Application Note 1052 Noise Floor Measurement of PLL Frequency Synthesizers

Literature Number: SNAA019

Noise Floor Measurement of PLL Frequency Synthesizers

National Semiconductor
Application Note 1052
Wireless Communications Group
November 1996

INTRODUCTION

Phase noise is a critical performance parameter of frequency synthesizers for wireless applications. RF system designers of phase modulated cellular systems, such as PHS, GSM and IS-54, need low noise local oscillator (L.O.) or frequency synthesizer blocks. In phase modulated system the integrated phase noise of the synthesizer contributes to the RMS phase error of the transceiver. The frequency switching time and the suppression of reference spurs are also critical for these modern digital standards. A narrower loop filter bandwidth would decrease the integrated phase noise for the locked condition, but would increase the PLL lock time. A standard measurement technique for quantifying the phase locked loop noise generated by the synthesizer is described in this note.

PHASE NOISE SPECTRUM

Single sideband phase noise is a critical performance parameter of any frequency control system. Sideband noise can be converted into the frequency band of interest and reduce system sensitivity. A typical plot of a PLL noise characteristic is shown in *Figure 1*. When using a spectrum analyzer it can be safely assumed that both sides of the spectrum are identical. The integrated phase noise is not an "apples to apples" comparison for most systems, since this is highly dependent on the divider ratio, loop filter bandwidth, and damping or phase margin of the PLL. The spectrum peaking and loop bandwidth are functions of the loop bandwidth, while the noise "inside the loop" is generally proportional to the divider ratio. Noise outside the 3 dB loop bandwidth falls off rapidly, and does not contribute to the integrated noise significantly.

FIGURE 1. Single Sided Phase Noise Spectrum

The phase/frequency comparator's function is to adjust the voltage presented to the VCO until the feedback signal's frequency (and phase) match that of the reference signal. When this "phase-locked" condition exists, the VCO's frequency will be N times that of the comparison frequency. Where N is the programmable VCO divide ratio. It is assumed that any noise present at the input of the phase detector is multiplied up by a factor of N, and appears inside the loop of the PLL. This is generally synthesizer divider noise and phase detector noise. Obviously, this is an oversimplification of the noise properties of a PLL, but does serve as a way of normalizing phase noise measurements.

PHASE NOISE FLOOR MEASUREMENT

The basic phase-lock-loop configuration we will be considering is shown in *Figure 3*. The PLL consists of a high-stability crystal reference oscillator, a frequency synthesizer such as the National Semiconductor LMX2332TM, a voltage controlled oscillator (VCO), and a passive loop filter. The crystal reference used is the 10 MHz signal from the back of a spectrum analyzer at about +7 dBm or 1.42 V_{PP}. The VCO used for this test was an ALPS URAE8x934 VCO with a tuning constant of 27 MHz/V phase locked at 900 MHz. By using a relatively wide loop filter bandwidth, (15 kHz for N = 4500) we are able to vary the reference frequency from 30 kHz to 400 kHz without changing the component values and maintain loop stability. The phase noise measurements were made at 150 Hz offset, to ensure that the data was on the flat portion of the curve "inside the loop". At least 20 video averages were taken over a 1 kHz span for each measurement. In order to come up with the phase noise floor figure of merit the spectrum analyzer measurement must be normalized in terms of dBc/Hz, by subtracting 10 log of the resolution bandwidth used in the measurement. The noise is then referenced to the input of the phase detector by subtracting 20 log N. Without taking into account any errors from the spectrum analyzer we have:

$$\text{Phase Noise Floor} = \left(\text{Phase Noise from S. A.} \right) - 10 \log \left(\frac{\text{S.A. Res}}{\text{BW}} \right) - 20 \log N$$

SUMMARY

A graph showing the phase noise floor of the LMX2332A vs. phase detector frequency is shown in *Figure 2*. This shows the phase noise floor is not solely dependent on the divider ratio N. The phase noise floor for a 900 MHz VCO frequency and a channel spacing of 30 kHz, is less than -169 dBc/Hz.

LIFE SUPPORT POLICY

NATIONAL'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN APPROVAL OF THE PRESIDENT OF NATIONAL SEMICONDUCTOR CORPORATION. As used herein:

1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body, or (b) support or sustain life, and whose failure to perform when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury to the user.
2. A critical component in any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

TI products are not authorized for use in safety-critical applications (such as life support) where a failure of the TI product would reasonably be expected to cause severe personal injury or death, unless officers of the parties have executed an agreement specifically governing such use. Buyers represent that they have all necessary expertise in the safety and regulatory ramifications of their applications, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of TI products in such safety-critical applications, notwithstanding any applications-related information or support that may be provided by TI. Further, Buyers must fully indemnify TI and its representatives against any damages arising out of the use of TI products in such safety-critical applications.

TI products are neither designed nor intended for use in military/aerospace applications or environments unless the TI products are specifically designated by TI as military-grade or "enhanced plastic." Only products designated by TI as military-grade meet military specifications. Buyers acknowledge and agree that any such use of TI products which TI has not designated as military-grade is solely at the Buyer's risk, and that they are solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI products are neither designed nor intended for use in automotive applications or environments unless the specific TI products are designated by TI as compliant with ISO/TS 16949 requirements. Buyers acknowledge and agree that, if they use any non-designated products in automotive applications, TI will not be responsible for any failure to meet such requirements.
