2.8-W STEREO FULLY DIFFERENTIAL AUDIO POWER AMPLIFIER

FEATURES
- Ideal for Notebook PCs
- Fully Differential Architecture and High PSRR (-80 dB) Provide Excellent RF Rectification Immunity
- 2.8 W into 3 Ω from a 5-V Supply at THD = 10% (Typical)
- Very Low Crosstalk:
  - -100 dB Typical at 5 V, 3 Ω
- 2.5-V to 5.5-V Operating Range
- Low Supply Current:
  - 8 mA Typical at 5 V
  - Shutdown Current: 80-nA Typical
- Fast Startup (27 ms) With Minimal Pop
- Internal Feedback Resistors Reduce Component Count
- Thermally Enhanced QFN Packaging

APPLICATIONS
- Notebook PCs
- LCD TVs

DESCRIPTION
The TPA6020A2 is a 2.8-W stereo bridge-tied load (BTL) amplifier designed to drive stereo speakers with at least 3-Ω impedance. The device operates from 2.5 V to 5.5 V, drawing only 8 mA of quiescent supply current. The feedback resistors are internal, allowing the gain to be set with only two input resistors per channel. The amplifier's fully differential architecture performs with -80 dB of power supply rejection from 20 Hz to 2 kHz, improved RF rectification immunity, small PCB area, and a fast startup time with minimal pop, making the TPA6020A2 ideal for notebook PC applications.

APPLICATION CIRCUIT

A. \( C_{\text{RBYPASS}} \) and \( C_{\text{LBYPASS}} \) are optional.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.
These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

**ORDERING INFORMATION**

(1) Stresses beyond those listed under “absolute maximum ratings” may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under “recommended operating conditions” is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

(2) In accordance with JEDEC Standard 22, Test Method A114-B.

(3) In accordance with JEDEC Standard 22, Test Method C101-A

APPLICATION INFORMATION

STEREO OPERATION
The TPA6020A2 is a stereo amplifier that can be operated in either a mono or stereo configuration. Each channel has independent shutdown control, giving the user greater flexibility.

Bypass Capacitor Configuration
If Bypass capacitors are used, it is necessary to use separate bypass capacitors for each bypass pin. (See the section entitled Bypass Capacitor (C_{BYPASS}) and Start-Up Time)

VDD and Decoupling Capacitors
Each VDD pin must have a separate power supply decoupling capacitor (see section entitled Decoupling Capacitor (C_g)). A single, bulk decoupling capacitor is also recommended. Additionally, the left and right channel VDD pins must be tied together on the PCB.

FULLY DIFFERENTIAL AMPLIFIER
The TPA6020A2 is a fully differential amplifier with differential inputs and outputs. The fully differential amplifier consists of a differential amplifier and a common-mode amplifier. The differential amplifier ensures that the amplifier outputs a differential voltage that is equal to the differential input times the gain. The common-mode feedback ensures that the common-mode voltage at the output is biased around \( V_D/2 \) regardless of the common-mode voltage at the input.

Advantages of Fully Differential Amplifiers
- **Input coupling capacitors not required**: A fully differential amplifier with good CMRR, like the TPA6020A2, allows the inputs to be biased at voltage other than mid-supply. For example, if a DAC has a lower mid-supply voltage than that of the TPA6020A2, the common-mode feedback circuit compensates, and the outputs are still biased at the mid-supply point of the TPA6020A2. The inputs of the TPA6020A2 can be biased from 0.5 V to \( V_D \cdot 0.8 \) V. If the inputs are biased outside of that range, input-coupling capacitors are required.

- **Mid-supply bypass capacitor, \( C_{BYPASS} \), not required**: The fully differential amplifier does not require a bypass capacitor. Any shift in the mid-supply voltage affects both positive and negative channels equally, thus canceling at the differential output. Removing the bypass capacitor slightly worsens power supply rejection ratio (\( k_{SVR} \)), but a slight decrease of \( k_{SVR} \) may be acceptable when an additional component can be eliminated (see Figure 18).

- **Better RF-immunity**: GSM handsets save power by turning on and shutting off the RF transmitter at a rate of 217 Hz. The transmitted signal is picked up on input and output traces. The fully differential amplifier cancels the signal much better than the typical audio amplifier.

APPLICATION SCHEMATICS
Figure 26 through Figure 29 show application schematics for differential and single-ended inputs. Typical values are shown in Table 1.

Table 1. Typical Component Values

<table>

A. $C_{\text{LBYPASS}}$ and $C_{\text{RBYPASS}}$ are optional.

**Figure 28. Single-Ended Input Application Schematic**
Selecting Components

Resistors ($R_I$)

The input resistor ($R_I$) can be selected to set the gain of the amplifier according to Equation 1.

$$\text{Gain} = \frac{R_F}{R_I} \quad (1)$$

The internal feedback resistors ($R_F$) are trimmed to 40 kΩ.

Matching input resistors are important to fully differential amplifier applications. Resistor matching has a significant impact on CMRR and PSRR. If the input resistor values are poorly matched, then the CMRR and PSRR performance is diminished. Therefore, 1%-tolerance resistors or better are recommended to optimize performance.

Bypass Capacitor ($C_{\text{BYPASS}}$) and Start-Up Time

The internal voltage divider at the BYPASS pin of this device sets a mid-supply voltage for internal references and sets the output common-mode voltage to $V_{DD}/2$. Adding a capacitor filters any noise into this pin, increasing $k_{SVR}$. $C_{\text{BYPASS}}$ also determines the rise time of $V_{O+}$ and $V_{O-}$ when the device exits shutdown. The larger the capacitor, the slower the rise time.

Input Capacitor ($C_I$)

The TPA6020A2 does not require input coupling capacitors when driven by a differential input source biased from 0.5 V to $V_{DD} - 0.8$ V. Use 1% tolerance or better gain-setting resistors if not using input-coupling capacitors.
In the single-ended input application, an input capacitor, \( C_I \), is required to allow the amplifier to bias the input signal to the proper dc level. In this case, \( C_I \) and \( R_I \) form a high-pass filter with the corner frequency defined in Equation 2.

\[
f_c = \frac{1}{2\pi R_I C_I}
\]

(2)

The value of \( C_I \) is an important consideration. It directly affects the bass (low frequency) performance of the circuit. Consider the example where \( R_I = 10 \text{ k}\Omega \) and the specification calls for a flat bass response down to 100 Hz. Equation 2 is reconfigured as Equation 3.

\[
C_I = \frac{1}{2\pi R_I f_c}
\]

(3)

In this example, \( C_I = 0.16 \mu\text{F} \), so the likely choice ranges from 0.22 \( \mu\text{F} \) to 0.47 \( \mu\text{F} \). Ceramic capacitors are preferred because they are the best choice in preventing leakage current. When polarized capacitors are used, the positive side of the capacitor faces the amplifier input in most applications. The input dc level is held at \( V_{DD}/2 \), typically higher than the source dc level. It is important to confirm the capacitor polarity in the application.

**Band-Pass Filter (\( R_a, C_a, \) and \( C_b \))**

It may be desirable to have signal filtering beyond the one-pole high-pass filter formed by the combination of \( C_I \) and \( R_I \). A low-pass filter may be added by placing a capacitor (\( C_F \)) between the inputs and outputs, forming a band-pass filter.

An example of when this technique might be used would be in an application where the desirable pass-band range is between 100 Hz and 10 kHz, with a gain of 4 V/V. The following equations illustrate how the proper values of \( C_F \) and \( C_I \) can be determined.

**Step 1: Low-Pass Filter**

\[
f_c(\text{LPF}) = \frac{1}{2\pi R_F C_F}
\]

where \( R_F \) is the internal 40 \( \text{k}\Omega \) resistor

(4)

\[
f_c(\text{LPF}) = \frac{1}{2\pi 40 \text{ k}\Omega C_F}
\]

(5)

Therefore,

\[
C_F = \frac{1}{2\pi 40 \text{ k}\Omega f_c(\text{LPF})}
\]

(6)

Substituting 10 kHz for \( f_c(\text{LPF}) \) and solving for \( C_F \):

\( C_F = 398 \mu\text{F} \)

**Step 2: High-Pass Filter**

\[
f_c(\text{HPF}) = \frac{1}{2\pi R_I C_I}
\]

where \( R_I \) is the input resistor

(7)

Because the application in this case requires a gain of 4 V/V, \( R_I \) must be set to 10 k\( \Omega \).

Substituting \( R_I \) into Equation 6.

\[
f_c(\text{HPF}) = \frac{1}{2\pi 10 \text{ k}\Omega C_I}
\]

(8)

Therefore,

\[
C_I = \frac{1}{2\pi 10 \text{ k}\Omega f_c(\text{HPF})}
\]

(9)

Substituting 100 Hz for \( f_c(\text{HPF}) \) and solving for \( C_I \):

\( C_I = 0.16 \mu\text{F} \)

At this point, a first-order band-pass filter has been created with the low-frequency cutoff set to 100 Hz and the high-frequency cutoff set to 10 kHz.

The process can be taken a step further by creating a second-order high-pass filter. This is accomplished by placing a resistor (\( R_a \)) and capacitor (\( C_a \)) in the input path. It is important to note that \( R_a \) must be at least 10 times smaller than \( R_I \); otherwise its value has a noticeable effect on the gain, as \( R_a \) and \( R_I \) are in series.

**Step 3: Additional Low-Pass Filter**

\( R_a \) must be at least 10X smaller than \( R_I \);

Set \( R_a = 1 \text{ k}\Omega \)

\[
f_c(\text{LPF}) = \frac{1}{2\pi R_a C_a}
\]

(10)

Therefore,
\[ C_a = \frac{1}{2\pi 1k\Omega f_c(LPF)} \]  

(11)

Substituting 10 kHz for \( f_c(LPF) \) and solving for \( C_a \):

\[ C_a = 160 \, \text{pF} \]

Figure 30 is a bode plot for the band-pass filter in the previous example. Figure 29 shows how to configure the TPA6020A2 as a band-pass filter.

\[ V_{\text{rms}} = \frac{V_{O(PP)}^2}{2} \]

Power = \[ \frac{V_{\text{rms}}^2}{R_L} \]

(12)

**Decoupling Capacitor (C_s)**

The TPA6020A2 is a high-performance CMOS audio amplifier that requires adequate power supply decoupling to ensure the output total harmonic distortion (THD) is as low as possible. Power-supply decoupling also prevents oscillations for long lead lengths between the amplifier and the speaker. For higher frequency transients, spikes, or digital hash on the line, a good low equivalent-series-resistance (ESR) ceramic capacitor, typically 0.1 \( \mu \)F to 1 \( \mu \)F, placed as close as possible to the device \( V_{DD} \) lead works best. For filtering lower frequency noise signals, a 10-\( \mu \)F or greater capacitor placed near the audio power amplifier also helps, but is not required in most applications because of the high PSRR of this device.

**USING LOW-ESR CAPACITORS**

Low-ESR capacitors are recommended throughout this applications section. A real (as opposed to ideal) capacitor can be modeled simply as a resistor in series with an ideal capacitor. The voltage drop across this resistor minimizes the beneficial effects of the capacitor in the circuit. The lower the equivalent value of this resistance the more the real capacitor behaves like an ideal capacitor.

**DIFFERENTIAL OUTPUT VERSUS SINGLE-ENDED OUTPUT**

Figure 31 shows a Class-AB audio power amplifier (APA) in a fully differential configuration. The TPA6020A2 amplifier has differential outputs driving both ends of the load. One of several potential benefits to this configuration is power to the load. The differential drive to the speaker means that as one side is slewing up, the other side is slewing down, and vice versa. This effect doubles the voltage swing on the load as compared to a ground-referenced load. Plugging 2X \( V_{O(PP)} \) into the power equation, where voltage is squared, yields 4X the output power from the same supply rail and load impedance Equation 12.

In a typical wireless handset operating at 3.6 V, bridging raises the power into an 8-\( \Omega \) speaker from a single-ended (SE, ground reference) limit of 200 mW to 800 mW. This is a 6-dB improvement in sound power—loudness that can be heard. In addition to increased power, there are frequency-response concerns. Consider the single-supply SE configuration shown in Figure 32. A coupling capacitor (\( C_C \)) is required to block the dc-offset voltage from the load. This capacitor can be quite large (approximately 33 \( \mu \)F to 1000 \( \mu \)F) so it tends to be expensive, heavy, occupy valuable PCB area, and have the additional drawback of limiting low-frequency performance. This frequency-limiting effect is due to the high-pass filter network created with the speaker impedance and the coupling capacitance. This is calculated with Equation 13.
\[ f_c = \frac{1}{2\pi R_L C_C} \] (13)

For example, a 68-µF capacitor with an 8-Ω speaker would attenuate low frequencies below 293 Hz. The BTL configuration cancels the dc offsets, which eliminates the need for the blocking capacitors. Low-frequency performance is then limited only by the input network and speaker response. Cost and PCB space are also minimized by eliminating the bulky coupling capacitor.

Increasing power to the load does carry a penalty of increased internal power dissipation. The increased dissipation is understandable considering that the BTL configuration produces 4X the output power of the SE configuration.

**FULLY DIFFERENTIAL AMPLIFIER EFFICIENCY AND THERMAL INFORMATION**

Class-AB amplifiers are inefficient, primarily because of voltage drop across the output-stage transistors. The two components of this internal voltage drop are the headroom or dc voltage drop that varies inversely to output power, and the sine wave nature of the output. The total voltage drop can be calculated by subtracting the RMS value of the output voltage from \( V_{DD} \). The internal voltage drop multiplied by the average value of the supply current, \( I_{DD}(\text{avg}) \), determines the internal power dissipation of the amplifier.

An easy-to-use equation to calculate efficiency starts out as being equal to the ratio of power from the power supply to the power delivered to the load. To accurately calculate the RMS and average values of power in the load and in the amplifier, the current and voltage waveform shapes must first be understood (see Figure 33).

![Figure 32. Single-Ended Output and Frequency Response](image)

Although the voltages and currents for SE and BTL are sinusoidal in the load, currents from the supply are different between SE and BTL configurations. In an SE application the current waveform is a half-wave rectified shape, whereas in BTL it is a full-wave rectified waveform. This means RMS conversion factors are different. Keep in mind that for most of the waveform both the push and pull transistors are not on at the same time, which supports the fact that each amplifier in the BTL device only draws current from the supply for half the waveform. The following equations are the basis for calculating amplifier efficiency.
Efficiency of a BTL amplifier = \frac{P_L}{P_{SUP}}

Where:

\[ P_L = \frac{V_L \text{rms}^2}{R_L}, \text{ and } V_{LRMS} = \frac{V_p}{\sqrt{2}}, \text{ therefore, } P_L = \frac{V_p^2}{2R_L} \]

and \[ P_{SUP} = V_{DD} I_{DDavg} \] and \[ I_{DDavg} = \frac{1}{\pi} \int_0^\pi \frac{V_p}{R_L} \sin(t) \, dt = -\frac{1}{\pi} \times \frac{V_p}{R_L} \left[ \cos(t) \right]_0^\pi = \frac{2V_p}{\pi R_L} \]

Therefore,

\[ P_{SUP} = \frac{2V_{DD} V_P}{\pi R_L} \]

substituting \[ P_L \] and \[ P_{SUP} \] into equation 6,

Efficiency of a BTL amplifier = \frac{\frac{V_P^2}{2R_L}}{\frac{2V_{DD} V_P}{4V_{DD}}} = \frac{\pi V_P}{4V_{DD}}

Where:

\[ V_P = \sqrt{2P_L R_L} \]

Therefore,

\[ \eta_{BTL} = \frac{\pi \sqrt{2P_L R_L}}{4V_{DD}} \]

(14)

</table>

(1) Package limited to 85°C ambient
Table 2 employs Equation 15 to calculate efficiencies for four different output power levels. Note that the efficiency of the amplifier is quite low for lower power levels and rises sharply as power to the load is increased resulting in a nearly flat internal power dissipation over the normal operating range. Note that the internal dissipation at full output power is less than in the half power range. Calculating the efficiency for a specific system is the key to proper power supply design. For a 2.8-W audio system with 3-Ω loads and a 5-V supply, the maximum draw on the power supply is almost 8.8 W.

A final point to remember about Class-AB amplifiers is how to manipulate the terms in the efficiency equation to the utmost advantage when possible. Note that in Equation 15, \( V_{DD} \) is in the denominator. This indicates that as \( V_{DD} \) goes down, efficiency goes up.

A simple formula for calculating the maximum power dissipated, \( P_{D\text{max}} \), may be used for a stereo, differential output application:

\[
P_{D\text{max}} = \frac{4 \, V_{DD}^2}{\pi \, R_L}
\]

(16)

\( P_{D\text{max}} \) for a 5-V, 4-Ω system is 2.53 W.

The maximum ambient temperature depends on the heat sinking ability of the PCB system. The derating factor for the 5 mm x 5 mm QFN package is shown in the dissipation rating table. Converting this to \( \theta_{JA} \):

\[
\theta_{JA} = \frac{1}{\text{Derating Factor}} = \frac{1}{0.2398} = 41.7^\circ C/W
\]

(17)

Given \( \theta_{JA} \), the maximum allowable junction temperature, and the maximum internal dissipation, the maximum ambient temperature can be calculated with Equation 18. The maximum recommended junction temperature for the TPA6020A2 is 150°C.

\[
T_A\text{ Max} = T_J\text{ Max} - \theta_{JA} \cdot P_D\text{ Max}
\]

\[= 150 - 41.7(2.53) = 44.5^\circ C/W\]

(18)

Equation 18 shows that the maximum ambient temperature is 44.5°C at maximum power dissipation with a 5-V supply.

Table 2 shows that for most applications no airflow is required to keep junction temperatures in the specified range. The TPA6020A2 is designed with thermal protection that turns the device off when the junction temperature surpasses 150°C to prevent damage to the IC. In addition, using speakers with an impedance higher than 4 Ω dramatically increases the thermal performance by reducing the output current.

The TPA6020A2 is capable of driving impedances as low as 3 Ω, but special layout techniques must be considered in order to achieve optimal performance. In a 5-V, 3-Ω stereo system, the maximum ambient temperature is just 9.1°C. To increase the maximum ambient temperature, \( \theta_{JA} \) has to be reduced. This is achieved by increasing the amount of copper on the board. Using 3 oz. or 4 oz. copper, and/or additional layers, increases the thermal performance of the device.

(1) The marketing status values are defined as follows:
- **ACTIVE**: Product device recommended for new designs.
- **LIFEBUY**: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
- **NRND**: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
- **PREVIEW**: Device has been announced but is not in production. Samples may or may not be available.
- **OBSOLETE**: TI has discontinued the production of the device.

(2) RoHS: TI defines “RoHS” to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, “RoHS” products are suitable for use in specified lead-free processes. TI may reference these types of products as “Pb-Free”.
- **RoHS Exempt**: TI defines “RoHS Exempt” to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.
- **Green**: TI defines “Green” to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a “~” will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

NOTES:  
A. All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5–1994. 
B. This drawing is subject to change without notice. 
C. Quad Flat pack, No–leads (QFN) package configuration 
D. The package thermal pad must be soldered to the board for thermal and mechanical performance. 
E. See the additional figure in the Product Data Sheet for details regarding the exposed thermal pad features and dimensions. 
F. Falls within JEDEC MO–220.
THERMAL INFORMATION

This package incorporates an exposed thermal pad that is designed to be attached directly to an external heatsink. The thermal pad must be soldered directly to the printed circuit board (PCB). After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For information on the Quad Flatpack No-Lead (QFN) package and its advantages, refer to Application Report, QFN/SON PCB Attachment, Texas Instruments Literature No. SLUA271. This document is available at www.ti.com.

The exposed thermal pad dimensions for this package are shown in the following illustration.

Refer to Application Note, QFN Packages, Texas Instruments Literature No. SLUA271, and also the Product Data Sheets for specific thermal information, via requirements, and recommended board layout. These documents are available at www.ti.com.  
E. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC 7525 for stencil design considerations.  
F. Customers should contact their board fabrication site for solder mask tolerances.
IMPORTANT NOTICE AND DISCLAIMER

TI PROVIDES TECHNICAL AND RELIABILITY DATA (INCLUDING DATASHEETS), DESIGN RESOURCES (INCLUDING REFERENCE DESIGNS), APPLICATION OR OTHER DESIGN ADVICE, WEB TOOLS, SAFETY INFORMATION, AND OTHER RESOURCES “AS IS” AND WITH ALL FAULTS, AND DISCLAIMS ALL WARRANTIES, EXPRESS AND IMPLIED, INCLUDING WITHOUT LIMITATION ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE OR NON-INFRINGEMENT OF THIRD PARTY INTELLECTUAL PROPERTY RIGHTS.

These resources are intended for skilled developers designing with TI products. You are solely responsible for (1) selecting the appropriate TI products for your application, (2) designing, validating and testing your application, and (3) ensuring your application meets applicable standards, and any other safety, security, or other requirements. These resources are subject to change without notice. TI grants you permission to use these resources only for development of an application that uses the TI products described in the resource. Other reproduction and display of these resources is prohibited. No license is granted to any other TI intellectual property right or to any third party intellectual property right. TI disclaims responsibility for, and you will fully indemnify TI and its representatives against, any claims, damages, costs, losses, and liabilities arising out of your use of these resources.

TI’s products are provided subject to TI’s Terms of Sale (www.ti.com/legal/termsofsale.html) or other applicable terms available either on ti.com or provided in conjunction with such TI products. TI’s provision of these resources does not expand or otherwise alter TI’s applicable warranties or warranty disclaimers for TI products.
