4.5.2 ICSSM Registers

ICSSM Registers

4.5.2.1 ICSSM_DRAM0_SLV_RAM_RAM_REG_J Register

4.5.2.1.1 ICSSM_DRAM0_SLV_RAM_RAM_REG_J Register (Offset = 0h) [reset = 0h]

The RAM memory words provide memory mapped random access data storage.

Return to Summary Table

Bit	Field	Type	Reset	Description
31:16	PCOUNTER_RST_VAL	R/W	0h	Program counter reset value
15	PDSP_STATE	R	0h	PDSP run state: 0=PDSP is halted, 1=PDSP is running
14	BIG_ENDIAN	R	0h	Big-endian input state
13:9	RESERVED	NONE	0h	Reserved
8	SINGLE_STEP	R/W	0h	Single step enable: 0=PDSP will free run when enabled, 1=PDSP will execute a single instruction and then the pdsp_enable bit will be cleared
7:5	RESERVED	NONE	0h	Reserved
4	RESTART	R/W	0h	Causes PDSP to stop current operation gracefully and return to the PC reset value
3	COUNTER_ENABLE	R/W	0h	PDSP cycle counter enable: 0=Counters not enabled, 1=Counters enabled
2	PDSP_SLEEPING	R/W	0h	PDSP sleep indicator: 0=PDSP is not asleep, 1=PDSP us asleep
1	PDSP_ENABLE	R/W	0h	PDSP enable: 0=PDSP is disabled, 1=PDSP is enabled
0	SOFT_RST_N	R	1h	Soft reset. When this bit is cleared, the PDSP will be reset. This bit is set back to 1 on the next cycle after it has been cleared.

4.5.2.225 ICSSM_PR1_ICSSS_UART_UART_SLV_RBR Register

4.5.2.225.1 ICSSM_PR1_ICSSS_UART_UART_SLV_RBR Register (Offset = 0h) [reset = 0h]

Receiver Buffer Register (read only)
The UART receiver section consists of a receiver shift register (RSR) and a receiver buffer register (RBR). When the UART is in the FIFO mode, RBR is a 16-byte FIFO. Timing is supplied by the 16x receiver clock or 13x receiver clock by programming OSM_SEL bit field of MDR register. Receiver section control is a function of the line control register (LCR).
RSR receives serial data from the UARTn_RXD pin. Then RSR concatenates the data and moves it into RBR (or the receiver FIFO). In the non-FIFO mode, when a character is placed in RBR and the receiver data-ready interrupt is enabled (DR = 1 in IER), an interrupt is generated. This interrupt is cleared when the character is read from RBR. In the FIFO mode, the interrupt is generated when the FIFO is filled to the trigger level selected in the FIFO control register (FCR), and it is cleared when the FIFO contents drop below the trigger level.

4.5.2.227 ICSSM_PR1_ICSSS_UART_UART_SLV_IIR Register

4.5.2.227.1 ICSSM_PR1_ICSSS_UART_UART_SLV_IIR Register (Offset = 8h) [reset = 1h]

The interrupt identification register (IIR) is a read-only register at the same address as the FIFO control register (FCR), which is a write-only register. When an interrupt is generated and enabled in the interrupt enable register (IER), IIR indicates that an interrupt is pending in the IPEND bit and encodes the type of interrupt in the INTID bits. Reading IIR clears any THR empty (THRE) interrupts that are pending.

4.5.2.228 ICSSM_PR1_ICSSS_UART_UART_SLV_LCR Register

4.5.2.228.1 ICSSM_PR1_ICSSS_UART_UART_SLV_LCR Register (Offset = Ch) [reset = 0h]

Line Control Register (LCR)
The system programmer controls the format of the asynchronous data communication exchange by using LCR. In addition, the programmer can retrieve, inspect, and modify the content of LCR; this eliminates the need for separate storage of the line characteristics in system memory.

Return to Summary Table

Bit	Field	Type	Reset	Description
31:8	RESERVED	NONE	0h	Reserved
7	DLAB	R/W	0h	Divisor latch access bit. The divisor latch registers (DLL and DLH) can be accessed at dedicated addresses or at addresses shared by RBR, THR, and IER. Using the shared addresses requires toggling DLAB to change which registers are selected. If you use the dedicated addresses, you can keep DLAB = 0. 0 Allows access to the receiver buffer register (RBR), the transmitter holding register (THR), and the interrupt enable register (IER) selected. At the address shared by RBR, THR, and DLL, the CPU can read from RBR and write to THR. At the address shared by IER and DLH, the CPU can read from and write to IER. 1 Allows access to the divisor latches of the baud generator during a read or write operation (DLL and DLH). At the address shared by RBR, THR, and DLL, the CPU can read from and write to DLL. At the address shared by IER and DLH, the CPU can read from and write to DLH.

Table 4-2036. ICSSM_PR1_ICSSS_UART_UART_SLV_LCR Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
6	BC	R/W	0h	Break Control 0 Break condition is disabled 1 Break condition is transmitted to the receiving UART. A break condition is a condition where the UARTn_TXD signal is forced to the spacing (cleared) state.
5	SP	R/W	0h	Stick parity. The SP bit works in conjunction with the EPS and PEN bits. 0 Stick parity is disabled 1 Stick parity is enabled -When odd parity is selected (EPS = 0), the PARITY bit is transmitted and checked as set. -When even parity is selected (EPS = 1), the PARITY bit is transmitted and checked as cleared.
4	EPS	R/W	0h	Even parity select. Selects the parity when parity is enabled (PEN = 1). The EPS bit works in conjunction with the SP and PEN bits. 0 Odd parity is selected (an odd number of logic 1s is transmitted or checked in the data and PARITY bits). 1 Even parity is selected (an even number of logic 1s is transmitted or checked in the data and PARITY bits).
3	PEN	R/W	0h	Parity enable. The PEN bit works in conjunction with the SP and EPS bits. 0 No PARITY bit is transmitted or checked. 1 Parity bit is generated in transmitted data and is checked in received data between the last data word bit and the first STOP bit.
2	STB	R/W	0h	Number of STOP bits generated. STB specifies 1, 1.5, or 2 STOP bits in each transmitted character. When STB = 1, the WLS bit determines the number of STOP bits. The receiver clocks only the first STOP bit, regardless of the number of STOP bits selected. 0 1 STOP bit is generated. 1 WLS bit determines the number of STOP bits: -When WLS = 0, 1.5 STOP bits are generated. -When WLS = 1h, 2h, or 3h, 2 STOP bits are generated.
1	WLS1	R/W	0h	Word Length Select Bit 1
0	WLS	R/W	0h	Word length select. Number of bits in each transmitted or received serial character. When STB = 1, the WLS bit determines the number of STOP bits. 0 5 bits 1 6 bits 2 7 bits 3 8 bits

4.5.2.229 ICSSM_PR1_ICSSS_UART_UART_SLV_MCR Register

4.5.2.229.1 ICSSM_PR1_ICSSS_UART_UART_SLV_MCR Register (Offset = 10h) [reset = 0h]

Modem Control Register (MCR)
The modem control register provides the ability to enable/disable the autoflow functions, and enable/disable the loopback function for diagnostic purposes.

Return to Summary Table

In non-FIFO mode: 0 = Either the transmitter holding register (THR) or the transmitter shift register (TSR) contains a data character. 1 = Both the transmitter holding register (THR) and the transmitter shift register (TSR) are empty. In FIFO mode: 0 = Either the transmitter FIFO or the transmitter shift register (TSR) contains a data character. 1 = Both the transmitter FIFO and the transmitter shift register (TSR) are empty.
5	THRE	R	1h	Transmitter holding register empty (THRE) indicator. If the THRE bit is set and the corresponding interrupt enable bit is set (ETBEI = 1 in IER), an interrupt request is generated. In non-FIFO mode: 0 = Transmitter holding register (THR) is not empty. THR has been loaded by the CPU. 1 = Transmitter holding register (THR) is empty (ready to accept a new character). The content of THR has been transferred to the transmitter shift register (TSR). In FIFO mode: 0 = Transmitter FIFO is not empty. At least one character has been written to the transmitter FIFO. You can write to the transmitter FIFO if it is not full. 1 = Transmitter FIFO is empty. The last character in the FIFO has been transferred to the transmitter shift register (TSR).
4	BI	R	0h	Break indicator. The BI bit is set whenever the receive data input (UARTn_RXD) was held low for longer than a full-word transmission time. A full-word transmission time is defined as the total time to transmit the START, data, PARITY, and STOP bits. If the BI bit is set and the corresponding interrupt enable bit is set (ELSI = 1 in IER), an interrupt request is generated. In non-FIFO mode: 0 = No break has been detected, or the BI bit was cleared because the CPU read the erroneous character from the receiver buffer register (RBR). 1 = A break has been detected with the character in the receiver buffer register (RBR). In FIFO mode: 0 = No break has been detected, or the BI bit was cleared because the CPU read the erroneous character from the receiver FIFO and the next character to be read from the FIFO has no break indicator. 1 = A break has been detected with the character at the top of the receiver FIFO.
3	FE	R	0h	Framing error (FE) indicator. A framing error occurs when the received character does not have a valid STOP bit. In response to a framing error, the UART sets the FE bit and waits until the signal on the RX pin goes high. Once the RX signal goes high, the receiver is ready to detect a new START bit and receive new data. If the FE bit is set and the corresponding interrupt enable bit is set (ELSI = 1 in IER), an interrupt request is generated. In non-FIFO mode: 0 = No framing error has been detected, or the FE bit was cleared because the CPU read the erroneous data from the receiver buffer register (RBR). 1 = A framing error has been detected with the character in the receiver buffer register (RBR). In FIFO mode: 0 = No framing error has been detected, or the FE bit was cleared because the CPU read the erroneous data from the receiver FIFO and the next character to be read from the FIFO has no framing error. 1 = A framing error has been detected with the character at the top of the receiver FIFO.

Table 4-2040. ICSSM_PR1_ICSSS_UART_UART_SLV_LSR Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
2	PE	R	0h	Parity error (PE) indicator. A parity error occurs when the parity of the received character does not match the parity selected with the EPS bit in the line control register (LCR). If the PE bit is set and the corresponding interrupt enable bit is set (ELSI = 1 in IER), an interrupt request is generated. In non-FIFO mode: 0 = No parity error has been detected, or the PE bit was cleared because the CPU read the erroneous data from the receiver buffer register (RBR). 1 = A parity error has been detected with the character in the receiver buffer register (RBR). In FIFO mode: 0 = No parity error has been detected, or the PE bit was cleared because the CPU read the erroneous data from the receiver FIFO and the next character to be read from the FIFO has no parity error. 1 = A parity error has been detected with the character at the top of the receiver FIFO.
1	OE	R	0h	Overrun error (OE) indicator. An overrun error in the non-FIFO mode is different from an overrun error in the FIFO mode. If the OE bit is set and the corresponding interrupt enable bit is set (ELSI = 1 in IER), an interrupt request is generated. In non-FIFO mode: 0 = No overrun error has been detected, or the OE bit was cleared because the CPU read the content of the line status register (LSR). 1 = Overrun error has been detected. Before the character in the receiver buffer register (RBR) could be read, it was overwritten by the next character arriving in RBR. In FIFO mode: 0 = No overrun error has been detected, or the OE bit was cleared because the CPU read the content of the line status register (LSR). 1 = Overrun error has been detected. If data continues to fill the FIFO beyond the trigger level, an overrun error occurs only after the FIFO is full and the next character has been completely received in the shift register. An overrun error is indicated to the CPU as soon as it happens. The new character overwrites the character in the shift register, but it is not transferred to the FIFO.
0	DR	R	0h	Data-ready (DR) indicator for the receiver. If the DR bit is set and the corresponding interrupt enable bit is set (ERBI = 1 in IER), an interrupt request is generated. In non-FIFO mode: 0 = Data is not ready, or the DR bit was cleared because the character was read from the receiver buffer register (RBR). 1 = Data is ready. A complete incoming character has been received and transferred into the receiver buffer register (RBR). In FIFO mode: 0 = Data is not ready, or the DR bit was cleared because all of the characters in the receiver FIFO have been read. 1 = Data is ready. There is at least one unread character in the receiver FIFO. If the FIFO is empty, the DR bit is set as soon as a complete incoming character has been received and transferred into the FIFO. The DR bit remains set until the FIFO is empty again.

4.5.2.231 ICSSM_PR1_ICSSS_UART_UART_SLV_MSR Register

4.5.2.231.1 ICSSM_PR1_ICSSS_UART_UART_SLV_MSR Register (Offset = 18h) [reset = 0h]

Modem Status Register (MSR)
MSR provides information to the CPU concerning the status of modem control signals. MSR is intended for read operations only; do not write to this register.

Return to Summary Table

Bit	Field	Type	Reset	Description
31:8	RESERVED	NONE	0h	Reserved
7	CD	R	0h	Complement of the Carrier Detect input. When the UART is in the diagnostic test mode (loopback mode MCR[4] = 1), this bit is equal to the MCR bit 3 (OUT2).
6	RI	R	0h	Complement of the Ring Indicator input. When the UART is in the diagnostic test mode (loopback mode MCR[4] = 1), this bit is equal to the MCR bit 2 (OUT1).
5	DSR	R	0h	Complement of the Data Set Ready input. When the UART is in the diagnostic test mode (loopback mode MCR[4] = 1), this bit is equal to the MCR bit 0 (DTR).
4	CTS	R	0h	Complement of the Clear To Send input. When the UART is in the diagnostic test mode (loopback mode MCR[4] = 1), this bit is equal to the MCR bit 1 (RTS).
3	DCD	R	0h	Change in DCD indicator bit. DCD indicates that the DCD input has changed state since the last time it was read by the CPU. When DCD is set and the modem status interrupt is enabled, a modem status interrupt is generated.
2	TERI	R	0h	Trailing edge of RI (TERI) indicator bit. TERI indicates that the RI input has changed from a low to a high. When TERI is set and the modem status interrupt is enabled, a modem status interrupt is generated.

Table 4-2042. ICSSM_PR1_ICSSS_UART_UART_SLV_MSR Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
1	DDSR	R	0h	Change in DSR indicator bit. DDSR indicates that the DSR input has changed state since the last time it was read by the CPU. When DDSR is set and the modem status interrupt is enabled, a modem status interrupt is generated.
0	DCTS	R	0h	Change in CTS indicator bit. DCTS indicates that the CTS input has changed state since the last time it was read by the CPU. When DCTS is set (autoflow control is not enabled and the modem status interrupt is enabled), a modem status interrupt is generated. When autoflow control is enabled, no interrupt is generated.

4.5.2.232 ICSSM_PR1_ICSSS_UART_UART_SLV_SCR Register

4.5.2.232.1 ICSSM_PR1_ICSSS_UART_UART_SLV_SCR Register (Offset = 1Ch) [reset = 0h]

Scratch Pad Register (SCR)
SCR is intended for programmer's use as a scratch pad. It temporarily holds the programmer's data without affecting UART operation.

4.5.2.238 ICSSM_PR1_ICSSS_UART_UART_SLV_THR Register

4.5.2.238.1 ICSSM_PR1_ICSSS_UART_UART_SLV_THR Register (Offset = 0h) [reset = 0h]

The transmitter holding register (THR) (write only)
The UART transmitter section consists of a transmitter hold register (THR) and a transmitter shift register (TSR). When the UART is in the FIFO mode, THR is a 16-byte FIFO. Transmitter section control is a function of the line control register (LCR).
THR receives data from the internal data bus and when TSR is idle, the UART moves the data from THR to TSR. The UART serializes the data in TSR and transmits the data on the TX pin. In the non-FIFO mode, if THR is empty and the THR empty (THRE) interrupt is enabled (ETBEI = 1 in IER), an interrupt is generated. This interrupt is cleared when a character is loaded into THR or the interrupt identification register (IIR) is read. In the FIFO mode, the interrupt is generated when the transmitter FIFO is empty, and it is cleared when at least one byte is loaded into the FIFO or IIR is read.

4.7.2.3 FSS_FSAS_GENREGS_DP_ERR_INJ_CTRL Register

4.7.2.3.1 FSS_FSAS_GENREGS_DP_ERR_INJ_CTRL Register (Offset = 80h) [reset = 0h]

This register is used to setup double pumping error injection. Only one error injection enable field has to be set in this register at a given time. After error injection is enabled, a read must be issued to a valid flash address in order to trigger the error. Once triggered, the error will be reported using IRQ.STATUS register dp_cmd_err/ dp_ret_err fields and corresponding interrupt fsas_ecc_intr_err_pend/fsas_ecc_intr_err_req will be generated if enabled.

2	EN_ORIG_RET	R/W	0h	Enable error injection on original read return fields.
1	EN_DUPL_CMD	R/W	0h	Enable error injection on duplicate command fields.
0	EN_ORIG_CMD	R/W	0h	Enable error injection on original command fields.

4.7.2.4 FSS_FSAS_GENREGS_IRQ_EOI Register

4.7.2.4.1 FSS_FSAS_GENREGS_IRQ_EOI Register (Offset = 0h) [reset = 0h]

The End of Interrupt (EOI) Register allows the CPU to acknowledge completion of fsas_ecc_intr_err_req pulse interrupt. When this register is written to 1'b0, INTD logic used for converting fsas_ecc_intr_err_pend level interrupt to pulse will be re-armed. That is, if interrupt sources remain after writing this register to 1'b0, another pulse interrupt will be triggered by INTD. Conversely, if this register is not written to 1'b0 after fsas_ecc_intr_err_req pulse interrupt is received, then another pulse interrupt will not be received as INTD has not been re-armed. This register will be reset one cycle after it has been written to. Please note that the reason for writing 1'b0 is because there is only one interrupt (no interrupt aggregation) associated with this EOI and the INTD vector associated with this interrupt is 1'b0.

Return to Summary Table

Table 4-2623. FSS_FSAS_GENREGS_ERR_ECC_TYPE Register Field Descriptions

Bit	Field	Type	Reset	Description
31	ECC_ERR_VALID	R/W1TC	0h	When set indicates that there is valid ECC error information available, Writing a one to this register will pop the top of the stack
30:6	RESERVED	NONE	0h	Reserved
5	ECC_ERR_ADR	R	0h	When set indicates that there was a single error detected within the address field. Bits 0 and 1 in this register indicate whether it is single or double error.
4	ECC_ERR_MAC	R	0h	When set indicates that there was a single error detected within the MAC field. Bits 0 and 1 in this register indicate whether it is single or double error.
3	ECC_ERR_DA1	R	0h	When set indicates that there was a single error detected within the High Data word, which is bits 127 through 64 of the data word. Bits 0 and 1 in this register indicate whether it is single or double error.
2	ECC_ERR_DA0	R	0h	When set indicates that there was a single error detected within the Low Data word, which is bits 63 through 0 of the data word. Bits 0 and 1 in this register indicate whether it is single or double error.
1	ECC_ERR_DED	R	0h	When set indicates that there was a double error detected for the block

Table 4-2623. FSS_FSAS_GENREGS_ERR_ECC_TYPE Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
0	ECC_ERR_SEC	R	0h	When set indicates that there was a single error detected for the block. The fields that had single error are reported by bits 2 through 5 in this register. It is possible that single error is reported in multiple fields since the ECCM inputs are partitioned into four partitions and ECC code is separate for each partition. It is also possible that none of the fields report single error even though ecc_err_sec bit is set. This can happen if single bit error occurred on the ECC code.

4.7.2.13 FSS_FSAS_GENREGS_ERR_WRT_TYPE Register

4.7.2.13.1 FSS_FSAS_GENREGS_ERR_WRT_TYPE Register (Offset = 8h) [reset = 0h]

The ERR_WRT_TYPE register holds the current top of stack write error info. this is only valid when the wrt_err_valid is set

Return to Summary Table

Table 4-2625. FSS_FSAS_GENREGS_ERR_WRT_TYPE Register Field Descriptions

Bit	Field	Type	Reset	Description
31	WRT_ERR_VALID	R/W1TC	0h	When set indicates that there is valid write error information available, Writing a one to this register will pop the top of the stack
30:14	RESERVED	NONE	0h	Reserved
13	WRT_ERR_BEN	R	0h	When set indicates that there was a write error due to a non-contiguous byte enables or because write byte count was not 32-byte multiple. Please note that this bit will always be set when wrt_err_valid bit is set. There is no write error if byte count is 32-byte multiple and if byte-enables are all set.
12	WRT_ERR_ADR	R	0h	When set indicates that there was a write error due to a non-aligned address. Please note that this bit can only be set if address was 16-byte multiple but not 32-byte multiple. For example, an address of 0x10 or 0x30 for writes will cause this bit to get set.
11:0	WRT_ERR_ROUTEID	R	0h	Indicates the Route ID for the Master that caused the write error

Table 4-2669. OSPI_FLASH_CFG_CONFIG_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31	IDLE_FLD	R	1h	Serial interface and low level SPI pipeline is IDLE: This is a STATUS read-only bit. Note this is a retimed signal, so there will be some inherent delay on the generation of this status signal.
30	DUAL_BYTE_OPCODE_EN_FLD	R/W	0h	Dual-byte Opcode Mode enable bit This bit is to be set in case the target Flash Device supports dual byte opcode [i.e. Macronix MX25]. It is applicable for Octal I/O Mode or Protocol only so should be set back to low if the device is configured to work in another SPI Mode. If enabled, the supplementing bytes are taken from Opcode Extension Register [Lower] and from Opcode Extension Register [Upper].
29	CRC_ENABLE_FLD	R/W	0h	CRC enable bit This bit is to be set in case the target Flash Device supports CRC [Macronix MX25]. It is applicable for Octal DDR Protocol only so should be set back to low if the device is configured to work in another SPI Mode.
28:26	CONFIG_RESV2_FLD	R	0h	Reserved
25	PIPELINE_PHY_FLD	R/W	0h	Pipeline PHY Mode enable: This bit is relevant only for configuration with PHY Module. It should be asserted to 1 between consecutive PHY pipeline reads transfers and de-asserted to 0 otherwise.
24	ENABLE_DTR_PROTOCOL_FLD	R/W	0h	Enable DTR Protocol: This bit should be set if device is configured to work in DTR protocol.

Table 4-2669. OSPI_FLASH_CFG_CONFIG_REG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
23	ENABLE_AHB_DECODER_FLD	R/W	0h	Enable AHB Decoder: Value 0 : Active target is selected based on Peripheral Chip Select Lines [bits [13:10]]. Value=1 Active target is selected based on actual AHB address [the partition for each device is calculated with respect to bits [28:21] of Device Size Configuration Register]
22:19	MSTR_BAUD_DIV_FLD	R/W	Fh	Master Mode Baud Rate Divisor: SPI baud rate = (master reference clock) baud_rate_divisor. Where BD is: 4b0000 = /2 4b0001 = /4 4b0010 = /6 4b0011 = /8 4b0100 = /10 4b0101 = /12 .. 4b1111 = /32 While the PHY Mode is enabled, clock from DLL is granted and consequently forwarded into external FLASH Device. Its frequency is equal to ref_clk i.e., value of /1 is used in PHY mode. Set this register up before enabling the Octal-SPI controller.
18	ENTER_XIP_MODE_IMM_FLD	R/W	0h	Enter XIP Mode immediately: Value 0 : If XIP is enabled, then setting to 0 will cause the controller to exit XIP mode on the next READ instruction. Value 1 : Operate the device in XIP mode immediately Use this register when the external device wakes up in XIP mode [as per the contents of its non- volatile configuration register]. The controller will assume the next READ instruction will be passed to the device as an XIP instruction, and therefore will not require the READ opcode to be transferred. Note: To exit XIP mode, this bit should be set to 0. This will take effect in the attached device only after the next READ instruction is executed. Software therefore should ensure that at least one READ instruction is requested after resetting this bit in order to be sure that XIP mode is exited.
17	ENTER_XIP_MODE_FLD	R/W	0h	Enter XIP Mode on next READ: Value 0 : If XIP is enabled, then setting to 0 will cause the controller to exit XIP mode on the next READ instruction. Value 1 : If XIP is disabled, then setting to ?1? will inform the controller that the device is ready to enter XIP on the next READ instruction. The controller will therefore send the appropriate command sequence, including mode bits to cause the device to enter XIP mode. Use this register after the controller has ensured the FLASH device has been configured to be ready to enter XIP mode. Note : To exit XIP mode, this bit should be set to 0. This will take effect in the attached device only AFTER the next READ instruction is executed. Software should therefore ensure that at least one READ instruction is requested after resetting this bit before it can be sure XIP mode in the device is exited.
16	ENB_AHB_ADDR_REMAP_FLD	R/W	0h	Enable AHB Address Re-mapping: [Direct Access Mode Only] When set to 1, the incoming AHB address will be adapted and sent to the FLASH device as [address + N], where N is the value stored in the remap address register.
15	ENB_DMA_IF_FLD	R/W	0h	Enable DMA Peripheral Interface: Set to 1 to enable the DMA handshaking logic. When enabled the controller will trigger DMA transfer requests via the DMA peripheral interface. Set to 0 to disable
14	WR_PROT_FLASH_FLD	R/W	0h	Write Protect Flash Pin: Set to drive the Write Protect pin of the FLASH device. This is resynchronized to the generated memory clock as necessary.

Table 4-2669. OSPI_FLASH_CFG_CONFIG_REG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
13:10	PERIPH_CS_LINES_FLD	R/W	0h	Peripheral Chip Select Lines: Peripheral chip select lines If pdec = 0, ss[3:0] are output thus: ss[3:0] n_ss_out[3:0] xxx0 1110xx01 1101x011 10110111 01111111 1111[no peripheral selected] else ss[3:0] directly drives n_ss_out[3:0]
9	PERIPH_SEL_DEC_FLD	R/W	0h	Peripheral select decode: 0 : only 1 of 4 selects n_ss_out[3:0] is active 1 : allow external 4-to-16 decode [n_ss_out = ss]
8	ENB_LEGACY_IP_MODE_FLD	R/W	0h	Legacy IP Mode Enable: 0 : Use Direct Access Controller/Indirect Access Controller 1 : legacy Mode is enabled. In this mode, any write to the controller via the AHB interface is serialized and sent to the FLASH device. Any valid AHB read will pop the internal RX-FIFO, retrieving data that was forwarded by the external FLASH device on the SPI lines,4,2 or 1 byte transfers are permitted and controlled via the HSIZE input.
7	ENB_DIR_ACC_CTLR_FLD	R/W	1h	Enable Direct Access Controller: 0 : disable the Direct Access Controller once current transfer of the data word [FF_W] is complete. 1 : enable the Direct Access Controller When the Direct Access Controller and Indirect Access Controller are both disabled, all AHB requested are completed with an error response.
6	RESET_CFG_FLD	R/W	0h	RESET pin configuration: 0 = RESET feature on DQ3 pin of the device 1 = RESET feature on dedicated pin of the device [controlling of 5th bit influences on reset_out output]
5	RESET_PIN_FLD	R/W	0h	Set to drive the RESET pin of the FLASH device and reset for de-activation of the RESET pin feature
4	HOLD_PIN_FLD	R/W	0h	Set to drive the HOLD pin of the FLASH device and reset for de-activation of the HOLD pin feature
3	PHY_MODE_ENABLE_FLD	R/W	0h	PHY mode enable: When enabled, the controller is informed that PHY Module is to be used for handling SPI transfers. This bit is relevant only for configuration with PHY Module.
2	SEL_CLK_PHASE_FLD	R/W	0h	Select Clock Phase: Selects whether the clock is in an active or inactive phase outside the SPI word. 0 : the SPI clock is active outside the word 1 : the SPI clock is inactive outside the word
1	SEL_CLK_POL_FLD	R/W	0h	Clock polarity outside SPI word: 0 : the SPI clock is quiescent low 1 : the SPI clock is quiescent high
0	ENB_SPI_FLD	R/W	1h	Octal-SPI Enable: 0 : disable the Octal-SPI, once current transfer of the data word [FF_W] is complete. 1 : enable the Octal-SPI, when spi_enable = 0, all output enables are inactive and all pins are set to input mode.

4.7.2.36 OSPI_FLASH_CFG_DEV_INSTR_RD_CONFIG_REG Register

Table 4-2695. OSPI_FLASH_CFG_WRITE_COMPLETION_CTRL_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31:24	POLL_REP_DELAY_FLD	R/W	0h	Defines additional delay for maintain Chip Select de-asserted during auto-polling phase
23:16	POLL_COUNT_FLD	R/W	1h	Defines the number of times the controller should expect to see a true result from the polling in successive reads of the device register.
15	ENABLE_POLLING_EXP_FLD	R/W	0h	Set to '1' for enabling auto-polling expiration.
14	DISABLE_POLLING_FLD	R/W	0h	This switches off the automatic polling function
13	POLLING_POLARITY_FLD	R/W	0h	Defines the polling polarity. If '1', then the write transfer to the device will be complete if the polled bit is equal to '1'. If '0', then the write transfer to the device will be complete if the polled bit is equal to '0'.
12:11	WR_COMP_CTRL_RESV1_FLD	R	0h	Reserved
10:8	POLLING_BIT_INDEX_FLD	R/W	0h	Defines the bit index that should be polled. A value of 010 means that bit 2 of the returned data will be polled for.A value of 111 means that bit 7 of the returned data will be polled for.
7:0	OPCODE_FLD	R/W	5h	Defines the opcode that should be issued by the controller when it is automatically polling for device program completion. This command is issued followed all device write operations. By default, this will poll the standard device STATUS register using opcode 0x05

4.7.2.49 OSPI_FLASH_CFG_NO_OF_POLLS_BEF_EXP_REG Register

Table 4-2699. OSPI_FLASH_CFG_IRQ_STATUS_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31:20	IRQ_STAT_RESV_FLD	R	0h	Reserved
19	ECC_FAIL_FLD	R/W1TC	0h	ECC failure This interrupt informs the system that Flash Device reported ECC error.
18	TX_CRC_CHUNK_BRK_FLD	R/W1TC	0h	TX CRC chunk was broken This interrupt informs the system that program page SPI transfer was discontinued somewhere inside the chunk.
17	RX_CRC_DATA_VAL_FLD	R/W1TC	0h	RX CRC data valid New RX CRC data was captured from Flash Device
16	RX_CRC_DATA_ERR_FLD	R/W1TC	0h	RX CRC data error CRC data from Flash Device does not correspond to the one dynamically calculated by the controller.
15	IRQ_STAT_RESV1_FLD	R	0h	Reserved
14	STIG_REQ_INT_FLD	R/W1TC	0h	The controller is ready for getting another STIG request.
13	POLL_EXP_INT_FLD	R/W1TC	0h	The maximum number of programmed polls cycles is expired
12	INDRD_SRAM_FULL_FLD	R/W1TC	0h	Indirect Read Partition overflow: Indirect Read Partition of SRAM is full and unable to immediately complete indirect operation

Table 4-2699. OSPI_FLASH_CFG_IRQ_STATUS_REG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
11	RX_FIFO_FULL_FLD	R/W1TC	0h	Small RX FIFO full: Current FIFO status can be ignored in non-SPI legacy mode 0 : FIFO is not full 1 : FIFO is full
10	RX_FIFO_NOT_EMPTY_FLD	R/W1TC	0h	Small RX FIFO not empty: Current FIFO status can be ignored in non-SPI legacy mode 0 : FIFO has less than RX THRESHOLD entries, 1 : FIFO has >= THRESHOLD entries
9	TX_FIFO_FULL_FLD	R/W1TC	0h	Small TX FIFO full: Current FIFO status can be ignored in non-SPI legacy mode 0 : FIFO is not full, 1 : FIFO is full
8	TX_FIFO_NOT_FULL_FLD	R/W1TC	0h	Small TX FIFO not full: Current FIFO status can be ignored in non-SPI legacy mode 0 : FIFO has >= THRESHOLD entries, 1 : FIFO has less than THRESHOLD entries
7	RECV_OVERFLOW_FLD	R/W1TC	0h	Receive Overflow: This should only occur in Legacy SPI mode. Set if an attempt is made to push the RX FIFO when it is full. This bit is reset only by a system reset and cleared only when this register is read. If a new push to the RX FIFO occurs coincident with a register read this flag will remain set. 0 : no overflow has been detected. 1 : an overflow has occurred.
6	INDIRECT_XFER_LEVEL_BREACH_FLD	R/W1TC	0h	Indirect Transfer Watermark Level Breached
5	ILLEGAL_ACCESS_DET_FLD	R/W1TC	0h	Illegal AHB access has been detected. AHB wrapping bursts and the use of SPLIT/RETRY accesses will cause this error interrupt to trigger.
4	PROT_WR_ATTEMPT_FLD	R/W1TC	0h	Write to protected area was attempted and rejected.
3	INDIRECT_READ_REJECT_FLD	R/W1TC	0h	Indirect operation was requested but could not be accepted. Two indirect operations already in storage.
2	INDIRECT_OP_DONE_FLD	R/W1TC	0h	Indirect Operation Complete: Controller has completed last triggered indirect operation
1	UNDERFLOW_DET_FLD	R/W1TC	0h	Underflow Detected: 0 : no underflow has been detected 1 : underflow is detected and an attempt to transfer data is made when the small TX FIFO is empty. This may occur when AHB write data is being supplied too slowly to keep up with the requested write operation This bit is reset only by a system reset and cleared only when the register is read.
0	MODE_M_FAIL_FLD	R/W1TC	0h	Mode M Failure: Mode M failure indicates the voltage on pin n_ss_in is inconsistent with the SPI mode. Set =1 if n_ss_in is low in master mode [multi-master contention]. These conditions will clear the spi_enable bit and disable the SPI. This bit is reset only by a system reset and cleared only when this register is read. 0 : no mode fault has been detected 1 : a mode fault has occurred

4.7.2.51 OSPI_FLASH_CFG_IRQ_MASK_REG Register

4.7.2.51.1 OSPI_FLASH_CFG_IRQ_MASK_REG Register (Offset = 44h) [reset = 0h]

Interrupt Mask: 0 : the interrupt for the corresponding interrupt status register bit is disabled.
1 : the interrupt for the corresponding interrupt status register bit is enabled.

Table 4-2729. OSPI_FLASH_CFG_FLASH_CMD_CTRL_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31:24	CMD_OPCODE_FLD	R/W	0h	Command Opcode: The command opcode field should be setup before triggering the command. For example, 0x20 maps to SubSector Erase. Writing to the execute field [bit 0] of this register launches the command. NOTE : Using this approach to issue commands to the device will make use of the instruction type of the device instruction configuration register. If this field is set to 2'b00, then the command opcode, command address, command dummy bytes and command data will all be transferred in a serial fashion. If this field is set to 2'b01, then the command opcode, command address, command dummy bytes and command data will all be transferred in parallel using DQ0 and DQ1 pins. If this field is set to 2'b10, then the command opcode, command address, command dummy bytes and command data will all be transferred in parallel using DQ0, DQ1, DQ2 and DQ3 pins.
23	ENB_READ_DATA_FLD	R/W	0h	Read Data Enable: Set to 1 if the command specified in the command opcode field [bits 31:24] requires read data bytes to be received from the device.
22:20	NUM_RD_DATA_BYTES_FLD	R/W	0h	Number of Read Data Bytes: Up to 8 data bytes may be read using this command. Set to 0 for 1 byte and 7 for 8 bytes.
19	ENB_COMD_ADDR_FLD	R/W	0h	Command Address Enable: Set to 1 if the command specified in bits 31:24 requires an address. This should be setup before triggering the command via Writing a 1 to the execute field.

Table 4-2729. OSPI_FLASH_CFG_FLASH_CMD_CTRL_REG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
18	ENB_MODE_BIT_FLD	R/W	0h	Mode Bit Enable: Set to 1 to ensure the mode bits as defined in the Mode Bit Configuration register are sent following the address bytes.
17:16	NUM_ADDR_BYTES_FLD	R/W	0h	Number of Address Bytes: Set to the number of address bytes required [the address itself is programmed in the FLASH COMMAND ADDRESS REGISTERS]. This should be setup before triggering the command via bit 0 of this register. 2'b00 : 1 address byte 2'b01 : 2 address bytes 2'b10 : 3 address bytes 2'b11 : 4 address bytes
15	ENB_WRITE_DATA_FLD	R/W	0h	Write Data Enable: Set to 1 if the command specified in the command opcode field requires write data bytes to be sent to the device.
14:12	NUM_WR_DATA_BYTES_FLD	R/W	0h	Number of Write Data Bytes: Up to 8 Data bytes may be written using this command Set to 0 for 1 byte, 7 for 8 bytes.
11:7	NUM_DUMMY_CYCLES_FLD	R/W	0h	Number of Dummy cycles: Set to the number of dummy cycles required. This should be setup before triggering the command via the execute field of this register.
6:3	FLASH_CMD_CTRL_RESV1_FLD	R	0h	Reserved
2	STIG_MEM_BANK_EN_FLD	R/W	0h	STIG Memory Bank enable bit.
1	CMD_EXEC_STATUS_FLD	R	0h	Command execution in progress.
0	CMD_EXEC_FLD	W	0h	Execute the command.

4.7.2.66 OSPI_FLASH_CFG_FLASH_CMD_ADDR_REG Register

4.7.2.79 FOTA_GENREGS_FOTA_INIT Register

4.7.2.79.1 FOTA_GENREGS_FOTA_INIT Register (Offset = 0h) [reset = 15h]

This register is used to initialize FOTA logic including M8051EW MCU.

Return to Summary Table

Table 4-2756. Instance Table

Instance Name	Physical Address
FSS0	5380 B000h

0h		0h	1h	0h	1h	0h	1h

Table 4-2757. FOTA_GENREGS_FOTA_INIT Register Field Descriptions

Bit	Field	Type	Reset	Description
31:6	RESERVED	NONE	0h	Reserved
5	MCU_STALL_EN	R/W	0h	Reserved field. This field SHALL be retained at 0, which is the default value.
4	FUNC_MODE	R/W	1h	This bit is used for selection functional or debug mode. 1'b1 - M8051EW uses functional mode for regular operation. 1'b0 - M8051EW uses debug mode for debug using JTAG.
3	PDMEM_INIT_DONE	R	0h	This bit indicates that FOTA program/data memory RAM initialization is done. Until this bit is set, access to program/data memory should not be performed by software.
2	MEMACCESS	R/W	1h	This bit provides SOC CPU access to program/data memory and internal memory through FSS config interface when set. If clear, these M8051EW memories are not accessible through config interface and is fully under the control of M8051EW. Software has to ensure that M8051EW is in reset by setting bit 0 of this register when memaccess is set.
1	CLKDIS	R/W	0h	This bit holds M8051EW core clock gated when set to 1'b1. Clock to M8051EW is enabled at reset. SOC software sets this bit to put M8051EW and other FOTA logic in low power state when not used by enabling clock gating.
0	RESET	R/W	1h	This bit holds M8051EW core in reset when set to 1'b1. System firmware clears this bit after setting up program and data memories.

4.7.2.80 FOTA_GENREGS_FOTA_CTRL Register

4.7.2.80.1 FOTA_GENREGS_FOTA_CTRL Register (Offset = 4h) [reset = 0h]

This register is used to start M8051EW firmware.

Table 4-2759. FOTA_GENREGS_FOTA_CTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31:1	RESERVED	NONE	0h	Reserved
0	GO	R/W1TS	0h	SOC CPU sets this bit to indicate to M8051EW firmware that it can start the next FOTA page write. Once go is set, SOC software has to ensure that it is set again only after receiving an interrupt (completion or error) from M8051EW. If this requirement is not followed, it could result in M8051EW firmware repeating the FOTA write erroneously. A write to this register causes an indirect write to ESFR space for M8051EW. Firmware polls until ESFR GO bit is set and then starts the FOTA write sequence. This bit is cleared by hardware when the MCU has acknowledged GO through a write to the GO_ACK ESFR bit.

4.7.2.81 FOTA_GENREGS_FOTA_ERR_INFO Register

4.7.2.81.1 FOTA_GENREGS_FOTA_ERR_INFO Register (Offset = 8h) [reset = 0h]

This register contains information from FOTA logic used when servicing fsas_fota_stat_err_pend/ fsas_fota_stat_err_req interrupt. This information is used in conjunction with FOTA interrupt status register ERR_STS_IRQ_STATUS_RAW. Software is expected to clear the fields in this register as it is not auto cleared by hardware.

Bit	Field	Type	Reset	Description
31:17	RESERVED	NONE	0h	Reserved
16:12	MCU_ERR_CODE	R/W	0h	This field contains error code reported by M8051EW firmware when ERR_STS_IRQ_STATUS_RAW.mcu_err is set. Error codes are software defined. Example encoding: 5'd0 - Flash error encountered during auto status polling, 5'd1 - Auto polling timeout error as status read from flash did not occur within expected time, 5'd2 - FOTA write timeout error where auto polling by M8051EW has indicated that flash write is still in progress after auto polling expiry time programmed in firmware, 5'd3 to 5'd31 - Reserved for future use.
11:9	DAT_ERR_SSTATUS	R/W	0h	This field contains read error status code when ERR_STS_IRQ_STATUS_RAW.dat_read_err interrupt flag is set
8:6	DAT_ERR_RSTATUS	R/W	0h	This field contains read error status code when ERR_STS_IRQ_STATUS_RAW.dat_read_err interrupt flag is set
5:3	CFG_ERR_SSTATUS	R/W	0h	This field contains read error status code when ERR_STS_IRQ_STATUS_RAW.cfg_read_err interrupt flag is set
2:0	CFG_ERR_RSTATUS	R/W	0h	This field contains read error status code when ERR_STS_IRQ_STATUS_RAW.cfg_read_err interrupt flag is set

4.7.2.82 FOTA_GENREGS_FOTA_GP0 Register

4.7.2.82.1 FOTA_GENREGS_FOTA_GP0 Register (Offset = 10h) [reset = 0h]

FOTA general purpose 0 register. SOC CPU can write to this register to pass information to M8051EW firmware through ESFR space.

Return to Summary Table

4.7.2.84 FOTA_GENREGS_FOTA_ADDR Register

4.7.2.84.1 FOTA_GENREGS_FOTA_ADDR Register (Offset = 18h) [reset = 0h]

FOTA operation write address register. SOC can write to this register to preload address for FOTA write instead of having 8051 firmware to setup address. Writing this register causes an indirect write to MCU_DAT_ADDR0-MCU_DAT_ADDR3 ESFR registers that are used by the VBUSM initiator as address for the FOTA write operation. Preloading these ESFR registers through this register removes the burden from 8051 firmware and reduces 8051 code size.

4.7.2.85 FOTA_GENREGS_FOTA_CNT Register

4.7.2.85.1 FOTA_GENREGS_FOTA_CNT Register (Offset = 1Ch) [reset = 0h]

FOTA operation write byte count. SOC can write to this register to preload byte count based on the page size of the flash memory used. Writing this register causes an indirect write to MCU_DAT_CNT0-MCU_DAT_CNT1 ESFR registers that are used by the VBUSM initiator as the overall byte count for the FOTA write operation. VBUSM initiator performs the required number of 32-byte writes to match this overall byte count. Preloading these ESFR registers through this register removes the burden from 8051 firmware and reduces 8051 code size.

4.7.2.86 FOTA_GENREGS_STS_IRQ_EOI Register

4.7.2.86.1 FOTA_GENREGS_STS_IRQ_EOI Register (Offset = 0h) [reset = 0h]

The End of Interrupt (EOI) Register allows the CPU to acknowledge completion of fsas_fota_stat_intr_req pulse interrupt. When this register is written to 1'b0, INTD logic used for converting fsas_ecc_intr_err_pend level interrupt to pulse will be re-armed. That is, if interrupt sources remain after writing this register to 1'b0, another pulse interrupt will be triggered by INTD. Conversely, if this register is not written to 1'b0 after fsas_fota_stat_intr_req pulse interrupt is received, then another pulse interrupt will not be received as INTD has not been re-armed. This register will be reset one cycle after it has been written to. Please note that the reason for writing 1'b0 is because there is only one interrupt (no interrupt aggregation) associated with this EOI and the INTD vector associated with this interrupt is 1'b0.

Bit	Field	Type	Reset	Description
31:7	RESERVED	NONE	0h	Reserved
6	MCU_ERR	R/W1TS	0h	MCU error raw status flag. This is used to communicate error conditions encountered by 8051 firmware to SOC CPU. Error code is captured in FOTA_ERR_INFO.mcu_err_code field. If 8051 firmware runs into any error conditions, it sets the FOTA_ERR_STAT.mcu_err ESFR bit to 1'b1 and writes the corresponding error code into FOTA_ERR_STAT.mcu_err_code field. This causes an indirect writes to STATUS_RAW.mcu_err MMR and FOTA_ERR_INFO.mcu_err_code MMR. M8051EW firmware defines the error codes that result in this error. Please refer to FOTA_ERR_INFO.mcu_err_code MMR description for suggested encoding.
5	DAT_WRITE_ERR	R/W1TS	0h	Data interface write status error raw status flag. This error flag gets set when M8051EW performs a data write and error status is returned. The CBA error status code received is stored in FOTA_ERR_INFO.dat_err_sstatus register.
4	DAT_READ_ERR	R/W1TS	0h	Data interface read status error raw status flag. This error flag gets set when M8051EW performs a data read and error status is returned. The CBA error status code received is stored in FOTA_ERR_INFO.dat_err_rstatus register.

Bit	Field	Type	Reset	Description
3	CFG_WRITE_ERR	R/W1TS	0h	Config interface write status error raw status flag. This error flag gets set when M8051EW performs a configuration write and error status is returned. The CBA error status code received is stored in FOTA_ERR_INFO.cfg_err_sstatus register.
2	CFG_READ_ERR	R/W1TS	0h	Config interface read status error raw status flag. This error flag gets set when M8051EW performs a configuration read and error status is returned. The CBA error status code received is stored in FOTA_ERR_INFO.cfg_err_rstatus register.
1:0	RESERVED	NONE	0h	Reserved

4.7.2.93 FOTA_GENREGS_ERR_STS_IRQ_STATUS Register

4.7.2.93.1 FOTA_GENREGS_ERR_STS_IRQ_STATUS Register (Offset = 8h) [reset = 0h]

The IRQ_STATUS register allows the interrupt sources to be manually cleared when writing a 1 to a specific bit. This register corresponds to fsas_fota_stat_err_pend/fsas_fota_stat_err_req interrupt output. Write 0: No action Write 1: Clear event Read 0: No event pending Read 1: Event pending

Table 4-2831. RL2_L2_CTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31	ENABLE	R/W	0h	The ~ienable field determines whether the L2 is enabled or not. Setting the enable from a 0 to 1 restarts the cache 0:Disabled 1:Enabled
30:3	RESERVED	NONE	0h	Reserved
2:0	SIZE	R/W	0h	The ~isize field determines the size of the remote cache data storage memory that is currently active. This field can be change dynamically, but will cause the entire cache to be invalidated when inflight transactions have completed. Changing the ~isize while ~ienable is already a '1' will restart the cache. 0:8KB 1:16KB 2:32KB 3:64KB 4:128KB 5:256KB (Dual Mode) Note: Setting this field to an invalid value will result in the field being set to '0'. The remote address range registers must be setup correctly to ensure it has sufficient memory for the selected size.

4.9.2.3 RL2_L2_STS Register

4.9.2.3.1 RL2_L2_STS Register (Offset = 8h) [reset = 0h]

The Status register displays the state of the RL2 module.

Return to Summary Table

Table 4-2843. RL2_IRQSTATUS_RAW Register Field Descriptions

Bit	Field	Type	Reset	Description
31:5	RESERVED	NONE	0h	Reserved
4	FLC_DON	R/W1TS	0h	The ~iflc_don bit indicates a FLC has completed the transfer to the FLC range. Write 1 to set the ~iflc_don status for diagnostic purposes. Writing a 0 has no effect.
3	FLC_WRERR	R/W1TS	0h	The ~iflc_wrerr bit indicates a write error from FLC remote range has occurred and the FLC is logically disabled while this bit is a '1'. Write 1 to set the ~iflc_wrerr status for diagnostic purposes. Writing a 0 has no effect.
2	FLC_RDERR	R/W1TS	0h	The ~iflc_rderr bit indicates a read error from FLC range has occurred and the FLC is logically disabled while this bit is a '1'. Write 1 to set the ~iflc_rderr status for diagnostic purposes. Writing a 0 has no effect.
1	WR_HIT	R/W1TS	0h	The ~iwr_hit bit indicates a write to the cacheable range has occurred potentially causing a coherency issue and the RL2 is logically disabled while this bit is a '1'. Write 1 to set the ~iwr_hit status for diagnostic purposes. Writing a 0 has no effect.
0	WR_ERR	R/W1TS	0h	The ~iwr_err bit indicates a write error has occurred to the remote cache data storage memory and the RL2 is logically disabled while this bit is a '1'. Write 1 to set the ~iwr_err status for diagnostic purposes. Writing a 0 has no effect.

4.9.2.9 RL2_IRQSTATUS_MSK Register

4.9.2.9.1 RL2_IRQSTATUS_MSK Register (Offset = 84h) [reset = 0h]

The Interrupt Masked Status Register holds the masked status for the FLC/RL2 status/error interrupts. Writing to this register will EOI the interrupt, that is if another interrupt is pending, a new pulse interrupt will be generated.

Return to Summary Table

Table 4-2845. RL2_IRQSTATUS_MSK Register Field Descriptions

Bit	Field	Type	Reset	Description
31:5	RESERVED	NONE	0h	Reserved
4	FLC_DON	R/W1TC	0h	The ~iflc_don bit indicates a FLC has completed the transfer to the FLC range. Write 1 to clear the ~iflc_don status after interrupt has been serviced (raw status gets cleared, i.e. even if not enabled). Writing a 0 has no effect to this field.
3	FLC_WRERR	R/W1TC	0h	The ~iflc_wrerr bit indicates a write error from FLC range has occurred and the FLC is logically disabled while this bit is a '1'. Write 1 to clear the ~iflc_wrerr status after interrupt has been serviced (raw status gets cleared, i.e. even if not enabled). Writing a 0 has no effect to this field.
2	FLC_RDERR	R/W1TC	0h	The ~iflc_rderr bit indicates a read error from FLC range has occurred and the FLC is logically disabled while this bit is a '1'. Write 1 to clear the ~iflc_rderr status after interrupt has been serviced (raw status gets cleared, i.e. even if not enabled). Writing a 0 has no effect to this field.
1	WR_HIT	R/W1TC	0h	The ~iwr_hit bit indicates a write to the cacheable range has occurred potentially causing a coherency issue and the RL2 is logically disabled while this bit is a '1'. Write 1 to clear the ~iwr_hit status after interrupt has been serviced (raw status gets cleared, i.e. even if not enabled). Writing a 0 has no effect to this field.

Table 4-2845. RL2_IRQSTATUS_MSK Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
0	WR_ERR	R/W1TC	0h	The ~iwr_err bit indicates a write error has occurred to the remote cache data storage memory and the RL2 is logically disabled while this bit is a '1'. Write 1 to clear the ~iwr_err status after interrupt has been serviced (raw status gets cleared, i.e. even if not enabled). Writing a 0 has no effect to this field.

4.9.2.10 RL2_IRQENABLE_SET Register

4.9.2.10.1 RL2_IRQENABLE_SET Register (Offset = 88h) [reset = 0h]

The Interrupt Enable Set Register holds the interrupt enable status of the FLC/RL2 status/error interrupts.

Table 4-3088. MPU_4_PROGRAMMABLE_3_MPPA Register Field Descriptions

Bit	Field	Type	Reset	Description
31:29	RESERVED3	R	0h	Always read as 0
28	LOCK	R/W	0h	this field is used for locking the corresponding MPU region configurations. Write 1 to lock the configurations along with the lock bit. Writing 1 is alllowed once per boot. Lock bit will clear on reset only. Once locked SW can not modify the MPU configurations along with lock bit.
27:26	RESERVED2	R	0h	Always read as 0.
25:10	AID15_0	R/W	0h	AIDs checked for this region. Defaults to input value. 0 = AID is not checked for these permissions. 1 = AID is checked for these permissions.
9	AIDX	R/W	0h	Additional AIDs checked. Defaults to input value.
8	RESERVED1	R	0h	Always read as 0.
7	NS	R/W	0h	Non-secure permission. Defaults to input value.
6	EMU	R/W	0h	Debug permission. Defaults to input value.
5	SR	R/W	0h	Supervisor read permission. Defaults to input value.
4	SW	R/W	0h	Supervisor write permission. Defaults to input value.
3	SX	R/W	0h	Supervisor executable permission. Defaults to input value.
2	UR	R/W	0h	User read permission. Defaults to input value.

Table 4-3088. MPU_4_PROGRAMMABLE_3_MPPA Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
1	UW	R/W	0h	User write permission. Defaults to input value.
0	UX	R/W	0h	User executable permission. Defaults to input value.

4.12.2.15 MPU_4_PROGRAMMABLE_4_START_ADDRESS Register

4.12.2.15.1 MPU_4_PROGRAMMABLE_4_START_ADDRESS Register (Offset = 230h) [reset = 0h]

Programmable_4_Start_Address.

Return to Summary Table

Table 5-5. CPSW_SS_SYNCE_COUNT_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31:0	SYNCE_CNT	R/W	0h	SyncE Count Value - This value determines the toggle rate of the TS_SYNCE output. When this value is zero the TS_SYNCE output is disabled (low). When this value is non-zero, the TS_SYNCE output toggles each time the synce count value is reached. If this value is to be changed to another non-zero value then it should be written with a zero value before Writing the new non-zero value.

5.1.2.3 CPSW_SS_SYNCE_MUX_REG Register

5.1.2.3.1 CPSW_SS_SYNCE_MUX_REG Register (Offset = 8h) [reset = 0h]

SS Synce Mux Register.

Return to Summary Table

Table 5-23. CPSW_MDIO_CONTROL_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31	IDLE	R	1h	MDIO state machine IDLE. Set to 1 by the hardware when the state machine is in the idle state.
30	ENABLE	R/W	0h	Enable control. Writing a 1 to this bit enables the MDIO state machine, writing a 0 disables it. If the MDIO state machine is active at the time it is disabled, it will complete the current operation before halting and setting the idle bit. If using byte access, the enable bit has to be the last bit written in this register.
29	RESERVED	NONE	0h	Reserved
28:24	HIGHEST_USER_CHANNEL	R	1h	Highest user channel. This field specifies the highest useraccess channel that is available in the module and is currently set to 1. This implies that MDIOUserAccess1 is the highest available user access channel.
23:21	RESERVED	NONE	0h	Reserved
20	PREAMBLE	R/W	0h	Preamble disable. Writing a 1 to this bit disables this device from sending MDIO frame preambles in clause 22 mode of operation. This bit has no effect in clause 45 mode of operation.
19	FAULT	R/W	0h	Fault indicator. This bit is set to 1 if the MDIO pins fail to read back what the device is driving onto them. This indicates a physical layer fault and the module state machine is reset. Writing a 1 to it clears this bit.
18	FAULT_DETECT_ENABLE	R/W	0h	Fault detect enable. This bit has to be set to 1 to enable the physical layer fault detection.
17	INT_TEST_ENABLE	R/W	0h	Interrupt test enable. This bit can be set to 1 to enable the host to set the userint and linkint bits for test purposes.

Table 5-23. CPSW_MDIO_CONTROL_REG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
16	RESERVED	NONE	0h	Reserved
15:0	CLKDIV	R/W	FFh	Clock Divider. This field specifies the division ratio between CLK and the frequency of MDCLK. MDCLK is disabled when clkdiv is set to 0. MDCLK frequency = clk frequency/(clkdiv+1).

5.1.2.12 CPSW_MDIO_ALIVE_REG Register

5.1.2.12.1 CPSW_MDIO_ALIVE_REG Register (Offset = 8h) [reset = 0h]

MDIO Alive Register

Table 5-25. CPSW_MDIO_ALIVE_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31:0	ALIVE	R/W	0h	MDIO Alive. Each of the 32 bits of this register is set if the most recent access to the PHY with address corresponding to the register bit number was acknowledged by the PHY, the bit is reset if the PHY fails to acknowledge the access. Both the user and polling accesses to a PHY will cause the corresponding alive bit to be updated. The alive bits are intended to be used to give an indication of the presence or not of the PHY with the corresponding address. Writing a 1 to any bit will clear it, writing a 0 has no effect.

5.1.2.13 CPSW_MDIO_LINK_REG Register

5.1.2.13.1 CPSW_MDIO_LINK_REG Register (Offset = Ch) [reset = 0h]

MDIO Link Register

Table 5-27. CPSW_MDIO_LINK_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31:0	LINK	R	0h	MDIO Link state. This register is updated after a read of the Generic Status Register of a PHY. The corresponding bit is set if the PHY with the corresponding address has link and the PHY acknowledges the read transaction. The bit is cleared to zero if the PHY indicates it does not have link or fails to acknowledge the read transaction. Writes to the register have no effect. In addition, in Normal Mode Operation, the status of the two PHYs specified in the MDIOUserPhySel registers can be determined using the MLINK input pins. This is determined by the linksel bit in the MDIOUserPhySel register. In State Change Mode the MLINK input pins are unused.

5.1.2.14 CPSW_MDIO_LINK_INT_RAW_REG Register

5.1.2.14.1 CPSW_MDIO_LINK_INT_RAW_REG Register (Offset = 10h) [reset = 0h]

MDIO Link Interrupt Raw Register

Return to Summary Table

Table 5-29. CPSW_MDIO_LINK_INT_RAW_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31:2	RESERVED	NONE	0h	Reserved
1:0	LINKINTRAW	R/W	0h	MDIO link change event raw value. Normal mode operation: When asserted, a bit indicates that there was an MDIO link change event (i.e. change in the MDIOLink register) corresponding to the PHY address in the MDIOUserPhySel register. linkintraw[0] and linkintraw[1] correspond to MDIOUserPhySel0 and MDIOUserPhysel1, respectively. Writing a 1 will clear the event and writing 0 has no effect. If the int_test bit in the MDIOControl register is set, the host may set linkintraw bits to a 1 which may be used for test purposes. MDIO link change event raw value. State Change Mode operation: The linkintraw[0] bit will be asserted when any bit (for any PHY) in the MDIOAlive or MDIOLink registers changes due to MDIO operations. The linkintraw[1] bit is unused in State Change Mode. State Change Mode allows any state change in any PHY to issue an interrupt. If the int_test bit in the MDIOControl register is set, the host may set the linkintraw[0] bit high which may be used for test purposes.

5.1.2.15 CPSW_MDIO_LINK_INT_MASKED_REG Register

5.1.2.15.1 CPSW_MDIO_LINK_INT_MASKED_REG Register (Offset = 14h) [reset = 0h]

Bit	Field	Type	Reset	Description
31:2	RESERVED	NONE	0h	Reserved
1:0	LINKINTMASKED	R/W	0h	MDIO link change interrupt masked value. Normal mode operation: When asserted, a bit indicates that there was an MDIO link change event (i.e. change in the MDIOLink register) corresponding to the PHY address in the MDIOUserPhySel register and the corresponding linkint_enable bit was set. linkintmasked[0] and linkintmasked[1] correspond to MDIOUserPhySel0 and MDIOUserPhysel1, respectively. Writing a 1 will clear the interrupt and writing 0 has no effect. These masked interrupt bits are the MDIO_LINKINT[1:0] pin values. MDIO link change interrupt masked value. State Change Mode operation: The linkintmasked[0] bit will be asserted when linkintraw[0] is asserted and when the linkintmaskset bit is set to 1. Writing a 1 will clear linkintmasked[0] (and the MDIO_LINKINT[0] output) and writing 0 has no effect. The linkintmasked[1] bit is not used in State Change Mode (MDIO_LINKINT[1] is therefore also unused in State Change Mode).

5.1.2.16 CPSW_MDIO_LINK_INT_MASK_SET_REG Register

5.1.2.16.1 CPSW_MDIO_LINK_INT_MASK_SET_REG Register (Offset = 18h) [reset = 0h]

2	MDIO_MDCLK_O	R/W	0h	MDIO Clock Output - This value is the MDCLK_O output value when the manualmode bit is set in the MDIO_POLL_IPG register.
1	MDIO_OE	R/W	0h	MDIO Output Enable - This value is inverted and output on the MDIO_OE_N output when the manualmode bit is set in the MDIO_POLL_IPG register.
0	MDIO_PIN	R/W	0h	MDIO_Pin Value - This is the external MDIO data pin value when the manualmode bit is set in the MDIO_POLL_IPG register. That is, this value is driven on the MDIO_O (the MDIO serial data output) when MDIO_OE is asserted. The read value for this bit comes from MDIO_I (the MDIO serial data input). If MDIO_OE is asserted and MDIO_PIN is written with a 1 then MDIO_PIN should read a 1 if there are no external devices pulling the MDIO data line low.

5.1.2.23 CPSW_MDIO_POLL_REG Register

5.1.2.23.1 CPSW_MDIO_POLL_REG Register (Offset = 34h) [reset = 0h]

MDIO Poll Register

Return to Summary Table

Table 5-46. Instance Table

Instance Name	Physical Address

Table 5-49. CPSW_MDIO_POLL_EN_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31:0	POLL_EN	R/W	FFFFFFFFh	Poll Enable - When set, the bit indicates that the associated PHY will be included in polling operations. When clear, the associated PHY will not be polled. Each bit in this field is associated with a PHY. Bit zero is associated with PHY 0 and so on. Due to a limitation in the hardware, bit 31 must always be set, regardless of the value of the preamble disable bit in the MDIO_CONTROL register. However, there does not have to be a PHY at address 31.

5.1.2.25 CPSW_MDIO_CLAUS45_REG Register

Table 5-195. CPSW_MDIO_USER_GROUP_USER_ACCESS_REG_J Register Field Descriptions

Bit	Field	Type	Reset	Description
31	GO	R/W	0h	Go. Writing a 1 to this bit causes the MDIO state machine to perform an MDIO access when it is convenient for it to do so, this is not an instantaneous process. Writing a 0 to this bit has no effect. This bit is write able only if the MDIO state machine is enabled. This bit will self clear when the requested access has been completed. Any writes to the MDIOUserAccess0 register are blocked when the go bit is 1. If byte access is being used, the go bit should be written last.
30	WRITE	R/W	0h	Write enable. Setting this bit to a 1 causes the MDIO transaction to be a register write, otherwise it is a register read.
29	ACK	R/W	0h	Acknowledge. This bit is set if the PHY acknowledged the read transaction.
28:26	RESERVED	NONE	0h	Reserved
25:21	REGADR	R/W	0h	Register address. This field specifies the PHY register to be accessed for this transaction in clause 22 mode or the MMD value in clause 45 mode.
20:16	PHYADR	R/W	0h	PHY address. This field specifies the PHY to be accessed for this transaction.
15:0	DATA	R/W	0h	User data. The data value read from or to be written to the specified PHY register.

Table 5-281. CPSW_NC_ETH_MAC_PN_FIFO_STATUS_REG_J Register Field Descriptions

Bit	Field	Type	Reset	Description
31:19	RESERVED	NONE	0h	Reserved
18	EST_BUFACT	R	0h	EST RAM active buffer - Indicates the active 64-word fetch buffer when pn_est_onebuf is cleared to zero. Indicates the fetch ram address MSB when pn_est_onebuf set to one.
17	EST_ADD_ERR	R	0h	EST Address Error - Indicates that the fetch ram was read again after the previous maximum buffer address read (the previous fetch from the maximum address is reused).
16	EST_CNT_ERR	R	0h	EST Fetch Count Error - Indicates that insufficient clocks were programmed into the fetch count and that another fetch was commanded before the previous fetch finished.
15:8	TX_E_MAC_ALLOW	R	FFh	Transmit mac allow - Bus that indicates the actual priorities assigned to the express queue (and inversely the priorities assigned to the prempt queue). The pn_mac_prempt[7:0] field in the Enet_Pn_IET_Control register indicates which priorities should be assigned to the express/prempt queues. The switch between queues happens only when the priority is empty and the actual assignment is shown in this field.
7:0	TX_PRI_ACTIVE	R	0h	Transmit Priority Active - Bus that indicates which priorities have packets (non-empty) at the time of the register read.

0h			0h	0h	0h	0h	0h

Table 5-283. CPSW_NC_ETH_MAC_PN_EST_CONTROL_REG_J Register Field Descriptions

Bit	Field	Type	Reset	Description
31:26	RESERVED	NONE	0h	Reserved
25:16	EST_FILL_MARGIN	R/W	0h	EST Fill Margin - Sets the fill margin (in bytes) required to ensure that the Ethernet wire is clear so that the timed EST express packet can egress at the correct required time. Setting this value too high will put an unnecessary gap on the wire. Setting this value too low will cause the express packet to egress at a time later than intended (pushed out by non express traffic that did not have sufficient time to finish).
15:9	EST_PREMPT_COMP	R/W	0h	EST Prempt Comparison Value - When the count in a zero allow is less than or equal to this value in bytes (times 8), prempt packets are cleared from the wire. This is the prempt clear margin value.
8	EST_FILL_EN	R/W	0h	EST Fill Enable - Enable EST fill mode when set.
7:5	EST_TS_PRI	R/W	0h	EST Timestamp Express Priority - Selects the express priority that timestamp(s) will be generated on when pn_est_ts_onepri is set.
4	EST_TS_ONEPRI	R/W	0h	EST Timestamp One Express Priority - When set, timestamps are only enabled on packets on the express priority selected by pn_est_ts_pri. When cleared to zero, express packet selection for timestamps is independent of priority.
3	EST_TS_FIRST	R/W	0h	EST Timestamp First Express Packet only - Generate a timestamp only on the first selected express packet in each EST time interval when express timestamps are enabled. (If pn_est_ts_onepri is also set then the timestamp is generated only on the first packet on pn_est_ts_pri).

Table 5-283. CPSW_NC_ETH_MAC_PN_EST_CONTROL_REG_J Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
2	EST_TS_EN	R/W	0h	EST Timestamp Enable - Enable express timestamps (when est_en and pn_est_port_en are set).
1	EST_BUFSEL	R/W	0h	EST Buffer Select - If pn_est_onebuf is cleared, this bit selects the upper (when set) or the lower (when cleared) 64-word fetch buffer. The actual fetch buffer used changes only at the start of the EST time interval and can be read in the Enet_Pn_FIFO_Status register pn_est_bufact bit.
0	EST_ONEBUF	R/W	0h	EST One Fetch Buffer - When set indicates that all 128 fetch words are used in one buffer. When cleared, indicates that the 128 fetch words are split into two 64-word fetch buffers. The pn_est_bufsel selects the buffer to be used when pn_est_onebuf is cleared to zero. Two buffers allows software to change a buffer while the hardware is using the other buffer.

Table 5-325. CPSW_NC_ETH_MAC_PN_MAC_CONTROL_REG_J Register Field Descriptions

Bit	Field	Type	Reset	Description
31:25	RESERVED	NONE	0h	Reserved
24	RX_CMF_EN	R/W	0h	RX Copy MAC Control Frames Enable - Enables MAC control frames to be transferred to memory. MAC control frames are normally acted upon (if enabled), but not copied/transferred to memory. MAC control frames that are pause frames will be acted upon if enabled in the MacControl register, regardless of the value of pn_rx_cmf_en. Frames transferred to memory due to pn_rx_cmf_en will have the mac_control bit set in their EOP buffer descriptor. 0 - MAC control frames are filtered (but are acted upon if enabled). 1 - MAC control frames are transferred to the host.
23	RX_CSF_EN	R/W	0h	RX Copy Short Frames Enable - Enables frames or fragments shorter than 64 bytes to be sent to the host. Frames transferred to the host due to pn_rx_csf_en will have the fragment or undersized bit set in their buffer descriptor. Short and fragment frame transfer is not guaranteed for all packet conditions and is best case only. Frames shorter than 33 bytes will be dropped in all cases. Fragments are short frames that contain CRC/align/code errors and undersized are short frames without errors. The pn_rx_cef_en bit must also be set to transfer fragment frames. 0 - Short frames are filtered. 1 - Short frames are transferred to the host.

Table 5-325. CPSW_NC_ETH_MAC_PN_MAC_CONTROL_REG_J Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
22	RX_CEF_EN	R/W	0h	RX Copy Error Frames Enable - Enables frames containing errors to be transferred to memory. The appropriate error bit will be set in the frame receive buffer descriptor. Frames containing errors will be filtered when this bit is not set. 0 - Frames containing errors are filtered. 1 - Frames containing errors are transferred to the host.
21	TX_SHORT_GAP_LIM_EN	R/W	0h	Transmit Short Gap Limit Enable - When set this bit limits the number of short gap packets transmitted to 100ppm. The pn_tx_short_gap_en bit must also be set. Each time a short gap packet is sent, a counter is loaded with 10,000 and decremented on each wireside clock. Another short gap packet will not be sent out until the counter decrements to zero. This mode is included to preclude the host from filling up the FIFO and sending every packet out with short gap which would violate the maximum number of packets per second allowed. This bit is used only with GMII (not XGMII).
20	EXT_TX_FLOW_EN	R/W	0h	External Transmit Flow Control Enable - Enables the pn_tx_flow_en to be selected from the EXT_TX_FLOW_EN input signal and not from the pn_tx_flow_en bit in this register.
19	EXT_RX_FLOW_EN	R/W	0h	External Receive Flow Control Enable - Enables the pn_rx_flow_en to be selected from the EXT_RX_FLOW_EN input signal and not from the pn_rx_flow_en bit in this register.
18	EXT_EN	R/W	0h	External Control Enable - Enables the fullduplex and gigabit mode to be selected from the FULLDUPLEX_IN and GIG_IN input signals and not from the pn_fullduplex and pn_gig bits in this register. The FULLDUPLEX_MODE bit reflects the actual fullduplex mode selected.
17	GIG_FORCE	R/W	0h	Gigabit Mode Force - This bit is used to force the Enet Mac into gigabit mode if the input GMII_MTCLK has been stopped by the PHY. 0 - GIG mode not forced 1 - GIG mode forced regardless of transmit clock
16	IFCTL_B	R/W	0h	Interface Control B - Intended as a general purpose output bit to be used to control external gaskets associated with the GMII (GMII to RGMII etc).
15	IFCTL_A	R/W	0h	Interface Control A - Intended as a general purpose output bit to be used to control external gaskets associated with the GMII (GMII to RGMII etc).
14:13	RESERVED	NONE	0h	Reserved
12	CRC_TYPE	R/W	0h	Port CRC Type - 0 - Ethernet CRC. 1 - Castagnoli CRC.
11	CMD_IDLE	R/W	0h	Command Idle - 0 - Idle not commanded. 1 - Idle Commanded (read pn_idle in Enet_Pn_Mac_Status).
10	TX_SHORT_GAP_ENABLE	R/W	0h	Transmit Short Gap Enable 0 - Transmit with a short IPG is disabled. 1 - Transmit with a short IPG is enabled.
9:8	RESERVED	NONE	0h	Reserved
7	GIG	R/W	0h	Gigabit Mode - 0 - 10/100 mode. 1 - Gigabit mode (full duplex only) The GIG_OUT output is the value of this bit. This bit is a don't care when pn_xgig is set.
6	TX_PACE	R/W	0h	Transmit Pacing Enable - 0 - Transmit Pacing Disabled. 1 - Transmit Pacing Enabled

Table 5-325. CPSW_NC_ETH_MAC_PN_MAC_CONTROL_REG_J Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
5	GMII_EN	R/W	0h	GMII Enable - 0 - GMII RX and TX held in reset. 1 - GMII RX and TX released from reset. This bit should be written with a logic high before the other bits in this register are written.
4	TX_FLOW_EN	R/W	0h	Transmit Flow Control Enable - Determines if incoming pause frames are acted upon in full-duplex mode. Incoming pause frames are not acted upon in half-duplex mode regardless of this bit setting. The RX_MBP_Enable bits determine whether or not received pause frames are transferred to memory. 0 - Transmit Flow Control Disabled. Full-duplex mode - Incoming pause frames are not acted upon. 1 - Transmit Flow Control Enabled . Full-duplex mode - Incoming pause frames are acted upon.
3	RX_FLOW_EN	R/W	0h	Receive Flow Control Enable - 0 - Receive Flow Control Disabled: Half-duplex mode - No flow control generated collisions are sent. Full-duplex mode - No outgoing pause frames are sent. 1 - Receive Flow Control Enabled: Half-duplex mode - Collisions are initiated when receive flow control is triggered. Full-duplex mode - Outgoing pause frames are sent when receive flow control is triggered.
2	MTEST	R/W	0h	Manufacturing Test mode - This bit must be set to allow writes to the Backoff_Test and PauseTimer registers.
1	LOOPBACK	R/W	0h	Loop Back Mode - Loopback mode forces internal fullduplex mode regardless of whether the pn_fullduplex bit is set or not. The pn_loopback bit should be changed only when pn_gmii_en is de-asserted. Loopback is used only with GMII (not XGMII). Loopback is not compatible with timestamp operations (CPTS). 0 - Loop Back Mode disabled. 1 - Loop Back Mode enabled.
0	FULLDUPLEX	R/W	0h	Full Duplex mode - Gigabit mode forces fullduplex mode regardless of whether the pn_fullduplex bit is set or not. The FULLDUPLEX_OUT output is the value of this register bit. 0 - half duplex mode. 1 - full duplex mode.

Table 5-327. CPSW_NC_ETH_MAC_PN_MAC_STATUS_REG_J Register Field Descriptions

Bit	Field	Type	Reset	Description
31	IDLE	R	1h	Enet IDLE - The Ethernet port (express and prempt) is in the idle state when high.
30	E_IDLE	R	1h	Express MAC is idle when high
29	P_IDLE	R	1h	Prempt MAC is idle when high
28	MAC_TX_IDLE	R	1h	Mac Transmit Idle - Both Prempt (if iet_incl) and Express MAC Transmit are in idle state.The transmit clock must be running for this to go idle.
27	TORF	R	0h	Top of receive FIFO flow control trigger occurred. This bit is write one to clear.
26:24	TORF_PRI	R	0h	The lowest priority that caused top of receive FIFO flow control trigger since the last write to clear. This field is write 0x7 to clear.
23:16	TX_PFC_FLOW_ACT	R	0h	Receive Priority Based Flow Control Active (priority 7 down to 0).
15:8	RX_PFC_FLOW_ACT	R	0h	Transmit Priority Based Flow Control Active (priority 7 down to 0).
7	RESERVED	NONE	0h	Reserved
6	EXT_TX_FLOW_EN	R	0h	External Transmit Flow Control Enable - This is the value of the EXT_TX_FLOW_EN input bit.
5	EXT_RX_FLOW_EN	R	0h	External Receive Flow Control Enable - This is the value of the EXT_RX_FLOW_EN input bit.
4	EXT_GIG	R	0h	External GIG - This is the value of the EXT_GIG input bit.
3	EXT_FULLDUPLEX	R	0h	External Fullduplex - This is the value of the EXT_FULLDUPLEX input bit.

Table 5-327. CPSW_NC_ETH_MAC_PN_MAC_STATUS_REG_J Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
2	RESERVED	NONE	0h	Reserved
1	RX_FLOW_ACT	R	0h	Receive Flow Control Active - When asserted, indicates that receive flow control is enabled and triggered.
0	TX_FLOW_ACT	R	0h	Transmit Flow Control Active - When asserted, this bit indicates that the pause time period is being observed for a received pause frame. No new transmissions will begin while this bit is asserted except for the transmission of pause frames. Any transmission in progress when this bit is asserted will complete.

Table 5-331. CPSW_NC_ETH_MAC_PN_MAC_BOFFTEST_REG_J Register Field Descriptions

Bit	Field	Type	Reset	Description
31	RESERVED	NONE	0h	Reserved
30:26	PACEVAL	R/W	0h	Pacing Current Value - A non-zero value in this field indicates that transmit pacing is active. A transmit frame collision or deferral causes paceval to loaded with decimal 31, good frame transmissions (with no collisions or deferrals) cause paceval to be decremented down to zero. When paceval is nonzero, the transmitter delays 4 IPGs between new frame transmissions after each successfully transmitted frame that had no deferrals or collisions. Transmit pacing helps reduce capture effects improving overall network bandwidth.
25:16	RNDNUM	R/W	0h	Backoff Random Number Generator - This field allows the Backoff Random Number Generator to be read (or written in test mode only). This field can be written only when pn_mtest has previously been set. Reading this field returns the generator's current value. The value is reset to zero and begins counting on the clock after the de-assertion of reset.
15:12	COLL_COUNT	R	0h	Collision Count - The number of collisions the current frame has experienced.
11:10	RESERVED	NONE	0h	Reserved
9:0	TX_BACKOFF	R	0h	Backoff Count - This field allows the current value of the backoff counter to be observed for test purposes. This field is loaded automatically according to the backoff algorithm, and is decremented by one for each slot time after the collision.

Table 5-355. CPSW_NC_ETH_MAC_PN_INTERVLAN_OPX_D_REG_J Register Field Descriptions

Bit	Field	Type	Reset	Description
31:16	RESERVED	NONE	0h	Reserved
15	DECREMENT_TTL	R/W	0h	Decrement Time To Live - When set, the Time To Live (TTL) field in the header is decremented. IPV4 - Decrement the TTL byte and update the Header Checksum. IPV6 - Decrement the Hop Limit. note: When this bit is set, the ALE should be configured to send any IPv4/6 packet with a zero or one TTL field to the host with the ALE egress operation ttl_check bit.When this bit is cleared the TTL/Hop Limit fields are not checked or modified.
14	DEST_FORCE_UNTAGGED_EGRESS	R/W	0h	Destination VLAN Force Untagged Egress - When set, this bit indicates that the VLAN should be removed on egress for the routed packet. The replace_vid bit should be set for this bit to be used, otherwise force untagged egress comes from the address lookup engine.
13	REPLACE_DA_SA	R/W	0h	Replace Destination Address and Source Address - When set this bit indicates that the routed packet destination address should be replaced by da[47:0] and the source address should be replaced by sa[47:0].
12	REPLACE_VID	R/W	0h	Replace VLAN ID - When set this bit indicates that the VLAN ID should be replaced for the routed packet.

Table 5-379. CPSW_NC_CPDMA_REGS_CONTROL_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31:9	RESERVED	NONE	0h	Reserved
8	FH_OWNERSHIP	R/W	0h	CPDMA FHost Ownership Write Bit Value. 0 - The CPDMA writes the FHost buffer descriptor ownership bit to zero at the end of packet processing as specified in CPPI 3.0. 1 - The CPDMA writes the FHost buffer descriptor ownership bit to one at the end of packet processing. Users who do not use the ownership mechanism can use this mode to preclude the necessity of software having to set this bit each time the buffer descriptor is used. Software must set this bit when building the packet chain.
7	TH_CH_OVERRIDE	R/W	0h	CPDMA THost Channel Classification Match Override Enable 0 - The THost channel is not overridden with the ALE classification match. 1 - The THOST channel is overridden with the lower 3-bits of the ALE classification match value (if a classification match occurred).
6	TH_TS_ENCAP	R/W	0h	CPDMA THost Packet Timestamp Encapsulation 0 - THost packets do not contain a 64-bit timestamp 1 - THost packets contain a 64-bit timestamp prepended to the packet data (32-bit lsword first).
5	TH_VLAN_ENCAP	R/W	0h	CPDMA THost Packet VLAN Encapsulation 0 - THost packets are not VLAN encapsulated 1 - THost packets are VLAN encapsulated

Table 5-379. CPSW_NC_CPDMA_REGS_CONTROL_REG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
4	TH_CEF	R/W	0h	CPDMA THost Copy Error Frames Enable - Enables THost DMA overrun frames to be transferred to memory (up to the point of buffer overrun). The overrun error bit will be set in the frame EOP buffer descriptor. Overrun frame data will be filtered when thost_cef is not set. THost frames with other error bits set are not affected by this bit. This is related only to frames that overrun on the THost DMA due to buffer limitations. 0 - Frames containing overrun errors are filtered. 1 - Frames containing overrun errors are transferred to memory.
3	CMD_IDLE	R/W	0h	CPDMA Command Idle 0 - Idle not commanded 1 - Idle Commanded (read idle in CPDMA_Status register)
2	TH_OFFLEN_BLOCK	R/W	0h	CPDMA THost Offset/Length word write block 0 - Do not block the DMA writes to the THost buffer descriptor offset/buffer length word. The offset/buffer length word is written as specified in CPPI 3.0. 1 - Block all CPDMA DMA controller writes to the THost buffer descriptor offset/buffer length words during CPPI packet processing. When this bit is set, the CPDMA will never write the third word to any THost buffer descriptor.
1	TH_OWNERSHIP	R/W	0h	CPDMA THost Ownership Write Bit Value 0 - The CPDMA writes the THost buffer descriptor ownership bit to zero at the end of packet processing as specified in CPPI 3.0. 1 - The CPDMA writes the THost buffer descriptor ownership bit to one at the end of packet processing. Users who do not use the ownership mechanism can use this mode to preclude the necessity of software having to set this bit each time the buffer descriptor is used. Software must set this bit when building the packet chain.
0	FH_PTYPE	R/W	0h	CPDMA FHost Queue Priority Type 0 - The queue uses a round robin scheme to select the next channel. 1 - The queue uses a fixed (channel 7 highest priority) priority scheme to select the next channel.

Table 5-381. CPSW_NC_CPDMA_REGS_STATUS_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31	IDLE	R	1h	CPDMA Idle Status Bit - Indicates when set that the CPDMA is not transferring a packet FHost or THost.
30:24	RESERVED	NONE	0h	Reserved
23:20	FH_HOST_ERROR_CODE	R	0h	CPDMA FHost Error Code - This field is set to indicate CPDMA detected FHost DMA related host errors. The host should read this field after a HOST_ERR_INT to determine the error. Host error Interrupts require hardware reset in order to recover. A zero packet length is an error, but it is not detected. 0000 - No error 0001 - SOP error 0010 - Ownership bit not set in SOP buffer 0011 - Zero Next Buffer Descriptor Pointer Without EOP 0100 - Zero Buffer Pointer 0101 - Zero Buffer Length 0110 - Packet Length Error (sum of buffers < packet length) 0111 - reserved ... 1111 - reserved
19	RESERVED	NONE	0h	Reserved
18:16	FH_ERR_CH	R	0h	CPDMA FHost Error Channel - This field indicates the FHost channel that had a host error. 000 - The host error occurred on TX channel 0 ... 111 - The host error occurred on TX channel 7

Table 5-381. CPSW_NC_CPDMA_REGS_STATUS_REG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
15:12	TH_HOST_ERROR_CODE	R	0h	CPDMA THost Error Code - This field is set to indicate CPDMA detected RX DMA related host errors. The host should read this field after a HOST_ERR_INT to determine the error. Host error Interrupts require hardware reset in order to recover. 0000 - No error 0001 - reserved 0010 - Ownership bit not set in input buffer. 0011 - reserved 0100 - Zero Buffer Pointer. 0101 - Zero buffer length on non-SOP descriptor 0110 - SOP buffer length not greater than offset ... 1111 - reserved
11	RESERVED	NONE	0h	Reserved
10:8	TH_ERR_CH	R	0h	CPDMA THost Host Error Channel - This field indicates which THost channel had a host error. 000 - The host error occurred on THost channel 0 ... 111 - The host error occurred on RX channel 7
7:0	RESERVED	NONE	0h	Reserved

Table 5-383. CPSW_NC_CPDMA_REGS_TH_BUFFER_OFFSET_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31:12	RESERVED	NONE	0h	Reserved
11:0	TH_BUFFER_OFFSET	R/W	0h	CPDMA THost Buffer Offset Value - The thost_buffer_offset will be written by the port into each frame SOP buffer descriptor buffer_offset field. The frame data will begin after the thost_buffer_offset value of bytes. A value of 0x0 indicates that there are no unused bytes at the beginning of the data and that valid data begins on the first byte of the buffer. A value of 0xF (decimal 15) indicates that the first 15 bytes of the buffer are to be ignored by the port and that valid buffer data starts on byte 16 of the buffer. This value is used for all channels.

Bit	Field	Type	Reset	Description
31:0	DMA_IN_VECTOR	R	0h	The value of CPDMA_In_Vector is reset to zero, but will change to the IN_VECTOR input bus value one clock after reset is deasserted. Thereafter, this value will change to a new IN_VECTOR input value one clock after the IN_VECTOR value changes.

5.1.2.198 CPSW_NC_CPDMA_INT_EOI_VECTOR_REG Register

5.1.2.198.1 CPSW_NC_CPDMA_INT_EOI_VECTOR_REG Register (Offset = 14h) [reset = 0h]

The CPDMA_EOI_VECTOR(4:0) output bus reflects the value written to this location one VBUSP_GCLK cycle after a write to this location. The EOI_WR signal is asserted for a single clock cycle after a latency of two VBUSP_GCLK cycles when a write is performed to this location.

Bit	Field	Type	Reset	Description
31:16	RESERVED	NONE	0h	Reserved
15:0	TH0_FREEBUFFER	R/W	0h	This field contains the count of host free buffers available. The th(0..7)_pendthresh value is compared with this field to determine if the THost threshold pending interrupt should be asseted (if enabled). This is a write to increment field. This field rolls over to zero on overflow. If THost threshold pending interrupts are used, the host must initialize this field to the number of available buffers (one register per channel). The port decrements (by the number of buffers in the frame) the associated channel register for each frame. This is a write to increment field. The host must write this field with the number of buffers that have been freed due to host processing.

Bit	Field	Type	Reset	Description
31:16	RESERVED	NONE	0h	Reserved
15:0	TH1_FREEBUFFER	R/W	0h	This field contains the count of host free buffers available. The th(0..7)_pendthresh value is compared with this field to determine if the THost threshold pending interrupt should be asseted (if enabled). This is a write to increment field. This field rolls over to zero on overflow. If THost threshold pending interrupts are used, the host must initialize this field to the number of available buffers (one register per channel). The port decrements (by the number of buffers in the frame) the associated channel register for each frame. This is a write to increment field. The host must write this field with the number of buffers that have been freed due to host processing.

11	HW4_TS_PUSH_EN	R/W	0h	Hardware push 4 enable

Table 5-711. CPSW_NC_CPTS_CONTROL_REG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
10	HW3_TS_PUSH_EN	R/W	0h	Hardware push 3 enable
9	HW2_TS_PUSH_EN	R/W	0h	Hardware push 2 enable
8	HW1_TS_PUSH_EN	R/W	0h	Hardware push 1 enable
7	TS_PPM_DIR	R/W	0h	PPM Correction Direction - 0 - Increase the time_stamp[63:0] value by the PPM value. 1 - Decrease the time_stamp[63:0] value by the PPM value.
6	TS_COMP_TOG	R/W	0h	Timestamp Compare Toggle mode - 0 - TS_COMP is in non-toggle mode. 1 - TS_COMP is in toggle mode.
5	MODE	R/W	0h	64-Bit Mode - 0 - The timestamp is 32-bits with the upper 32-bits forced to zero. 1 - The timestamp is 64-bits.
4	SEQUENCE_EN	R/W	0h	Sequence Enable - 0 - The timestamp value increments with the selected RFTCLK (normal operation). 1 - The timestamp for received packets is the sequence number of the received packet (first packet is 1, second packet is 2, etc). This can be used for test purposes.
3	TSTAMP_EN	R/W	0h	Host Receive Timestamp Enable - 0 - Timestamps are disabled on received packets to host. 1 - Timestamps enabled on received packets to host (cpts_en must be set).
2	TS_COMP_POLARITY	R/W	1h	TS_COMP Polarity 0 - TS_COMP is asserted low 1 - TS_COMP is asserted high
1	INT_TEST	R/W	0h	Interrupt Test - When set, this bit allows the raw interrupt to be written to facilitate interrupt test.
0	CPTS_EN	R/W	0h	Time Sync Enable - When disabled (cleared to zero), the CPTS RCLK domain is held in reset.

5.1.2.356 CPSW_NC_CPTS_RFTCLK_SEL_REG Register

5.1.2.356.1 CPSW_NC_CPTS_RFTCLK_SEL_REG Register (Offset = 8h) [reset = 0h]

Table 5-715. CPSW_NC_CPTS_TS_PUSH_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31:1	RESERVED	NONE	0h	Reserved
0	TS_PUSH	W	0h	Time stamp event push - When a logic high is written to this bit a time stamp event is pushed onto the event FIFO. The time stamp value is the time of the write of this register, not the time of the event read. The time stamp value can then be read on interrupt via the event registers. Software should not push a second time stamp event onto the event FIFO until the first time stamp value has been read from the event FIFO (there should be only one time stamp event in the event FIFO at any given time). This bit is write only and always reads zero.

5.1.2.358 CPSW_NC_CPTS_TS_LOAD_VAL_REG Register

Table 5-745. CPSW_NC_CPTS_TS_COMP_HIGH_VAL_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31:0	TS_COMP_HIGH_VAL	R/W	0h	Time Stamp Comparison High Value - Writing a non-zero value to the TS_Comp_Length[31:0] register causes a pulse of TS_Comp_Length RCLK periods on the TS_COMP output and a comparison event when the time_stamp counter value is equivalent to ts_comp_val[63:0]. This value is unused in 32-bit mode. The upper 32-bits in this register should be written before the lower 32-bits in the TS_Comp_Low register.

5.1.2.373 CPSW_NC_CPTS_TS_ADD_VAL_REG Register

5.1.2.373.1 CPSW_NC_CPTS_TS_ADD_VAL_REG Register (Offset = 4Ch) [reset = 0h]

TS Add Value Register

5.1.2.379 CPSW_NC_ALE_STATUS Register

5.1.2.379.1 CPSW_NC_ALE_STATUS Register (Offset = 4h) [reset = 80000400h]

The ALE status provides information on the ALE configuration and state. The ramdepth is used to determine how IPv6 entries are stored in the table. IPv6 entries are stored in two entries where IPv6 Entry Hi is designated by the odd slice index and Lo is designated by the even slice index. The slice index is above the ram depth like {SliceIndex,RamIndex}. So, for a 64 deep RAM index of 0x005, the Hi portion of the IPv6 entry is located at 0x005|(0x040) and the Lo portion is located at 0x005 & (~0x040).

Table 5-761. CPSW_NC_ALE_CONTROL Register Field Descriptions

Bit	Field	Type	Reset	Description
31	ENABLE_ALE	R/W	0h	Enable ALE 0 - Drop all packets 1 - Enable ALE packet processing
30	CLEAR_TABLE	R/W	0h	Clear ALE address table - Setting this bit causes the ALE hardware to write all table bit values to zero. Software must perform a clear table operation as part of the ALE setup/configuration process. Setting this bit causes all ALE accesses to be held up for 64 clocks while the clear is performed. Access to all ALE registers will be blocked (wait states) until the 64 clocks have completed. This bit cannot be read as one because the read is blocked until the clear table is completed at which time this bit is cleared to zero.
29	AGE_OUT_NOW	R/W	0h	Age Out Address Table Now - Setting this bit causes the ALE hardware to remove (free up) any ageable table entry that does not have a set touch bit. This bit is cleared when the age out process has completed. This bit may be read. The age out process takes four times the number of table entries clock cycles (4096 cycles for 1K addresses) best case (no ale packet processing during ageout) and sixty five times the number of table entries clock cycles (66560 cycles for 1K addresses) absolute worst case.
28:26	RESERVED	NONE	0h	Reserved
25:24	MIRROR_DP	R/W	0h	Mirror Destination Port - This field defines the port to which destination traffic destined will be duplicated. That is all traffic that is forwarded to this port will also be mirrored to the mirror_top port.

Table 5-761. CPSW_NC_ALE_CONTROL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
23:21	UPD_BW_CTRL	R/W	0h	The upd_bw_ctrl field allows for up to 8 times the rate in which adds, updates, touches, writes, and aging updates can occur. At frequencies of 350Mhz, the table update rate should be at it lowest or 5 Million updates per second. When operating the switch core at frequencies or above, the upd_bw_ctrl can be programmed more aggressive. If the upd_bw_ctrl is set but the frequency of the switch subsystem is below the associated value, ALE will drop packets due to insufficient time to complete lookup under high traffic loads. 0 - 350Mhz, 5M 1 - 359Mhz, 11M 2 - 367Mhz, 16M 3 - 375Mhz, 22M 4 - 384Mhz, 28M 5 - 392Mhz, 34M 6 - 400Mhz, 39M 7 - 409Mhz, 45M
20:18	RESERVED	NONE	0h	Reserved
17:16	MIRROR_TOP	R/W	0h	Mirror To Port - This field defines the destination port for the mirror traffic. If the traffic is received or transmitted on the mirror destination port it will not be duplicated. Traffic defined as mirror traffic only may be dropped by the switch due to congestion.
15	UPD_STATIC	R/W	0h	Update Static Entries - A static Entry is an entry that is not agable. When clear this bit will prevent any static entry (agable bit clear) from being updated due to port change. When set it allows static entries (agable bit clear) to update the source port if required. This bit should normally be '0' for most switch configurations.
14	LRN_HOST_DST	R/W	0h	Learn Host Destination - This field is set to only learn unicast packet source addresses that are destined to the host port. This bit is only valid for 3 port switches and allows the ALE table to only contain addresses the host port is concerned about. This bit is affectively disabled when en_host_uni_flood is set since any unknown unicast is also sent to the host port for extended bridging operations.
13	UVLAN_NO_LEARN	R/W	0h	Unknown VLAN No Learn - This field when set will prevent source addresses of unknown VLAN IDs from being automatically added into the look up table if learning is enabled.
12	MIRROR_MEN	R/W	0h	Mirror Match Entry Enable - This field enables the match mirror option. When this bit is set any traffic whose destination, source, VLAN or OUI matches the mirror_midx entry index will have that traffic also sent to the mirror_top port.
11	MIRROR_DEN	R/W	0h	Mirror Destination Port Enable - This field enables the destination port mirror option. When this bit is set any traffic destined for the mirror_dp port will have its transmit traffic also sent to the mirror_top port.
10	MIRROR_SEN	R/W	0h	Mirror Source Port Enable - This field enables the source port mirror option. When this bit is set any port with the pX_mirror_sp set in the ALE Port Control registers set will have its received traffic also sent to the mirror_top port.
9	RESERVED	NONE	0h	Reserved
8	EN_HOST_UNI_FLOOD	R/W	0h	Unknown unicast packets flood to host 0 - unknown unicast packets are not sent to the host 1 - unknown unicast packets flood to host port as well as other ports
7	LEARN_NO_VLANID	R/W	0h	Learn No VID - 0 - VID is learned with the source address 1 - VID is not learned with the source address (source address is not tied to VID). Determines the entry type.
6	ENABLE_VID0_MODE	R/W	0h	Enable VLAN ID = 0 Mode 0 - Process the priority tagged packet with VID = PORT_VLAN[11:0]. 1 - Process the priority tagged packet with VID = 0.

Table 5-761. CPSW_NC_ALE_CONTROL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
5	ENABLE_OUI_DENY	R/W	0h	Enable OUI Deny Mode - When set, any packet with a non-matching OUI source address will be dropped to the host unless the packet destination address matches a supervisory destination address table entry. When cleared, any packet source address matching an OUI address table entry will be dropped to the host unless the destination address matches with a supervisory destination address table entry.
4	ENABLE_BYPASS	R/W	0h	ALE Bypass - When set, packets received on non-host ports are sent to the host. It is expected that packets from the host are directed to the particular port. 0 - no bypass 1 - bypass the ALE
3	BCAST_MCAST_CTL	R/W	0h	Rate Limit Transmit mode 0 - Broadcast and multicast rate limit counters are received port based 1 - Broadcast and multicast rate limit counters are transmit port based
2	ALE_VLAN_AWARE	R/W	0h	ALE VLAN Aware - Determines how traffic is forwarded using VLAN rules. 0 - Simple switch rules, packets forwarded to all ports for unknown destinations. 1 - VLAN Aware rules, packets forwarded based on VLAN members
1	ENABLE_AUTH_MODE	R/W	0h	Enable MAC Authorization Mode - Mac authorization mode requires that all table entries be made by the host software. There is no auto learning of addresses in authorization mode and the packet will be dropped if the source address is not found (and the destination address is not a multicast address with the super table entry bit set). 0 - The ALE is not in MAC authorization mode 1 - The ALE is in MAC authorization mode
0	ENABLE_RATE_LIMIT	R/W	0h	Enable Broadcast and Multicast Rate Limit 0 - Broadcast/Multicast rates not limited 1 - Broadcast/Multicast packet reception limited to the port control register rate limit fields.

5.1.2.381 CPSW_NC_ALE_CTRL2 Register

5.1.2.381.1 CPSW_NC_ALE_CTRL2 Register (Offset = Ch) [reset = 0h]

The ALE Control 2 Register is used to set the extended features used for all ports.

Return to Summary Table

Table 5-763. CPSW_NC_ALE_CTRL2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	TRK_EN_DST	R/W	0h	Trunk Enable Destination Address - This field enables the destination MAC address to be used with the hash function G(X) = 1 + X + X^3 and affect the trunk port transmit link determination.
30	TRK_EN_SRC	R/W	0h	Trunk Enable Source Address - This field enables the source MAC address to be used with the hash function G(X) = 1 + X + X^3 and affect the trunk port transmit link determination.
29	TRK_EN_PRI	R/W	0h	Trunk Enable Priority - This field enables the VLAN Priority bits to be used with the hash function G(X) = 1 + X + X^3 and affect the trunk port transmit link determination. In the event that DSCP mapping is enabled and there is no VLAN the DSCP priority will be used. For all other non IP frames without VLAN the port default priority is used.
28	RESERVED	NONE	0h	Reserved
27	TRK_EN_IVLAN	R/W	0h	Trunk Enable Inner VLAN - This field enables the inner VLAN ID value (C-VLANID) to be used with the hash function G(X) = 1 + X + X^3 and affect the trunk port transmit link determination.
26	RESERVED	NONE	0h	Reserved
25	TRK_EN_SIP	R/W	0h	Trunk Enable Source IP Address - This field enables the source IP address to be used with the hash function G(X) = 1 + X + X^3 and affect the trunk port transmit link determination. This feature supports No tag, Priority tagged, VLAN tagged, Q-in-Q double tagging for both IPV6 and IPV4.

Table 5-763. CPSW_NC_ALE_CTRL2 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
24	TRK_EN_DIP	R/W	0h	Trunk Enable Destination IP Address - This field enables the destination IP address to be used with the hash function G(X) = 1 + X + X^3 and affect the trunk port transmit link determination. This feature supports No tag, Priority tagged, VLAN tagged, Q-in-Q double tagging for both IPV6 and IPV4.
23	DROP_BADLEN	R/W	0h	Drop Bad Length will drop any packet that the 802.3 length field is larger than the packet. Ethertypes 0-1500 are 802.3 lengths, all others are Ether types.
22	NODROP_SRCMCST	R/W	0h	No Drop Source Multicast will disable the dropping of any source address with the multicast bit set.
21	DEFNOFRAG	R/W	0h	Default No Frag field will cause an IPv4 fragmented packet to be dropped if a VLAN entry is not found.
20	DEFLMTNXTHDR	R/W	0h	Default limit next header field will cause an IPv4 protocol or IPv6 next header packet to be dropped if a VLAN entry is not found and the protocol or next header does not match the ALE_NXT_HDR register values.
19	RESERVED	NONE	0h	Reserved
18:16	TRK_BASE	R/W	0h	Trunk Base - This field is the hash formula starting value. Changing this value will cause the packet distribution on trunk ports to be changed. If all the trk_en_dst, trk_en_src, trk_en_pri and trk_en_vlan are '0', this value is used as the distribution index. That is a '0' will select the 1st bit of an 'N' link trunk, a '1' will select the second, etc. Below is the distribution across the trunk links. The first number in the italic sequence indicates the traffic is sent to the lowest numbered port of a trunk group. For example if you have a 3 port trunk, the hash result 0 will go to the base port (0), hash result 1 will go to the highest port of the trunk group (2), hash result 2 will go to the middle port (1), etc. 1 - 00000000 2 - 01010101 3 - 02102102 4 - 03210321
15	MULTIHOST	R/W	0h	The ~multihost allows host traffic to be sent bact to the host if the DA is market for the host port.
14:9	RESERVED	NONE	0h	Reserved
8:0	MIRROR_MIDX	R/W	0h	Mirror Index - This field is the ALE lookup table entry index that when a match occurs will cause this traffic to be mirrored to the mirror_top port. That is any VLAN, ONU or address with or withou VLAN can be selected for traffic mirroring.

5.1.2.382 CPSW_NC_ALE_PRESCALE Register

5.1.2.382.1 CPSW_NC_ALE_PRESCALE Register (Offset = 10h) [reset = 0h]

The ALE Prescale Register is used to set the Broadcast and Multicast rate limiting prescaler value.

Table 5-765. CPSW_NC_ALE_PRESCALE Register Field Descriptions

Bit	Field	Type	Reset	Description
31:20	RESERVED	NONE	0h	Reserved
19:0	ALE_PRESCALE	R/W	0h	ALE Prescale - The input clock is divided by this value for use in the multicast/broadcast rate limiters. The minimum operating value is 0x10. The prescaler is off when the value is zero.

5.1.2.383 CPSW_NC_ALE_AGING_CTRL Register

5.1.2.383.1 CPSW_NC_ALE_AGING_CTRL Register (Offset = 14h) [reset = 0h]

The ALE Aging Control sets the aging interval which will cause periodic aging to occur. This value specifies the minimum time between aging starts.

Return to Summary Table

31	PRESCALE_2_DISABLE	R/W	0h	ALE Prescaler 2 Disable - When set will divide the aging interval by 1000. This bit is designed for device verification and should not be used in production software. Combination of PreScale1Disable and PreScale2Disable will divide the aging interval by 1,000,000 for test purposes.
30	PRESCALE_1_DISABLE	R/W	0h	ALE Prescaler 1 Disable - When set will divide the aging interval by 1000. This bit is designed for device verification and should not be used in production software. Combination of PreScale1Disable and PreScale2Disable will divide the aging interval by 1,000,000 for test purposes.
29:24	RESERVED	NONE	0h	Reserved
23:0	ALE_AGING_TIMER	R/W	0h	ALE Aging Timer - This field specifies the number of clock cycles times 1,000,000 between aging operations.

5.1.2.384 CPSW_NC_ALE_NXT_HDR Register

5.1.2.384.1 CPSW_NC_ALE_NXT_HDR Register (Offset = 1Ch) [reset = 0h]

The ALE Next Header is used to limit the IPv6 Next header or IPv4 Protocol values found in the IP header. It is enabled via the ~iLmtNxtHdr bit in the VLAN entry. All four ~iip_nxt_hdr0-3 are compared when enabled, so if only one is required, set them all to the one value to be tested.

Table 5-779. CPSW_NC_ALE_I0_PORTCTL0_J Register Field Descriptions

Bit	Field	Type	Reset	Description
31:24	I0_REG_P0_BCAST_LIMIT	R/W	0h	Broadcast Packet Rate Limit - Each prescale pulse loads this field into the port broadcast rate limit counter. The port counters are decremented with each packet received or transmitted depending on whether the mode is transmit or receive. If the counters decrement to zero, then further packets are rate limited until the next prescale pulse. Broadcast rate limiting is enabled by a non-zero value in this field.
23:16	I0_REG_P0_MCAST_LIMIT	R/W	0h	Multicast Packet Rate Limit - Each prescale pulse loads this field into the port multicast rate limit counter. The port counters are decremented with each packet received or transmitted depending on whether the mode is transmit or receive. If the counters decrement to zero, then further packets are rate limited until the next prescale pulse. Multicast rate limiting is enabled by a non-zero value in this field.The mcast_limit is the number of Multicast packets that will be forwaded per ale_prescale time.
15	I0_REG_P0_DROP_DOUBLE_VLAN	R/W	0h	Drop Double VLAN - When set cause any received packet with double VLANs to be dropped. That is if there are two ctag or two stag fields in the packet it will be dropped.
14	I0_REG_P0_DROP_DUAL_VLAN	R/W	0h	Drop Dual VLAN - When set will cause any received packet with dual VLAN stag followed by ctag to be dropped.

Table 5-779. CPSW_NC_ALE_I0_PORTCTL0_J Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
13	I0_REG_P0_MACONLY_CAF	R/W	0h	Mac Only Copy All Frames - When set a Mac Only port will transfer all received good frames to the host. When clear a Mac Only port will transfer packets to the host based on ALE destination address lookup operation (which operates more like an Ethernet Mac). A Mac Only port is a port with maconly set.
12	I0_REG_P0_DIS_PAUTHMOD	R/W	0h	Disable Port authorization - When set will allow unknown addresses to arrive on a switch in authorization mode. It is intended for device to device network connection on ports which do not require MACSEC encryption.
11	I0_REG_P0_MACONLY	R/W	0h	MAC Only - When set enables this port be treated like a MAC port for the host. All traffic received is only sent to the host. The host must direct traffic to this port as the lookup engine will not send traffic to the ports with the p0_maconly bit set and the p0_no_learn also set. If p0_maconly bit is set and the p0_no_learn is not set, the host can send non-directed packets that can be sent to the destination of a MacOnly port. It is also possible that The host can broadcast to all ports including MacOnly ports in this mode.
10	I0_REG_P0_TRUNKEN	R/W	0h	Trunk Enable - This field is used to enable a port into a trunk. Any port can be used as a trunk port, any two or more ports with the p0_trunken its set and having the same p0_trunknum will be placed in the same trunk. There is no requirement for trunk ports to be adjacent. If all ports are enabled in the same trunk, no traffic can flow as traffic received within a trunk is never trasnmitted out the same trunk. If only a single port is a member of a trunk, it looks like a normal port with exception of entries in the look up table will be noted as a trunk entry.
9:8	I0_REG_P0_TRUNKNUM	R/W	0h	Trunk Number - This field is used as the trunk number when the p0_trunken is also set. Ports with the same trunk number that have the p0_trunken also set will have traffic distributed within the trunk based on the result of the hash function descrived above.
7	I0_REG_P0_MIRROR_SP	R/W	0h	Mirror Source Port - This field enables the source port mirror option. When this bit is set any traffic received on the port with the reg_p0_mirror_sp bit set will have its received traffic also sent to the mirror_top port.
6	RESERVED	NONE	0h	Reserved
5	I0_REG_P0_NO_SA_UPDATE	R/W	0h	No Source Address Update - When set will not update the source addresses for this port.
4	I0_REG_P0_NO_LEARN	R/W	0h	No Learn - When set will not learn the source addresses for this port.
3	I0_REG_P0_VID_INGRESS_CHECK	R/W	0h	VLAN Ingress Check - When set if a packet received is not a member of the VLAN, the packet will be dropped.
2	I0_REG_P0_DROP_UN_TAGGED	R/W	0h	If Drop Untagged - When set will drop packets without a VLAN tag.
1:0	I0_REG_P0_PORTSTATE	R/W	0h	Port State - Defins the current port state used for lookup operations. 0 - Disabled 1 - Blocked 2 - Learning 3 - Forwarding

5.1.2.390 CPSW_NC_ALE_UVLAN_MEMBER Register

5.1.2.390.1 CPSW_NC_ALE_UVLAN_MEMBER Register (Offset = 90h) [reset = 0h]

The ALE Unknown VLAN Member Mask Register is used to specify the member list for unknown VLAN ID.

Return to Summary Table

Bit	Field	Type	Reset	Description
31:3	RESERVED	NONE	0h	Reserved
2:0	OAM_LB_CTRL	R/W	0h	The oam_lb_ctrl allows any port to be put into OAM loopback, that is any packet received will be returned to the same port with an egressop of 0xFF which swaps the source and destination address. BPDUs will still flow through as normal so that OAM can be remotly requested and disabled.

5.1.2.397 CPSW_NC_ALE_EGRESSOP Register

5.1.2.397.1 CPSW_NC_ALE_EGRESSOP Register (Offset = FCh) [reset = 0h]

The Egress Operation register allows enabled classifiers with any match like IPSA or IPDA match to use the CPSW Egress Packet Operations Inter VLAN Routing sub functions. If the packet was destined for the host or is destined to any port without any errors, but matches a clasifier that has a programmed egress opcode, it will be forwarded to the destination ports where the destination ports will use the thier egress opcode entry to modify the packet. InterVLAN Routing and mirroring need to be understood, they are orthogonal functions. Care must be taken not to violate VLAN rules as this can redirect packets based on classifier matches.

Table 5-795. CPSW_NC_ALE_EGRESSOP Register Field Descriptions

Bit	Field	Type	Reset	Description
31:24	EGRESS_OP	R/W	0h	The Egress Operation defines the operation performed by the CPSW Egress Packet Operations 0: NOP : 1-n: Defines which egress Operation will be performed. This allows Inter VLAN routing to be configured for high bandwidth traffic, reducing CPU load. 0xff: Swap SA and DA of packet, this is intended to allow OAM diagnostics for a link.
23:21	EGRESS_TRK	R/W	0h	The Egress Trunk Index is the calculated trunk index from the SA, DA or VLAN if modified to that InterVLAN routing will work on trunks as well. The DA, SA and VLAN are ignored for trunk generation on InterVLAN Routing so that this field is the index generated from the Egress Op replacements elclusive or'd together into a three bit index.
20	TTL_CHECK	R/W	0h	The TTL Check will cause any packet that fails TTL checks to not be routed to the Inter VLAN Routing sub functions. The packet will be routed to the host it was destined to.
19:3	RESERVED	NONE	0h	Reserved

Table 5-795. CPSW_NC_ALE_EGRESSOP Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
2:0	DEST_PORTS	R/W	0h	The Destination Ports is a list of the ports the classified packet will be set to. If a destination is a Trunk, all the port bits for that trunck must be set.

5.1.2.398 CPSW_NC_ALE_POLICECFG0 Register

5.1.2.398.1 CPSW_NC_ALE_POLICECFG0 Register (Offset = 100h) [reset = 0h]

The Policing Config 0 holds the port, frame priority and ONU address index as well as match enables for port, frame priority and ONU address matching.

Table 5-819. CPSW_NC_ALE_THREADMAPDEF Register Field Descriptions

Bit	Field	Type	Reset	Description
31:16	RESERVED	NONE	0h	Reserved
15	DEFTHREAD_EN	R/W	0h	Default Tread Enable - When set the switch will use the defthreadval for the host interface thread ID if no classifier is matched. If clear the switch will generate its own thread ID based on port and priority if there is no classifier match.
14:6	RESERVED	NONE	0h	Reserved
5:0	DEFTHREADVAL	R/W	0h	Default Thread Value - This field specifies the default thread ID value.

5.1.2.410 CPSW_NC_ALE_THREADMAPCTL Register

5.1.2.410.1 CPSW_NC_ALE_THREADMAPCTL Register (Offset = 138h) [reset = 0h]

The THREAD Mapping Control register allows the highest matched classifier to return a particular thread ID for traffic sent to the host. This allows particular classifier matched traffic to be placed an a particular hosts queue.

Bit	Field	Type	Reset	Description
31:1	RESERVED	NONE	0h	Reserved
0	VAL	R/W1TC	0h	Read the current interrupt status. Write 1 to clear the interrupt output. The interrupt will reassert if the conditions that triggered it persist

5.2.2.32 ESM_GROUP_N_LOCK Register

5.2.2.32.1 ESM_GROUP_N_LOCK Register (Offset = 100h) [reset = 0h]

The fields of the Group N Interrupt Lock Register lock the configuration for the associated Error Group N Interrupt Enable Set/Clear Registers and the Error Group N Interrupt Priority Register. This locks the associated enable and priority bits for each Group for Low and High Priority Interrupts. Locks may be written until the associated Commit MMR fields are set to 1. Once Lock is 1 and Commit is 1, the associated configuration may not be changed until reset.

Table 5-983. OTTOCAL_HRPWR Register Field Descriptions

Bit	Field	Type	Reset	Description
15	CALPWRON	R/W	0h	MEP Calibration Power Bits [only available on ePWM1] 0:Disables MEP calibration logic in the HRPWM and reduces power consumption. 1:Enables MEP calibration logic
14:10	RESERVED_1	R	0h	Reserved
9:6	CALSEL	R/W	0h	EPWM Delay Line Selection for Calibration:
5	TESTSEL	R/W	0h	Test Mode Select Bit: This bit selects if a dummy delay is added in Oscillator Calibration mode to help reducing frequency when small delays are used:
4	CALSTS	R	0h	Calibration Status Bit: This bit, when set to 1, indicates that calibration is in progress. It is set to 0 when:
3	CNTSEL	R/W	0h	Counter Select Bit: Functionality of this bit has changed. When HRCNT0 or HRCNT1 reaches 0xFFFF, both counters are frozen. This bit will have an effect on when calibration starts:
2	CALSTART	R/W	0h	Calibration Start/Stop Bit:
1:0	CALMODE	R/W	0h	Note: CALMODE bits in HRPWM Module. Not used here.

5.3.2.2 OTTOCAL_HRCAL Register

5.3.2.2.1 OTTOCAL_HRCAL Register (Offset = 44h) [reset = 0h]

HRPWM Calibration Register.

Bit	Field	Type	Reset	Description
31:12	RESERVED	NONE	0h	Reserved
11:8	FIFO_NONERR	R/W	5h	Enables/disables FIFO writes without the error event on completion of comparison window. User, privilege, and debug mode (read): Returns the current field value. Privilege and debug mode (write): Sets the value of field value. Source values: 0101 Counter values are captured to non-full FIFO only upon Error event. Others 1010 : Write counter values to non-full FIFO upon completion of comparison window regardless of error or not. It is recommended to write 1010 to avoid single soft errors.

Table 5-1019. MSS_DCC_DCCGCTRL2 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
7:4	FIFO_READ	R/W	5h	Enables the counter read registers reflect FIFO output instead of the live counter value. User, privilege, and debug mode (read): Returns the current field value. Privilege and debug mode (write): Sets the value of field value. Source values: 0101 Counter value is read directly. Others 1010 : Counters FIFO output is read. It is recommended to write 1010 to avoid single soft errors.
3:0	CONT_ON_ERR	R/W	5h	Continues to next window of comparison despite the error condition. User, privilege, and debug mode (read): Returns the current field value. Privilege and debug mode (write): Sets the value of field value. Enable values: 0101 Comparison and counter reload is stopped from advancing if error is detected. Others 1010:Counters get reloaded with seed and continue counting despite the error condition. It is recommended to write 1010 to avoid single soft errors.

5.4.2.13 MSS_DCC_DCCSTATUS2 Register

5.4.2.13.1 MSS_DCC_DCCSTATUS2 Register (Offset = 30h) [reset = 7h]

Specifies the status of the DCC FIFOs.

Return to Summary Table

31:4	RESERVED	NONE	0h	Reserved
3:2	TIMEOUT	R/WI	0h	2-bit saturating counter of the number of timeout errors that have occurred since last cleared. 2'b00 - No timeout errors have occurred 2'b01 - 1 timeout error has occurred 2'b10 - 2 timeout error has occurred 2'b11 - 3 or more timeout errors have occurred A write of a non-zero value to this register increments that many from the timeout fields. If the value written is less than the current value of the counter, then the pending level interrupt stays asserted. . If this register goes from 0 ot non zero a level interrupt will be asserted as well as a pulse interrupt. If the value was non zero to non zero then the level interrupt would remain asserted, but no new pulse interrupt would be asserted. You must write the eoi register to get a new pulse interrupt.

Table 5-1066. ECC_AGGR_AGGR_STATUS_SET Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
1:0	PARITY	R/WI	0h	2-bit saturating counter of the number of parity errors that have occurred since last cleared. 2'b00 - No parity errors have occurred 2'b01 - 1 parity error has occurred 2'b10 - 2 parity error has occurred 2'b11 - 3 or more parity error have occurred A write of a non-zero value to this register incrments that many from the parity fields. If the value written is less than the current value of the counter, then the pending level interrupt stays asserted. If this register goes from 0 ot non zero a level interrupt will be asserted as well as a pulse interrupt. If the value was non zero to non zero then the level interrupt would remain asserted, but no new pulse interrupt would be asserted. You must write the eoi register to get a new pulse interrupt.

5.5.2.22 ECC_AGGR_AGGR_STATUS_CLR Register

5.5.2.22.1 ECC_AGGR_AGGR_STATUS_CLR Register (Offset = 20Ch) [reset = 0h]

Status clear register for aggregator interrupts.

Table 5-1226. OSPI_FLASH_CFG_CONFIG_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31	IDLE_FLD	R	1h	Serial interface and low level SPI pipeline is IDLE: This is a STATUS read-only bit. Note this is a retimed signal, so there will be some inherent delay on the generation of this status signal.
30	DUAL_BYTE_OPCODE_EN_FLD	R/W	0h	Dual-byte Opcode Mode enable bit This bit is to be set in case the target Flash Device supports dual byte opcode [i.e. Macronix MX25]. It is applicable for Octal I/O Mode or Protocol only so should be set back to low if the device is configured to work in another SPI Mode. If enabled, the supplementing bytes are taken from Opcode Extension Register [Lower] and from Opcode Extension Register [Upper].
29	CRC_ENABLE_FLD	R/W	0h	CRC enable bit This bit is to be set in case the target Flash Device supports CRC [Macronix MX25]. It is applicable for Octal DDR Protocol only so should be set back to low if the device is configured to work in another SPI Mode.
28:26	CONFIG_RESV2_FLD	R	0h	Reserved
25	PIPELINE_PHY_FLD	R/W	0h	Pipeline PHY Mode enable: This bit is relevant only for configuration with PHY Module. It should be asserted to 1 between consecutive PHY pipeline reads transfers and de-asserted to 0 otherwise.
24	ENABLE_DTR_PROTOCOL_FLD	R/W	0h	Enable DTR Protocol: This bit should be set if device is configured to work in DTR protocol.

Table 5-1226. OSPI_FLASH_CFG_CONFIG_REG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
23	ENABLE_AHB_DECODER_FLD	R/W	0h	Enable AHB Decoder: Value 0 : Active target is selected based on Peripheral Chip Select Lines [bits [13:10]]. Value=1 Active target is selected based on actual AHB address [the partition for each device is calculated with respect to bits [28:21] of Device Size Configuration Register]
22:19	MSTR_BAUD_DIV_FLD	R/W	Fh	Master Mode Baud Rate Divisor: SPI baud rate = (master reference clock) baud_rate_divisor. Where BD is: 4b0000 = /2 4b0001 = /4 4b0010 = /6 4b0011 = /8 4b0100 = /10 4b0101 = /12 .. 4b1111 = /32 While the PHY Mode is enabled, clock from DLL is granted and consequently forwarded into external FLASH Device. Its frequency is equal to ref_clk i.e., value of /1 is used in PHY mode. Set this register up before enabling the Octal-SPI controller.
18	ENTER_XIP_MODE_IMM_FLD	R/W	0h	Enter XIP Mode immediately: Value 0 : If XIP is enabled, then setting to 0 will cause the controller to exit XIP mode on the next READ instruction. Value 1 : Operate the device in XIP mode immediately Use this register when the external device wakes up in XIP mode [as per the contents of its non- volatile configuration register]. The controller will assume the next READ instruction will be passed to the device as an XIP instruction, and therefore will not require the READ opcode to be transferred. Note: To exit XIP mode, this bit should be set to 0. This will take effect in the attached device only after the next READ instruction is executed. Software therefore should ensure that at least one READ instruction is requested after resetting this bit in order to be sure that XIP mode is exited.
17	ENTER_XIP_MODE_FLD	R/W	0h	Enter XIP Mode on next READ: Value 0 : If XIP is enabled, then setting to 0 will cause the controller to exit XIP mode on the next READ instruction. Value 1 : If XIP is disabled, then setting to ?1? will inform the controller that the device is ready to enter XIP on the next READ instruction. The controller will therefore send the appropriate command sequence, including mode bits to cause the device to enter XIP mode. Use this register after the controller has ensured the FLASH device has been configured to be ready to enter XIP mode. Note : To exit XIP mode, this bit should be set to 0. This will take effect in the attached device only AFTER the next READ instruction is executed. Software should therefore ensure that at least one READ instruction is requested after resetting this bit before it can be sure XIP mode in the device is exited.
16	ENB_AHB_ADDR_REMAP_FLD	R/W	0h	Enable AHB Address Re-mapping: [Direct Access Mode Only] When set to 1, the incoming AHB address will be adapted and sent to the FLASH device as [address + N], where N is the value stored in the remap address register.
15	ENB_DMA_IF_FLD	R/W	0h	Enable DMA Peripheral Interface: Set to 1 to enable the DMA handshaking logic. When enabled the controller will trigger DMA transfer requests via the DMA peripheral interface. Set to 0 to disable
14	WR_PROT_FLASH_FLD	R/W	0h	Write Protect Flash Pin: Set to drive the Write Protect pin of the FLASH device. This is resynchronized to the generated memory clock as necessary.

Table 5-1226. OSPI_FLASH_CFG_CONFIG_REG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
13:10	PERIPH_CS_LINES_FLD	R/W	0h	Peripheral Chip Select Lines: Peripheral chip select lines If pdec = 0, ss[3:0] are output thus: ss[3:0] n_ss_out[3:0] xxx0 1110xx01 1101x011 10110111 01111111 1111[no peripheral selected] else ss[3:0] directly drives n_ss_out[3:0]
9	PERIPH_SEL_DEC_FLD	R/W	0h	Peripheral select decode: 0 : only 1 of 4 selects n_ss_out[3:0] is active 1 : allow external 4-to-16 decode [n_ss_out = ss]
8	ENB_LEGACY_IP_MODE_FLD	R/W	0h	Legacy IP Mode Enable: 0 : Use Direct Access Controller/Indirect Access Controller 1 : legacy Mode is enabled. In this mode, any write to the controller via the AHB interface is serialized and sent to the FLASH device. Any valid AHB read will pop the internal RX-FIFO, retrieving data that was forwarded by the external FLASH device on the SPI lines,4,2 or 1 byte transfers are permitted and controlled via the HSIZE input.
7	ENB_DIR_ACC_CTLR_FLD	R/W	1h	Enable Direct Access Controller: 0 : disable the Direct Access Controller once current transfer of the data word [FF_W] is complete. 1 : enable the Direct Access Controller When the Direct Access Controller and Indirect Access Controller are both disabled, all AHB requested are completed with an error response.
6	RESET_CFG_FLD	R/W	0h	RESET pin configuration: 0 = RESET feature on DQ3 pin of the device 1 = RESET feature on dedicated pin of the device [controlling of 5th bit influences on reset_out output]
5	RESET_PIN_FLD	R/W	0h	Set to drive the RESET pin of the FLASH device and reset for de-activation of the RESET pin feature
4	HOLD_PIN_FLD	R/W	0h	Set to drive the HOLD pin of the FLASH device and reset for de-activation of the HOLD pin feature
3	PHY_MODE_ENABLE_FLD	R/W	0h	PHY mode enable: When enabled, the controller is informed that PHY Module is to be used for handling SPI transfers. This bit is relevant only for configuration with PHY Module.
2	SEL_CLK_PHASE_FLD	R/W	0h	Select Clock Phase: Selects whether the clock is in an active or inactive phase outside the SPI word. 0 : the SPI clock is active outside the word 1 : the SPI clock is inactive outside the word
1	SEL_CLK_POL_FLD	R/W	0h	Clock polarity outside SPI word: 0 : the SPI clock is quiescent low 1 : the SPI clock is quiescent high
0	ENB_SPI_FLD	R/W	1h	Octal-SPI Enable: 0 : disable the Octal-SPI, once current transfer of the data word [FF_W] is complete. 1 : enable the Octal-SPI, when spi_enable = 0, all output enables are inactive and all pins are set to input mode.

5.8.2.22 OSPI_FLASH_CFG_DEV_INSTR_RD_CONFIG_REG Register

5.8.2.22.1 OSPI_FLASH_CFG_DEV_INSTR_RD_CONFIG_REG Register (Offset = 4h) [reset = 3h]

Bit	Field	Type	Reset	Description
31:24	D_NSS_FLD	R/W	0h	Clock Delay for Chip Select Deassert: Delay in initiator reference clocks for the length that the initiator mode chip select outputs are de-asserted between transactions. The minimum delay is always SCLK period to ensure the chip select is never re-asserted within an SCLK period.
23:16	D_BTWN_FLD	R/W	0h	Clock Delay for Chip Select Deactivation: Delay in initiator reference clocks between one chip select being de-activated and the activation of another. This is used to ensure a quiet period between the selection of two different targets and requires the transmit FIFO to be empty.
15:8	D_AFTER_FLD	R/W	0h	Clock Delay for Last Transaction Bit: Delay in initiator reference clocks between last bit of current transaction and deasserting the device chip select [n_ss_out]. By default, the chip select will be deasserted on the cycle following the completion of the current transaction.
7:0	D_INIT_FLD	R/W	0h	Clock Delay with n_ss_out: Delay in initiator reference clocks between setting n_ss_out low and first bit transfer.

5.8.2.25 OSPI_FLASH_CFG_RD_DATA_CAPTURE_REG Register

5.8.2.25.1 OSPI_FLASH_CFG_RD_DATA_CAPTURE_REG Register (Offset = 10h) [reset = 1h]

Read Data Capture Register.

31:24	POLL_REP_DELAY_FLD	R/W	0h	Defines additional delay for maintain Chip Select de-asserted during auto-polling phase
23:16	POLL_COUNT_FLD	R/W	1h	Defines the number of times the controller should expect to see a true result from the polling in successive reads of the device register.
15	ENABLE_POLLING_EXP_FLD	R/W	0h	Set to '1' for enabling auto-polling expiration.
14	DISABLE_POLLING_FLD	R/W	0h	This switches off the automatic polling function
13	POLLING_POLARITY_FLD	R/W	0h	Defines the polling polarity. If '1', then the write transfer to the device will be complete if the polled bit is equal to '1'. If '0', then the write transfer to the device will be complete if the polled bit is equal to '0'.
12:11	WR_COMP_CTRL_RESV1_FLD	R	0h	Reserved
10:8	POLLING_BIT_INDEX_FLD	R/W	0h	Defines the bit index that should be polled. A value of 010 means that bit 2 of the returned data will be polled for.A value of 111 means that bit 7 of the returned data will be polled for.
7:0	OPCODE_FLD	R/W	5h	Defines the opcode that should be issued by the controller when it is automatically polling for device program completion. This command is issued followed all device write operations. By default, this will poll the standard device STATUS register using opcode 0x05

5.8.2.36 OSPI_FLASH_CFG_NO_OF_POLLS_BEF_EXP_REG Register

5.8.2.36.1 OSPI_FLASH_CFG_NO_OF_POLLS_BEF_EXP_REG Register (Offset = 3Ch) [reset = FFFFFFFFh]

Polling Expiration Register.

5.8.2.37 OSPI_FLASH_CFG_IRQ_STATUS_REG Register

5.8.2.37.1 OSPI_FLASH_CFG_IRQ_STATUS_REG Register (Offset = 40h) [reset = 0h]

Interrupt Status Register: The status fields in this register are set when the described event occurs and the interrupt is enabled in the mask register. When any of these bit fields are set, the interrupt output is asserted high. The fields are each cleared by writing a 1 to the field. Note that bit fields 6 thru 10 are only valid when legacy SPI mode is active.

Table 5-1258. OSPI_FLASH_CFG_IRQ_STATUS_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31:20	IRQ_STAT_RESV_FLD	R	0h	Reserved
19	ECC_FAIL_FLD	R/W1TC	0h	ECC failure This interrupt informs the system that Flash Device reported ECC error.
18	TX_CRC_CHUNK_BRK_FLD	R/W1TC	0h	TX CRC chunk was broken This interrupt informs the system that program page SPI transfer was discontinued somewhere inside the chunk.
17	RX_CRC_DATA_VAL_FLD	R/W1TC	0h	RX CRC data valid New RX CRC data was captured from Flash Device
16	RX_CRC_DATA_ERR_FLD	R/W1TC	0h	RX CRC data error CRC data from Flash Device does not correspond to the one dynamically calculated by the controller.
15	IRQ_STAT_RESV1_FLD	R	0h	Reserved
14	STIG_REQ_INT_FLD	R/W1TC	0h	The controller is ready for getting another STIG request.
13	POLL_EXP_INT_FLD	R/W1TC	0h	The maximum number of programmed polls cycles is expired
12	INDRD_SRAM_FULL_FLD	R/W1TC	0h	Indirect Read Partition overflow: Indirect Read Partition of SRAM is full and unable to immediately complete indirect operation

Table 5-1258. OSPI_FLASH_CFG_IRQ_STATUS_REG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
11	RX_FIFO_FULL_FLD	R/W1TC	0h	Small RX FIFO full: Current FIFO status can be ignored in non-SPI legacy mode 0 : FIFO is not full 1 : FIFO is full
10	RX_FIFO_NOT_EMPTY_FLD	R/W1TC	0h	Small RX FIFO not empty: Current FIFO status can be ignored in non-SPI legacy mode 0 : FIFO has less than RX THRESHOLD entries, 1 : FIFO has >= THRESHOLD entries
9	TX_FIFO_FULL_FLD	R/W1TC	0h	Small TX FIFO full: Current FIFO status can be ignored in non-SPI legacy mode 0 : FIFO is not full, 1 : FIFO is full
8	TX_FIFO_NOT_FULL_FLD	R/W1TC	0h	Small TX FIFO not full: Current FIFO status can be ignored in non-SPI legacy mode 0 : FIFO has >= THRESHOLD entries, 1 : FIFO has less than THRESHOLD entries
7	RECV_OVERFLOW_FLD	R/W1TC	0h	Receive Overflow: This should only occur in Legacy SPI mode. Set if an attempt is made to push the RX FIFO when it is full. This bit is reset only by a system reset and cleared only when this register is read. If a new push to the RX FIFO occurs coincident with a register read this flag will remain set. 0 : no overflow has been detected. 1 : an overflow has occurred.
6	INDIRECT_XFER_LEVEL_BREACH_FLD	R/W1TC	0h	Indirect Transfer Watermark Level Breached
5	ILLEGAL_ACCESS_DET_FLD	R/W1TC	0h	Illegal AHB access has been detected. AHB wrapping bursts and the use of SPLIT/RETRY accesses will cause this error interrupt to trigger.
4	PROT_WR_ATTEMPT_FLD	R/W1TC	0h	Write to protected area was attempted and rejected.
3	INDIRECT_READ_REJECT_FLD	R/W1TC	0h	Indirect operation was requested but could not be accepted. Two indirect operations already in storage.
2	INDIRECT_OP_DONE_FLD	R/W1TC	0h	Indirect Operation Complete: Controller has completed last triggered indirect operation
1	UNDERFLOW_DET_FLD	R/W1TC	0h	Underflow Detected: 0 : no underflow has been detected 1 : underflow is detected and an attempt to transfer data is made when the small TX FIFO is empty. This may occur when AHB write data is being supplied too slowly to keep up with the requested write operation This bit is reset only by a system reset and cleared only when the register is read.
0	MODE_M_FAIL_FLD	R/W1TC	0h	Mode M Failure: Mode M failure indicates the voltage on pin n_ss_in is inconsistent with the SPI mode. Set =1 if n_ss_in is low in initiator mode [multi-initiator contention]. These conditions will clear the spi_enable bit and disable the SPI. This bit is reset only by a system reset and cleared only when this register is read. 0 : no mode fault has been detected 1 : a mode fault has occurred

5.8.2.38 OSPI_FLASH_CFG_IRQ_MASK_REG Register

5.8.2.38.1 OSPI_FLASH_CFG_IRQ_MASK_REG Register (Offset = 44h) [reset = 0h]

Interrupt Mask: 0 : the interrupt for the corresponding interrupt status register bit is disabled.
1 : the interrupt for the corresponding interrupt status register bit is enabled.

Table 5-1288. OSPI_FLASH_CFG_FLASH_CMD_CTRL_REG Register Field Descriptions

Bit	Field	Type	Reset	Description
31:24	CMD_OPCODE_FLD	R/W	0h	Command Opcode: The command opcode field should be setup before triggering the command. For example, 0x20 maps to SubSector Erase. Writing to the execute field [bit 0] of this register launches the command. NOTE : Using this approach to issue commands to the device will make use of the instruction type of the device instruction configuration register. If this field is set to 2'b00, then the command opcode, command address, command dummy bytes and command data will all be transferred in a serial fashion. If this field is set to 2'b01, then the command opcode, command address, command dummy bytes and command data will all be transferred in parallel using DQ0 and DQ1 pins. If this field is set to 2'b10, then the command opcode, command address, command dummy bytes and command data will all be transferred in parallel using DQ0, DQ1, DQ2 and DQ3 pins.
23	ENB_READ_DATA_FLD	R/W	0h	Read Data Enable: Set to 1 if the command specified in the command opcode field [bits 31:24] requires read data bytes to be received from the device.
22:20	NUM_RD_DATA_BYTES_FLD	R/W	0h	Number of Read Data Bytes: Up to 8 data bytes may be read using this command. Set to 0 for 1 byte and 7 for 8 bytes.
19	ENB_COMD_ADDR_FLD	R/W	0h	Command Address Enable: Set to 1 if the command specified in bits 31:24 requires an address. This should be setup before triggering the command via Writing a 1 to the execute field.

Table 5-1288. OSPI_FLASH_CFG_FLASH_CMD_CTRL_REG Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
18	ENB_MODE_BIT_FLD	R/W	0h	Mode Bit Enable: Set to 1 to ensure the mode bits as defined in the Mode Bit Configuration register are sent following the address bytes.
17:16	NUM_ADDR_BYTES_FLD	R/W	0h	Number of Address Bytes: Set to the number of address bytes required [the address itself is programmed in the FLASH COMMAND ADDRESS REGISTERS]. This should be setup before triggering the command via bit 0 of this register. 2'b00 : 1 address byte 2'b01 : 2 address bytes 2'b10 : 3 address bytes 2'b11 : 4 address bytes
15	ENB_WRITE_DATA_FLD	R/W	0h	Write Data Enable: Set to 1 if the command specified in the command opcode field requires write data bytes to be sent to the device.
14:12	NUM_WR_DATA_BYTES_FLD	R/W	0h	Number of Write Data Bytes: Up to 8 Data bytes may be written using this command Set to 0 for 1 byte, 7 for 8 bytes.
11:7	NUM_DUMMY_CYCLES_FLD	R/W	0h	Number of Dummy cycles: Set to the number of dummy cycles required. This should be setup before triggering the command via the execute field of this register.
6:3	FLASH_CMD_CTRL_RESV1_FLD	R	0h	Reserved
2	STIG_MEM_BANK_EN_FLD	R/W	0h	STIG Memory Bank enable bit.
1	CMD_EXEC_STATUS_FLD	R	0h	Command execution in progress.
0	CMD_EXEC_FLD	W	0h	Execute the command.

Table 5-1321. RL2_L2_CTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31	ENABLE	R/W	0h	The ~ienable field determines whether the L2 is enabled or not. Setting the enable from a 0 to 1 restarts the cache 0:Disabled 1:Enabled
30:3	RESERVED	NONE	0h	Reserved
2:0	SIZE	R/W	0h	The ~isize field determines the size of the remote cache data storage memory that is currently active. This field can be change dynamically, but will cause the entire cache to be invalidated when inflight transactions have completed. Changing the ~isize while ~ienable is already a '1' will restart the cache. 0:8KB 1:16KB 2:32KB 3:64KB 4:128KB 5:256KB (Dual Mode) Note: Setting this field to an invalid value will result in the field being set to '0'. The remote address range registers must be setup correctly to ensure it has sufficient memory for the selected size.

5.9.2.3 RL2_L2_STS Register

5.9.2.3.1 RL2_L2_STS Register (Offset = 8h) [reset = 0h]

The Status register displays the state of the RL2 module.

Return to Summary Table

Bit	Field	Type	Reset	Description
31:5	RESERVED	NONE	0h	Reserved
4	FLC_DON	R/W1TS	0h	The ~iflc_don bit indicates a FLC has completed the transfer to the FLC range. Write 1 to set the ~iflc_don status for diagnostic purposes. Writing a 0 has no effect.
3	FLC_WRERR	R/W1TS	0h	The ~iflc_wrerr bit indicates a write error from FLC remote range has occurred and the FLC is logically disabled while this bit is a '1'. Write 1 to set the ~iflc_wrerr status for diagnostic purposes. Writing a 0 has no effect.
2	FLC_RDERR	R/W1TS	0h	The ~iflc_rderr bit indicates a read error from FLC range has occurred and the FLC is logically disabled while this bit is a '1'. Write 1 to set the ~iflc_rderr status for diagnostic purposes. Writing a 0 has no effect.
1	WR_HIT	R/W1TS	0h	The ~iwr_hit bit indicates a write to the cacheable range has occurred potentially causing a coherency issue and the RL2 is logically disabled while this bit is a '1'. Write 1 to set the ~iwr_hit status for diagnostic purposes. Writing a 0 has no effect.
0	WR_ERR	R/W1TS	0h	The ~iwr_err bit indicates a write error has occurred to the remote cache data storage memory and the RL2 is logically disabled while this bit is a '1'. Write 1 to set the ~iwr_err status for diagnostic purposes. Writing a 0 has no effect.

5.9.2.9 RL2_IRQSTATUS_MSK Register

5.9.2.9.1 RL2_IRQSTATUS_MSK Register (Offset = 84h) [reset = 0h]

The Interrupt Masked Status Register holds the masked status for the FLC/RL2 status/error interrupts. Writing to this register will EOI the interrupt, that is if another interrupt is pending, a new pulse interrupt will be generated.

Return to Summary Table

Table 5-1361. RL2_FLC_CTL_J Register Field Descriptions

Bit	Field	Type	Reset	Description
31	FENABLE	R/W	0h	The ~ifenable0 enables the FLC_LO0>=FLCrange<FLC_HI0 to be copied. if the ~ifenable0 is set to zero, the range is disabled and commands forwarded directly without change.
30:29	RESERVED	NONE	0h	Reserved
28	FCOPIED	R/W	0h	The ~ifcopied0 bit indicates the FLC range has already been copied to the ~iradr0 address so a transfer is not required. Setting this bit at the same cycle or prior to setting the ~ifenable will prevent the FLC transfer but enable the mapping.
27:0	RESERVED	NONE	0h	Reserved

Table 5-1388. GPMC_PREFETCH_CONFIG1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31	RESERVED_221	R	0h	Write 0's for future compatibility. Read returns 0
30:28	CYCLEOPTIMIZATION	R/W	0h	Define the number of GPMC.FCLK cycles to be substracted from RdCycleTime, WrCycleTime, AccessTime, CSRdOffTime, CSWrOffTime, ADVRdOffTime, ADVWrOffTime, OEOffTime, WEOffTime [0x0 corresponds to 0 GPMC.FCLK cycle, 0x1 corresponds to 1 GPMC.FCLK cycle, &, 0x7 corresponds to 7 GPMC.FCLK cycles]
27	ENABLEOPTIMIZEDACCESS	R/W	0h	Enables access cycle optimization 0 Access cycle optimization is disabled 1 Access cycle optimization is enabled
26:24	ENGINECSSELECTOR	R/W	0h	Selects the CS where Prefetch Postwrite engine is active [0x0 corresponds toCS0, 0x1 corresponds to CS1, &, 0x7 corresponds to CS7]
23	PFPWENROUNDROBIN	R/W	0h	Enables the PFPW RoundRobin arbitration 0 Prefetch Postwrite engine round robin arbitration is disabled 1 Prefetch Postwrite engine round robin arbitration is enabled
22:20	RESERVED_224	R	0h	Write 0's for future compatibility. Read returns 0

Table 5-1388. GPMC_PREFETCH_CONFIG1 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
19:16	PFPWWEIGHTEDPRIO	R/W	0h	When an arbitration occurs between a direct memory access and a PFPW engine access, the direct memory access is always serviced. If the PFPWEnRoundRobin is enabled, 0x0 means : the next access is granted to the PFPW engine, 0x1 means : the two next accesses are granted to the PFPW engine, ..., 0xF means : the 16 next accesses are granted to the PFPW engine.
15	RESERVED_220	R	0h	Write 0's for future compatibility. Read returns 0
14:8	FIFOTHRESHOLD	R/W	40h	Selects the maximum number of bytes read from the FIFO or written to the FIFO by the host on a DMA or interrupt request [0x00 corresponds to 0 byte, 0x01 corresponds to 1 byte, &, 0x40 corresponds to 64 bytes]
7	ENABLEENGINE	R/W	0h	Enables the Prefetch Postwite engine 0 Prefetch Postwrite engine is disabled 1 Prefetch Postwrite engine is enabled
6	RESERVED_223	R	0h	Write 0's for future compatibility. Read returns 0
5:4	WAITPINSELECTOR	R/W	0h	Select which wait pin edge detector should start the engine in synchronized mode 0 Selects Wait0EdgeDetection 1 Selects Wait1EdgeDetection 2 Selects Wait2EdgeDetection 3 Selects Wait3EdgeDetection
3	SYNCHROMODE	R/W	0h	Selects when the engine starts the access to CS 0 Engine starts the access to CS as soon as StartEngine is set 1 Engine starts the access to CS as soon as StartEngine is set AND wait to non wait edge detection on the selected wait pin
2	DMAMODE	R/W	0h	Selects interrupt synchronization or DMA request synchronization 0 Interrupt synchronization is enabled. Only interrupt line will be activated on FIFO threshold crossing. 1 DMA request synchronization is enabled.A DMA request protocol is used.
1	ENDIANISMTYPE	R/W	0h	Selects endianism for prefetch data [0x0 for Little Endian and 0x1 for Big Endian]
0	ACCESSMODE	R/W	0h	Selects pre-fetch read or write posting accesses 0 Pre-fetch read mode 1 Write posting mode

Table 5-1406. GPMC_CONFIG1_J Register Field Descriptions

Bit	Field	Type	Reset	Description
31	WRAPBURST	R/W	0h	Enables the wrapping burst capability. Must be set if the attached device is configured in wrapping burst 0 Synchronous wrapping burst not supported 1 Synchronous wrapping burst supported
30	READMULTIPLE	R/W	0h	Selects the read single or multiple access 0 single access 1 multiple access (burst if synchonous, page if asynchronous)
29	READTYPE	R/W	0h	Selects the read mode operation 0 Read Asynchronous 1 Read Synchronous
28	WRITEMULTIPLE	R/W	0h	Selects the write single or multiple access 0 single access 1 multiple access (burst if synchonous, considered as single if asynchronous)
27	WRITETYPE	R/W	0h	Selects the write mode operation 0 Write Asynchronous 1 Write Synchronous

Table 5-1406. GPMC_CONFIG1_J Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
26:25	CLKACTIVATIONTIME	R/W	0h	Output GPMC.CLK activation time 0 First rising edge of GPMC.CLK at Start Access Time 1 First rising edge of GPMC.CLK one GPMC.FCLK cycle after Start Access Time 2 First rising edge of GPMC.CLK two GPMC.FCLK cycles after Start Access Time 3 not defined
24:23	ATTACHEDDEVICEPAGELENGTH	R/W	0h	Specifies the attached device page [burst] length 0 4 words 1 8 words 2 16 words 3 32 words
22	WAITREADMONITORING	R/W	0h	Selects the Wait monitoring configuration for Read accesses [Reset value is BOOTWAITEN input pin sampled at IC reset] 0 Wait pin is not monitored for read accesses 1 Wait pin is monitored for read accesses
21	WAITWRITEMONITORING	R/W	0h	Selects the Wait monitoring configuration for Write accesses 0 Wait pin is not monitored for write accesses 1 Wait pin is monitored for write accesses
20	RESERVED_9	R	0h	Write 0's for future compatibility. Read returns 0
19:18	WAITMONITORINGTIME	R/W	0h	Selects input pin Wait monitoring time 0 Wait pin is monitored with valid data 1 Wait pin is monitored one GPMC.CLK cycle before valid data 2 Wait pin is monitored two GPMC.CLK cycle before valid data 3 not defined
17:16	WAITPINSELECT	R/W	0h	Selects the input WAIT pin for this chip select [Reset value is BOOTWAITSELECT input pin sampled at IC reset for CS0 and 0 for CS1-7] 0 Wait input pin is WAIT0 1 Wait input pin is WAIT1 2 Wait input pin is WAIT2 3 Wait input pin is WAIT3
15:14	RESERVED_11	R	0h	Write 0's for future compatibility. Read returns 0
13:12	DEVICESIZE	R/W	0h	Selects the device size attached [Reset value is BOOTDEVICESIZE input pin sampled at IC reset for CS0 and 01 for CS1-7] 0 8 bit 1 16 bit 2 32 bit 3 reserved
11:10	DEVICETYPE	R/W	0h	Selects the attached device type 0 NOR Flash, pSRAM, asynchronous devices 1 reserved 2 NAND Flash stream mode 3 reserved
9:8	MUXADDDATA	R/W	0h	Enables the Address and data multiplexed protocol [Reset value is CS0MUXDEVICE input pin sampled at IC reset for CS0 and 0 for CS1-7] 0 Non Multiplexed attached device 1 AAD-Mux protocol device 2 Address and data multiplexed attached device 3 Reserved
7:5	RESERVED_12	R	0h	Write 0's for future compatibility. Read returns 0

Table 5-1406. GPMC_CONFIG1_J Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
4	TIMEPARAGRANULARITY	R/W	0h	Signals timing latencies scalar factor [Rd/WRCycleTime, AccessTime, PageBurstAccessTime, CSOnTime, CSRd/WrOffTime, ADVOnTime, ADVRd/WrOffTime, OEOnTime, OEOffTime, WEOnTime, WEOffTime, Cycle2CycleDelay, BusTurnAround, TimeOutStartValue] 0 x1 latencies 1 x2 latencies
3:2	RESERVED_10	R	0h	Write 0's for future compatibility. Read returns 0
1:0	GPMCFCLKDIVIDER	R/W	0h	Divides the GPMC.FCLK clock 0 GPMC.CLK frequency = GPMC.FCLK frequency 1 GPMC.CLK frequency = GPMC.FCLK frequency / 2 2 GPMC.CLK frequency = GPMC.FCLK frequency / 3 3 GPMC.CLK frequency = GPMC.FCLK frequency /4

0h		0h	0h	0h	0h	0h	0h

Table 5-1506. I2C_ICSTR Register Field Descriptions

Bit	Field	Type	Reset	Description
31:15	NU2	NU2	0h	Reserved
14	SDIR	R/W	0h	Target Direction. This bit is clear to '0' indicating the I2C is a master transmitter/receiver or a target receiver. This bit is also clear by STOP condition or START condition. It is set to '1' when the I2C target is a transmitter. In DLB mode [which the configuration should be master-transmitter target-receiver] this bit is clear to '0'. Writing a"1" to this bit to clear it.
13	NACKSNT	R/W	0h	A No Acknowledge is sent due to NACKMOD is set to a"1". NACKSNT 0:A No Acknowledge is not sent. NACKSNT 1:A No Acknowledge is sent. Writing a"1" to this bit to clear it.
12	BB	R/W	0h	Bus Busy. This bit indicates the state of the serial bus. BB 0:The bus is free. BB 1:The bus is occupied. On reception of a"start" condition the device sets BB to 1. This bit is also set if the I2C detects SCL low state. BB is clear to 0 after reception of a"stop" condition. BB is kept to"0" regardless SCL state when the I2C is in reset [IRS_=0]. If the IRS_ is set to"1" during transaction between other I2C devices the BB bit is set at the first falling edge of SCL or START condition. - [RW]

Table 5-1506. I2C_ICSTR Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
11	RSFULL	R/W	0h	Receive shift full. This bit indicates whether the receiver has experienced overrun. Overrun occurs when the receive shift register [ICRSR] is full and ICDRR has not been read since the ICRSR-to-ICDRR transfer. The FSM is holding for ICDRR read access. RSFULL is clear when Reading the ICDRR. RSFULL is set to"1" when the I2C has recognized an overrun. The contents of ICDRR are NOT lost in this case. In repeat mode since double buffer [ICRSR and ICDRR] behaves like a single buffer RSFULL is set to"1" every time the data is received. RSFULL is clear as a result of Reading the ICDRR. - [RW]
10	XSMT	R/W	0h	Transmit shift empty not. This bit indicates whether the transmitter has experienced underflow. Underflow occurs when the transmit shift register [ICXSR] is empty and ICDXR has not been loaded. The FSM is holding for ICDXR write access. XSMT_ is cleared when underflow has occurred. XSMT_ is set to"1" as a result of Writing to ICDXR. In repeat mode if the I2C in master transmitter mode is holding transfer with XSMT_=0 [i.e. waiting for further action] and the STT or STP bit is set XSMT_ is set to"1" by hardware.
9	AAS	R/W	0h	Address As Target. This bit is set to 1 by the device when it has recognized its own target address or an address of all [8] zeros. The AAS bit is reset by stop condition or detection of any address byte that does not match ICOAR. - [RW]
8	AD0	R/W	0h	Address Zero Status: This bit is set to 1 by device if it detects the address of all [8] zeros [i.e. general call]. The AD0 bit is reset to 0 [default value] when a"start" or"stop" condition is detected. - [RW]
7:6	NU1	NU1	0h	Reserved
5	SCD	R/W	0h	Stop Condition Detection bit SCD is set when the I2C sends or receives STOP condition. This bit is cleared by Reading ICIVR [as 110] or Writing '1' to itself.
4	ICXRDY	R/W	0h	Transmit Data Ready interrupt flag bit. ICXRDY is set to"1" is generated when the transmitted data has been copied from ICDXR to the transmit-shift register [ICXSR]. ICRXDY is clear to"0" when the ICDXR is written. This bit can also be polled by the CPU to write a new transmitted data into the ICDXR. Write '1' to this bit will set it and DXR Write will clear it.
3	ICRRDY	R/W	0h	Receive Data Ready interrupt flag bit. ICRRDY is set to"1" when the received data has been copied from ICRSR into the ICDRR. ICRRDY is cleared to"0" when the ICDRR is read. This bit can also be polled by the CPU to read the received data in the ICDRR. Write '1' or DRR Read will clear it.
2	ARDY	R/W	0h	Register-access-ready interrupt flag bit. ARDY is generated by the hardware if the I2C is in the master mode when the previously programmed data and command has been performed and status bit has been updated. This flag is used by the CPU to let it knows that the I2C registers are ready to be accessed again. When RM=0 ARDY is set when the internal data count is passed 0 if STP register bit has not been set. When RM=1 ARDY is set at each byte end. If the I2C is in FDF mode[FDF=1] ARDY is set just after Start condition. This bit is automatically cleared by hardware when Writing data to ICDXR in transmit mode Reading data from ICDRR in receive mode or setting STT or STP bit. Write '1' will clear it.
1	NACK	R/W	0h	No-Acknowledgement interrupt flag bit. The No Acknowledge flag bit is set when the hardware in "master" mode detects no acknowledge has been received. This bit is NOT set by no-acknowledgement after Start byte Write '1' or Read the ICIVR [as 010] will clear it.
0	AL	R/W	0h	Arbitration-Lost interrupt flag bit. The Arbitration Lost flag bit is set to 1 when the device in the "master" mode senses it has lost an arbitration when two or more transmitters start a transmission almost simultaneously or when the I2C attempts to start a transfer while BB [bus busy] is 1. When this is set to 1 due to arbitration lost the MST/STT/STP bits are clear the I2C becomes a target. Write '1' or Read the ICIVR [as 001] will clear it.

Table 5-1520. I2C_ICMDR Register Field Descriptions

Bit	Field	Type	Reset	Description
31:16	NU2	NU2	0h	Reserved
15	NACKMOD	R/W	0h	No Acknowledge [NACK] mode. This bit is used to send an Acknowledge [ACK] or a No Acknowledge [NACK] to the transmitter. This bit is only applicable when the I2C is in receiver mode. In master receiver mode when the internal data count counter decrements to zero the I2C sends a NACK. The master receiver I2C finishes a transfer when it sends a NACK. The I2C ignores ICCNT when NACKMOD is '1'. The NACKMOD bit should be set before the rising edge of the last data bit [bit 8] if a NACK must be sent and this bit is cleared once a NACK has been sent. NACKMOD=0 the I2C sends an ACK to the transmitter during the acknowledge cycle. NACKMOD=1 the I2C sends a NACK to the transmitter during the acknowledge cycle.
14	FREE	R/W	0h	Free Running. This bit is used to determine the state of the I2C when a breakpoint is encountered in the HLL debugger. FREE 0:[default] Stops immediately if SCL is low and keep driving SCL low whether I2C is master transmitter/receiver. If SCL is high I2C waits until SCL becomes low and then stops. If the I2C is a target it will stop when the transmission/receiving completes. FREE 1:The I2C runs free.

Table 5-1520. I2C_ICMDR Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
13	STT	R/W	0h	Start Condition [Master only mode]. This bit can be set to a"1" by the CPU to generate a Start condition. In master mode when setting Start to"1" generates a Start condition. It is reset to "0" by the hardware after the Start condition has been generated. The Start/ Stop bits can be configured to generate different transfer formats. Note that the STT and STP can be used to terminate the repeat mode. STT STP Conditions Bus Activities 1 0 Start S-A-D 0 1 Stop P 1 1 Start-Stop [ICCNT= n] S-A-D..[n]..D-P 1 0 Start [ICCNT= n] S-A-D..[n]..D
12	NU1	NU1	0h	Reserved for IDLEEN [IDLE Enable on 5509. - [RW]
11	STP	R/W	0h	Stop Condition [Master mode only]. This bit can be set to a"1" by the CPU to generate a Stop condition. It is reset to "0" by the hardware after the Stop condition has been generated. The Stop condition is generated when ICCNT passes 0 when the I2C is in non-repeat mode[RM=0].
10	MST	R/W	0h	Master. MST 0:The I 2 C peripheral is in the"target" mode and clock is received from the"master" device. MST 1:The I 2 C peripheral is in the"master" mode and it generates the clock. This bit is clear when the transfer completed.
9	TRX	R/W	0h	Transmitter. TRX 0:The I 2 C is in the"receiver" mode and data on data line SDA is shifted into the data register ICDRR. TRX 1:The I 2 C is in the"transmitter" mode and the data in ICDXR is shifted out on data line SDA. The operating modes [not in FDF mode] are defined as follows. In FDF mode TRX must be configured even if the I2C is in target mode because there is no address/ direction byte in FDF mode. MST TRX Operating Modes 0 x "target receiver" 0 x "target transmitter" 1 0 "master receiver" 1 1 "master transmitter"
8	XA	R/W	0h	Expanded Address. XA 0:[default] 7-bit address mode [normal address mode]. XA 1:10-bit address mode [expanded address mode] Please note that XA needs to be configured even if the I2C is in target mode.
7	RM	R/W	0h	Repeat Mode. This bit is set to a"1" by the CPU to put the I2C in the repeat mode. In this mode data is continuously transmitted out of the ICDXR until the STP bit is set to"1" regardless of ICCNT value. This bit is don"t care if the I2C is configured in target mode. RM STT STP Conditions Bus Activities Mode 0 0 0 Idle None NA 0 0 1 Stop P NA 0 1 0 [Re]Start S-A-D..[n]..D Repeat n 0 1 1 [Re]Start-Stop S-A-D..[n]..D-P Repeat n 1 0 0 Idle none NA 1 0 1 Stop P NA 1 1 0 [Re]Start S-A-D-D-D.. Continuous 1 1 1 Reserved None NA

Table 5-1520. I2C_ICMDR Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
6	DLB	R/W	0h	Digital Loop Back [in master transmit mode only]. This bit is set to a"1" by the CPU to put the I2C in the loop back mode. In this mode data transmitted out of the ICDXR will be received in the ICDRR after [[CPU freq/I2C freq]8] CPU cycles via an internal path. The address of the ICOAR is output on SDA.
5	IRS	R/W	0h	I2C Reset Not. This can be set to a"0" by the CPU to put the I2C in reset or to a"1" to take the I2C out of reset. When this bit is reset to 0 all status bits in ICSTR and ICIVR are set to default values. Note that if this bit is reset during a transfer it can cause the I2C bus hang [SDA and SCL are tri-stated].
4	STB	R/W	0h	Start Byte [Master only mode]. The Start Byte mode bit is set to 1 by the CPU to configure the I2C in Start byte mode the I2C sends "00000001" regardless ICSAR value. Refer to the Philip I2C spec for more details.
3	FDF	R/W	0h	Free Data Format. This bit can be set to"1" by the CPU to configure the I2C in Free Data Format mode. FDF___MST___TRX_____Operating mode _0_____0_____ x____Target in non FDF mode _0_____1_____0____Master receive in non FDF mode _0_____1_____1____Master transmit in non FDF mode _1_____0_____0____Target receiver in FDF mode _1_____0_____1____Target transmitter in FDF mode _1_____1_____0____Master receiver in FDF mode _1_____1_____1____Master transmitter in FDF mode
2:0	BC2_BC1_BC0	R/W	0h	Bit Count : Bit Count 2, Bit Count 1 and Bit Count 0 define the number of bits starting from the lsb [excluding the acknowledge bit] of the next byte which are yet to be received or transmitted. Table 5-1551. LIN_SCIGCR1 Register Field Descriptions

Bit	Field	Type	Reset	Description
31:26	RESERVED_3	R	0h	Reserved
25	TXENA	R/W	0h	Transmit enable. This bit is effective in LIN and SCI modes. Data is transferred from SCITD or the TDy [with y=0, 1,...7] buffers in LIN mode to the SCITXSHF shift out register only when the TXENA bit is set. Note: Data written to SCITD or the transmit multi-buffer before TXENA is set is not transmitted. If TXENA is cleared while transmission is ongoing, the data previously written to SCITD is sent [including the checksum byte in LIN mode]. 0 Disable transfers from SCITD or TDy to SCITXSHF 1 Enable transfers of data from SCITD or TDy to SCITXSHF

Table 5-1551. LIN_SCIGCR1 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
24	RXENA	R/W	0h	Receive enable. This bit is effective in LIN or SCI-compatible mode. RXENA allows or prevents the transfer of data from SCIRXSHF to SCIRD or the receive multibuffers. Note: Clearing RXENA stops received characters from being transferred into the receive buffer or multi-buffers, prevents the RX status flags [see Table 7] from being updated by receive data, and inhibits both receive and error interrupts. However, the shift register continues to assemble data regardless of the state of RXENA. Note: If RXENA is cleared before the time the reception of a frame is complete, the data from the frame is not transferred into the receive buffer. Note: If RXENA is set before the time the reception of a frame is complete, the data from the frame is transferred into the receive buffer. If RXENA is set while SCIRXSHF is in the process of assembling a frame, the status flags are not guaranteed to be accurate for that frame. To ensure that the status flags correctly reflect what was detected on the bus during a particular frame, RXENA should be set before the detection of that frame 0 Prevents the receiver from transferring data from the shift buffer to the receive buffer or multi-buffers 1 Allows the receiver to transfer data from the shift buffer to the receive buffer or multi-buffers
23:18	RESERVED_2	R	0h	Reserved
17	CONT	R/W	0h	Continue on suspend. This bit has an effect only when a program is being debugged with an emulator, and it determines how the SCI/LIN operates when the program is suspended. This bit affects the LIN counters. When this bit is set, the counters are not stopped during debug. When this bit is cleared, the counters are stopped during debug. 0 When debug mode is entered, the SCI/LIN state machine is frozen. Transmissions and LIN counters are halted and resume when debug mode is exited. 1 When debug mode is entered, the SCI/LIN continues to operate until the current transmit and receive functions are complete.
16	LOOPBACK	R/W	0h	Loopback bit. This bit is effective in LIN or SCI-compatible mode. The self-checking option for the SCI/LIN can be selected with this bit. If the LINTX and LINRX pins are configured with SCI/LIN functionality, then the LINTX pin is internally connected to the LINRX pin. Externally, during loop back operation, the LINTX pin outputs a high value and the LINRX pin is in a high-impedance state. If this bit value is changed while the SCI/LIN is transmitting or receiving data, errors may result. 0 Loopback mode is disabled. 1 Loopback mode is enabled.
15:14	RESERVED_1	R	0h	Reserved
13	STOPEXTFRAME	R/W	0h	Stop extended frame communication. This bit is effective in LIN mode only. This bit can be written only during extended frame communication. When the extended frame communication is stopped, this bit is cleared automatically. 0 No effect 1 Extended frame communication will be stopped, once current frame transmission/reception is completed.

Table 5-1551. LIN_SCIGCR1 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
12	HGENCTRL	R/W	0h	HGEN control bit. This bit is effective in LIN mode only. This bit controls the type of mask filtering comparison. 0 ID filtering using ID-Byte. RECEIVEDID and IDBYTE fields in the LINID register are used for detecting a match (using TX/RXMASK values). Mask of 0xFF in LINMASK register will result in NO match. 1 ID filtering using ID-SlaveTask byte (Recommended). RECEIVEDID and IDSLAVETASKBYTE fields in the LINID register are used for detecting a match (using TX/RXMASK values). Mask of 0xFF in LINMASK register will result in ALWAYS match
11	CTYPE	R/W	0h	Checksum type. This bit is effective in LIN mode only. This bit controls the type of checksum to be used: classic or enhanced. 0 Classic checksum is used. This checksum is compatible with LIN 1.3 slave nodes. The classic checksum contains the modulo-256 sum with carry over all data bytes. Frames sent with Identifier 60 (0x3C) to 63 (0x3F) must allways use the classic checksum. 1 Enhanced checksum is used. The enhanced checksum is compatible with LIN 2.0 and newer slave nodes. The enhanced checksum contains the modulo-256 sum with carry over all data bytes AND the protected Identifier.
10	MBUFMODE	R/W	0h	Multibuffer mode. This bit is effective in LIN or SCI-compatible mode. This bit controls receive/transmit buffer usage, that is, whether the RX/TX multibuffers are used or a single register, RD0/TD0, is used. 0 The multi-buffer mode is disabled. 1 The multi-buffer mode is enabled.
9	ADAPT	R/W	0h	Adapt mode enable. This mode is effective in LIN mode only. This bit has an effect during the detection of the Sync Field. There are two LIN protocol bit rate modes that could be enabled with this bit according to the Node capability file definition: automatic or select. Software and network configuration will decide which of the previous two modes. When this bit is cleared, the LIN 2.0 protocol fixed bit rate should be used. If the ADAPT bit is set, a LIN target node detecting the baudrate will compare it to the prescalers in BRSR register and update it if they are different. The BRSR register will be updated with the new value. If this bit is not set there will be no adjustment to the BRSR register. This field is writable in LIN mode only. 0 Automatic baudrate adjustment is disabled. 1 Automatic baudrate adjustment is enabled.

Table 5-1551. LIN_SCIGCR1 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
8	SLEEP	R/W	0h	SCI sleep. SCI compatibility mode only. In a multiprocessor configuration, this bit controls the receive sleep function. Clearing this bit brings the SCI out of sleep mode. The receiver still operates when the SLEEP bit is set; however, RXRDY is updated and SCIRD is loaded with new data only when an address frame is detected. The remaining receiver status flags are updated and an error interrupt is requested if the corresponding interrupt enable bit is set, regardless of the value of the SLEEP bit. In this way, if an error is detected on the receive data line while the SCI is asleep, software can promptly deal with the error condition. The SLEEP bit is not automatically cleared when an address byte is detected. This field is writable in SCI mode only. 0 Sleep mode is disabled. 1 Sleep mode is enabled.
7	SWNRST	R/W	0h	Software reset [active low]. This bit is effective in LIN or SCI-compatible mode. The SCI/LIN should only be configured while SWnRST = 0. Only the following configuration bits can be changed in runtime [i.e., while SWnRESET = 1]: - STOP EXT Frame [SCIGCR1[13]] - CC bit [SCIGCR2[17]] - SC bit [SCIGCR2[16]] 0 The SCI/LIN is in its reset state; no data will be transmitted or received. Writing a 0 to this bit intializes the SCI/LIN state machines and operating flags. All affected logic is held in the reset state until a 1 is written to this bit. 1 The SCI/LIN is in its ready state; transmission and reception can occur. After this bit is set to 1, the configuration of the module should not change.
6	LINMODE	R/W	0h	LIN mode This bit controls the mode of operation of the module. 0 LIN mode is disabled; SCI compatibility mode is enabled. 1 LIN mode is enabled; SCI compatibility mode is disabled.
5	CLK_MASTER	R/W	0h	SCI internal clock enable or LIN Master/Target configuration. In the SCI mode, this bit enables the clock to the SCI module. In LIN mode, this bit determines whether a LIN node is a target or master. 0 SCI-compatible mode: Reserved. LIN mode: The module is in slave mode. 1 SCI-compatible mode: Enable clock to the SCI module. LIN mode: The node is in master mode.
4	STOP	R/W	0h	SCI number of stop bits. This bit is effective in SCI-compatible mode only. Note: The receiver checks for only one stop bit. However in idle-line mode, the receiver waits until the end of the second stop bit [if STOP = 1] to begin checking for an idle period. This field is writable in SCI mode only. 0 One stop bit is used. 1 Two stop bits are used.

Table 5-1551. LIN_SCIGCR1 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3	PARITY	R/W	0h	SCI parity odd/even selection. This bit is effective in SCI-compatible mode only. If the PARITY ENA bit [SCIGCR1.2] is set, PARITY designates odd or even parity. The parity bit is calculated based on the data bits in each frame and the address bit [in address-bit mode]. The start and stop fields in the frame are not included in the parity calculation. This field is writable in SCI mode only. 0 Odd parity is used. The SCI transmits and expects to receive a value in the parity bit that makes odd the total number of bits in the frame with the value of 1. 1 Even parity is used. The SCI transmits and expects to receive a value in the parity bit that makes even the total number of bits in the frame with the value of 1.
2	PARITYENA	R/W	0h	Parity enable. Enables or disables the parity function. 0 SCI-compatible mode: Parity disabled; no parity bit is generated during transmission or is expected during reception. LIN mode: ID-parity verification is disabled. 1 SCI compatible mode: Parity enabled. A parity bit is generated during transmission and is expected during reception. LIN mode: ID-parity verification is enabled.
1	TIMINGMODE	R/W	0h	SCI timing mode bit. This bit is effective in SCI-compatible mode only. It must be set to 1 when the SCI mode is used. This bit configures the SCI for asynchronous operation. 0 Reserved. 1 Must be set to 1 when module is configured for SCI operation
0	COMMMODE	R/W	0h	SCI/LIN communication mode bit. In compatibility mode, it selects the SCI communication mode. In LIN mode it selects length control option for ID-field bits ID4 and ID5. 0 SCI-compatible mode: Idle-line mode is used. LIN mode: ID4 and ID5 are not used for length control. 1 SCI-compatible mode: Address-bit mode is used. LIN mode: ID4 and ID5 are used for length control.

5.13.2.3 LIN_SCIGCR2 Register

5.13.2.3.1 LIN_SCIGCR2 Register (Offset = 8h) [reset = 0h]

The SCIGCR2 register is used to send or compare a checksum byte during extended frames, to generate a wakeup and for low-power mode control of the LIN module.

Table 5-1553. LIN_SCIGCR2 Register Field Descriptions

Bit	Field	Type	Reset	Description
31:18	RESERVED_3	R	0h	Reserved
17	CC	R/W	0h	Compare Checksum. This mode is effective in LIN mode only. This bit is used by the receiver for extended frames to trigger a checksum compare. The user will initiate this transaction by Writing a one to this bit. In non multibuffer mode, once the CC bit is set, the checksum will be compared on the byte that is currently being received, expected to be the checkbyte. During Multi-buffer mode, following are the scenarios associated with the CC bit : - If CC bit is set during the reception of the data, then the byte that is received after the reception of the programmed no. of data bytes indicated by SCIFORMAT[18:16], is treated as a checksum byte. - If CC bit is set during the IDLE period [i.e. during inter-frame space], then the next immediate byte will be treated as a checksum byte. A CE will immediatly be flagged if there is a checksum error. This bit is automatically cleared once the checksum is successfully compared. 0 No effect 1 Compare checksum on expected checkbyte

Table 5-1553. LIN_SCIGCR2 Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
16	SC	R/W	0h	Send Checksum This mode is effective in LIN mode only. This bit is used by the transmitter with extended frames to send a checkbyte. In non multibuffer mode the checkbyte will be sent after the current byte transmission. In multibuffer mode the checkbyte will be sent after the last byte count, indicated by the SCIFORMAT[18:16]]. This field is writable in LIN mode only. 0 No checkbyte will be sent. 1 A checkbyte will be sent. This bit will automatically get cleared after the checkbyte is transmitted. The checksum will not be sent if this bit is set before transmitting the very first byte, that is, during interframe space.
15:9	RESERVED_2	R	0h	Reserved
8	GENWU	R/W	0h	Generate wakeup signal. This bit controls the generation of a wakeup signal, by transmitting the TDO buffer value. This bit is cleared on reception of a valid sync break. 0 No effect 1 Transmit TDO for wakeup. This bit will be cleared on a SWnRST (SCIGCR1.7)
7:1	RESERVED_1	R	0h	Reserved
0	POWERDOWN	R/W	0h	Power down. This bit is effective in LIN or SCI-compatible mode. When the powerdown bit is set, the SCI/LIN module attempts to enter local low-power mode. If the POWERDOWN bit is set while the receiver is actively receiving data and the wakeup interrupt is disabled, then the SCI/LIN will delay low-power mode from being entered until completion of reception. In LIN mode the user may set the POWERDOWN bit on Sleep Command reception or on idle bus detection [more than 4 seconds, i.e. 80,000 cycles at 20kHz] 0 Normal operation 1 Request local low-power mode

5.13.2.4 LIN_SCISETINT Register

5.13.2.4.1 LIN_SCISETINT Register (Offset = Ch) [reset = 0h]

The SCISETINT register is used to enable the various interrupts available in the LIN module.

Bit	Field	Type	Reset	Description
31	SETBEINT	R/W1TS	0h	Set bit error interrupt. This bit is effective in LIN mode only. Setting this bit enables the SCI/LIN module to generate an interrupt when there is a bit error. This field is writable in LIN mode only. 0 Interrupt is disabled. Writing a 0 to this bit has no effect. 1 Interrupt is enabled.
30	SETPBEINT	R/W1TS	0h	Set physical bus error interrupt. This bit is effective in LIN mode only. Setting this bit enables the SCI/LIN module to generate an interrupt when a physical bus error occurs. This field is writable in LIN mode only. 0 Interrupt is disabled. Writing a 0 to this bit has no effect. 1 Interrupt is enabled.

Table 5-1555. LIN_SCISETINT Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
29	SETCEINT	R/W1TS	0h	Set checksum-error Interrupt. This bit is effective in LIN mode only. Setting this bit enables the SCI/LIN module to generate an interrupt when there is a checksum error. This field is writable in LIN mode only. 0 Interrupt is disabled. Writing a 0 to this bit has no effect. 1 Interrupt is enabled.
28	SETISFEINT	R/W1TS	0h	Set inconsistent-sync-field-error interrupt. This bit is effective in LIN mode only. Setting this bit enables the SCI/LIN module to generate an interrupt when there is an inconsistent sync field error. This field is writable in LIN mode only. 0 Interrupt is disabled. Writing a 0 to this bit has no effect. 1 Interrupt is enabled.
27	SETNREINT	R/W1TS	0h	Set no-response-error interrupt. This bit is effective in LIN mode only. Setting this bit enables the SCI/LIN module to generate an interrupt when a no-response error occurs. This field is writable in LIN mode only. 0 Interrupt is disabled. Writing a 0 to this bit has no effect. 1 Interrupt is enabled.
26	SETFEINT	R/W1TS	0h	Set framing-error interrupt. This bit is effective in LIN or SCI-compatible mode. Setting this bit enables the SCI/LIN module to generate an interrupt when a framing error occurs. 0 Interrupt is disabled. Writing a 0 to this bit has no effect. 1 Interrupt is enabled.
25	SETOEINT	R/W1TS	0h	Set overrun-error interrupt. This bit is effective in LIN or SCI-compatible mode. Setting this bit enables the SCI/LIN module to generate an interrupt when an overrun error occurs. 0 Interrupt is disabled. Writing a 0 to this bit has no effect. 1 Interrupt is enabled.
24	SETPEINT	R/W1TS	0h	Set parity interrupt. This bit is effective in LIN or SCI-compatible mode. Setting this bit enables the SCI/LIN module to generate an interrupt when a parity error occurs. 0 Interrupt is disabled. Writing a 0 to this bit has no effect. 1 Interrupt is enabled.
23:19	RESERVED_5	R	0h	Reserved
18	SET_RX_DMA_ALL	R/W1TS	0h	Set receiver DMA for Address & Data frames. This bit is effective in LIN or SCI-compatible mode. To enable RX DMA request for address and data frames this bit must be set. If it is cleared, RX interrupt request is generated for address frames and DMA requests are generated for data frames. 0 Receiver DMA request is disabled for address frames (RX interrupt request is enabled for address frames). Writing a 0 to this bit has no effect. 1 Receiver DMA request is enabled for address and data frames

Table 5-1555. LIN_SCISETINT Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
17	SET_RX_DMA	R/W1TS	0h	Set receiver DMA. This bit is effective in LIN or SCI-compatible mode. To enable DMA requests for the receiver this bit must be set. If it is cleared, interrupt requests are generated depending on SETRXINT. 0 Receiver DMA request is disabled. Writing a 0 to this bit has no effect. 1 Receiver DMA request is enabled.
16	SET_TX_DMA	R/W1TS	0h	Set transmit DMA. This bit is effective in LIN or SCI-compatible mode. To enable DMA requests for the transmitter, this bit must be set. If it is cleared, interrupt requests are generated depending on SETTXINT. 0 Transmit DMA request is disabled. Writing a 0 to this bit has no effect. 1 Transmit DMA request is enabled
15:14	RESERVED_4	R	0h	Reserved
13	SETIDINT	R/W1TS	0h	Set Identification interrupt. This bit is effective in LIN mode only. This bit is set to enable interrupt once a valid matching identifier is received. 0 Interrupt is disabled. Writing a 0 to this bit has no effect. 1 Interrupt is enabled.
12:10	RESERVED_3	R	0h	Reserved
9	SETRXINT	R/W1TS	0h	Set Receiver interrupt. Setting this bit enables the SCI/LIN to generate a receive interrupt after a frame has been completely received and the data is being transferred from SCIRXSHF to SCIRD. 0 Interrupt is disabled. Writing a 0 to this bit has no effect. 1 Interrupt is enabled.
8	SETTXINT	R/W1TS	0h	Set Transmitter interrupt. Setting this bit enables the SCI/LIN to generate a transmit interrupt as data is being transferred from SCITD to SCITXSHF and the TXRDY bit is being set. 0 Interrupt is disabled. Writing a 0 to this bit has no effect. 1 Interrupt is enabled.
7	SETTOA3WUSINT	R/W1TS	0h	Set Timeout After 3 Wakeup Signals interrupt. This bit is effective in LIN mode only. Setting this bit enables the SCI/LIN to generate an interrupt when there is a timeout after 3 wakeup signals have been sent. This field is writable in LIN mode only. 0 Interrupt is disabled. Writing a 0 to this bit has no effect. 1 Interrupt is enabled.
6	SETTOAWUSINT	R/W1TS	0h	Set Timeout After Wakeup Signal interrupt. This bit is effective in LIN mode only. Setting this bit enables the SCI/LIN to generate an interrupt when there is a timeout after one wakeup signal has been sent. This field is writable in LIN mode only. 0 Interrupt is disabled. Writing a 0 to this bit has no effect. 1 Interrupt is enabled.
5	RESERVED_2	R	0h	Reserved

Table 5-1555. LIN_SCISETINT Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
4	SETTIMEOUTINT	R/W1TS	0h	Set timeout interrupt. This bit is effective in LIN mode only. Setting this bit enables the SCI/LIN to generate an interrupt when no LIN bus activity [bus idle] occurs for at least 4 seconds. This field is writable in LIN mode only. 0 Interrupt is disabled. Writing a 0 to this bit has no effect. 1 Interrupt is enabled.
3:2	RESERVED_1	R	0h	Reserved
1	SETWAKEUPINT	R/W1TS	0h	Set wake-up interrupt. This bit is effective in LIN or SCI-compatible mode. Setting this bit enables the SCI/LIN to generate a wake-up interrupt and thereby exit low-power mode. The wake-up interrupt is asserted on falling edge of the wake-up pulse. If enabled, the wake-up interrupt is asserted when local low-power mode is requested while the receiver is busy or if a low level is detected on the SCIRX pin during low-power mode. Wake-up interrupt is not asserted upon a wakeup pulse if the module is not in power down mode. 0 Interrupt is disabled. Writing a 0 to this bit has no effect. 1 Interrupt is enabled.
0	SETBRKDTINT	R/W1TS	0h	Set break-detect interrupt. This bit is effective in SCI-compatible mode only. Setting this bit enables the SCI/LIN to generate an interrupt if a break condition is detected on the LINRX pin. This field is writable in SCI mode only. 0 Interrupt is disabled. Writing a 0 to this bit has no effect. 1 Interrupt is enabled.

5.13.2.5 LIN_SCICLEARINT Register

5.13.2.5.1 LIN_SCICLEARINT Register (Offset = 10h) [reset = 0h]

The SCICLEARINT register is used to disable the enabled interrupts without accessing the SCISETINT register.

Table 5-1557. LIN_SCICLEARINT Register Field Descriptions

Bit	Field	Type	Reset	Description
31	CLRBEINT	R/W1TC	0h	Clear Bit Error Interrupt. This bit is effective in LIN mode only. Setting this bit disables the bit error interrupt. This field is writable in LIN mode only. 0 Interrupt is disabled. Writing a 0 to this bit has no effect. 1 Interrupt is enabled. Writing a 1 to this bit will disable the interrupt and clear this bit.
30	CLRPBEINT	R/W1TC	0h	Clear Physical Bus Error Interrupt. This bit is effective in LIN mode only. Setting this bit disables the physical-bus error interrupt. This field is writable in LIN mode only. 0 Interrupt is disabled. Writing a 0 to this bit has no effect. 1 Interrupt is enabled. Writing a 1 to this bit will disable the interrupt and clear this bit.

Table 5-1557. LIN_SCICLEARINT Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
29	CLRCEINT	R/W1TC	0h	Clear checksum-error Interrupt. This bit is effective in LIN mode only. Setting this bit disables the checksum-error interrupt. This field is writable in LIN mode only. 0 Interrupt is disabled. Writing a 0 to this bit has no effect. 1 Interrupt is enabled. Writing a 1 to this bit will disable the interrupt and clear this bit.
28	CLRISFEINT	R/W1TC	0h	Clear Inconsistent-Sync-Field-Error Interrupt. This bit is effective in LIN mode only. Setting this bit disables the ISFE interrupt. This field is writable in LIN mode only. 0 Interrupt is disabled. Writing a 0 to this bit has no effect. 1 Interrupt is enabled. Writing a 1 to this bit will disable the interrupt and clear this bit.
27	CLRNREINT	R/W1TC	0h	Clear No-Reponse-Error Interrupt. This bit is effective in LIN mode only. Setting this bit disables the no-response error interrupt. This field is writable in LIN mode only. 0 Interrupt is disabled. Writing a 0 to this bit has no effect. 1 Interrupt is enabled. Writing a 1 to this bit will disable the interrupt and clear this bit.
26	CLRFEINT	R/W1TC	0h	Clear Framing-Error Interrupt. This bit is effective in LIN or SCI-compatible mode. Setting this bit disables framing-error interrupt. 0 Interrupt is disabled. Writing a 0 to this bit has no effect. 1 Interrupt is enabled. Writing a 1 to this bit will disable the interrupt and clear this bit.
25	CLROEINT	R/W1TC	0h	Clear Overrun-Error Interrupt. This bit is effective in LIN or SCI-compatible mode. Setting this bit disables the overrun interrupt. 0 Interrupt is disabled. Writing a 0 to this bit has no effect. 1 Interrupt is enabled. Writing a 1 to this bit will disable the interrupt and clear this bit.
24	CLRPEINT	R/W1TC	0h	Clear Parity Interrupt. This bit is effective in LIN or SCI-compatible mode. Setting this bit disables the parity error interrupt. 0 Interrupt is disabled. Writing a 0 to this bit has no effect. 1 Interrupt is enabled. Writing a 1 to this bit will disable the interrupt and clear this bit.
23:19	RESERVED_6	R	0h	Reserved
18	RESERVED_5	R	0h	Reserved
17	SETRXDMA	R/W1TC	0h	Clear receiver DMA. This bit is effective in LIN or SCI-compatible mode. Setting this bit disables the receive DMA request. 0 Receiver DMA request is disabled. Writing a 0 to this bit has no effect. 1 Receiver DMA request is enabled. Writing a 1 to this bit will disable the DMA request and clear this bit.

Table 5-1557. LIN_SCICLEARINT Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
16	CLRTXDMA	R/W1TC	0h	Clear transmit DMA. This bit is effective in LIN or SCI-compatible mode. Setting this bit disables the transmit DMA request. 0 Transmit DMA request is disabled. Writing a 0 to this bit has no effect. 1 Transmit DMA request is enabled. Writing a 1 to this bit will disable the DMA request and clear this bit.
15:14	RESERVED_4	R	0h	Reserved
13	CLRIDINT	R/W1TC	0h	Clear Identifier interrupt. This bit is effective in LIN mode only. Setting this bit disables the ID interrupt. 0 Interrupt is disabled. Writing a 0 to this bit has no effect. 1 Interrupt is enabled. Writing a 1 to this bit will disable the interrupt and clear this bit.
12:10	RESERVED_3	R	0h	Reserved
9	CLRRXINT	R/W1TC	0h	Clear Receiver interrupt. This bit is effective in LIN or SCI-compatible mode. Setting this bit disables the receiver interrupt. 0 Interrupt is disabled. Writing a 0 to this bit has no effect. 1 Interrupt is enabled. Writing a 1 to this bit will disable the interrupt and clear this bit.
8	CLRTXINT	R/W1TC	0h	Clear Transmitter interrupt. This bit is effective in LIN or SCI-compatible mode. Setting this bit disables the transmitter interrupt. 0 Interrupt is disabled. Writing a 0 to this bit has no effect. 1 Interrupt is enabled. Writing a 1 to this bit will disable the interrupt and clear this bit.
7	CLRTOA3WUSINT	R/W1TC	0h	Clear Timeout After 3 Wakeup Signals interrupt. This bit is effective in LIN mode only. Setting this bit disables the timeout after 3 wakeup signals interrupt. This field is writable in LIN mode only. 0 Interrupt is disabled. Writing a 0 to this bit has no effect. 1 Interrupt is enabled. Writing a 1 to this bit will disable the interrupt and clear this bit.
6	CLRTOAWUSINT	R/W1TC	0h	Clear Timeout After Wakeup Signal interrupt. This bit is effective in LIN mode only. Setting this bit disables the timeout after one wakeup signal interrupt. This field is writable in LIN mode only. 0 Interrupt is disabled. Writing a 0 to this bit has no effect. 1 Interrupt is enabled. Writing a 1 to this bit will disable the interrupt and clear this bit.
5	RESERVED_2	R	0h	Reserved
4	CLRTIMEOUTINT	R/W1TC	0h	Clear Timeout interrupt. This bit is effective in LIN mode only. Setting this bit disables the timeout [LIN bus idle] interrupt. This field is writable in LIN mode only. 0 Interrupt is disabled. Writing a 0 to this bit has no effect. 1 Interrupt is enabled. Writing a 1 to this bit will disable the interrupt and clear this bit.

Table 5-1557. LIN_SCICLEARINT Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
3:2	RESERVED_1	R	0h	Reserved
1	CLRWAKEUPINT	R/W1TC	0h	Clear Wake-up interrupt. This bit is effective in LIN or SCI-compatible mode. Setting this bit disables the wake-up interrupt. 0 Interrupt is disabled. Writing a 0 to this bit has no effect. 1 Interrupt is enabled. Writing a 1 to this bit will disable the interrupt and clear this bit.
0	CLRBRKDTINT	R/W1TC	0h	Clear Break-detect interrupt. This bit is effective in SCI-compatible mode only. Setting this bit disables the Break-detect interrupt. This field is writable in SCI mode only. 0 Interrupt is disabled. Writing a 0 to this bit has no effect. 1 Interrupt is enabled. Writing a 1 to this bit will disable the interrupt and clear this bit.

5.13.2.6 LIN_SCISETINTLVL Register

5.13.2.6.1 LIN_SCISETINTLVL Register (Offset = 14h) [reset = 0h]

The SCISETINTLVL register is used to map individual interrupt sources to the INT1 interrupt line.

Table 5-1561. LIN_SCICLEARINTLVL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
9	CLRRXINTLVL	R/W1TC	0h	Clear Receiver interrupt level. This bit is effective in LIN or SCI-compatible mode. Writing to this bit maps the receiver interrupt level to the INT0 line. 0 Interrupt level mapped to INT0 line. 1 Interrupt level mapped to INT1 line. Writing a 1 to this bit will map the interrupt to INT0 and clear this bit.
8	CLRTXINTLVL	R/W1TC	0h	Clear Transmitter interrupt level. This bit is effective in LIN or SCI-compatible mode. Writing to this bit maps the transmitter interrupt level to the INT0 line. 0 Interrupt level mapped to INT0 line. 1 Interrupt level mapped to INT1 line. Writing a 1 to this bit will map the interrupt to INT0 and clear this bit.
7	CLRTOA3WUSINTLVL	R/W1TC	0h	Clear Timeout After 3 Wakeup Signals interrupt level. This bit is effective in LIN mode only. Writing to this bit maps the timeout after 3 wakeup signals interrupt level to the INT0 line. This field is writable in LIN mode only. 0 Interrupt level mapped to INT0 line. 1 Interrupt level mapped to INT1 line. Writing a 1 to this bit will map the interrupt to INT0 and clear this bit.
6	CLRTOAWUSINTLVL	R/W1TC	0h	Clear Timeout After Wakeup Signal interrupt level. This bit is effective in LIN mode only. Writing to this bit maps the the timeout after wakeup interrupt level to the INT0 line. This field is writable in LIN mode only. 0 Interrupt level mapped to INT0 line. 1 Interrupt level mapped to INT1 line. Writing a 1 to this bit will map the interrupt to INT0 and clear this bit.
5	RESERVED_2	R	0h	Reserved
4	CLRTIMEOUTINTLVL	R/W1TC	0h	Clear Timeout interrupt level. This bit is effective in LIN mode only. Writing to this bit maps the timeout interrupt level to the INT0 line. This field is writable in LIN mode only. 0 Interrupt level mapped to INT0 line. 1 Interrupt level mapped to INT1 line. Writing a 1 to this bit will map the interrupt to INT0 and clear this bit.
3:2	RESERVED_1	R	0h	Reserved
1	CLRWAKEUPINTLVL	R/W1TC	0h	Clear Wake-up interrupt level. This bit is effective in LIN or SCI-compatible mode. Writing to this bit maps the Wake-up interrupt level to the INT0 line. 0 Interrupt level mapped to INT0 line. Writing a 0 to this bit has no effect. 1 Interrupt level mapped to INT1 line. Writing a 1 to this bit will map the interrupt to INT0 and clear this bit.
0	CLRBRKDTINTLVL	R/W1TC	0h	Clear Break-detect interrupt level. This bit is effective in SCI-compatible mode only. Writing to this bit maps the Break-detect interrupt level to the INT0 line. This field is writable in SCI mode only. 0 Interrupt level mapped to INT0 line. 1 Interrupt level mapped to INT1 line. Writing a 1 to this bit will map the interrupt to INT0 and clear this bit.

5.13.2.8 LIN_SCIFLR Register

5.13.2.8.1 LIN_SCIFLR Register (Offset = 1Ch) [reset = 904h]

The SCIFLR register indicates the current status of the various interrupt sources of the LIN module.

Return to Summary Table

Table 5-1563. LIN_SCIFLR Register Field Descriptions

Bit	Field	Type	Reset	Description
31	BE	R/W1TC	0h	Bit Error Flag. This bit is effective in LIN mode only. This bit is set when there has been a bit error. This is detected by the bit monitor in the internal bit monitor. This bit is cleared by: - Reading the corresponding interrupt offset in the SCIINTVECT0/1 register - Setting the SWnRESET bit [SCIGCR1.7] - RESET bit [SCIGCR0.0] - System reset - Writing a 1 to this bit - Reception of a new sync break This field is writable in LIN mode only. 0 No bit error detected. 1 Bit error detected.

Table 5-1563. LIN_SCIFLR Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
30	PBE	R/W1TC	0h	Physical Bus Error Flag. This bit is effective in LIN mode only. This bit is set when there has been a physical bus error. This is detected by the bit monitor in TED. This bit is cleared by: - Reading the corresponding interrupt offset in the SCIINTVECT0/1 register - Setting the SWnRESET bit [SCIGCR1.7] - RESET bit [SCIGCR0.0] - System reset - Writing a 1 to this bit - Reception of a new sync break Note: thie PBE will ony be flagged if no sync break can be generated. [because of a bus shortage to VBAT] or if no sync break delimeter can be generated [because of a bus shortage to GND]. This field is writable in LIN mode only. 0 No physiscal bus error detected. 1 Physical bus error detected.
29	CE	R/W1TC	0h	Checksum Error Flag. This bit is effective in LIN mode only. This bit is set when there is checksum error detected by a receiving node. The type of checksum to be used depends on the SCIGCR1.CTYPE bit. This bit is cleared by: - Reading the corresponding interrupt offset in the SCIINTVECT0/1 register - Setting the SWnRESET bit [SCIGCR1.7] - RESET bit [SCIGCR0.0] - System reset - Writing a 1 to this bit - Reception of a new sync break This field is writable in LIN mode only. 0 No Checksum error detected. 1 Checksum error detected.
28	ISFE	R/W1TC	0h	Inconsistent Sync Field Error Flag. This bit is effective in LIN mode only. This bit is set when there has been an inconsistent Sync Field error detected by the synchronizer during header reception. See the "Header Reception and Adaptive Baudrate" section for more information. This bit is cleared by: - Reading the corresponding interrupt offset in the SCIINTVECT0/1 register - Setting the SWnRESET bit [SCIGCR1.7] - RESET bit [SCIGCR0.0] - System reset - Writing a 1 to this bit - Reception of a new sync break This field is writable in LIN mode only. 0 No Inconsistent Sync Field error detected. 1 Inconsistent Sync Field error detected.
27	NRE	R/W1TC	0h	No-Response Error Flag. This bit is effective in LIN mode only. This bit is set when there is no response to a master's header completed within TFRAME_MAX. This timeout period is applied for message frames of unknown length [identifiers 0 to 61]. This error is detected by the synchronizer of the module. This bit is cleared by: - Reading the corresponding interrupt offset in the SCIINTVECT0/1 register - Setting the SWnRESET bit [SCIGCR1.7] - RESET bit [SCIGCR0.0] - System reset - Writing a 1 to this bit - Reception of a new sync break This field is writable in LIN mode only. 0 No No-Response error detected. 1 No-Response error detected.

Table 5-1563. LIN_SCIFLR Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
26	FE	R/W1TC	0h	Framing error flag. This bit is effective in LIN or SCI-compatible mode. This bit is set when an expected stop bit is not found. In SCI compatible mode, only the first stop bit is checked. The missing stop bit indicates that synchronization with the start bit has been lost and that the character is incorrectly framed. Detection of a framing error causes the SCI to generate an error interrupt if the RXERR INT ENA bit is set. This bit is cleared by: - Reading the corresponding interrupt offset in the SCIINTVECT0/1 register - Setting the SWnRESET bit [SCIGCR1.7] - RESET bit [SCIGCR0.0] - System reset - Writing a 1 to this bit - Reception of a new character [SCI-compatible mode], or frame [LIN mode] In multibuffer mode the frame is defined in the SCIFORMAT register. 0 No framing error detected. 1 Framing error detected.
25	OE	R/W1TC	0h	Overrun error flag. This bit is effective in LIN or SCI-compatible mode. This bit is set when the transfer of data from SCIRXSHF to SCIRD overwrites unread data already in SCIRD or the RDy buffers. Detection of an overrun error causes the LIN to generate an error interrupt if the SET OE INT bit is one. This bit is cleared by: - Reading the corresponding interrupt offset in the SCIINTVECT0/1 register - Setting the SWnRESET bit [SCIGCR1.7] - RESET bit [SCIGCR0.0] - System reset - Writing a 1 to this bit 0 No overrun error detected. 1 Overrun error detected.
24	PE	R/W1TC	0h	Parity error flag. This bit is effective in LIN or SCI-compatible mode. This bit is set when a parity error is detected in the received data. In SCI address-bit mode, the parity is calculated on the data and address bit fields of the received frame. In idle-line mode, only the data is used to calculate parity. An error is generated when a character is received with a mismatch between the number of 1s and its parity bit. For more information on parity checking, see the "SCI Global Control Register [SCIGCR1]" description. If the parity function is disabled [that is, SCIGCR1.2 = 0], the PE flag is disabled and read as 0. Detection of a parity error causes the LIN to generate an error interrupt if the SET PE INT bit = 1. This bit is cleared by: - Reading the corresponding interrupt offset in the SCIINTVECT0/1 register - Setting the SWnRESET bit [SCIGCR1.7] - RESET bit [SCIGCR0.0] - System reset - Reception of a new charcter [SCI-compatible mode] or frame [LIN mode] - Writing a 1 to this bit 0 No parity error or parity disabled. 1 Parity error detected.
23:16	RESERVED_3	R	0h	Reserved
15	RESERVED_2	R	0h	Reserved

Table 5-1563. LIN_SCIFLR Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
14	IDRXFLAG	R/W1TC	0h	Identifier On Receive Flag. This bit is effective in LIN mode only. This flag is set once an identifier is received with an RX match and no ID-parity error. See the "Message Filtering and Validation" section for more details. When this flag is set it indicates that a new valid identifier has been received on an RX match. This bit is cleared by: - Reading the corresponding interrupt offset in the SCIINTVECT0/1 register - Setting the SWnRESET bit [SCIGCR1.7] - RESET bit [SCIGCR0.0] - System reset - Reading the LINID register - Writing a 1 to this bit This field is writable in LIN mode only. 0 No valid ID received. 1 Valid ID RX received in LINID[23:16] on RX match.
13	IDTXFLAG	R/W1TC	0h	Identifier On Transmit Flag. This bit is effective in LIN mode only. This flag is set once an identifier is received with a TX match and no ID-parity error. See the "Message Filtering and Validation" section for more details. When this flag is set it indicates that a new valid identifier has been received on a TX match. This bit is cleared by: - Reading the corresponding interrupt offset in the SCIINTVECT0/1 register - RESET bit [SCIGCR0.0] - Setting SWnRESET - System reset - Reading the LINID register - Writing a 1 to this bit This field is writable in LIN mode only. 0 No valid ID received. 1 Valid ID received in LINID[23:16] on TX match.
12	RXWAKE	R	0h	Receiver wakeup detect flag. This bit is effective in SCI-compatible mode only. The SCI sets this bit to indicate that the data currently in SCIRD is an address. This bit is cleared by: - RESET bit - Setting the SWnRESET bit [SCIGCR1.7] - System reset - Receipt of a data frame This bit is writable in SCI mode only. 0 The data in SCIRD is not an address. 1 The data in SCIRD is an address. See [1] Section 3.4.4, Sleep Mode for Multiprocessor Communication, on page 16 for more information on using the RXWAKE bit with sleep mode.

Table 5-1563. LIN_SCIFLR Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
11	TXEMPTY	R	1h	Transmitter Empty flag. The value of this flag indicates the contents of the transmitter's buffer register[s] [SCITD/TDy] and shift register [SCITXSHF]. In multibuffer mode, this flag indicates the value of the TDx registers and shift register [SCITXSHF]. In non multibuffer mode, this flag indicates the value of LINTD0 [byte] and shift register [SCITXSHF]. This bit is set by: - RESET bit [SCIGCR0.0] - Setting the SWnRESET bit [SCIGCR1.7] - System reset. Note: This bit does not cause an interrupt request. 0 Compatible mode or LIN with no multibuffer: Transmitter buffer or shift register (or both) are loaded with data. In LIN mode using multibuffer mode: Multibuffer or shift register (or all) are loaded with data. 1 Compatible mode or LIN with no multibuffer: Transmitter buffer and shift registers are both empty. In LIN mode using multibuffer mode: Multibuffer and shift registers are all empty.
10	TXWAKE	R/W	0h	SCI transmitter wakeup method select. This bit is effective in SCI-compatible mode only. The TXWAKE bit controls whether the data in SCITD should be sent as an address or data frame using multiprocessor communication format. This bit is set to 1 or 0 by software before a byte is written to SCITD and is cleared by the SCI when data is transferred from SCITD to SCITXSHF or by a system reset. TXWAKE is not cleared by the SWnRESET bit [SCIGCR1.7]. 0 Address-bit mode: Frame to be transmitted will be data (address bit = 0). Idle-line mode: Frame to be transmitted will be data. 1 Address-bit mode: Frame to be transmitted will be an address (address bit=1). Idle-line mode: Following frame to be transmitted will be an address (writing a 1 to this bit followed by writing dummy data to the SCITD will result in a idle period of 11 bit periods before the next frame is transmitted).

Table 5-1563. LIN_SCIFLR Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
9	RXRDY	R/W1TC	0h	Receiver ready flag. In SCI compatibility mode, the receiver sets this bit to indicate that the SCIRD contains new data and is ready to be read by the CPU. In LIN mode, RXRDY is set once a valid frame is received in multibuffer mode, a valid frame being a message frame received with no errors. In non multibuffer mode RXRDY is set for each received byte and will be set for the last byte of the frame if there are no errors. The SCI/LIN generates a receive interrupt when RXRDY flag bit is set if the interrupt-enable bit is set [SCISETINT.9]. RXRDY is cleared by: - RESET bit [SCIGCR0.0] - Setting the SWnRESET - System reset - Writing a 1 to this bit - Reading SCIRD in while in SCI compatibility mode - Reading last data byte RDy of the response in LIN mode Note: The RXRDY flag cannot be cleared by Reading the corresponding interrupt offset in the SCIINTVECT0/1 register. 0 No new data in SCIRD/RDy. 1 New data ready to be read from SCIRD.
8	TXRDY	R	1h	Transmitter buffer register ready flag. When set, this bit indicates that the transmit buffer[s] register [SCITD in compatibility mode and LINTD0, LINTD1 in MBUF mode] is/are ready to get another character from a CPU write. In SCI compatibility mode, Writing data to SCITD automatically clears this bit. In LIN mode, this bit is cleared once byte 0 [TD0] is written to LINTD0. This bit is set after the data of the TX buffer are shifted into the SCITXSHF register. This event can trigger a transmit DMA event if the DMA enable bit is set. This bit is set to 1 by: - RESET bit [SCIGCR0.0] - Setting the SWnRESET [SCIGCR1.7] - System reset Note: The TXRDY flag cannot be cleared by Reading the corresponding interrupt offset in the SCIINTVECT0/1 register. Note: The transmit interrupt request can be eliminated until the next series of data is written into the transmit buffers LINTD0 and LINTD1, by disaLINg the corresponding interrupt via the SCICLEARINT register or by disaLINg the transmitter via the TXENA bit [SCIGCR1.25=0]. 0 Compatible mode: SCITD is full. LIN mode: The multibuffers are full. 1 Compatible mode: SCITD is ready to receive the next character. LIN mode: The multibuffers are ready to receive the next character(s).
7	TOA3WUS	R/W1TC	0h	Timeout After 3 Wakeup Signals flag. This bit is effective in LIN mode only. This flag is set if there is no Sync Break received after 3 wakeup signals and a period of 1.5 seconds have passed. Such expiration time is used before issuing another round of wakeup signals. This bit is cleared by: - Reading the corresponding interrupt offset in the SCIINTVECT0/1 register - Setting the SWnRESET bit [SCIGCR1.7] - RESET bit [SCIGCR0.0] - System reset - Writing a 1 to this bit This field is writable in LIN mode only. 0 No timeout after 3 wakeup signals. 1 Timeout after 3 wakeup signals and 1.5s time.

Table 5-1563. LIN_SCIFLR Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
6	TOAWUS	R/W1TC	0h	Timeout After Wakeup Signal flag. This bit is effective in LIN mode only. This bit is set if there is no Sync Break received after a wakeup signal has been sent. A minimum of 150 ms expiration time is used before issuing another wakeup signal. This bit is cleared by: - Reading the corresponding interrupt offset in the SCIINTVECT0/1 register - Setting the SWnRESET bit [SCIGCR1.7] - RESET bit [SCIGCR0.0] - System reset - Writing a 1 to this bit This field is writable in LIN mode only. 0 No timeout after one wakeup signal (150 ms). 1 Timeout after one wakeup signal.
5	RESERVED_1	R	0h	Reserved
4	TIMEOUT	R/W1TC	0h	LIN Bus IDLE timeout flag. This bit is effective in LIN mode only. This bit is set if there is no LIN bus activity for at least 4 seconds. LIN bus activity being a transition from recessive to dominant. This bit is cleared by: - Reading the corresponding interrupt offset in the SCIINTVECT0/1 register - Setting the SWnRESET bit [SCIGCR1.7] - RESET bit [SCIGCR0.0] - System reset - Writing a 1 to this bit This field is writable in LIN mode only. 0 No bus idle detected. 1 LIN bus idle detected.
3	BUSY	R	0h	Bus BUSY flag. This bit is effective in LIN mode and SCI-compatible mode. This bit indicates whether the receiver is in the process of receiving a frame. As soon as the receiver detects the beginning of a start bit, the BUSY bit is set to 1. When the reception of a frame is complete, the BUSY bit is cleared. If SET WAKEUP INT is set and power down is requested while this bit is set, the SCI/LIN automatically prevents low-power mode from being entered and generates wakeup interrupt. The BUSY bit is controlled directly by the SCI receiver but can be cleared by: - Setting the SWnRESET bit [SCIGCR1.7] - RESET bit [SCIGCR0.0] - System reset. 0 Receiver is not currently receiving a frame. 1 Receiver is currently receiving a frame.
2	IDLE	R	1h	SCI receiver in idle state. This bit is effective in SCI-compatible mode only. While this bit is set, the SCI looks for an idle period to resynchronize itself with the bit stream. The receiver does not receive any data while the bit is set. The bus must be idle for 11 bit periods to clear this bit. The SCI enters this state: - After a system reset - Setting the SWnRESET bit [SCIGCR1.7] - After coming out of power down This bit is writable in SCI mode only. 0 Idle period detected, the SCI is ready to receive. 1 Idle period not detected, the SCI will not receive any data.

Table 5-1563. LIN_SCIFLR Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
1	WAKEUP	R/W1TC	0h	Wake-up flag. This bit is effective in LIN mode only. This bit is set by the SCI/LIN when receiver or transmitter activity has taken the module out of power-down mode. An interrupt is generated if the SET WAKEUP INT bit [SCISETINT.1] is set. This bit is cleared by: - Reading the corresponding interrupt offset in the SCIINTVECT0/1 register. - Setting the SWnRESET bit [SCIGCR1.7] - RESET bit [SCIGCR0.0] - System reset - Writing a 1 to this bit. This field is writable in LIN mode only. 0 Do not wake up from power-down mode. 1 Wake up from power-down mode.
0	BRKDT	R/W1TC	0h	SCI break-detect flag. This bit is effective in SCI-compatible mode only. This bit is set when the SCI detects a break condition on the LINRX pin. A break condition occurs when the LINRX pin remains continuously low for at least 10 bits after a missing first stop bit, that is, after a framing error. Detection of a break condition causes the SCI to generate an error interrupt if the BRKDT INT ENA bit is set. The BRKDT bit is cleared by the following: - Reading the corresponding interrupt offset in the SCIINTVECT0/1 register. - Setting the SWnRESET bit [SCIGCR1.7] - RESET bit [SCIGCR0.0] - System reset - By Writing a 1 to this bit. This bit is writable in SCI mode only. 0 No break condition detected. 1 Break condition detected.

5.13.2.9 LIN_SCIINTVECT0 Register

5.13.2.9.1 LIN_SCIINTVECT0 Register (Offset = 20h) [reset = 0h]

The SCIINTVECT0 register indicates the offset for the INT0 interrupt line.

15:5	RESERVED_1	R	0h	Reserved
4:0	INTVECT0	R	0h	Interrupt vector offset for INT0. This register indicates the offset for interrupt line INT0. A read to this register updates its value to the next highest priority pending interrupt in SCIFLR and clears the flag corresponding to the offset that was read. Note: The flags for the receive [SCIFLR.9] and the transmit [SCIFLR.8] interrupts cannot be cleared by Reading the corresponding offset vector in this register [see detailed description in SCIFLR register].

5.13.2.10 LIN_SCIINTVECT1 Register

5.13.2.10.1 LIN_SCIINTVECT1 Register (Offset = 24h) [reset = 0h]

The SCIINTVECT1 register indicates the offset for the INT1 interrupt line.

Table 5-1569. LIN_SCIFORMAT Register Field Descriptions

Bit	Field	Type	Reset	Description
31:19	RESERVED_2	R	0h	Reserved
18:16	LENGTH	R/W	0h	Frame length control bits. In LIN mode, these bits indicate the number of bytes in the response field from 1 to 8 bytes. In buffered SCI mode, these bits indicate the number of characters. When these bits are used to indicate LIN response length [SCIGCR1[0] = 1], then when there is an ID RX match, this value should be updated with the expected length of the response. In buffered SCI mode, these bits indicate the number of characters with SCIFORMAT[2:0] bits per character. i.e. these bits indicate the transmitter/receiver format for the number of characters: 1 to 8. There can be up to eight characters with eight bits each. 0 The response field has 1 bytes/characters. 1 The response field has 2 bytes/characters. 2 The response field has 3 bytes/characters. 3 The response field has 4 bytes/characters. 4 The response field has 5 bytes/characters. 5 The response field has 6 bytes/characters. 6 The response field has 7 bytes/characters. 7 The response field has 8 bytes/characters.
15:3	RESERVED_1	R	0h	Reserved

Table 5-1569. LIN_SCIFORMAT Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
2:0	CHAR	R/W	0h	Character length control bits. These bits are effective in SCI compatible mode only. These bits set the SCI character length from 1 to 8 bits. Note: In compatibility mode or buffered SCI mode, when data of fewer than eight bits in length is received, it is left justified in SCIRD/RDy and padded with trailing zeros. Data read from the SCIRD should be shifted by software to make the received data right justified. Note: Data written to the SCITD should be right justified but does not need to be padded with leading zeros. These bits are witable in SCI mode only. 0 The character is 1 bits long. 1 The character is 2 bits long. 2 The character is 3 bits long. 3 The character is 4 bits long. 4 The character is 5 bits long. 5 The character is 6 bits long. 6 The character is 7 bits long. 7 The character is 8 bits long.

5.13.2.12 LIN_BRSR Register

5.13.2.12.1 LIN_BRSR Register (Offset = 2Ch) [reset = 0h]

The BRSR register is used to configure the baud rate of the LIN module.

Table 5-1571. LIN_BRSR Register Field Descriptions

Bit	Field	Type	Reset	Description
31	RESERVED_1	R	0h	Reserved
30:28	U	R/W	0h	Superfractional Divider Selection. [U] These bits are an additional fractional part for the baudrate specification. These bits allow a super fine tuning of the fractional baudrate with 7 more intermediate values for each of the M fractional divider values. See the Superfractional Divider section for more details.
27:24	M	R/W	0h	SCI/LIN 4-bit Fractional Divider Selection. [M] These bits are effective in LIN or SCI asynchronous mode. These bits are used to select a baud rate for the SCI/LIN module, and they are a fractional part for the baud rate specification. The M divider allows fine-tuning of the baud rate over the P prescaler with 15 additional intermediate values for each of the P integer values.
23:16	SCI_LIN_PSH	R/W	0h	PRESCALER P [High Bits]. SCI/LIN 24-bit Integer Prescaler Selection. These bits are used to select a baudrate for the SCI/LIN module. These bits are effective in LIN mode and SCI compatible mode. The SCI/LIN has an internally generated serial clock determined by the LIN module input clock and the prescalers P and M in this register. The SCI/LIN uses the 24-bit integer prescaler P value to select 1 of over 16,700,000 available baud rates. The additional 4-bit fractional prescaler M refines the baudate selection.

Table 5-1571. LIN_BRSR Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
15:0	SCI_LIN_PSL	R/W	0h	PRESCALER P [Low Bits]. SCI/LIN 24-bit Integer Prescaler Selection. These bits are used to select a baudrate for the SCI/LIN module. These bits are effective in LIN mode and SCI compatible mode. The SCI/LIN has an internally generated serial clock determined by the LIN module input clock and the prescalers P and M in this register. The SCI/LIN uses the 24-bit integer prescaler P value to select 1 of over 16,700,000 available baud rates. The additional 4-bit fractional prescaler M refines the baudate selection.

5.13.2.13 LIN_SCIED Register

5.13.2.13.1 LIN_SCIED Register (Offset = 30h) [reset = 0h]

The SCIED register is a duplicate copy of SCIRD register that has no effect on the RXRDY flag for use with an emulator.

Return to Summary Table

Table 5-1573. LIN_SCIED Register Field Descriptions

Bit	Field	Type	Reset	Description
31:8	RESERVED_1	R	0h	Reserved
7:0	ED	R	0h	Receiver Emulation Data. This bit is effective in SCI-compatible mode only. Reading SCIED[7-0] does not clear the RXRDY flag. This register should be used only by an emulator that must continually read the data buffer without affecting the RXRDY flag.

5.13.2.14 LIN_SCIRD Register

5.13.2.14.1 LIN_SCIRD Register (Offset = 34h) [reset = 0h]

The SCIRD register is where received data is stored and can be read from.

Return to Summary Table

Table 5-1574. Instance Table

Instance Name	Physical Address

Table 5-1575. LIN_SCIRD Register Field Descriptions

Bit	Field	Type	Reset	Description
31:8	RESERVED_1	R	0h	Reserved
7:0	RD	R	0h	Received Data. This bit is effective in SCI-compatible mode only. When a frame has been completely received, the data in the frame is transferred from the receiver shift register SCIRXSHF to this register. As this transfer occurs, the RXRDY flag is set and a receive interrupt is generated if RX INT ENA [SCISETINT0.9] is set. When the data is read from SCIRD, the RXRDY flag is automatically cleared. When the SCI receives data that is fewer than eight bits in length, it loads the data into this register in a left justified format padded with trailing zeros. Therefore, your software should perform a logical shift on the data by the correct number of positions to make it right justified.

5.13.2.15 LIN_SCITD Register

5.13.2.15.1 LIN_SCITD Register (Offset = 38h) [reset = 0h]

The SCITD register is where data to be transmitted is written to by application software.

Return to Summary Table

Table 5-1577. LIN_SCITD Register Field Descriptions

Bit	Field	Type	Reset	Description
31:8	RESERVED_1	R	0h	Reserved
7:0	TD	R/W	0h	Transmit data This bit is effective in SCI-compatible mode only. Data to be transmitted is written to this register. The transfer of data from this register to the transmit shift register SCITXSHF sets the TXRDY flag [SCIFLR.23], which indicates that SCITD is ready to be loaded with another byte of data. Note: If TX INT ENA [SCISETINT.8] is set, this data transfer also causes an interrupt. Note: Data written to the SCIRD register that is fewer than eight bits long must be right justified, but it does not need to be padded with leading zeros.

5.13.2.16 LIN_SCIPIO0 Register

5.13.2.16.1 LIN_SCIPIO0 Register (Offset = 3Ch) [reset = 0h]

The SCIPIO0 register is used to enable the LINTX and LINRX pins.

Table 5-1603. LIN_LINMASK Register Field Descriptions

Bit	Field	Type	Reset	Description
31:24	RESERVED_2	R	0h	Reserved
23:16	RXIDMASK	R/W	0h	Receive ID mask. This field is effective in LIN mode only.This 8-bit mask is used for filtering an incoming ID message and compare it to the ID-byte. A compare match of the received ID witht the RX ID mask will set the ID RX flag and trigger and ID interrupt if enabled. A 0 bit in the mask indicates that bit is compared to the ID-byte. A 1 bit in the mask indicates that that bit is filtered and therefore not used in the compare. When HGENCTRL is set to 1, this field must be set to 0xFF.
15:8	RESERVED_1	R	0h	Reserved
7:0	TXIDMASK	R/W	0h	Transmit ID mask. This field is effective in LIN mode only. This 8-bit mask is used for filtering an incoming ID message and compare it to the ID-byte. A compare match of the received ID with the TX ID Mask will set the ID TX flag and trigger an ID interrupt if enabled. A 0 bit in the mask indicates that bit is compared to the ID-byte. A 1 bit in the mask indicates that bit is filtered and therefore not used for the compare. When HGENCTRL is set to 1, this field must be set to 0xFF.

5.13.2.29 LIN_LINID Register

5.13.2.29.1 LIN_LINID Register (Offset = 70h) [reset = 0h]

The LINID register contains the identification fields for LIN communication.
NOTE: For software compatibility with future LIN modules, the HGEN CTRL bit must be set to 1, the RX ID MASK field must be set to FFh, and the TX ID MASK field must be set to FFh.

Table 5-1605. LIN_LINID Register Field Descriptions

Bit	Field	Type	Reset	Description
31:24	RESERVED_1	R	0h	Reserved
23:16	RECEIVEDID	R	0h	Received ID. This bit is effective in LIN mode only. This byte contains the current message identifier. During header reception the received ID is copied from the SCIRXSHF register to this byte if there is no ID-parity error and there has been an RX/TX match. Note: If a framing error [FE] is detected during ID reception, the received ID will also not be copied to the LINID register.
15:8	IDSLAVETASKBYTE	R/W	0h	ID Target Task byte. This field is effective in LIN mode only. This byte contains the identifier to which the received ID of an incoming header will be compared in order to decide whether a RX response, a TX response, or no action needs to be done by the LIN node. These bits are writable in LIN mode only.
7:0	IDBYTE	R/W	0h	ID byte. This field is effective in LIN mode only. This byte is the LIN mode message ID. On a master node, a write to this register by the CPU initiates a header transmission. For a target task, this byte is used for message filtering when HGENCTRL [SCIGCR1.12] is '0'. These bits are writable in LIN mode only.

5.13.2.30 LIN_LINTD0 Register

5.13.2.30.1 LIN_LINTD0 Register (Offset = 74h) [reset = 0h]

The LINTD0 register contains the lower 4 bytes of the data to be transmitted.
NOTE: TD<x-1> is equivalent to Data byte <x> of the LIN frame.

Return to Summary Table

Table 5-1611. LIN_MBRSR Register Field Descriptions

Bit	Field	Type	Reset	Description
31:13	RESERVED_1	R	0h	Reserved
12:0	MBR	R/W	DACh	Maximum Baud Rate Prescaler. This field is effective in LIN mode only. This 13-bit prescaler is used during the synchronization phase [see the "Header Reception and Adaptive Baudrate" section] of a target module if the ADAPT bit is set. In this way, a SCI/LIN target using an automatic or select bit rate modes detects any LIN bus legal rate automatically. The MBR value should be programmed to allow a maximum baud rate that is not more than 10% above the expected operating baud rate in the LIN network. Otherwise a s 0x00 data byte could mistakenly be detected as sync break. The default value is for a 70MHz LINCLK [0xDAC]. This MBR prescaler is used by the wake-up and idle time counters for a constant expiration time relative to a 20kHz rate.

5.13.2.33 LIN_RESERVED_1_J Register

Table 5-1615. LIN_IODFTCTRL Register Field Descriptions

Bit	Field	Type	Reset	Description
31	BERRENA	R/W	0h	Bit Errror Enable bit. This bit is effective in LIN mode only. This bit is used to create a Bit error. When this bit is set, the bit received is ORed with 1 and passed to the Bit monitor circuitry.
30	PBERRENA	R/W	0h	Physical Bus Error Enable bit. This bit is effective in LIN mode only. This bit is used to create a Physical Bus Error. When this bit is set, the bit received during Sync Break field transmission is ORed with 1 and passed to the Bit monitor circuitry
29	CERRENA	R/W	0h	Checksum Error Enable bit. This bit is effective in LIN mode only. This bit is used to create a checksum error. When this bit is set, the polarity of the CTYPE [checksum type] in the receive checksum calculator is changed so that a checksum error is generated.
28	ISFERRENA	R/W	0h	Inconsistent Sync Field Error Enable bit. This bit is effective in LIN mode only. This bit is used to create an ISF error. When this bit is set, the bit widths in the sync field are varied so that the ISF check fails and the error flag is set.
27	RESERVED_4	R	0h	Reserved

Table 5-1615. LIN_IODFTCTRL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
26	FERRENA	R/W	0h	This bit is used to create a Frame Error. This bit is effective in SCI-compatible mode only. When this bit is set, the stop bit received is ANDed with '0' and passed to the stop bit check circuitry.
25	PERRENA	R/W	0h	Compatible Mode only This bit is effective in SCI-compatible mode only. This bit is used to create a Parity Error. When this bit is set, in compatible mode, the parity bit received is toggled so that a parity error occurs.
24	BRKDTERRENA	R/W	0h	Compatible Mode only This bit is effective in SCI-compatible mode only. This bit is used to create BRKDT error [SCI mode only]. When this bit is set, the stop bit of the frame is ANDed with '0' and passed to the RSM so that a frame error occurs. Then the RX Pin is forced to continuous low for 10 Tbits so that a BRKDT error occurs.
23:21	RESERVED_3	R/W	0h	Reserved
20:19	PINSAMPLEMASK	R/W	0h	Pin sample mask. These bits define the sample number at which the TX Pin value that is being transmitted will be inverted to verify the receive pin samples correctly with the majority detection circuitry. Note: During IODFT mode testing for the pin sample mask, the prescalar P must be programmed to be greater than 2. 0 No Mask 1 Invert the TX Pin value at TBIT_CENTER 2 Invert the TX Pin value at TBIT_CENTER + SCLK 3 Invert the TX Pin value at TBIT_CENTER + 2 SCLK
18:16	TXSHIFT	R/W	0h	Transmit shift. These bits define the delay by which the value on LINTX is delayed so that the value on LINRX is asynchronous. [Not applicable to Start Bit] 0 No Delay 1 Delay by 1 SCLK 2 Delay by 2 SCLK 3 Delay by 3 SCLK 4 Delay by 4 SCLK 5 Delay by 5 SCLK 6 Delay by 6 SCLK 7 Delay by 7 SCLK
15:12	RESERVED_2	R	0h	Reserved
11:8	IODFTENA	R/W	5h	IO DFT Enable Key This field is used to enable the IODFT mode of the SCI/LIN module for testing. 0 IODFT is disabled 1 IODFT is disabled 2 IODFT is disabled 3 IODFT is disabled 4 IODFT is disabled 5 IODFT is disabled 6 IODFT is disabled 7 IODFT is disabled 8 IODFT is disabled 9 IODFT is disabled 10 IODFT is enabled 11 IODFT is disabled 12 IODFT is disabled 13 IODFT is disabled 14 IODFT is disabled 15 IODFT is disabled
7:2	RESERVED_1	R	0h	Reserved

Table 5-1615. LIN_IODFTCTRL Register Field Descriptions (continued)

Bit	Field	Type	Reset	Description
1	LPBENA	R/W	0h	Module loopback enable. In analog loopback mode the complete communication path through the I/Os can be tested, whereas in digital loopback mode the I/O buffers are excluded from this path. 0 Digital loopback is enabled. 1 Analog loopback is enabled in module I/O DFT mode (when IODFTENA = 1010)
0	RXPENA	R/W	0h	Module Analog loopback through receive pin enable. This bit defines whether the I/O buffers for the transmit or the receive pin are included in the communication path in analog loopback mode only. 0 Analog loopback through the transmit pin is enabled. 1 Analog loopback through the receive pin is enabled.

0	IES	R	0h	External TimeStamp Counter Overflow Interrupt. Read Enabled Interrupts. [IES - Interrupt Enable Status]

5.15.2.11 CFG_SS_EOI Register

5.15.2.11.1 CFG_SS_EOI Register (Offset = 20h) [reset = 0h]

End Of Interrupt (EOI) Register. The EOI register is used to re-trigger the pulse interrupt signal to ensure that any nested interrupt events are serviced. For level interrupt signals the EOI register is not functional and must not be used.

Return to Summary Table

5.15.2.17 CFG_DBTP Register

5.15.2.17.1 CFG_DBTP Register (Offset = 20Ch) [reset = A33h]

Data Bit Timing & Prescaler Register.
Configuration of data phase bit timing, transmitter delay compensation enable. This register is only writable if the MCAN_CCCR[1] CCE and MCAN_CCCR[0] INIT bits are set. The CAN bit time may be programed in the range of 4 to 49 time quanta. The CAN time quantum may be programmed in the range of 1 to 32 MCAN functional clock periods. tq = (MCAN_DBTP[20-16] DBRP + 1) mtq (minimum time quantum = CAN clock period (MCAN functional clock)). The MCAN_DBTP[12-8] DTSEG1 field is the sum of Prop_Seg and Phase_Seg1. The MCAN_DBTP[7-4] DTSEG2 field is Phase_Seg2. Therefore the length of the bit time is (programmed values) [MCAN_DBTP[12-8] DTSEG1 + MCAN_DBTP[7-4] DTSEG2 + 3] tq or (functional values) [Sync_Seg + Prop_Seg + Phase_Seg1 + Phase_Seg2] tq. The Information Processing Time (IPT) is zero, meaning the data for the next bit is available at the first clock edge after the sample point.
Note: With a CAN clock (MCAN functional clock) of 8 MHz, the reset value of 0000 0A33h configures the MCAN module for a data phase bit rate of 500 kbit/s.
Note: The bit rate configured for the CAN FD data phase via the MCAN_DBTP register must be higher or equal to the bit rate configured for the arbitration phase via the MCAN_DBTP register.

Return to Summary Table
