SBOS779D -JUNE 2016-REVISED MAY 2017

# TLV600x Low-Power, Rail-to-Rail In/Out, 1-MHz Operational Amplifier for Cost-Sensitive Systems

#### 1 Features

Precision Amplifiers for Cost-Sensitive Systems

Low Quiescent Current: 75 μA/ch

Supply Range: 1.8 V to 5.5 V

Input Voltage Noise Density: 28 nV/√Hz at 1 kHz

· Rail-to-Rail Input and Output

Gain Bandwidth: 1 MHz

Low Input Bias Current: 1 pA

Low Offset Voltage: 0.75 mV

· Unity-Gain Stable

Internal RF and EMI Filter

 Extended Temperature Range: -40°C to +125°C

#### 2 Applications

- Industrial and Consumer Electronics
- Portable Equipment
- Portable Blood Glucose Systems
- Smoke Detectors
- · White Goods
- Power Banks

#### **CMRR** and **PSRR** vs Temperature

#### 3 Description

The TLV600x family of single-, dual-, and quad-channel operational amplifiers is specifically designed for general-purpose applications. Featuring rail-to-rail input and output (RRIO) swings, low quiescent current (75  $\mu A$ , typical), wide bandwidth (1 MHz) and low noise (28 nV/\delta at 1 kHz), this family is attractive for a variety of applications that require a good balance between cost and performance, such as consumer electronics, smoke detectors, and white goods. The low-input-bias current (±1.0 pA, typical) enables the TLV600x to be used in applications with megaohm source impedances.

The robust design of the TLV600x provides ease-ofuse to the circuit designer: unity-gain stability with capacitive loads of up to 150 pF, integrated RF/EMI rejection filter, no phase reversal in overdrive conditions, and high electrostatic discharge (ESD) protection (4-kV HBM).

The devices are optimized for operation at voltages as low as 1.8 V ( $\pm$ 0.9 V) and up to 5.5 V ( $\pm$ 2.75 V), and are specified over the extended temperature range of  $-40^{\circ}$ C to  $+125^{\circ}$ C.

The single-channel TLV6001 is available in SC70-5 and SOT23-5 packages. The dual-channel TLV6002 is offered in SOIC-8 and VSSOP-8 packages, and the quad-channel TLV6004 is offered in a TSSOP-14 package.

#### Device Information<sup>(1)</sup>

PART NUMBER	PACKAGE	BODY SIZE (NOM)
TLV6001	SC70 (5)	2.00 mm × 1.25 mm
	SOT-23 (5)	2.90 mm × 1.60 mm
TLVCOOD	SOIC (8)	4.90 mm × 3.91 mm
TLV6002	VSSOP (8)	3.00 mm × 3.00 mm
TLV6004	TSSOP (14)	5.00 mm × 4.40 mm

(1) For all available packages, see the orderable addendum at the end of the data sheet.

## 4 Revision History

Changes from Revision C (December 2016)	to Revision D	Page
Changed inverting input pin to noninverting	g input pin in Pin Functions: TLV6001 table	3
Changed inverting input pin to noninverting	g input pin in Pin Functions: TLV6001R table	4
Changed inverting input pin to noninverting	g input pin in Pin Functions: TLV6001U table	4
Changed "Sample and Buy" to "Order Now	v" in Related Links table	21
Changes from Revision B (October 2016) to	o Revision C	Page
Changed all pin outs in Pin Configuration a	and Functions section to reflect correct pin names and or	der3
Changes from Revision A (July 2016) to Re	evision B	Page
Added TLV6001R pinout drawing to Pin Co	onfigurations and Functions section	2
Added TLV6001U pinout drawing to Pin Co	onfigurations and Functions section	4
Changes from Original (June 2016) to Revis	sion A	Page
Changed Product Status from Product Pre	view to Production Data	
	nentation section	
• Changed wording of the Receiving Notifica	ation of Documentation Updates section	21

#### 7 Specifications

#### 7.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)<sup>(1)</sup>

		MIN	MAX	UNIT
Voltage	Supply voltage		7	V
	Signal input pins, voltage (2)	(V-) - 0.5	(V+) + 0.5	V
Current	Signal input pins, current <sup>(2)</sup>	-10	10	mA
	Output short-circuit (3)	Cont	inuous	mA
	Operating, T <sub>A</sub>	-40	150	°C
Temperature	Junction, T <sub>J</sub>		150	°C
	Storage, T <sub>stg</sub>	-65	150	°C

<sup>(1)</sup> Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under Recommended Operating Conditions. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

#### 7.2 ESD Ratings

			VALUE	UNIT
V	Floatrootatio discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 <sup>(1)</sup>	±4000	V
V <sub>(ESD)</sub> Electrostatic discharge		Charged-device model (CDM), per JEDEC specification JESD22-C101 <sup>(2)</sup>	±1000	V

<sup>(1)</sup> JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

#### 7.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	MAX	UNIT
V <sub>S</sub>	Supply voltage	1.8	5.5	V
T <sub>A</sub>	Specified temperature range	-40	125	°C

<sup>(2)</sup> Input pins are diode-clamped to the power-supply rails. Input signals that may swing more than 0.5 V beyond the supply rails must be current limited to 10 mA or less.

<sup>(3)</sup> Short-circuit to ground, one amplifier per package.

<sup>(2)</sup> JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

#### 7.4 Thermal Information: TLV6001

#### 8 Detailed Description

#### 8.1 Overview

The TLV600x family of operational amplifiers are general-purpose, low-cost devices that are suitable for a wide range of portable applications. Rail-to-rail input and output swings, low quiescent current, and wide dynamic range make the op amps well-suited for driving sampling analog-to-digital converters (ADCs) and other single-supply applications.

#### 8.2 Functional Block Diagram

Copyright © 2017, Texas Instruments Incorporated

#### 8.3 Feature Description

#### 8.3.1 Operating Voltage

The TLV600x series is fully specified and tested from 1.8 V to 5.5 V (±0.9 V to ±2.75 V). Parameters that vary with supply voltage are illustrated in the *Typical Characteristics* section.

#### 8.3.2 Rail-to-Rail Input

The input common-mode voltage range of the TLV600x series extends 200 mV beyond the supply rails. This performance is achieved with a complementary input stage: an N-channel input differential pair in parallel with a P-channel differential pair, as shown in the *Functional Block Diagram*. The N-channel pair is active for input voltages close to the positive rail, typically (V+) - 1.3 V to 200 mV above the positive supply, while the P-channel pair is on for inputs from 200 mV below the negative supply to approximately (V+) - 1.3 V. There is a small transition region, typically (V+) - 1.4 V to (V+) - 1.2 V, in which both pairs are on. This 200-mV transition region may vary up to 300 mV with process variation. Thus, the transition region (both stages on) may range from (V+) - 1.7 V to (V+) - 1.5 V on the low end, up to (V+) - 1.1 V to (V+) - 0.9 V on the high end. Within this transition region, PSRR, CMRR, offset voltage, offset drift, and THD may be degraded compared to device operation outside this region.

#### 8.3.3 Rail-to-Rail Output

Designed as a micro-power, low-noise operational amplifier, the TLV600x delivers a robust output drive capability. A class AB output stage with common-source transistors is used to achieve full rail-to-rail output swing capability. For resistive loads up to 100 k $\Omega$ , the output swings typically to within 5 mV of either supply rail regardless of the power-supply voltage applied. Different load conditions change the ability of the amplifier to swing close to the rails, as shown in Figure 11.

#### 8.3.4 Common-Mode Rejection Ratio (CMRR)

CMRR for the TLV600x is specified in several ways so the best match for a given application may be used; see *Electrical Characteristics*. First, the CMRR of the device in the common-mode range below the transition region  $[V_{CM} < (V+) - 1.3 \text{ V}]$  is given. This specification is the best indicator of the capability of the device when the application requires the use of one of the differential input pairs. Second, the CMRR over the entire common-mode range is specified at  $(V_{CM} = -0.2 \text{ V to } 5.7 \text{ V})$ . This last value includes the variations seen through the transition region, as shown in Figure 4.

#### 8.3.5 Capacitive Load and Stability

The TLV600x is designed to be used in applications where driving a capacitive load is required. As with all op amps, there may be specific instances where the TLV600x may become unstable. The particular op amp circuit configuration, layout, gain, and output loading are some of the factors to consider when establishing whether or not an amplifier is stable in operation. An op amp in the unity-gain ( $\frac{1}{2}-1$ -V/V) buffer configuration that drives a capacitive load exhibits a greater tendency to be unstable than an amplifier operated at a higher noise gain. The capacitive load, in conjunction with the op amp output resistance, creates a pole within the feedback loop that degrades the phase margin. The degradation of the phase margin increases as the capacitive loading increases. When operating in the unity-gain configuration, the TLV600x remains stable with a pure capacitive load up to approximately 1 nF. The equivalent series resistance (ESR) of some capacitors ( $C_L$  greater than 1  $\mu$ F) is sufficient to alter the phase characteristics in the feedback loop such that the amplifier remains stable. Increasing the amplifier closed-loop gain allows the amplifier to drive increasingly larger capacitance. This increased capability is evident when observing the overshoot response of the amplifier at higher voltage gains.

#### **Feature Description (continued)**

One technique for increasing the capacitive load drive capability of the amplifier when it operates in a unity-gain configuration is to insert a small resistor, typically  $10\frac{1}{1000} + \Omega$  to  $20\frac{1}{1000} + \Omega$ , in series with the output, as shown in Figure 19. This resistor significantly reduces the overshoot and ringing associated with large capacitive loads. One possible problem with this technique is that a voltage divider is created with the added series resistor and any resistor connected in parallel with the capacitive load. The voltage divider introduces a gain error at the output that reduces the output swing.

Figure 19. Improving Capacitive Load Drive

#### 8.3.6 EMI Susceptibility and Input Filtering

Operational amplifiers vary with regard to the susceptibility of the device to electromagnetic interference (EMI). If conducted EMI enters the op amp, the dc offset observed at the amplifier output may shift from the nominal value while EMI is present. This shift is a result of signal rectification associated with the internal semiconductor junctions. While all op amp pin functions may be affected by EMI, the signal input pins are likely to be the most susceptible. The TLV600x family incorporates an internal input low-pass filter that reduces the amplifiers response to EMI. Common-mode and differential mode filtering are provided by this filter. The filter is designed for a cutoff frequency of approximately 35 MHz (–3 dB), with a !— roll-off!— rolloff of 20 dB per decade.

Texas Instruments has developed the ability to accurately measure and quantify the immunity of an operational amplifier over a broad frequency spectrum extending from 10 MHz to 6 GHz. The EMI rejection ratio (EMIRR) metric allows op amps to be directly compared by the EMI immunity. Figure 18 illustrates the results of this testing on the TLV600x family. Detailed information may be found in *EMI Rejection Ratio of Operational Amplifiers* (SBOA128), available for download from www.ti.com.

#### 8.4 Device Functional Modes

The TLV600x have a single functional mode. The devices are powered on as long as the power-supply voltage is between 1.8 V ( $\pm 0.9$  V) and 5.5 V ( $\pm 2.75$  V).

#### 8.5 Input and ESD Protection

The TLV600x incorporates internal electrostatic discharge (ESD) protection circuits on all pins. In the case of input and output pins, this protection primarily consists of current-steering diodes connected between the input and power-supply pins. The ESD protection diodes provide in-circuit, input overdrive protection, as long as the current is limited to 10 mA, as stated in the *Absolute Maximum Ratings* table. Figure 20 shows how a series input resistor may be added to the driven input to limit the input current. The added resistor contributes thermal noise at the amplifier input and the value must be kept to a minimum in noise-sensitive applications.

Figure 20. Input Current Protection

#### 9 Application and Implementation

#### NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

#### 9.1 Application Information

The TLV600x is a family of low-power, rail-to-rail input and output operational amplifiers specifically designed for portable applications. The devices operate from 1.8 V to 5.5 V, are unity-gain stable, and are suitable for a wide range of general-purpose applications. The class AB output stage is capable of driving  $\leq$  10-k $\Omega$  loads connected to any point between V+ and ground. The input common-mode voltage range includes both rails, and allows the TLV600x to be used in any single-supply application.

#### 9.2 Typical Application

A typical application for an operational amplifier is an inverting amplifier, as shown in Figure 21. An inverting amplifier takes a positive voltage on the input and outputs a signal inverted to the input, making a negative voltage of the same magnitude. In the same manner, the amplifier makes negative input voltages positive on the output. In addition, amplification may be added by selecting the input resistor  $R_I$  and the feedback resistor  $R_I$ .

Copyright @ 2010, Texas mandinents incorpora

Figure 21. Application Schematic

#### 9.2.1 Design Requirements

The supply voltage must be chosen to be larger than the input voltage range and the desired output range. The limits of the input common-mode range ( $V_{CM}$ ) and the output voltage swing to the rails ( $V_O$ ) must be considered. For instance, this application scales a signal of  $\pm 0.5$  V (1 V) to  $\pm 1.8$  V (3.6 V). Setting the supply at  $\pm 2.5$  V is sufficient to accommodate this application.

#### 9.2.2 Detailed Design Procedure

Determine the gain required by the inverting amplifier using Equation 1 and Equation 2:

$$A_{V} = \frac{V_{OUT}}{V_{IN}} \tag{1}$$

$$A_{V} = \frac{1.8}{-0.5} = -3.6 \tag{2}$$

#### **Typical Application (continued)**

When the desired gain is determined, choose a value for  $R_I$  or  $R_F$ . Choosing a value in the kilohm range is desirable for general-purpose applications because the amplifier circuit uses currents in the milliamp range. This milliamp current range ensures the device does not draw too much current. The trade-off is that large resistors (hundreds of kilohms) draw the smallest current but generate the highest noise. Small resistors (100s of ohms) generate low noise but draw high current. This example uses 10 k $\Omega$  for  $R_I$ , meaning 36 k $\Omega$  is used for  $R_F$ . The values are determined by Equation 3:

$$A_{V} = -\frac{R_{F}}{R_{I}} \tag{3}$$

#### 9.2.3 Application Curve

Figure 22. Inverting Amplifier Input and Output

#### 9.3 System Examples

When receiving low-level signals, limiting the bandwidth of the incoming signals into the system is often required. The simplest way to establish this limited bandwidth is to place an RC filter at the noninverting terminal of the amplifier, as shown in Figure 23.

$$\frac{V_{OUT}}{V_{IN}} = \left(1 + \frac{R_F}{R_G}\right) \left(\frac{1}{1 + sR_1C_1}\right)$$

Figure 23. Single-Pole Low-Pass Filter

#### **System Examples (continued)**

If even more attenuation is needed, a multiple pole filter is required. The Sallen-Key filter may be used for this task, as shown in Figure 24. For best results, the amplifier must have a bandwidth that is eight to 10 times the filter frequency bandwidth. Failure to follow this guideline may result in phase shift of the amplifier.

Figure 24. Two-Pole, Low-Pass, Sallen-Key Filter

#### 10 Power Supply Recommendations

The TLV600x is specified for operation from 1.8 V to 5.5 V (±0.9 V to ±2.75 V); many specifications apply from –40°C to +125°C. The *Typical Characteristics* presents parameters that may exhibit significant variance with regard to operating voltage or temperature.

#### **CAUTION**

Supply voltages larger than 7 V may permanently damage the device. (See the *Absolute Maximum Ratings* table).

Place  $0.1-\mu F$  bypass capacitors close to the power-supply pins to reduce errors coupling in from noisy or high-impedance power supplies. For more detailed information on bypass capacitor placement, see *Layout Guidelines*.

#### 11 Layout

#### 11.1 Layout Guidelines

For best operational performance of the device, use good printed circuit board (PCB) layout practices, including:

- Noise may propagate into analog circuitry through the power pins of the circuit and the operational amplifier. Use bypass capacitors to reduce the coupled noise by providing low-impedance power sources local to the analog circuitry.
  - Connect low-ESR, 0.1-µF ceramic bypass capacitors between each supply pin and ground, placed as close to the device as possible. A single bypass capacitor from V+ to ground is applicable for singlesupply applications.
- Separate grounding for analog and digital portions of the circuitry is one of the simplest and most
  effective methods of noise suppression. One or more layers on multilayer PCBs are typically devoted to
  ground planes. A ground plane helps distribute heat and reduces EMI noise pickup. Take care to
  physically separate digital and analog grounds, paying attention to the flow of the ground current. For
  more detailed information, refer to Circuit Board Layout Techniques (SLOA089).
- To reduce parasitic coupling, run the input traces as far away from the supply or output traces as possible. If the traces cannot be kept separate, crossing the sensitive trace perpendicularly is much better than crossing in parallel with the noisy trace.
- Place the external components as close to the device as possible. Keep R<sub>F</sub> and R<sub>G</sub> close to the inverting input in order to minimize parasitic capacitance, as shown in Figure 25.
- Keep the length of input traces as short as possible. Remember that the input traces are the most sensitive part of the circuit.
- Consider a driven, low-impedance guard ring around the critical traces. A guard ring may significantly
  reduce leakage currents from nearby traces that are at different potentials.

#### 12.3 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on ti.com. In the upper right corner, click on *Alert me* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

#### 12.4 Community Resources

The following links connect to TI community resources. Linked contents are provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's Terms of Use.

TI E2E™ Online Community TI's Engineer-to-Engineer (E2E) Community. Created to foster collaboration among engineers. At e2e.ti.com, you can ask questions, share knowledge, explore ideas and help solve problems with fellow engineers.

**Design Support** *TI's Design Support* Quickly find helpful E2E forums along with design support tools and contact information for technical support.

#### 12.5 Trademarks

E2E is a trademark of Texas Instruments.

All other trademarks are the property of their respective owners.

#### 12.6 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

- (2) Material type: When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.
- (3) RoHS values: Yes, No, RoHS Exempt. See the TI RoHS Statement for additional information and value definition.

Production

- (4) Lead finish/Ball material: Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
- (5) MSL rating/Peak reflow: The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.
- (6) Part marking: There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

TSSOP (PW) | 14

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

- 1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.

  2. This drawing is subject to change without notice.

  3. This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not
- exceed 0.15 mm per side.
- 4. This dimension does not include interlead flash. Interlead flash shall not exceed 0.25 mm per side.
- 5. Reference JEDEC registration MO-153.

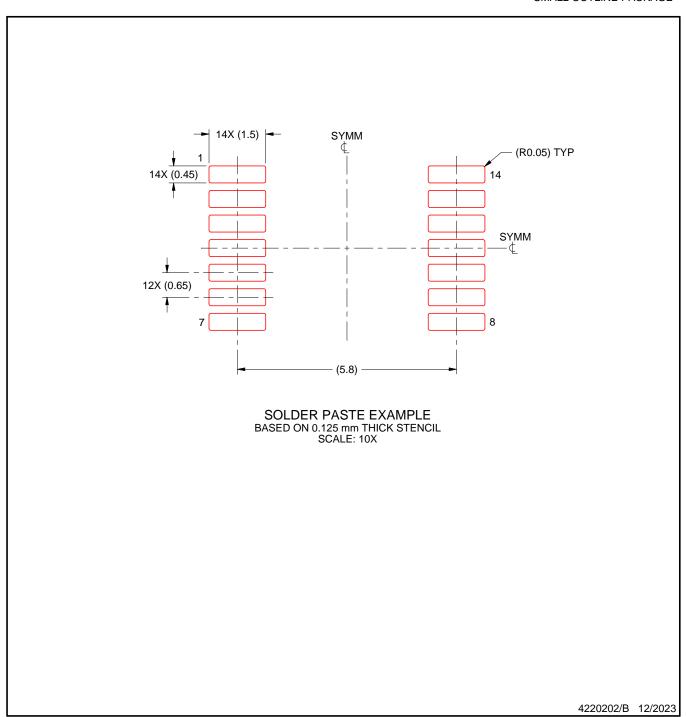

NOTES: (continued)

6. Publication IPC-7351 may have alternate designs.

7. Solder mask tolerances between and around signal pads can vary based on board fabrication site.

NOTES: (continued)

- 8. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
- 9. Board assembly site may have different recommendations for stencil design.

#### IMPORTANT NOTICE AND DISCLAIMER

TI PROVIDES TECHNICAL AND RELIABILITY DATA (INCLUDING DATASHEETS), DESIGN RESOURCES (INCLUDING REFERENCE DESIGNS), APPLICATION OR OTHER DESIGN ADVICE, WEB TOOLS, SAFETY INFORMATION, AND OTHER RESOURCES "AS IS" AND WITH ALL FAULTS, AND DISCLAIMS ALL WARRANTIES, EXPRESS AND IMPLIED, INCLUDING WITHOUT LIMITATION ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE OR NON-INFRINGEMENT OF THIRD PARTY INTELLECTUAL PROPERTY RIGHTS.

These resources are intended for skilled developers designing with TI products. You are solely responsible for (1) selecting the appropriate TI products for your application, (2) designing, validating and testing your application, and (3) ensuring your application meets applicable standards, and any other safety, security, regulatory or other requirements.

These resources are subject to change without notice. TI grants you permission to use these resources only for development of an application that uses the TI products described in the resource. Other reproduction and display of these resources is prohibited. No license is granted to any other TI intellectual property right or to any third party intellectual property right. TI disclaims responsibility for, and you fully indemnify TI and its representatives against any claims, damages, costs, losses, and liabilities arising out of your use of these resources.

TI's products are provided subject to TI's Terms of Sale, TI's General Quality Guidelines, or other applicable terms available either on ti.com or provided in conjunction with such TI products. TI's provision of these resources does not expand or otherwise alter TI's applicable warranties or warranty disclaimers for TI products. Unless TI explicitly designates a product as custom or customer-specified, TI products are standard, catalog, general purpose devices.

TI objects to and rejects any additional or different terms you may propose.
