ABSTRACT
The next-generation high-end timer module (HET) on Hercules MCUs is an intelligent timer that provides sophisticated timing functions for real-time applications. The timer is an independent coprocessor, using its own reduced instruction set, with a specialized timer micromachine and an attached I/O port. The HET can be used for generating pulse-width-modulated outputs, for capturing or comparing inputs, or for general-purpose I/O (GPIO). The programmable nature of the HET allows it to be used to implement several kinds of interfaces. This application report describes an implementation of a quadrature decoder using the HET module. This allows you the flexibility to interface to one or more quadrature encoders, thereby, allowing you to design a closed-loop sensored motor-control algorithm using a position/direction/speed sensor.

1 Introduction

Quadrature encoders are a type of incremental encoders. These provide cyclical outputs when the encoder is rotated. They can be mechanical, optical or magnetic. Optical quadrature encoders are used when higher speeds are required or a higher degree of precision is required.

Quadrature encoders have two main outputs: QEPA and QEPB. These are 90° out of phase, therefore, the name quadrature outputs.

![Figure 1. Optical Encoder Disk](image)

The two outputs QEPA and QEPB are decoded to count up or down depending on the direction of movement. Some encoders have an additional output, named QEPI. This is an "index" marker that occurs once every rotation. This marker is used as an accurate reference point.

![Figure 2. Encoder Output Signals for Forward and Reverse Movement](image)

Legend: \(N\) = lines per revolution

The encoder wheel typically makes one revolution for every revolution of the motor, or the wheel may be at a geared rotation ratio with respect to the motor. Therefore, the frequency of the digital signal coming from the QEPA and QEPB outputs varies proportionally with the speed of rotation of the motor. For example, a 2000-line encoder directly coupled to a motor running at 5000 revolutions per minute (rpm) results in a QEPA/QEPB signal frequency of 166.67 kHz. So by measuring the frequency of either QEPA or QEPB, the MCU can determine the velocity of the motor.
2 HET Implementation of Quadrature Decoding

This document describes the implementation of a quadrature decoder using the high-end timer (HET) module on Hercules MCUs.

2.1 Quadrature Decoder State Diagram

![Quadrature Decoder State Diagram](image_url)

**Figure 3. Quadrature Decoder State Machine**

*Figure 3 shows the quadrature decoder state machine implemented using the HET. The HET program determines which one of the inputs, QEPA or QEPB, is leading and accordingly increments or decrements a counter. The QEP (index) pulse is used to reset the counter to zero on each rotation of the encoder.*
2.2 HET Program for Implementing Quadrature Decoder State Machine

```assembly
Pin_A .equ 0 ; Signal A from QEP encoder
Pin_B .equ 1 ; Signal B from QEP encoder
INDEX .equ 2 ; Index from QEP encoder

;---------------------------INDEX-CLR Counter ----------------------------------
START ECNT { next = AFE, cond_addr = CLRCNT, event = Fall, pin = INDEX, reg = NONE, data = 0}
CLRCNT MOV32 { next = AFE, remote = FOR, type = IMTOREG&REM, reg = A, Data = 0}

;---------------------------check: aFbL / aFbH ------------------------------
AFE BR { next = ARE, cond_addr = AFL, event = Fall, pin = Pin_A}
AFL BR { next = FOR, cond_addr = BAC, event = Low, pin = Pin_B}

;---------------------------check: aRbL / aRbH ------------------------------
ARE BR { next = BFE, cond_addr = ARL, event = rise, pin = Pin_A}
ARL BR { next = FOR, cond_addr = BAC, event = high, pin = Pin_B}

;---------------------------check: bFaL / bFaH ------------------------------
BFE BR { next = BRE, cond_addr = BFL, event = Fall, pin = Pin_B}
BFL BR { next = FOR, cond_addr = BAC, event = high, pin = Pin_A}

;---------------------------check: bRaL / bRaH ------------------------------
BRE BR { next = START, cond_addr = BRL, event = rise, pin = Pin_B}
BRL BR { next = FOR, cond_addr = BAC, event = low, pin = Pin_A}

FOR CNT { next = START, reg = NONE, max = 0x0FA0}

BAC MOV32 { next = LIM, remote = FOR, type = REMTOREG, reg = A}
LIM ECMP { next = SSUB, cond_addr= HIL, hr_lr=LOW, en_pin_action=off, pin=CC0, reg= A, data=0}
HIL ADM32 { next = START, remote = FOR, type = IM<REGTOREM, reg = A, data = 0x0000FA0}
SSUB ADM32 { next = START, remote = FOR, type = IM<REGTOREM, reg = A, data = 0x1FFFFFF}
```

2.2.1 Accessing Position Counter Information

The data field of the HET instruction labeled FOR can be read to determine the current count and therefore the current position of the rotor position with respect to the last index pulse. Refer to the high-end-time module chapter of the part's technical reference manual for more details.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as “components”) are sold subject to TI’s terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI’s terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers’ products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers’ products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components by Buyer into its products, customer systems, and/or applications. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI’s goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or “enhanced plastic” are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have not been so designated is solely at the Buyer’s risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
