIPE USB3 transceiver. Recommendation is to use the core's SW reset instead, or simultaneously.
30	RESERVED2	R	0h	Reserved
29	U2SSINACTP3OK	R/W	0h	Use mode P3 for U2/SSInactive states
28	DISRXDETP3	R/W	0h	Disabled Rx Detection in P3 mode [in the PHY]
27	UX_EXIT_IN_PX	R/W	0h	Workaround for SS PHY injecting a glitch on RxElecIdle while receiving Ux exit LFPS, and PowerDown change is in progress.
26	PING_ENHANCEMENT_EN	R/W	0h	Ping Enhancement Enable: Extended downstream port U1 ping receive timeout. Invalid for Upstream port.
25	U1U2EXITFAIL_TO_RECOV	R/W	0h	Enhancement to prevent interoperability issue in case of incorrect LFPS handshake by the remote link.
24	REQUEST_P1P2P3	R/W	0h	Control the systematic request of P1/P2/P3 for U1/U2/U3
23	STARTRXDETU3RXDET	R/W	0h	Manual control for periodic Rx detection required in U3 and Rx.Detect, host mode.
22	DISRXDETU3RXDET	R/W	0h	Disable the HW-scheduled periodic Rx detection required in U3 and SS.Disabled, for host mode.
21:19	P1P2P3DELAY	R/W	1h	If DelayP0toP1P2P3=1, delays the transition to P1/P2/P3 when entering U1/U2/U3 until P1P2P3Delay*8b10b errors occur, or RxValid=0 on PIPE.

Table 5-2911. USB_DWC3_GUSB3PIPECTL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
18	DELAYP0TOP1P2P3	R/W	1h	Delay PHY change from P0 to P1/P2/P3 when link state changes from U0 to U1/U2/U3, respectively.
17	SUSPENDENABLE	R/W	0h	Suspend Enable for USB3.0 SS PHY. Set to 1 only after core initialization is complete.
16:15	DATWIDTH	R	0h	PIPE Data Width [input from phy: refer to PIPE standard]. Field updated to the input's value immediately after reset.
14	ABORTRXDETINU2	R/W	0h	Abort Rx Detect in U2. For Downstream port only.
13	SKIPRXDET	R/W	0h	Skip Rx Detect. When set, the core skips Rx Detection if pipe signal "RxElecIdle" is low. Skip is defined as waiting for the appropriate timeout, then repeating the operation.
12	LFPSP0ALGN	R/W	0h	LFPS P0 Align. When set to 1: The core deasserts LFPS transmission on the clock edge that it requests Phy power state 0 when exiting U1, U2, or U3 low power states. Otherwise, LFPS transmission is asserted one clock earlier. - The core requests symbol transmission two pipe_rx_pclks periods after The Phy asserts PhyStatus as a result of The Phy switching from Q1 or Q2 state to P0 state.
11	P3P2TRANOK	R/W	0h	P3-to-P2 Transitions OK
10	P3EXSIGP2	R/W	0h	PHY power state behaviour upon U3 exit handshake.
9	LFPSFILT	R/W	0h	LFPS Filter. When set, filter LFPS reception with pipe "RxValid" signal in PHY power state P0, that is, ignore LFPS reception from the PHY unless both pipe signals "RxElecIdle" and "RxValid" are deasserted.
8	RXDETPOLLINGDELAYDIS	R/W	0h	Disable 400us delay from Rx.Detect to Polling.LFPS
7	RESERVED	R	0h	Reserved
6	TXSWING	R/W	0h	Tx Swing [output to phy: refer to PIPE standard]
5:3	TXMARGIN	R/W	0h	Tx Margin[2:0] [output to phy: refer to PIPE standard]
2:1	TXDEEMPHASIS	R/W	1h	Tx Deemphasis [output to phy: refer to PIPE standard]. The value driven to the PHY is controlled by the LTSSM during USB3 Compliance mode.
0	ELASTICBUFFERMODE	R/W	0h	Elastic Buffer Mode [output to phy: refer to PIPE standard]

5.27.2.218 USB_DWC3_GTXFIFOSIZ0 Register

5.27.2.218.1 USB_DWC3_GTXFIFOSIZ0 Register (Offset = C300h) [reset = 42h]

Table 5-3271. USB_DWC3_OEVT Register Field Descriptions

Bit	Field	Type	Reset	Description
31	DEVICEMODE	R	1h	Dual-role device's mode, based on iddig input.
30:25	RESERVED2	R	0h	Reserved
24	OTGCONIDSTSCHNGEVNT	R/W0TC	0h	Connector ID status change event. Set in both A-device and B-device mode.
23	HRRCONFNOTIFEVNT	R/W0TC	0h	Host Role Request Confirm Notifier Event. Set upon reception of HRR Device Notification TP with Confirm field set. Set in OTG3, SS, A-host or B-host mode only. OTG3: NOT IMPLEMENTED
22	HRRINITNOTIFEVNT	R/W0TC	0h	Host Role Request Initiate Notifier Event. Set upon reception of HRR Device Notification TP with Initiate field set. Set in OTG3, SS, A-host or B-host mode only. OTG3: NOT IMPLEMENTED
21	OTGADEVIDLEEVNT	R/W0TC	0h	A-device A-IDLE Event. Set when OTG FSM enters A-IDLE state from any other state. Set in A-device mode only. OTG3: NOT IMPLEMENTED
20	OTGADEVBHOSTENDEVNT	R/W0TC	0h	A-device B-host End Event. Set when connected B-device has completed its B-host role and returns to B-peripheral. Set in A-device mode only.
19	OTGADEVHOSTEVNT	R/W0TC	0h	A-device Host Event. Set when device enters host role, upon initial connect to B-device as well as upon HNP from A-peripheral to A-host. Set in A-device mode only.

Table 5-3271. USB_DWC3_OEVT Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
18	OTGADEVHNPCHNGDETEVNT	R/W0TC	0h	A-device HNP change Detected Event. Set when there is an HNP event. Set in A-device mode only.
17	OTGADEVSRPDETEVNT	R/W0TC	0h	A-device SRP Detected Event. Set when SRP request from B-device is detected. Set in A-device mode only.
16	OTGADEVSESSENDDETEVNT	R/W0TC	0h	A-device Session End Detected Event. Set when UTMI input "a-vbus-valid" is deasserted [0]. Set in A-device mode only.
15:12	RESERVED1	R	0h	Reserved
11	OTGBDEVHOSTENDEVNT	R/W0TC	0h	B-device Host End Event. Set completing B-host role and returning to default B-peripheral role. Set in B-device mode only.
10	OTGBDEVHNPCHNGEVNT	R/W0TC	0h	B-device HNP Change Event. Set upon [success of failure of an] HNP attempt. Set in B-device mode only.
9	OTGBDEVSESSVLDDETEVNT	R/W0TC	0h	B-device Session Valid Detected Event. Set when B-device succeeds in starting a session. Set in B-device mode only.
8	OTGBDEVVBUSCHNGEVNT	R/W0TC	0h	B-device VBUS Change Event. Set when UTMI input "b-session-valid" transitions [to 0 or 1]. Set in B-device mode only.
7:4	RESERVED	R	0h	Reserved
3	BSESVLD	R	0h	B-Session Valid. Updated when OTGBDevVBUSChngEvnt is set.
2	HSTNEGSTS	R	0h	Host Negociation Status. Updated when OTGADevHNPChngEvnt or OTGBDevHNPChngEvnt is set.
1	SESREQSTS	R	0h	Session Request Status. Updated when OTGBDevSessVldDetEvnt is set.
0	OEVTERROR	R/W0TC	0h	No errors currently defined.

Table 5-3287. USB_USB2PHY_RX_CALIB Register Field Descriptions

Bit	Field	Type	Reset	Description
31	RESTART_HSRX_CAL	R/W	0h	Restart the HSRX calibration state machine when this bit goes from 0 to 1.
30	USE_HS_OFF_REG	R/W	0h	Override HS offset correction with HS_OFF_CODE when set to '1'
29:24	HS_OFF_CODE	R/W	0h	HS offset code, this code is forced when bit 30 is 1. Code is updated from calibration logic when bit 30 = 0.
23	HSRX_COMP_OUT	R	0h	The output of the HSRX comparator.Read value is valid only if VDDLDO is on.
22	HSRX_CAL_DONE	R	0h	Signal that indicates that the HSRX calibration is done. This gets reset at every restart.Read value is valid only if VDDLDO is on.
21	USE_SQ_OFF_DAC1	R/W	0h	Override Squelch offset DAC1 code when '1'
20:15	SQ_OFF_CODE_DAC1	R/W	0h	When read returns current Sq offset code for DAC1, if VDDLDO is on. When written this is used as Sq offset code for DAC1 when USE_SQ_OFF_DAC2 = '1'
14	USE_SQ_OFF_DAC2	R/W	0h	Override Squelch offset DAC2 code when '1'
13:9	SQ_OFF_CODE_DAC2	R/W	0h	When read returns current Sq offset code for DAC2, if VDDLDO is on. When written this is used as Sq offset code for DAC2 when USE_SQ_OFF_DAC2 = '1'
8	USE_SQ_OFF_DAC3	R/W	0h	Override Squelch offset DAC3 code when '1'

Table 5-3287. USB_USB2PHY_RX_CALIB Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
7:3	SQ_OFF_CODE_DAC3	R/W	0h	When read returns current Sq offset code for DAC3, if VDDLDO is on. When written this is used as Sq offset code for DAC3 when USE_SQ_OFF_DAC3 = '1'
2	SQ_COMP_OUT	R	0h	Sq comp output.Read value is valid only if VDDLDO is on.
1	SQ_CAL_DONE	R	0h	Sq calibration is done when this bit = 1. see RESTART_SQ_CAL for more description.Read value is valid only if VDDLDO is on.
0	RESTART_SQ_CAL	R/W	0h	the squelch calibration continuously goes through restart cycles when this bit is 1. i.e. restarts waits for done then restarts again etc

5.27.2.406 USB_USB2PHY_DLLHS_2 Register

5.27.2.406.1 USB_USB2PHY_DLLHS_2 Register (Offset = 8h) [reset = 1Fh]

The 2nd DLLHS control register. Bits 4:0 are unrelated to the DLLHS and are linestate filter settings.

Return to Summary Table
