Bit	Field	Type	Reset	Description
31:0	QPOSCNT	R/W	0h	Position Counter This 32-bit position counter register counts up/down on every eQEP pulse based on direction input. This counter acts as a position integrator whose count value is proportional to position from a give reference point. This Register acts as a Read ONLY register while counter is counting up/down. Note: It is recommended to only write to the position counter register [QPOSCNT] during initialization, i.e. when the eQEP position counter is disabled [QPEN bit of QEPCTL is zero]. Once the position counter is enabled [QPEN bit is one], Writing to the eQEP position counter register [QPOSCNT] may cause unexpected results.

3.10.2.2 SDFM_SDIFLGCLR Register

3.10.2.2.1 SDFM_SDIFLGCLR Register (Offset = 4h) [reset = 0h]

SD Module Interrupt Flag Clear Bits:
Writing a "1" will clear the respective flag bit in the SDIFLG register.
Writes of "0" are ignored.
Note: If user writes a "1" to clear a bit on the same cycle that the hardware is trying to set the bit to "1", then hardware has priority and the bit will not be cleared.

1	FLUSH	R/W	0h	Flush Operation Start bit This bit will cause the transmitter to initiate a flush pattern of a single toggle on the TXD0 and TXD1 followed by five full cycles of TXCLK. This bit should be written only when the CORE_RST bit is 0 and the clock to the Transmitter core is turned on. 0h[R/W] = Clear this bit. 1h[R/W] = Setting this bit will Initiate flush sequence. To properly execute a flush sequence, Set FLUSH to 1, wait for five TXCLK cycles then clear FLUSH to 0. Note: The KEY field must contain 0xA5 for any write to this bit to take effect. The software must keep this bit set to 1 for at least five TXCLK cycles before setting it back to 0.
0	CORE_RST	R/W	0h	Transmitter Master Core Reset bit This bit controls the transmitter master core reset. In order to send any frame, this bit must be cleared. 0h[R/W] = Transmitter core is not in reset and can transmit frames. 1h[R/W] = Transmitter core is held in reset. Note: The KEY field must contatin 0xA5 for any write to this bit to take effect.

Bit	Field	Type	Reset	Description
31:0	TO_CNT	R	0h	Ping Timer Counter Value This register contains the current value of the ping timer counter. After reset, this counter will increment until it reaches the reference value [TX_PING_TO_REF], at which point it generates a ping frame transmission. After this point, the counter will reset to 0 and continue counting. This is a free-running counter

3	PING_TRIGGERED	R	0h	Ping Frame Triggered Flag Bit This bit indicates that a ping frame has been triggered. This bit is set by hardware when either the ping timer or an external trigger event have occured. Software can also force this bit to get set by Writing to the TX_EVT_FRC register. 0h[R] = A ping frame has not been triggered. 1h[R] = A ping frame has been triggered by either the ping timer or external trigger. Bit	Field	Type	Reset	Description
15:8	KEY	W	0h	Write Key. In order to write to this register, 0xA5 must be written to this field at the same time. Otherwise, writes are ignored. The key is cleared immediately after Writing, so it must be written again for every change to this register.
7:5	RESERVED_1	R	0h	Reserved
4	DATA_FILTER_EN	R/W	0h	Data Filter Enable Bit. 0h[R/W] = Data filtering is disabled. 1h[R/W] = Data filtering is enabled.
3	INPUT_ISOLATE	R/W	0h	When set to 1, the FSI RX inputs [RXCLK, RXD0 and RXD1] will be isolated from what is driven from the device pins and will be held at inactive level of '1'.This isolation facilitates the user to switch the RX inputs to a different set of device pins and hence any potential glitch that could occur during the process of switching will not effect the RX module itself.
2	SPI_PAIRING	R/W	0h	Clock Pairing for SPI-like Behavior Enable bit This bit enables the internal clock pairing with the FSI TX module. This feature internally connects the TXCLK to RXCLK allowing the FSI TX module, acting as a SPI master, to clock data into the receiver and out of the transmitter like a standard SPI module. This configuration is valid when the Module is in SPI mode only [RX_OPER_CTRL.SPI_MODE = 1] 0h[R/W] = SPI clock pairing is not enabled. 1h[R/W] = SPI clock pairing is enabled. The RXCLK will be internally connected to the TXCLK of the corresponding FSI module. Note: The KEY field must contatin 0xA5 for any write to this bit to take effect.

Table 3-757. FSI_RX_CFG_RX_MASTER_CTRL_ALTC Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
1	INT_LOOPBACK	R/W	0h	Internal Loopback Enable bit This bit enables the internal loopback functionality of the FSI receiver. By enabling this bit, a mux will select the signals coming directly from the corresponding FSI transmitter module rather than from the pins. 0h[R/W] = Internal loopback is disabled. The FSI RX module will receive signals coming from the pins. 1h[R/W] = Internal loopback is enabled. The FSI RX module will receive signals from the directly from FSI TX module rather than the pins. Note: The KEY field must contatin 0xA5 for any write to this bit to take effect.
0	CORE_RST	R/W	0h	Receiver Controller Core Reset bit This bit controls the receiver master core reset. In order to receive any frame, this bit must be cleared. Note: For reset to take affect, the FSI RX module must be held in reset for at least 4 SYSCLK cycles. 0h[R/W] = Receiver core is not in reset and can receive frames. 1h[R/W] = Receiver core is held in reset. Note: The KEY field must contatin 0xA5 for any write to this bit to take effect.

8	PING_WD_RST_MODE	R/W	0h	Ping Watchdog Timeout Mode Select bit This bit selects the mode by which the ping watchdog counter is reset. The watchdog counter can be reset and restarted only by ping frames or by any received frame. 0h[R/W] = The ping watchdog counter will reset and restart only by ping frames. 1h[R/W] = The ping watchdog counter will reset and restart by any received frame.
7	ECC_SEL	R/W	0h	ECC Data Width Select bit This bit selects between whether the ECC computation is done on 16-bit or 32-bit words. 0h[R/W] = 32-bit ECC is used. 1h[R/W] = 16-bit ECC is used.
6:3	N_WORDS	R/W	0h	Number of Words to Receive This field defines the number of words which will be received in a DATA_N_WORD frame. This is a user-defined field that must match the corresponding field in the transmitter. Set this bitfield to be one less than the number of words to be received. This value is only applicable when the frame type received is DATA_N_WORD. 0h[R/W] = 1 data word frame [16-bit data]. 1h[R/W] = 2 data word frame [32-bit data]. .. Fh [R/W] = 16 data word frame [256-bit data].
2	SPI_MODE	R/W	0h	SPI Mode Enable bit This bit enables and disables the SPI compatibility mode of the FSI RX. The received data must be formatted as an FSI frame in order for the data to properly be received. SPI compatibility mode will allow FSI RX to receive data that is sent using SPI signal format. Refer to the applicable section in the FSI TRM chapter for more information. 0h[R/W] = FSI is in normal mode of operation. 1h[R/W] = FSI is operating in SPI compatibility mode.

10	FRAME_OVERRUN	R	0h	Frame Overrun Flag This bit indicates that a frame overrun condition has occured. This bit gets set to 1 when a new DATA/ERROR frame is received and the corresponding DATA_FRAME_RCVD/ERROR_FRAME_RCVD flag is still set to 1. Software can also force this bit to get set by Writing to the RX_EVT_FRC register. 0h[R] = Frame overrun has not ocurred. 1h[R] = Frame overrun has ocurred. To clear this bit, write to the corresponding bit in the RX_EVT_CLR register.
9	PING_FRAME	R	0h	Ping Frame Received Flag This bit indicates that an ping frame has been received. Software can also force this bit to get set by Writing to the RX_EVT_FRC register. 0h[R] = No ping frame has been received. 1h[R] = A ping frame has been received. To clear this bit, write to the corresponding bit in the RX_EVT_CLR register.
8	ERR_FRAME	R	0h	Error Frame Received Flag This bit indicates that an error frame has been received. Software can also force this bit to get set by Writing to the RX_EVT_FRC register. 0h[R] = No error frame has been received. 1h[R] = An error frame has been received. To clear this bit, write to the corresponding bit in the RX_EVT_CLR register.
7	BUF_UNDERRUN	R	0h	Receive Buffer Underrun Flag This bit indicates that a buffer underrun condition has occured in the receive buffer. This will happen when software reads the buffer which is empty and has no valid data. Software can also force this bit to get set by Writing to the RX_EVT_FRC register. 0h[R] = Receive Buffer Underrun has not ocurred. 1h[R] = Receive Buffer Underrun has ocurred. To clear this bit, write to the corresponding bit in the RX_EVT_CLR register.
6	FRAME_DONE	R	0h	Frame Done Flag This bit indicates that a frame has been successfully received without error. Software can also force this bit to get set by Writing to the RX_EVT_FRC register. 0h[R] = No frame has been successfully received. 1h[R] = A frame has been successfully received. To clear this bit, write to the corresponding bit in the RX_EVT_CLR register.

3:0	BUF_PTR_LOAD	R/W	0h	Buffer Pointer Load. This is the value to be loaded into the receive word pointer when written. This is to allow software to force the receiver to start storing the received data starting at a specific location in the buffer. NOTE: The value of the CURR_BUF_PTR in the RX_BUF_PTR_STS will not get reflected immediately. This will take effect only when there is a valid receive operation with incoming clocks after [3 RXCLK + 3 SYCLK] cycles.

Bit	Field	Type	Reset	Description
31:8	RX_TRIG_DLY	R/W	0h	This is the 24 bit count of the trigger delay in SYSCLK cycles. If enabled, the Trigger-1 output of the trigger module will generate a 3 SYSCLK wide trigger pulse after the selected input trigger source sees a rising edge with a delay defined by this 24-bt value.
7:5	RESERVED_1	R	0h	Reserved
4:1	TRIG_SEL	R/W	0h	This is the mux Select Value which selects which of the inputs will be used as the trigger source.

3	RX_CORE_STS	R	0h	Receiver Core Status bit This bit indicates the status of the receiver core. If this bit is set, the receiver should undergo a reset and subsequent resynchronization with the transmitter. This bit will be always be set when the receiver has detected and end of frame error or a frame type error. This bit can also be set if the receiver becomes corrupted due to noise on the signal lines. If the receiver has experienced a ping watchdog or frame watchdog timeout, this bit should be read to determine if the cause was due to a corrupt transaction, thus putting the receiver core into an unrecoverable state. Only a soft reset will reset the recevier core and thus reset this bit. 0h[R] The receiver core is operating normally. 1h[R] The receiver core has entered into an error state and should be reset.

29:28	RESERVED_1	R	0h	Reserved
27:16	FUNC	R	0h	Functional Release Number Reflects software-compatability. If there is no software compatability, a unique func number is assigned; for compatible modules, the same number is maintained.
15:11	RTL	R	0h	Design Release Number Incremented for releases due to spec changes or post-release design changes. Reset to 0 when either MAJOR or MINOR is incremented.
10:8	MAJOR	R	0h	Major Revision Number Represents major changes to the module [e.g. entirely new features are added/changed]. The major revision number for this module.
7:6	CUSTOM	R	0h	Custom Module Number Indicates a special version of the module. May not be supported by standard software.
5:0	MINOR	R	0h	Minor Revision Number Represents minor changes to the module [e.g. enhancements to existing features]. The minor revision number for this module.

Table 4-375. VIM0_INTVECTOR_Q Register Field Descriptions

Bit	Field	Type	Reset	Description
31:2	ADDR	R/W	0h	This is the 32-bit Vector Address associated with interrupt Q. It is the address that will be reflected in the IRQ Vector Address [Base Address + 0x18] or FIQ Vector Address [Base Address + 0x1C] and the VECADDR pin when interrupt Q is the active interrupt. Internally, these values are kept in a RAM. The FIQ and IRQ state machines have priority access to this RAM. Writes to this register will be piped internally, but further writes to the MMR interface may be stalled until this write has a chance to complete in the RAM. The new Vector Address will not take effect until this write completes to the RAM. In order to tell if this write has completed, software may read this register back. That read will not be able to complete unless the write has landed. Reads to this register will stall the MMR interface until the read is able to be completed at the RAM.
1:0	RES20	R	0h	Reserved. Read as 0. The lower 2 bits of the 32-bit vector address are always 0. Vector addresses must be 32-bit aligned.

Table 4-421. VIM1_INTVECTOR_Q Register Field Descriptions

Bit	Field	Type	Reset	Description
31:2	ADDR	R/W	0h	This is the 32-bit Vector Address associated with interrupt Q. It is the address that will be reflected in the IRQ Vector Address [Base Address + 0x18] or FIQ Vector Address [Base Address + 0x1C] and the VECADDR pin when interrupt Q is the active interrupt. Internally, these values are kept in a RAM. The FIQ and IRQ state machines have priority access to this RAM. Writes to this register will be piped internally, but further writes to the MMR interface may be stalled until this write has a chance to complete in the RAM. The new Vector Address will not take effect until this write completes to the RAM. In order to tell if this write has completed, software may read this register back. That read will not be able to complete unless the write has landed. Reads to this register will stall the MMR interface until the read is able to be completed at the RAM.
1:0	RES20	R	0h	Reserved. Read as 0. The lower 2 bits of the 32-bit vector address are always 0. Vector addresses must be 32-bit aligned.

This is a fail safe feature to avoid system hang-up situation on account of any run away self test issues. This register should be loaded with a meaningful count value for this feature to be effective. This register value [preload count value] gets loaded into the self test timeout down counter whenever a self test run is initiated [ST_ENA is enabled]. and gets disabled on completion of a self test run.

29:28	RESERVED_1	R	0h	Reserved
27:16	FUNC	R	0h	Functional Release Number Reflects software-compatability. If there is no software compatability, a unique func number is assigned; for compatible modules, the same number is maintained.
15:11	RTL	R	0h	Design Release Number Incremented for releases due to spec changes or post-release design changes. Reset to 0 when either MAJOR or MINOR is incremented.
10:8	MAJOR	R	0h	Major Revision Number Represents major changes to the module [e.g. entirely new features are added/changed]. The major revision number for this module.
7:6	CUSTOM	R	0h	Custom Module Number Indicates a special version of the module. May not be supported by standard software.
5:0	MINOR	R	0h	Minor Revision Number Represents minor changes to the module [e.g. enhancements to existing features]. The minor revision number for this module.

29:28	RESERVED_1	R	0h	Reserved
27:16	FUNC	R	0h	Functional Release Number Reflects software-compatability. If there is no software compatability, a unique func number is assigned; for compatible modules, the same number is maintained.
15:11	RTL	R	0h	Design Release Number Incremented for releases due to spec changes or post-release design changes. Reset to 0 when either MAJOR or MINOR is incremented.
10:8	MAJOR	R	0h	Major Revision Number Represents major changes to the module [e.g. entirely new features are added/changed]. The major revision number for this module.
7:6	CUSTOM	R	0h	Custom Module Number Indicates a special version of the module. May not be supported by standard software.
5:0	MINOR	R	0h	Minor Revision Number Represents minor changes to the module [e.g. enhancements to existing features]. The minor revision number for this module.

16	TCERR	R	0h	Transfer Completion Code Error: TCCERR = 0 : Total number of allowed TCCs outstanding has not been reached. TCCERR = 1 : Total number of allowed TCCs has been reached. TCCERR can be cleared by Writing a '1' to corresponding bit in CCERRCLR register. If any bit in the CCERR register is set [and all errors were previously clear] then an error will be signaled with TPCC error interrupt.
15:8	RES34	R	0h	RESERVE FIELD
7	QTHRXCD7	R	0h	Queue Threshold Error for Q7: QTHRXCD7 = 0 : Watermark/threshold has not been exceeded. QTHRXCD7 = 1 : Watermark/threshold has been exceeded. CCERR.QTHRXCD7 can be cleared by Writing a '1' to corresponding bit in CCERRCLR register. If any bit in the CCERR register is set [and all errors [including EMR/QEMR] were previously clear] then an error will be signaled with the TPCC error interrupt.
6	QTHRXCD6	R	0h	Queue Threshold Error for Q6: QTHRXCD6 = 0 : Watermark/threshold has not been exceeded. QTHRXCD6 = 1 : Watermark/threshold has been exceeded. CCERR.QTHRXCD6 can be cleared by Writing a '1' to corresponding bit in CCERRCLR register. CCERR.QTHRXCD5 can be cleared by Writing a '1' to corresponding bit in CCERRCLR register. If any bit in the CCERR register is set [and all errors [including EMR/QEMR] were previously clear] then an error will be signaled with the TPCC error interrupt.
4	QTHRXCD4	R	0h	Queue Threshold Error for Q4: QTHRXCD4 = 0 : Watermark/threshold has not been exceeded. QTHRXCD4 = 1 : Watermark/threshold has been exceeded. CCERR.QTHRXCD4 can be cleared by Writing a '1' to corresponding bit in CCERRCLR register. If any bit in the CCERR register is set [and all errors [including EMR/QEMR] were previously clear] then an error will be signaled with the TPCC error interrupt.
3	QTHRXCD3	R	0h	Queue Threshold Error for Q3: QTHRXCD3 = 0 : Watermark/threshold has not been exceeded. QTHRXCD3 = 1 : Watermark/threshold has been exceeded. CCERR.QTHRXCD3 can be cleared by Writing a '1' to corresponding bit in CCERRCLR register. If any bit in the CCERR register is set [and all errors [including EMR/QEMR] were previously clear] then an error will be signaled with the TPCC error interrupt.
2	QTHRXCD2	R	0h	Queue Threshold Error for Q2: QTHRXCD2 = 0 : Watermark/threshold has not been exceeded. QTHRXCD2 = 1 : Watermark/threshold has been exceeded. CCERR.QTHRXCD2 can be cleared by Writing a '1' to corresponding bit in CCERRCLR register. If any bit in the CCERR register is set [and all errors [including EMR/QEMR] were previously clear] then an error will be signaled with the TPCC error interrupt.
1	QTHRXCD1	R	0h	Queue Threshold Error for Q1: QTHRXCD1 = 0 : Watermark/threshold has not been exceeded. QTHRXCD1 = 1 : Watermark/threshold has been exceeded. CCERR.QTHRXCD1 can be cleared by Writing a '1' to corresponding bit in CCERRCLR register. If any bit in the CCERR register is set [and all errors [including EMR/QEMR] were previously clear] then an error will be signaled with the TPCC error interrupt.
0	QTHRXCD0	R	0h	Queue Threshold Error for Q0: QTHRXCD0 = 0 : Watermark/threshold has not been exceeded. QTHRXCD0 = 1 : Watermark/threshold has been exceeded. CCERR.QTHRXCD0 can be cleared by Writing a '1' to corresponding bit in CCERRCLR register. If any bit in the CCERR register is set [and all errors [including EMR/QEMR] were previously clear] then an error will be signaled with the TPCC error interrupt.

13:8	COMPACTV	R	0h	Completion Request Active: Counter that tracks the total number of completion requests submitted to the TC. The counter increments when a TR is submitted with TCINTEN or TCCHEN set to '1'. The counter decrements for every valid completion code received from any of the external TCs. The CC will not service new TRs if COMPACTV count is already at the limit. COMPACTV = 0 : No completion requests outstanding. COMPACTV = 1:Total of '1' completion request outstanding. ... COMPACTV = 63 : Total of 63 completion requests are outstanding. No additional TRs will be submitted until count is less than 63.

4.2.2.43 TPCC_ER Register

4.2.2.43.1 TPCC_ER Register (Offset = 1000h) [reset = 0h]

Event Register: If ER.En bit is set and the EER.En bit is also set then the corresponding DMA channel is prioritized vs. other pending DMA events for submission to the TC. ER.En bit is set when the input event #n transitions from inactive (low) to active (high) regardless of the state of EER.En bit. ER.En bit is cleared when the corresponding event is prioritized and serviced. If the ER.En bit is already set and a new inactive to active transition is detected on the input event #n input AND the corresponding bit in the EER register is set then the corresponding bit in the Event Missed Register is set. Event N can be cleared via sw by writing a '1' to the ECR pseudo-register.

4.2.2.49 TPCC_CER Register

4.2.2.49.1 TPCC_CER Register (Offset = 1018h) [reset = 0h]

Chained Event Register: If CER.En bit is set (regardless of state of EER.En) then the corresponding DMA channel is prioritized vs. other pending DMA events for submission to the TC. CER.En bit is set when a chaining completion code is returned from one of the 3PTCs via the completion interface or is generated internally via Early Completion path. CER.En bit is cleared when the corresponding event is prioritized and serviced. If the CER.En bit is already set and the corresponding chaining completion code is returned from the TC then the corresponding bit in the Event Missed Register is set. CER.En cannot be set or cleared via software.

4.2.2.51 TPCC_EER Register

4.2.2.51.1 TPCC_EER Register (Offset = 1020h) [reset = 0h]

Event Enable Register: Enables DMA transfers for ER.En pending events. ER.En is set based on externally asserted events (via tpcc_eventN_pi). This register has no effect on Chained Event Register (CER) or Event Set Register (ESR). Note that if a bit is set in ER.En while EER.En is disabled no action is taken. If EER.En is enabled at a later point (and ER.En has not been cleared via SW) then the event will be recognized as a valid 'TR Sync' EER.En is not directly writeable. Events can be enabled via writes to EESR and can be disabled via writes to EECR register. EER.En = 0: ER.En is not enabled to trigger DMA transfers. EER.En = 1: ER.En is enabled to trigger DMA transfers.

4.2.2.72 TPCC_QER Register

4.2.2.72.1 TPCC_QER Register (Offset = 1080h) [reset = 0h]

QDMA Event Register: If QER.En bit is set then the corresponding QDMA channel is prioritized vs. other qdma events for submission to the TC. QER.En bit is set when a vbus write byte matches the address defined in the QCHMAPn register. QER.En bit is cleared when the corresponding event is prioritized and serviced. QER.En is also cleared when user writes a '1' to the QSECR.En bit. If the QER.En bit is already set and a new QDMA event is detected due to user write to QDMA trigger location and QEER register is set then the corresponding bit in the QDMA Event Missed Register is set.

4.2.2.76 TPCC_QSER Register

4.2.2.76.1 TPCC_QSER Register (Offset = 1090h) [reset = 0h]

QDMA Secondary Event Register: The QDMA secondary event register is used along with the QDMA Event Register (QER) to provide information on the state of a QDMA Event. En = 0 : Event is not currently in the Event Queue. En = 1 : Event is currently stored in Event Queue. Event arbiter will not prioritize additional events.

4.2.2.77.1 TPCC_QSECR Register (Offset = 1094h) [reset = 0h]

QDMA Secondary Event Clear Register: The secondary event clear register is used to clear the status of the QSER and QER register (note that this is slightly different than the SER operation which does not clear the ER.En register). CPU write of '1' to the QSECR.En bit clears the QSER.En and QER.En register fields. CPU write of '0' has no effect..

4.2.2.78 TPCC_ER_RN Register

4.2.2.78.1 TPCC_ER_RN Register (Offset = 2000h) [reset = 0h]

Event Register: If ER.En bit is set and the EER.En bit is also set then the corresponding DMA channel is prioritized vs. other pending DMA events for submission to the TC. ER.En bit is set when the input event #n transitions from inactive (low) to active (high) regardless of the state of EER.En bit. ER.En bit is cleared when the corresponding event is prioritized and serviced. If the ER.En bit is already set and a new inactive to active transition is detected on the input event #n input AND the corresponding bit in the EER register is set then the corresponding bit in the Event Missed Register is set. Event N can be cleared via sw by writing a '1' to the ECR pseudo-register.

4.2.2.84 TPCC_CER_RN Register

4.2.2.84.1 TPCC_CER_RN Register (Offset = 2018h) [reset = 0h]

Chained Event Register: If CER.En bit is set (regardless of state of EER.En) then the corresponding DMA channel is prioritized vs. other pending DMA events for submission to the TC. CER.En bit is set when a chaining completion code is returned from one of the 3PTCs via the completion interface or is generated internally via Early Completion path. CER.En bit is cleared when the corresponding event is prioritized and serviced. If the CER.En bit is already set and the corresponding chaining completion code is returned from the TC then the corresponding bit in the Event Missed Register is set. CER.En cannot be set or cleared via software.

4.2.2.86 TPCC_EER_RN Register

4.2.2.86.1 TPCC_EER_RN Register (Offset = 2020h) [reset = 0h]

Event Enable Register: Enables DMA transfers for ER.En pending events. ER.En is set based on externally asserted events (via tpcc_eventN_pi). This register has no effect on Chained Event Register (CER) or Event Set Register (ESR). Note that if a bit is set in ER.En while EER.En is disabled no action is taken. If EER.En is enabled at a later point (and ER.En has not been cleared via SW) then the event will be recognized as a valid 'TR Sync' EER.En is not directly writeable. Events can be enabled via writes to EESR and can be disabled via writes to EECR register. EER.En = 0: ER.En is not enabled to trigger DMA transfers. EER.En = 1: ER.En is enabled to trigger DMA transfers.

4.2.2.97 TPCC_IERH_RN Register

4.2.2.97.1 TPCC_IERH_RN Register (Offset = 2054h) [reset = 0h]

Int Enable Register (High Part): IERH.In is not directly writeable. Interrupts can be enabled via writes to IESRH and can be disabled via writes to IECRH register. IERH.In = 0: IPRH.In is NOT enabled for interrupts. IERH.In = 1: IPRH.In IS enabled for interrupts.

QDMA Event Register: If QER.En bit is set then the corresponding QDMA channel is prioritized vs. other qdma events for submission to the TC. QER.En bit is set when a vbus write byte matches the address defined in the QCHMAPn register. QER.En bit is cleared when the corresponding event is prioritized and serviced. QER.En is also cleared when user writes a '1' to the QSECR.En bit. If the QER.En bit is already set and a new QDMA event is detected due to user write to QDMA trigger location and QEER register is set then the corresponding bit in the QDMA Event Missed Register is set.

Bit	Field	Type	Reset	Description
31:16	BCNT	R/W	0h	BCNT : Count for 2nd Dimension: BCNT is a 16-bit unsigned value that specifies the number of arrays of length ACNT. For normal operation valid values for BCNT can be anywhere between 1 and 65535. Therefore the maximum number of arrays in a frame is 65535 [64K-1 arrays]. BCNT=1 means 1 array in the frame and BCNT=0 means 0 arrays in the frame. In normal mode a BCNT of '0' is considered as either a Null or Dummy transfer. A Dummy or Null transfer will generate a Completion code depending on the settings of the completion bit fields of the OPT field. If the OPT.WIMODE bit is set then the programmed BCNT value will be incremented by '1' before submission to TC. I.e. 0 means 1 1 means 2 2 means 3 ...

Table 4-1229. TPCC_ABCNT Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
15:0	ACNT	R/W	0h	ACNT : number of bytes in 1st dimension: ACNT represents the number of bytes within the first dimension of a transfer. ACNT is a 16-bit unsigned value with valid values between 0 and 65535. Therefore the maximum number of bytes in an array is 65535 bytes [64K-1 bytes]. ACNT must be greater than or equal to '1' for a TR to be submitted to TC. An ACNT of '0' is considered as either a null or dummy transfer. A Dummy or Null transfer will generate a Completion code depending on the settings of the completion bit fields of the OPT field. If the OPT.WIMODE bit is set then the ACNT field represents a word count. The CC must internally multiply by 4 to translate the word count to a byte count prior to submission to the TC. The 2 MSBs of the 16-bit ACNT are reserved and should always be written as 'b00 by the user. If user writes a value other than 0 it will still be treated as 0 since the multiply-by-4 operation [to translate between a word count and a byte count] will drop the 2 msbits. For dummy and null transfer definition the ACNT definition will disregard the 2 msbits. I.e. a programmed ACNT value of 0x8000 in WI-mode will be treated as 0 byte transfer resulting in null or dummy operation dependent on the state of BCNT and CCNT.

31:16	BCNTRLD	R/W	0h	BCNT Reload: BCNTRLD is a 16-bit unsigned value used to reload the BCNT field once the last array in the 2nd dimension is transferred. This field is only used for A-Sync'ed transfers. In this case the CC decrements the BCNT value by one on each TR submission. When BCNT [conceptually] reaches zero then the CC decrements CCNT and uses the BCNTRLD value to reinitialize the BCNT value. For AB-synchronized transfers the CC submits the BCNT in the TR and therefore the TC is responsible to keep track of BCNT not thus BCNTRLD is a don't care field.

Table 4-1235. TPCC_LNK Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
15:0	LINK	R/W	0h	Link Address: The CC provides a mechanism to reload the current PaRAM Entry upon its natural termination [i.e. after count fields are decremented to '0'] with a new PaRAM Entry. This is called 'linking'. The 16-bit parameter LINK specifies the byte address offset in the PaRAM from which the CC loads/reloads the next PaRAM entry in the link. The CC should disregard the value in the upper 2 bits of the LINK field as well as the lower 5-bits of the LINK field. The upper two bits are ignored such that the user can program either the 'literal' byte address of the LINK parameter or the 'PaRAM base-relative' address of the link field. Therefore if the user uses the literal address with a range from 0x4000 to 0x7FFF it will be treated as a PaRAM-base-relative value of 0x0000 to 0x3FFF. The lower-5 bits are ignored and treated as 'b00000 thereby guaranteeing that all Link pointers point to a 32-byte aligned PaRAM entry. In the latter case [5-lsbs] behavior is undefined for the user [i.e. don't have to test it]. In the former case [2 msbs] user should be able to take advantage of this feature [i.e. do have to test it]. If a Link Update is requested to a PaRAM address that is beyond the actual range of implemented PaRAM then the Link will be treated as a Null Linkand all 0s plus 0xFFFF will be written to the current entry location. A LINK value of 0xFFFF is referred to as a NULL link which should cause the CC to write 0x0 to all entries of the current PaRAM Entry except for the LINK field which is set to 0xFFFF. The Priv/Privid/Secure state is overwritten to 0x0 when linking. MSBs and LSBS should not be masked when comparing against the 0xFFFF value. I.e. a value of 0x3FFE is a non-NULL PaRAM link field.
