ABSTRACT

Micro SMDxt is a wafer level CSP (WLCSP) with the following features:
• Package size equal to die size
• Smallest footprint per I/O count
• No need for underfill material
• Interconnect layout available in 0.4 mm or 0.5 mm pitch
• No interposer between the silicon IC and the printed circuit board

1 Package Construction

Figure 1 shows typical micro SMDxt products. They have solder bumps located on the active side of silicon IC. The micro SMDxt manufacturing process steps include standard wafer fabrication process, wafer re-passivation, deposition of solder bumps on I/O pads, application of protective encapsulation coating, testing using wafer sort platform, laser marking, singulation and packing in tape and reel. The package is assembled on the printed circuit board (PCB) using standard surface mount assembly techniques (SMT).

3 Surface Mount Assembly Considerations

Micro SMDxt surface mount assembly operations include,

- Printing solder paste on PCB.
- Component placement using standard pick and place equipment.
- Solder reflow and cleaning (depending on flux type)

Advantages of micro SMDxt during SMT assembly include:

- Standard tape and reel shipping media eases handling issues (per EIA-481-1)
- Uses standard SMT pick and place equipment
- Standard reflow process

4 PCB Layout

Two types of land patterns are used for surface mount packages:

- Non-solder mask defined (NSMD)
- Solder mask defined (SMD)

![NSMD and SMD Pad Definition](image)

- NSMD configuration is highly preferred due to its tighter control on copper etch process and a reduction in the stress concentration points on the PCB side compared to SMD configuration.
- A copper layer thickness of less than 1 oz. is recommended to achieve higher stand-off. A 1 oz. (30 micron) or greater copper thickness results in a lowering of the effective stand-off, which may compromise solder joint reliability.
- For the NSMD pad geometry, the trace width at the connection to the land pad should not exceed 2/3 of the pad diameter.

The recommended pad geometry is shown in Table 3.

<table>
<thead>
<tr>
<th>Table 3. Recommended PCB Pad Geometry</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Pitch</strong></td>
</tr>
<tr>
<td><strong>Solder Ball Size</strong></td>
</tr>
<tr>
<td><strong>Pad Definition</strong></td>
</tr>
<tr>
<td>NSMD</td>
</tr>
<tr>
<td>SMD</td>
</tr>
</tbody>
</table>

For PCB layouts employing via-in-pad structures (micro-via), NSMD pad definition should be used, since this ensures adequate wetting area on the copper pads and, hence, a better joint. It is recommended that the wall thickness of the microvias be a minimum of 15 microns. It is recommended that 'offset' vias be used when microvias are required for routing on the PCB.
Nickel-gold board finish on PCB pads is used for internal characterization.

- For Ni-Au (electroplated nickel, immersion gold) gold thickness must be less than 0.2 microns to avoid solder joint embrittlement.
- The fan-out for the traces should be symmetrical across X and Y directions to avoid part rotation due to surface tension of solder.
- HASL (hot air solder leveled) board finish is not recommended.

5 Stencil Printing Process

- Use laser cutting followed by electro-polishing for stencil fabrication.
- The recommended stencil apertures are shown in Table 4.
- Use type 3 (25 to 45 micron particle size range) or finer solder paste for printing.

<table>
<thead>
<tr>

<td>0.275 x 0.275 mm to 0.3 x 0.3 mm square, 0.100 mm to 0.125 mm thick</td>
<td>0.25 X 0.25 mm square, 0.1 mm thick</td>
</tr>
</tbody>
</table>

6 Component Placement

Standard pick-and-place machines can be used for placing the micro SMDxt. Either of the following methods can be used for recognition and positioning:

- Vision system to locate package silhouette
- Vision system to locate individual bumps. It is recommended that the side-lighting option on the pick and place machine’s vision system be used when attempting to use a individual bump recognition approach to ensure better contrast for bump recognition.

Other features of micro SMDxt placement are as follows:

- It is preferable to use IC placement/fine pitch placement machines instead of chip-shooters for better accuracy.
- Although micro SMDxt can withstand a placement force of up to 1 kg for 0.5 seconds, little or no force needs to be exerted during placement. It is recommended that bumps be dipped into the printed solder paste to greater than 20% of paste block height.

7 Solder Paste Reflow and Cleaning

- Micro SMDxt is compatible with industry standard reflow process for lead-free solder composition.
- Micro SMDxt is qualified for up to four reflow operations (260°C peak) per J-STD-020.
- Use of Pb-free micro SMDxt with Sn/Pb eutectic solder paste is not recommended. Such an application can result in assemblies that will not meet desired reliability standards.

The micro SMDxt solder ball structure is engineered to maintain its shape with controlled (minimal) collapse compared to a standard solder ball. This allows significant improvement in solder joint reliability.

8 Rework

The key features for the micro SMDxt rework are listed below:

- Rework procedure used is similar to the one used for most BGA and CSP packages.
- Additional solder paste is required to be applied to either the PCB or to the component bumps prior to placement on PCB.
- Rework reflow process should duplicate original reflow profile used for assembly.
- Rework system should include localized convection heating element with profiling capability, a bottom side pre-heater and a part pick and place tool with image overlay.
9 Qualification

The following sections describe solder joint reliability qualification and mechanical testing results for micro SMDxt when mounted on FR-4 PCB. Testing included use of daisy chain components. Product reliability data is included in respective product qualification reports.

9.1 Solder Joint Reliability Qualification

9.1.1 Temperature Cycling

Testing performed per IPC-SM-785 Guidelines for Accelerated Reliability Testing of Surface Mount Solder Attachments. The results of this testing after following the above mentioned assembly conditions described here are shown in Figure 3 and Figure 4.

![Figure 3. Thermal Cycling Profile Specified for the −40 to 125°C Profile With 5 Minute Ramp and 10 Minute Hold Times](image)
9.1.2 Package Shear

As part of the manufacturing process, bump shear data is collected at package level to ensure attachment of solder ball to the package.

- 0.5 mm pitch micro SMDxt
  - 0.32 mm diameter solder bump: The package shear strength is greater than 250 g per solder joint.
- 0.4 mm pitch micro SMDxt
  - 0.265 mm diameter solder bump: The package shear strength is greater than 165 gm per solder joint.

Measured value of package shear may vary slightly depending on materials and methods used in surface mount assembly.
9.1.3 Drop Test

Drop test results are shown in Figure 5 and Figure 6. The results shown are for a 100 bump part tested in drop test per JEDEC's JESD22–B111 drop test specification. The drop test setup, board layout, fixtures and all drop criteria are per the JESD22–B111 specification. All drops are carried out 'face-down'. The peak deceleration is 1500 g for 0.5 ms (half-sine pulse). The fail criteria is 1k Ω resistance for 200 nano-seconds, recorded 4 times during 6 consecutive drops. The results show there is no significant difference between the PCB pad finish (OSP vs. ENIG) options tested.

Figure 5. Weibull Plot for the 100 Bump micro SMDxt Showing Results of Drop Test per JESD22–B111
Figure 6. Weibull Plot for the 100 Bump micro SMDxt (0.4mm pitch) Showing Results of Drop Test per JESD22-B111
9.1.4  Flex Test

This is a repetitive flexing test where PCB is flexed at a preset frequency. Flex test results are shown in Table 5. An increase of 10% in resistance of network (daisy chain) is considered a failure. Figure 7 shows the setup used for the Flex test.

Figure 7. Test Setup for Flexural Testing

</tbody>
</table>

(1) Flexing span: 50 mm
(2) PCB thickness: 0.79 mm (32 mil)
(3) Flexural frequency: 1 Hz
(4) First Fails: PCB location directly under plunger.
(5) PCB pad finish: ENIG (Electroless Ni, Immersion Gold)
(6) Test is not sensitive to PCB build-up type (RCC or ALIVH)
(7) 2 mm and 3 mm displacement are accelerated test deflection levels, not seen in a typical application.
9.1.5 Recommendations for Device Placement on PCB

It is recommended that in cases where PCB flexing is likely, the part should be placed as close to the mounting/rivet point as possible. It is also recommended that the device location be away from the area of maximum PCB flexing.

10 Thermal Characterization

Thermal performance of micro SMDxt packages was assessed using low effective thermal conductivity test boards per EIA/JESD51-3. The performance of the micro SMDxt product depends on product die size and application (PCB layout and design), and the details of $\theta_JA$ values are available in relevant device-specific data sheets at [http://www.ti.com](http://www.ti.com).

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as “components”) are sold subject to TI’s terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI’s terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers’ products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers’ products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI’s goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms. No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or “enhanced plastic” are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have not been so designated is solely at the Buyer’s risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
