CC1201 Low-Power, High-Performance RF Transceiver

1 Device Overview

1.1 Features

• RF Performance and Analog Features:
  – High-Performance, Single-Chip Transceiver
    • Excellent Receiver Sensitivity:
      – –120 dBm at 1.2 kbps
      – –109 dBm at 50 kbps
    – Blocking Performance: 85 dB at 10 MHz
    – Adjacent Channel Selectivity: Up to 62 dB at 50-kHz Offset
    – Very Low Phase Noise: –114 dBc/Hz at 10-kHz Offset (169 MHz)
    – Programmable Output Power Up to +16 dBm With 0.4-dB Step Size
  – Automatic Output Power Ramping
  – Supported Modulation Formats: 2-FSK, 2-GFSK, 4-FSK, 4-GFSK, MSK, OOK
  – Supports Data Rate Up to 1.25 Mbps in Transmit and Receive
  – Low Current Consumption:
    – Enhanced Wake-On-Radio (eWOR) Functionality for Automatic Low-Power Receive Polling
    – Power Down: 0.12 μA (0.5 μA With eWOR Timer Active)
      • RX: 0.5 mA in RX Sniff Mode
      • RX: 19 mA Peak Current in Low-Power Mode
      • RX: 23 mA Peak Current in High-Performance Mode
      • TX: 46 mA at +14 dBm
  – Digital Features:
    – WaveMatch: Advanced Digital Signal Processing for Improved Sync Detect Performance
    – Autonomous Image Removal
    – Security: Hardware AES128 Accelerator
    – Data FIFOs: Separate 128-Byte RX and TX
    – Includes Functions for Antenna Diversity Support
    – Support for Retransmission
    – Support for Auto-Acknowledge of Received Packets
    – Automatic Clear Channel Assessment (CCA) for Listen-Before-Talk (LBT) Systems
    – Built-in Coding Gain Support for Increased Range and Robustness
    – Digital RSSI Measurement
    – Improved OOK Shaping for Less Occupied Bandwidth, Enabling Higher Output Power While Meeting Regulatory Requirements
  – Dedicated Packet Handling for 802.15.4g:
    – CRC 16/32
    – FEC, Dual Sync Detection (FEC and non-FEC Packets)
    – Whitening
  – General:
    – RoHS-Compliant 5-mm × 5-mm No-Lead QFN 32-Pin Package (RHB)
    – Pin-Compatible With the CC1120 Device
  – Regulations – Suitable for Systems Targeting Compliance With:
    – Europe: ETSI EN 300 220
    – US: FCC CFR47 Part 15
    – Japan: ARIB STD-T108

1.2 Applications

• Low-Power, High-Performance, Wireless Systems With Data Rate up to 1250 kbps
• ISM/SRD Bands: 169, 433, 868, 915, and 920 MHz
• Possible Support for Additional Frequency Bands: 137 to 158.3 MHz, 205 to 237.5 MHz, and 274 to 316.6 MHz
• Smart Metering (AMR/AMI)
• Home and Building Automation
• Wireless Alarm and Security Systems
• Industrial Monitoring and Control
• Wireless Healthcare Applications
• Wireless Sensor Networks and Active RFID
• IEEE 802.15.4g Applications

An IMPORTANT NOTICE at the end of this data sheet addresses availability, warranty, changes, use in safety-critical applications, intellectual property matters and other important disclaimers. PRODUCTION DATA.
1.3 Description

The CC1201 device is a fully integrated single-chip radio transceiver designed for high performance at very low-power and low-voltage operation in cost-effective wireless systems. All filters are integrated, thus removing the need for costly external SAW and IF filters. The device is mainly intended for the ISM (Industrial, Scientific, and Medical) and SRD (Short Range Device) frequency bands at 164–190 MHz, 410–475 MHz, and 820–950 MHz.

The CC1201 device provides extensive hardware support for packet handling, data buffering, burst transmissions, clear channel assessment, link quality indication, and Wake-On-Radio. The main operating parameters of the CC1201 device can be controlled through an SPI interface. In a typical system, the CC1201 device will be used with a microcontroller and only few external passive components.

The CC1201 offers the same performance as the CC1200 for channel filter bandwidths of 50 kHz or more, and therefore presents a lower cost option for applications that do not require narrowband support.

</tbody>
</table>

(1) Stresses beyond those listed under absolute maximum ratings may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under recommended operating conditions is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

(2) All voltage values are with respect to \(V_{SS}\), unless otherwise noted.

4.2 Handling Ratings

<td>–2</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Charged device model (CDM), per JESD22-C101(^{(2)})</td>
<td>All pins</td>
</tr>
</tbody>
</table>

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

(2) JEDEC document JEP157 states that 250-V HBM allows safe manufacturing with a standard ESD control process.

4.10 Receive Parameters

All RX measurements made at the antenna connector, to a bit error rate (BER) limit of 1%. Selectivity and blocking is measured with the desired signal 3 dB above the sensitivity level.

4.10.1 General Receive Parameters (High-Performance Mode)

\( T_A = 25^\circ C, \ VDD = 3.0 \ V, \ f_c = 869.5 \ MHz \) (unless otherwise noted)

4.13 Wake-up and Timing

\[ T_A = 25^\circ C, \ VDD = 3.0 \ V, \ f_c = 869.5 \ MHz \] (unless otherwise noted)

The turnaround behavior to and from RX and/or TX is highly configurable, and the time it takes will depend on how the device is set up. See the CC120X user guide (SWRU346) for more information.

5 Detailed Description

5.1 Block Diagram

Figure 5-1 shows the system block diagram of the CC120x family of devices.

![System Block Diagram](image)

Figure 5-1. System Block Diagram

5.2 Frequency Synthesizer

At the center of the CC1201 device there is a fully integrated, fractional-N, ultra-high-performance frequency synthesizer. The frequency synthesizer is designed for excellent phase noise performance, providing very high selectivity and blocking performance. The system is designed to comply with the most stringent regulatory spectral masks at maximum transmit power.

Either a crystal can be connected to XOSC_Q1 and XOSC_Q2, or a TCXO can be connected to the EXT_XOSC input. The oscillator generates the reference frequency for the synthesizer, as well as clocks for the analog-to-digital converter (ADC) and the digital part. To reduce system cost, the CC1201 device has high-accuracy frequency estimation and compensation registers to measure and compensate for crystal inaccuracies. This compensation enables the use of lower cost crystals. If a TCXO is used, the CC1201 device automatically turns on and off the TCXO when needed to support low-power modes and Wake-On-Radio operation.
5.3 Receiver

The CC1201 device features a highly flexible receiver. The received RF signal is amplified by the low-noise amplifier (LNA) and is down-converted in quadrature (I/Q) to the intermediate frequency (IF). At IF, the I/Q signals are digitized by the high dynamic-range ADCs.

An advanced automatic gain control (AGC) unit adjusts the front-end gain, and enables the CC1201 device to receive strong and weak signals, even in the presence of strong interferers. High-attenuation channel and data filtering enable reception with strong neighbor channel interferers. The I/Q signal is converted to a phase and magnitude signal to support the FSK and OOK modulation schemes.

NOTE

A unique I/Q compensation algorithm removes any problem of I/Q mismatch, thus avoiding time-consuming and costly I/Q image calibration steps.

5.4 Transmitter

The CC1201 transmitter is based on direct synthesis of the RF frequency (in-loop modulation). To use the spectrum effectively, the CC1201 device has extensive data filtering and shaping in TX mode to support high throughput data communication in narrowband channels. The modulator also controls power ramping to remove issues such as spectral splattering when driving external high-power RF amplifiers.

5.5 Radio Control and User Interface

The CC1201 digital control system is built around the main radio control (MARC), which is implemented using an internal high-performance, 16-bit ultra-low-power processor. MARC handles power modes, radio sequencing, and protocol timing.

A 4-wire SPI serial interface is used for configuration, strobe commands, and FIFO access. The digital baseband includes support for channel configuration, packet handling, and data buffering. The host MCU can stay in sleep mode until a valid RF packet is received. This greatly reduces power consumption. When the host MCU receives a valid RF packet, it burst-reads the data. This reduces the required computing power.

The CC1201 radio control and user interface are based on the widely used CC1101 transceiver. This relationship enables an easy transition between the two platforms. The command strobes and the main radio states are the same for the two platforms.

For legacy formats, the CC1201 device also supports two serial modes.

- **Synchronous serial mode:** The CC1201 device performs bit synchronization and provides the MCU with a bit clock with associated data.
- **Transparent mode:** The CC1201 device outputs the digital baseband signal using a digital interpolation filter to eliminate jitter introduced by digital filtering and demodulation.

5.6 Enhanced Wake-On-Radio (eWOR)

eWOR, using a flexible integrated sleep timer, enables automatic receiver polling with no intervention from the MCU. When the CC1201 device enters RX mode, it listens and then returns to sleep if a valid RF packet is not received. The sleep interval and duty cycle can be configured to make a trade-off between network latency and power consumption. Incoming messages are time-stamped to simplify timer re-synchronization.

The eWOR timer runs off an ultra-low-power RC oscillator. To improve timing accuracy, the RC oscillator can be automatically calibrated to the RF crystal in configurable intervals.
5.7 RX Sniff Mode

The CC1201 device supports quick start up times, and requires few preamble bits. RX Sniff Mode uses these conditions to dramatically reduce the current consumption while the receiver is waiting for data.

Because the CC1201 device can wake up and settle much faster than the duration of most preambles, it is not required to be in RX mode continuously while waiting for a packet to arrive. Instead, the Enhanced Wake On Radio feature can be used to put the device into sleep mode periodically. By setting an appropriate sleep time, the CC1201 device can wake up and receive the packet when it arrives with no performance loss. This sequence removes the need for accurate timing synchronization between transmitter and receiver, and lets the user trade off current consumption between the transmitter and receiver.

For more information, see the sniff mode design note (SWRA428).

5.8 Antenna Diversity

Antenna diversity can increase performance in a multipath environment. An external antenna switch is required. The CC1201 device uses one of the GPIO pins to automatically control the switch. This device also supports differential output control signals typically used in RF switches.

If antenna diversity is enabled, the GPIO alternates between high and low states until a valid RF input signal is detected. An optional acknowledge packet can be transmitted without changing the state of the GPIO.

An incoming RF signal can be validated by received signal strength or by using the automatic preamble detector. Using the automatic preamble detector ensures a more robust system and avoids the need to set a defined signal strength threshold (such a threshold sets the sensitivity limit of the system).
5.9 WaveMatch

Advanced capture logic locks onto the synchronization word and does not require preamble settling bytes. Therefore, receiver settling time is reduced to the settling time of the AGC, typically 4 bits.

The WaveMatch feature also greatly reduces false sync triggering on noise, further reducing the power consumption and improving sensitivity and reliability. The same logic can also be used as a high-performance preamble detector to reliably detect a valid preamble in the channel.

See swrc046 for more information.

Figure 5-2. Receiver Configurator in SmartRF™ Studio
6 Typical Application Circuit

NOTE
This section is intended only as an introduction.

Very few external components are required for the operation of the CC1201 device. Figure 6-1 shows a typical application circuit. The board layout will greatly influence the performance of the CC1201 device. Figure 6-1 does not show decoupling capacitors for power pins.

Figure 6-1. Typical Application Circuit

For more information, see the reference designs available for the CC1201 device in Section 7.2, Documentation Support.
7 Device and Documentation Support

7.1 Device Support

7.1.1 Development Support

7.1.1.1 Configuration Software

The CC1201 device can be configured using the SmartRF Studio software (SWRC046). The SmartRF Studio software is highly recommended for obtaining optimum register settings, and for evaluating performance and functionality.

7.1.2 Device and Development-Support Tool Nomenclature

To designate the stages in the product development cycle, TI assigns prefixes to the part numbers of all microprocessors (MPUs) and support tools. Each device has one of three prefixes: X, P, or null (no prefix) (for example, CC1201). Texas Instruments recommends two of three possible prefix designators for its support tools: TMDX and TMDS. These prefixes represent evolutionary stages of product development from engineering prototypes (TMDX) through fully qualified production devices and tools (TMDS).

Device development evolutionary flow:

- **X** Experimental device that is not necessarily representative of the final device's electrical specifications and may not use production assembly flow.
- **P** Prototype device that is not necessarily the final silicon die and may not necessarily meet final electrical specifications.
- **null** Production version of the silicon die that is fully qualified.

Support tool development evolutionary flow:

- **TMDX** Development-support product that has not yet completed Texas Instruments internal qualification testing.
- **TMDS** Fully qualified development-support product.

X and P devices and TMDX development-support tools are shipped against the following disclaimer:

"Developmental product is intended for internal evaluation purposes."

Production devices and TMDS development-support tools have been characterized fully, and the quality and reliability of the device have been demonstrated fully. TI’s standard warranty applies.

Predictions show that prototype devices (X or P) have a greater failure rate than the standard production devices. Texas Instruments recommends that these devices not be used in any production system because their expected end-use failure rate still is undefined. Only qualified production devices are to be used.

TI device nomenclature also includes a suffix with the device family name. This suffix indicates the package type (for example, RHB), the temperature range (for example, blank is the default commercial temperature range), and the device speed range, in megahertz. provides a legend for reading the complete device name for any CC1201 device.

For orderable part numbers of CC1201 devices in the QFN package types, see the Package Option Addendum of this document, the TI website (www.ti.com), or contact your TI sales representative.
7.2 Documentation Support
The following documents describe the CC1201 processor. Copies of these documents are available on the Internet at www.ti.com. *Tip:* Enter the literature number in the search box provided at www.ti.com.

- **SWRR106**  CC112x IPC 868- and 915-MHz 2-layer Reference Design
- **SWRR107**  CC112x IPC 868- and 915-MHz 4-layer Reference Design
- **SWRR122**  CC1201EM 420- to 470-MHz Reference Design
- **SWRR121**  CC1201EM 868- to 930-MHz Reference Design

7.3 Community Resources
The following links connect to TI community resources. Linked contents are provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's Terms of Use.

- **TI E2E™ Online Community**  *TI's Engineer-to-Engineer (E2E) Community.* Created to foster collaboration among engineers. At e2e.ti.com, you can ask questions, share knowledge, explore ideas and help solve problems with fellow engineers.
- **TI Embedded Processors Wiki**  *Texas Instruments Embedded Processors Wiki.* Established to help developers get started with Embedded Processors from Texas Instruments and to foster innovation and growth of general knowledge about the hardware and software surrounding these devices.

7.4 Trademarks
SmartRF, E2E are trademarks of Texas Instruments.
All other trademarks are the property of their respective owners.

7.5 Electrostatic Discharge Caution
This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

7.6 Glossary

**SLYZ022**  — *TI Glossary.*
This glossary lists and explains terms, acronyms, and definitions.
8 Mechanical Packaging and Orderable Information

The following pages include mechanical packaging and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

</tbody>
</table>

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBsolete: TI has discontinued the production of the device.

(2) RoHS: TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".
RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.
Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.
