FEATURES

- 900MHz −3dB bandwidth (A<sub>IN</sub> = 1)
- Large signal bandwidth and slew rate 100% tested
- 280MHz −3dB bandwidth (A<sub>IN</sub> = +2, V<sub>OUT</sub> = 2V<sub>PP</sub>)
- 90mA linear output current
- 1400V/μs slew rate
- Unity gain stable
- <1mA input Offset voltage
- 7mA Supply current (no load)
- 6.6V to 12V supply voltage range
- 0.01%/0.026° differential gain/phase PAL
- 3.1nV√Hz voltage noise
- Improved replacement for CLC440, CL420, CL426

APPLICATIONS

- Test equipment
- IF/RF amplifier
- A/D Input driver
- Active filter
- Integrator
- DAC output buffer
- TI’s Transimpedance amplifier

DESCRIPTION

The LMH6609 is an ultra wideband, unity gain stable, low power, voltage feedback op amp that offers 900MHz bandwidth at a gain of 1, 1400V/μs slew rate and 90mA of linear output current.

The LMH6609 is designed with voltage feedback architecture for maximum flexibility especially for active filters and integrators. The LMH6609 has balanced, symmetrical inputs with well-matched bias currents and minimal offset voltage.

With Differential Gain of 0.01% and Differential Phase of 0.026° the LMH6609 is suited for video applications. The 90mA of linear output current makes the LMH6609 suitable for multiple video loads and cable driving applications as well.

The supply voltage is specified at 6.6V and 10V. A low supply current of 7mA (at 10V supply) makes the LMH6609 useful in a wide variety of platforms, including portable or remote equipment that must run from battery power.

The LMH6609 is available in the industry standard 8-pin SOIC package and in the space-saving 5-pin SOT-23 package. The LMH6609 is specified for operation over the -40°C to +85°C temperature range. The LMH6609 is manufactured in state-of-the-art VIP10™ technology for high performance.

Typical Application

\[
K = 1 + \frac{R_F}{R_G}, \quad Q = \frac{m}{1 + m^2(2-K)}, \quad \omega_n = \frac{1}{mRC}
\]

Q, K ARE UNITLESS.

\(\omega_n\) IS RELATED TO BANDWIDTH AND IS IN UNITS OF
RADUANS/SEC. DIVIDE \(\omega_n\) BY 2π TO GET IT IN Hz.

REFER TO OA-26 FOR MORE INFORMATION.

Figure 1. Sallen Key Low Pass Filter with Equal C Value
These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

### Absolute Maximum Ratings (1)

</tbody>
</table>

(1) Absolute Maximum Ratings indicate limits beyond which damage to the device may occur. Operating Ratings indicate conditions for which the device is intended to be functional. For specifications, see the Electrical Characteristics tables.

(2) The maximum output current ($I_{OUT}$) is determined by device power dissipation limitations. See the Power Dissipation section of the Application Section for more details.

(3) Human body model, 1.5kΩ in series with 100pF. Machine model, 0Ω In series with 200pF.

Product Folder Links: LMH6609
APPLICATION INFORMATION

GENERAL DESIGN EQUATION

The LMH6609 is a unity gain stable voltage feedback amplifier. The matched input bias currents track well over temperature. This allows the DC offset to be minimized by matching the impedance seen by both inputs.

GAIN

The non-inverting and inverting gain equations for the LMH6609 are as follows:

NON-INVERTING GAIN : 1+$ \frac{R_F}{R_G}$

INVERTING GAIN : $- \frac{R_F}{R_G}$

$$AV = 1 + \frac{R_F}{R_G}$$

Figure 32. Typical Non-Inverting Application
Figure 33. Typical Inverting Application

Note: $R_B$, provides DC bias for non-inverting input.

$R_B$, $R_L$ and $R_T$ are tied to $V^+$/2 for minimum power consumption and maximum output swing.

Figure 34. Single Supply Inverting

$\frac{V_{OUT}}{V_{IN}} = A_V = -\frac{R_F}{R_G}$ Select $R_T$ to yield desired $R_{IN} = R_T||R_G$
GAIN BANDWIDTH PRODUCT

The LMH6609 is a voltage feedback amplifier, whose closed-loop bandwidth is approximately equal to the gain-bandwidth product (GBP) divided by the gain ($A_V$). For gains greater than 5, $A_V$ sets the closed-loop bandwidth of the LMH6609.

$$\text{CLOSED LOOP BANDWIDTH} = \frac{\text{GBP}}{A_V}$$

$$A_V = \frac{(R_F + R_G)}{R_G}$$

$$\text{GBP} = 240\text{MHz}$$

(2)

For gains less than 5, refer to the frequency response plots to determine maximum bandwidth. For large signal bandwidth the slew rate is a more accurate predictor of bandwidth.

$$f_{\text{MAX}} = \frac{S_R}{2\pi V_P}$$

(3)

Where $f_{\text{MAX}} = \text{bandwidth}$, $S_R = \text{Slew rate}$ and $V_P = \text{peak amplitude}$.

OUTPUT DRIVE AND SETTLING TIME PERFORMANCE

The LMH6609 has large output current capability. The 100mA of output current makes the LMH6609 an excellent choice for applications such as:

- Video Line Drivers
- Distribution Amplifiers
When driving a capacitive load or coaxial cable, include a series resistance \( R_{\text{OUT}} \) to back match or improve settling time. Refer to the Driving Capacitive Loads section for guidance on selecting an output resistor for driving capacitive loads.

**EVALUATION BOARDS**

TI offers the following evaluation boards as a guide for high frequency layout and as an aid in device testing and characterization. Many of the data sheet plots were measured with these boards.

<table>

</tr>
</tbody>
</table>

**CIRCUIT LAYOUT CONSIDERATION**

A proper printed circuit layout is essential for achieving high frequency performance. TI provides evaluation boards for the LMH6609 as shown above. These boards were laid out for optimum, high-speed performance. The ground plane was removed near the input and output pins to reduce parasitic capacitance. Also, all trace lengths were minimized to reduce series inductances.

Supply bypassing is required for the amplifiers performance. The bypass capacitors provide a low impedance return current path at the supply pins. They also provide high frequency filtering on the power supply traces. 10\( \mu \)F tantalum and .01\( \mu \)F capacitors are recommended on both supplies (from supply to ground). In addition, a 0.1\( \mu \)F ceramic capacitor can be added from V\(^+\) to V\(^-\) to aid in second harmonic suppression.

![Figure 36. Driving Capacitive Loads with \( R_{\text{OUT}} \) for Improved Stability](image)

**DRIVING CAPACITIVE LOADS**

Capacitive output loading applications will benefit from the use of a series output resistor \( R_{\text{OUT}} \). Figure 36 shows the use of a series output resistor, \( R_{\text{OUT}} \) as it might be applied when driving an analog to digital converter. The charts “Suggested \( R_O \) vs. Cap Load” in the Typical Performance Section give a recommended value for mitigating capacitive loads. The values suggested in the charts are selected for .5dB or less of peaking in the frequency response. This gives a good compromise between settling time and bandwidth. For applications where maximum frequency response is needed and some peaking is tolerable, the value of \( R_O \) can be reduced slightly from the recommended values. There will be amplitude lost in the series resistor unless the gain is adjusted to compensate; this effect is most noticeable with heavy resistive loads.
COMPONENT SELECTION AND FEEDBACK RESISTOR

Surface mount components are highly recommended for the LMH6609. Leaded components will introduce unpredictable parasitic loading that will interfere with proper device operation. Do not use wire wound resistors.

The LMH6609 operates best with a feedback resistor of approximately 250Ω for all gains of +2 and greater and for −1 and less. With lower gains in particular, large value feedback resistors will exaggerate the effects of parasitic capacitances and may lead to ringing on the pulse response and frequency response peaking. Large value resistors also add undesirable thermal noise. Feedback resistors that are much below 100Ω will load the output stage, which will reduce voltage output swing, increase device power dissipation, increase distortion and reduce current available for driving the load.

In the buffer configuration the output should be shorted directly to the inverting input. This feedback does not load the output stage because the inverting input is a high impedance point and there is no gain set resistor to ground.

OPTIMIZING DC ACCURACY

The LMH6609 offers excellent DC accuracy. The well-matched inputs of this amplifier allows even better performance if care is taken to balance the impedances seen by the two inputs. The parallel combination of the gain setting $R_G$ and feedback $R_F$ resistors should be equal to $R_{SEQ}$, the resistance of the source driving the op amp in parallel with any terminating Resistor (See Figure 32). Combining this with the non inverting gain equation gives the following parameters:

$$R_F = \frac{AV_{RSEQ}}{R_G}$$

For Inverting gains the bias current cancellation is accomplished by placing a resistor $R_B$ on the non-inverting input equal in value to the resistance seen by the inverting input (See Figure 33). $R_B = R_F \parallel (R_G + R_S)$

The additional noise contribution of $R_B$ can be minimized by the use of a shunt capacitor (not shown).

POWER DISSIPATION

The LMH6609 has the ability to drive large currents into low impedance loads. Some combinations of ambient temperature and device loading could result in device overheating. For most conditions peak power values are not as important as RMS powers. To determine the maximum allowable power dissipation for the LMH6609 use the following formula:

$$P_{MAX} = \frac{(150^\circ - T_{AMB})}{\theta_{JA}}$$

Where $T_{AMB}$ = Ambient temperature (°C) and $\theta_{JA}$ = Thermal resistance, from junction to ambient, for a given package (°C/W). For the SOIC package $\theta_{JA}$ is 148°C/W, for the SOT-23 it is 250°C/W. 150°C is the absolute maximum limit for the internal temperature of the device.

Either forced air cooling or a heat sink can greatly increase the power handling capability for the LMH6609.

VIDEO PERFORMANCE

The LMH6609 has been designed to provide good performance with both PAL and NTSC composite video signals. The LMH6609 is specified for PAL signals. NTSC performance is typically marginally better due to the lower frequency content of the signal. Performance degrades as the loading is increased, therefore best performance will be obtained with back-terminated loads. The back termination reduces reflections from the transmission line and effectively masks transmission line and other parasitic capacitances from the amplifier output stage. This means that the device should be configured for a gain of 2 in order to have a net gain of 1 after the terminating resistor. (See Figure 37)
ESD PROTECTION

The LMH6609 is protected against electrostatic discharge (ESD) on all pins. The LMH6609 will survive 2000V Human Body model or 200V Machine model events.

Under closed loop operation the ESD diodes have no effect on circuit performance. There are occasions, however, when the ESD diodes may be evident. For instance, if the amplifier is powered down and a large input signal is applied the ESD diodes will conduct.

TRANSIMPEDANCE AMPLIFIER

The low input current noise and unity gain stability of the LMH6609 make it an excellent choice for transimpedance applications. Figure 38 illustrates a low noise transimpedance amplifier that is commonly implemented with photo diodes. $R_F$ sets the transimpedance gain. The photo diode current multiplied by $R_F$ determines the output voltage.

The capacitances are defined as:

- $C_D =$ Equivalent Diode Capacitance
- $C_F =$ Feedback Capacitance

The feedback capacitor is used to give optimum flatness and stability. As a starting point the feedback capacitance should be chosen as $\frac{1}{2}$ of the Diode capacitance. Lower feedback capacitors will peak frequency response.
Rectifier

The large bandwidth of the LMH6609 allows for high-speed rectification. A common rectifier topology is shown in Figure 39. $R_1$ and $R_2$ set the gain of the rectifier.

(1) The marketing status values are defined as follows:
**ACTIVE**: Product device recommended for new designs.
**LIFEBUY**: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
**NRND**: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
**PREVIEW**: Device has been announced but is not in production. Samples may or may not be available.
**OBSOLETE**: TI has discontinued the production of the device.

(2) **RoHS**: TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt**: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green**: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) **MSL, Peak Temp.** - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.
Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

**TAPE AND REEL INFORMATION**

### TAPE DIMENSIONS
- **A0** Dimension designed to accommodate the component width
- **B0** Dimension designed to accommodate the component length
- **K0** Dimension designed to accommodate the component thickness
- **W** Overall width of the carrier tape
- **P1** Pitch between successive cavity centers

### REEL DIMENSIONS
- Reel Diameter
- Reel Width (W1)

### QUADRANT ASSIGNMENTS FOR PIN 1 ORIENTATION IN TAPE
- Sprocket Holes
- User Direction of Feed
- Pocket Quadrants
