## ADC3564 14-Bit, 125-MSPS, Low-Noise, Ultra-Low Power ADC

## 1 Features

- 14-Bit 125 MSPS ADC
- Noise floor: - $156 \mathrm{dBFS} / \mathrm{Hz}$
- Ultra low power: 137 mW at 125 Msps
- Latency: $\leq 2$ clock cycles
- Specified 14-bit, no missing codes
- INL: $\pm 1.5$ LSB; DNL: $\pm 0.5$ LSB
- Reference: external or internal
- Input bandwidth: 1200 MHz (3 dB)
- Industrial temperature range: $-40^{\circ} \mathrm{C}$ to $+105^{\circ} \mathrm{C}$
- On-chip digital filter (optional)
- Decimation by $2,4,8,16,32$
- 32-bit NCO
- Serial LVDS digital interface (2-, 1- and 1/2-wire)
- Small footprint: 40-WQFN ( $5 \mathrm{~mm} \times 5 \mathrm{~mm}$ ) package
- Spectral performance ( $\mathrm{f}_{\mathrm{IN}}=10 \mathrm{MHz}$ ):
- SNR: 77.5 dBFS
- SFDR: 80-dBc HD2, HD3
- SFDR: 95-dBFS worst spur
- Spectral performance ( $\mathrm{f}_{\mathrm{IN}}=70 \mathrm{MHz}$ ):
- SNR: 75 dBFS
- SFDR: 75-dBc HD2, HD3
- SFDR: 90-dBFS worst spur

## 2 Applications

- High-speed data acquisition
- Industrial monitoring
- Thermal imaging
- Imaging and sonar
- Software defined radio
- Power quality analyzer
- Communications infrastructure
- Control loops
- Instrumentation
- Smart grids
- Spectroscopy
- Radar

## 3 Description

The ADC3564 device is a low-noise, ultra-low power, 14-bit, 125-MSPS, high-speed ADC. Designed for low power consumption, the device delivers a noise spectral density of $-156 \mathrm{dBFS} / \mathrm{Hz}$ combined with excellent linearity and dynamic range. The ADC3564 offers IF sampling support which makes the device suited for a wide range of applications. High-speed control loops benefit from the short latency of as little as one clock cycle. The ADC consumes only 137 mW at 125 MSPS, and the power consumption scales well with lower sampling rates.
The ADC3564 uses serial LVDS (SLVDS) interface to output the data which minimizes the number of digital interconnects. The device supports two-lane, one-lane and half-lane options. The device is a pin-to-pin compatible family with different speed grades and comes in a 40-pin VQFN package. The device supports the extended industrial temperature range from -40 to $+105^{\circ} \mathrm{C}$.

Package Information

| PART NUMBER | PACKAGE ${ }^{(1)}$ | BODY SIZE (NOM) |
| :--- | :--- | :--- |
| ADC3564 | WQFN $(40)$ | $5.00 \times 5.00 \mathrm{~mm}$ |

(1) For all available packages, see the orderable addendum at the end of the data sheet.

Table 3-1. Device Comparison

| PART NUMBER | RESOLUTION | SAMPLING RATE |
| :--- | :--- | :--- |
| ADC3561 | 16 BIT | 10 MSPS |
| ADC3562 | 16 BIT | 25 MSPS |
| ADC3563 | 16 BIT | 65 MSPS |
| ADC3564 | 14 BIT | 125 MSPS |

## 5 Pin Configuration and Functions

Figure 5-1. RSB (WQFN) Package, 40-Pin
(Top View)
Table 5-1. Pin Descriptions

| PIN |  | 1/O | DESCRIPTION |
| :---: | :---: | :---: | :---: |
| NAME | NO. |  |  |
| INPUT/REFERENCE |  |  |  |
| AINP | 12 | I | Positive analog input |
| AINM | 13 | I | Negative analog input |
| VCM | 8 | O | Common-mode voltage output for the analog inputs |
| VREF | 2 | I | External voltage reference input |
| REFBUF | 4 | I | 1.2 V external voltage reference input for use with internal reference buffer |
| REFGND | 3 | I | Reference ground input, 0 V |
| CLOCK |  |  |  |
| CLKM | 7 | I | Negative differential sampling clock input for the ADC |
| CLKP | 6 | I | Positive differential sampling clock input for the ADC |
| CONFIGURATION |  |  |  |
| PDN/SYNC | 1 | I | Power down/Synchronization input. This pin can be configured via the SPI interface. Active high. This pin has an internal $21 \mathrm{k} \Omega$ pull-down resistor. |
| RESET | 9 | I | Hardware reset. Active high. This pin has an internal $21 \mathrm{k} \Omega$ pull-down resistor. |
| SEN | 16 | I | Serial interface enable. Active low. This pin has an internal $21 \mathrm{k} \Omega$ pull-up resistor to AVDD. |
| SCLK | 35 | I | Serial interface clock input. This pin has an internal $21 \mathrm{k} \Omega$ pull-down resistor. |

ADC3564
Table 5-1. Pin Descriptions (continued)

| PIN |  | 1/0 | DESCRIPTION |
| :---: | :---: | :---: | :---: |
| NAME | NO. |  |  |
| SDIO | 10 | 1 | Serial interface data input and output. This pin has an internal $21 \mathrm{k} \Omega$ pull-down resistor. |
| NC | 27,38,39 | - | Do not connect |
| DIGITAL INTERFACE |  |  |  |
| DAOP | 20 | 0 | Positive differential serial LVDS output for lane 0, channel A |
| DAOM | 19 | 0 | Negative differential serial LVDS output for lane 0 , channel A |
| DA1P | 18 | 0 | Positive differential serial LVDS output for lane 1, channel A |
| DA1M | 17 | O | Negative differential serial LVDS output for lane 1, channel A |
| DB0P | 31 | O | Positive differential serial LVDS output for lane 0, channel B. Used only in dual band complex decimation. Default is powered down. |
| DB0M | 32 | O | Negative differential serial LVDS output for lane 0 , channel B. Used only in dual band complex decimation. Default is powered down. |
| DB1P | 33 | O | Positive differential serial LVDS output for lane 1, channel B. Used only in dual band complex decimation. Default is powered down. |
| DB1M | 34 | O | Negative differential serial LVDS output for lane 1, channel B. Used only in dual band complex decimation. Default is powered down. |
| DCLKP | 23 | 0 | Positive differential serial LVDS bit clock output. |
| DCLKM | 22 | 0 | Negative differential serial LVDS bit clock output. |
| FCLKP | 28 | 0 | Positive differential serial LVDS frame clock output. |
| FCLKM | 29 | 0 | Negative differential serial LVDS frame clock output. |
| DCLKINP | 25 | I | Positive differential serial LVDS bit clock input. |
| DCLKINM | 24 | 1 | Negative differential serial LVDS bit clock input. |

POWER SUPPLY

| AVDD | $5,15,36$ | I | Analog 1.8 V power supply |
| :--- | :---: | :---: | :--- |
| GND | $11,14,37,40$, <br> PowerPad | I | Ground, 0 V |
| IOGND | 26 | I | Ground, 0 V for digital interface |
| IOVDD | 21,30 | I | 1.8 V power supply for digital interface |

SBAS887 - AUGUST 2022

## 6 Specifications

### 6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted) ${ }^{(1)}$

| PARAMETER | TEST CONDITIONS | MIN | MAX | UNIT |
| :---: | :---: | :---: | :---: | :---: |
| Supply voltage range, AVDD, IOVDD |  | -0.3 | 2.1 | V |
| Supply voltage range, GND, IOGND, REFGND |  | -0.3 | 0.3 | V |
| Voltage applied to input pins | AINP/M, CLKP/M, DCLKINP/M, VREF, REFBUF | -0.3 | $\begin{aligned} & \mathrm{N}(2.1, \\ & +0.3) \end{aligned}$ | V |
|  | PDN/SYNC, RESET, SCLK, SEN, SDIO | -0.3 | $\begin{gathered} \mathrm{N}(2.1, \\ +0.3) \end{gathered}$ |  |
| Junction temperature, $\mathrm{T}_{\mathrm{J}}$ |  |  | 105 | ${ }^{\circ} \mathrm{C}$ |
| Storage temperature, $\mathrm{T}_{\text {stg }}$ |  | -65 | 150 | ${ }^{\circ} \mathrm{C}$ |

(1) Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under Recommended Operating Conditions. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

### 6.2 ESD Ratings

| $\mathrm{V}_{(\text {ESD })}$ |  | Electrostatic <br> discharge | Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins ${ }^{(1)}$ | Charged device model (CDM), per JEDEC specification JESD22-C101, all <br> pins $^{(2)}$ |
| :--- | :--- | :--- | :---: | :---: |

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

### 6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

| Supply <br> voltage range |  | AVDD $^{(1)}$ | MIN | NOM |
| :--- | :--- | ---: | ---: | :---: |
|  | OVDD $^{(1)}$ | 1.75 | 1.8 | 1.85 |
| MAX | UNIT |  |  |  |
| $\mathrm{T}_{\mathrm{A}}$ | Operating free-air temperature | 1.75 | 1.8 | 1.85 |
| $\mathrm{~T}_{J}$ | Operating junction temperature | -40 | V |  |

(1) Measured to GND.
(2) Prolonged use above this junction temperature may increase the device failure-in-time (FIT) rate.

### 6.4 Thermal Information

| THERMAL METRIC ${ }^{(1)}$ |  | $\begin{gathered} \hline \text { ADC3564 } \\ \hline \text { RSB (QFN) } \end{gathered}$ | UNIT |
| :---: | :---: | :---: | :---: |
|  |  |  |  |
|  |  | 40 Pins |  |
| $\mathrm{R}_{\text {©JA }}$ | Junction-to-ambient thermal resistance | 30.7 | ${ }^{\circ} \mathrm{C} / \mathrm{W}$ |
| $\mathrm{R}_{\text {©JC(top) }}$ | Junction-to-case (top) thermal resistance | 16.4 | ${ }^{\circ} \mathrm{C} / \mathrm{W}$ |
| $\mathrm{R}_{\text {®JB }}$ | Junction-to-board thermal resistance | 10.5 | ${ }^{\circ} \mathrm{C} / \mathrm{W}$ |
| $\Psi_{\text {JT }}$ | Junction-to-top characterization parameter | 0.2 | ${ }^{\circ} \mathrm{C} / \mathrm{W}$ |
| $\Psi_{\text {JB }}$ | Junction-to-board characterization parameter | 10.5 | ${ }^{\circ} \mathrm{C} / \mathrm{W}$ |
| $\mathrm{R}_{\text {©JC(bot) }}$ | Junction-to-case (bottom) thermal resistance | 2.0 | ${ }^{\circ} \mathrm{C} / \mathrm{W}$ |

[^0]
### 6.5 Electrical Characteristics - Power Consumption

Typical values are over the operating free-air temperature range, at $\mathrm{T}_{\mathrm{A}}=25^{\circ} \mathrm{C}$, full temperature range is $\mathrm{T}_{\mathrm{MIN}}=-40^{\circ} \mathrm{C}$ to $\mathrm{T}_{\mathrm{MAX}}=105^{\circ} \mathrm{C}, \mathrm{ADC}$ sampling rate $=125 \mathrm{MSPS}, 50 \%$ clock duty cycle, $\mathrm{AVDD}=$ IOVDD $=1.8 \mathrm{~V}$, external 1.6 V reference, and -1 -dBFS differential input, unless otherwise noted

| PARAMETER |  | TEST CONDITIONS | MIN TYP | MAX | UNIT |
| :---: | :---: | :---: | :---: | :---: | :---: |
| ADC3564: 125 MSPS |  |  |  |  |  |
| $\mathrm{I}_{\text {AVDD }}$ | Analog supply current | External reference | 41 | 62 | mA |
| lovdd | I/O supply current | SLVDS 2-wire | 35 | 57 |  |
| $\mathrm{P}_{\text {DIS }}$ | Power dissipation | External reference, SLVDS 2-wire | 137 |  | mW |
| IIOVDD | I/O supply current | SLVDS 2-wire, 1/2-swing | 27 |  | mA |
|  |  | 4 x real decimation, SLVDS 1-wire | 41 |  |  |
|  |  | 16x real decimation, SLVDS 1-wire | 36 |  |  |
|  |  | 4 x complex decimation, SLVDS 1-wire | 48 |  |  |
|  |  | 8 x complex decimation, SLVDS 1-wire | 45 |  |  |
|  |  | 16x complex decimation, SLVDS 1-wire | 41 |  |  |
|  |  | 32x complex decimation, SLVDS 1-wire | 40 |  |  |

## MISCELLANOUS

| $\mathrm{I}_{\text {AVdD }}$ | Internal reference, additional analog supply current | Enabled via SPI | 4 | mA |
| :---: | :---: | :---: | :---: | :---: |
|  | External 1.2V reference (REFBUF), additional analog supply current |  | 0.5 |  |
|  | Single ended clock input, reduces analog supply current by |  | 1 |  |
| $\mathrm{P}_{\text {DIS }}$ | Power consumption in global power down mode | Default mask settings | 12 | mW |

### 6.6 Electrical Characteristics - DC Specifications

Typical values are over the operating free-air temperature range, at $\mathrm{T}_{\mathrm{A}}=25^{\circ} \mathrm{C}$, full temperature range is $\mathrm{T}_{\text {MIN }}=-40^{\circ} \mathrm{C}$ to $\mathrm{T}_{\mathrm{MAX}}=105^{\circ} \mathrm{C}, \mathrm{ADC}$ sampling rate $=125 \mathrm{MSPS}, 50 \%$ clock duty cycle, AVDD $=$ IOVDD $=1.8 \mathrm{~V}, 1.6 \mathrm{~V}$ external reference, and -1 -dBFS differential input, unless otherwise noted

| PARAMETER |  | TEST CONDITIONS | MIN TYP | MAX | UNIT |
| :---: | :---: | :---: | :---: | :---: | :---: |
| DC ACCURACY |  |  |  |  |  |
| No missing codes |  |  | 14 |  | bits |
| PSRR |  | $\mathrm{F}_{\text {IN }}=1 \mathrm{MHz}$ | 35 |  | dB |
| DNL | Differential nonlinearity | $\mathrm{F}_{\text {IN }}=5 \mathrm{MHz}$ | -0.97 $\pm 0.9$ | 0.97 | LSB |
| INL | Integral nonlinearity | $\mathrm{F}_{\text {IN }}=5 \mathrm{MHz}$ | $-7.5 \pm 2.6$ | 7.5 | LSB |
| V ${ }_{\text {OS_ERR }}$ | Offset error |  | $-55 \pm 30$ | 55 | LSB |
| Vos_DRIFT | Offset drift over temperature |  | $\pm 0.06$ |  | LSB $/{ }^{\circ} \mathrm{C}$ |
| GAINERR | Gain error | External 1.6V Reference | $\pm 2$ |  | \%FSR |
| GAIN $_{\text {DRIFT }}$ | Gain drift over temperature | External 1.6V Reference | $\pm 57$ |  | ppm/ ${ }^{\circ} \mathrm{C}$ |
| GAIN ${ }_{\text {ERr }}$ | Gain error | Internal Reference | $\pm 3$ |  | \%FSR |
| GAIN ${ }_{\text {DRIFT }}$ | Gain drift over temperature | Internal Reference | 106 |  | ppm $/{ }^{\circ} \mathrm{C}$ |
| Transition Noise |  |  | 0.7 |  | LSB |

ADC ANALOG INPUT (AINP/M)

| FS | Input full scale | Differential | 3.2 | Vpp |
| :--- | :--- | :--- | ---: | :---: |
| $\mathrm{V}_{\mathrm{CM}}$ | Input common model voltage |  | 0.9 | 0.95 |
| $\mathrm{R}_{\mathrm{IN}}$ | Input resistance | Differential at DC | 8 | V |
| $\mathrm{C}_{\mathrm{IN}}$ | Input Capacitance | Differential at DC | 5.4 | $\mathrm{k} \Omega$ |
| $\mathrm{V}_{\mathrm{OCM}}$ | Output common mode voltage |  | 0.95 | pF |
| BW | Analog Input Bandwidth (-3dB) |  | 1.4 | V |

Internal Voltage Reference

| $V_{\text {REF }}$ | Internal reference voltage | 1.6 | V |
| :--- | :--- | :--- | :--- |
| $\mathrm{~V}_{\text {REF }}$ Output Impedance |  | 8 | $\Omega$ |

Reference Input Buffer (REFBUF)

| External reference voltage |  | 1.2 | V |
| :--- | :--- | :--- | :---: |
| External voltage reference (VREF) |  |  |  |

| $\mathrm{V}_{\text {REF }}$ | External voltage reference |  |  | 1.6 |  | V |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Input Current |  |  |  | 1 |  | mA |
| Input impedance |  |  |  | 5.3 |  | $\mathrm{k} \Omega$ |
| Clock Input (CLKP/M) |  |  |  |  |  |  |
| Input clock frequency |  | External reference | 10 |  | 125 | MHz |
|  |  | Internal reference | 100 |  | 125 | MHz |
| $\mathrm{V}_{\text {ID }}$ | Differential input voltage |  |  | 1 | 3.6 | Vpp |
| $\mathrm{V}_{\mathrm{CM}}$ | Input common mode voltage |  |  | 0.9 |  | V |
| $\mathrm{R}_{\text {IN }}$ | Single ended input resistance to common mode |  |  | 5 |  | k $\Omega$ |
| $\mathrm{C}_{\text {IN }}$ | Single ended input capacitance |  |  | 1.5 |  | pF |
| Clock duty cycle |  |  | 45 | 50 | 60 | \% |

### 6.6 Electrical Characteristics - DC Specifications (continued)

Typical values are over the operating free-air temperature range, at $\mathrm{T}_{\mathrm{A}}=25^{\circ} \mathrm{C}$, full temperature range is $\mathrm{T}_{\text {MIN }}=-40^{\circ} \mathrm{C}$ to $\mathrm{T}_{\mathrm{MAX}}=105^{\circ} \mathrm{C}, \mathrm{ADC}$ sampling rate $=125 \mathrm{MSPS}, 50 \%$ clock duty cycle, $\mathrm{AVDD}=$ IOVDD $=1.8 \mathrm{~V}, 1.6 \mathrm{~V}$ external reference, and -1-dBFS differential input, unless otherwise noted

| PARAMETER | TEST CONDITIONS | MIN | TYP | MAX | UNIT |
| :--- | :--- | ---: | ---: | :---: | :---: |
| Digital Inputs (RESET, PDN, SCLK, SEN, SDIO) |  |  |  |  |  |
| $\mathrm{V}_{\mathrm{IH}}$ | High level input voltage | 1.4 |  |  |  |
| $\mathrm{~V}_{\mathrm{IL}}$ | Low level input voltage |  | 0.4 | V |  |
| $\mathrm{I}_{\mathrm{IH}}$ | High level input current |  | 90 | 150 | uA |
| $\mathrm{I}_{\mathrm{IL}}$ | Low level input current | -150 | -90 |  |  |
| $\mathrm{C}_{\mathrm{I}}$ | Input capacitance |  | 1.5 | uA |  |

Digital Output (SDOUT)

| $\mathrm{V}_{\text {OH }}$ | High level output voltage | $\mathrm{I}_{\text {LOAD }}=-400 \mathrm{uA}$ | $\begin{array}{rr}\text { IOVDD } \\ -0.1 & \text { IOVDD }\end{array}$ | v |
| :---: | :---: | :---: | :---: | :---: |
| $\mathrm{V}_{\text {OL }}$ | Low level output voltage | $\mathrm{l}_{\text {LOAD }}=400 \mathrm{uA}$ | 0.1 |  |

SLVDS Interface

| $\mathrm{V}_{\mathrm{ID}}$ | Differential input voltage | DCLKIN | 200 | 350 | 650 | mVpp |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathrm{V}_{\text {CM }}$ | Input common mode voltage |  | 1 | 1.2 | 1.3 | V |
| Output data rate |  | per differential SLVDS output |  |  | 1 | Gbps |
| $V_{\text {OD }}$ | Differential output voltage |  | 500 | 700 | 850 | mVpp |
| $\mathrm{V}_{\mathrm{CM}}$ | Output common mode voltage |  |  | 1.0 |  | V |

### 6.7 Electrical Characteristics - AC Specifications

Typical values are over the operating free-air temperature range, at $\mathrm{T}_{\mathrm{A}}=25^{\circ} \mathrm{C}$, full temperature range is $\mathrm{T}_{\text {MIN }}=-40^{\circ} \mathrm{C}$ to $\mathrm{T}_{\mathrm{MAX}}=105^{\circ} \mathrm{C}, \mathrm{ADC}$ sampling rate $=125 \mathrm{MSPS}, 50 \%$ clock duty cycle, $\mathrm{AVDD}=\operatorname{IOVDD}=1.8 \mathrm{~V}, 1.6 \mathrm{~V}$ external reference, and -1 -dBFS differential input, unless otherwise noted

| PARAMETER |  | TEST CONDITIONS | MIN TYP | MAX | UNIT |
| :---: | :---: | :---: | :---: | :---: | :---: |
| NSD | Noise Spectral Density | $\mathrm{f}_{\mathrm{IN}}=5 \mathrm{MHz}, \mathrm{A}_{\text {IN }}=-20 \mathrm{dBFS}$ | -156.9 |  | dBFS/Hz |
| SNR | Signal to noise ratio | $\mathrm{fiN}=5 \mathrm{MHz}$ | $72 \quad 77.5$ |  | dBFS |
|  |  | $\mathrm{fiN}_{\text {IN }}=5 \mathrm{MHz}, \mathrm{A}_{\text {IN }}=-20 \mathrm{dBFS}$ | 78.9 |  | dBFS |
|  |  | $\mathrm{f}_{\mathrm{IN}}=10 \mathrm{MHz}$ | 77.6 |  |  |
|  |  | $\mathrm{f}_{\mathrm{iN}}=40 \mathrm{MHz}$ | 76.9 |  |  |
|  |  | $\mathrm{f}_{\mathrm{IN}}=70 \mathrm{MHz}$ | 75.5 |  |  |
|  |  | $\mathrm{fiN}_{\text {IN }}=100 \mathrm{MHz}$ | 74.1 |  |  |
| SINAD | Signal to noise and distortion ratio | $\mathrm{f}_{\mathrm{IN}}=5 \mathrm{MHz}$ | 75.7 |  | dBFS |
|  |  | $\mathrm{f}_{\mathrm{IN}}=10 \mathrm{MHz}$ | 74.2 |  |  |
|  |  | $\mathrm{f}_{\mathrm{IN}}=40 \mathrm{MHz}$ | 72.6 |  |  |
|  |  | $\mathrm{f}_{\mathrm{IN}}=70 \mathrm{MHz}$ | 71.3 |  |  |
|  |  | $\mathrm{f}_{\mathrm{IN}}=100 \mathrm{MHz}$ | 72.4 |  |  |
| ENOB | Effective number of bits | $\mathrm{f}_{\mathrm{IN}}=5 \mathrm{MHz}$ | 12.6 |  | bit |
|  |  | $\mathrm{f}_{\mathrm{iN}}=10 \mathrm{MHz}$ | 12.6 |  |  |
|  |  | $\mathrm{f}_{\mathrm{IN}}=40 \mathrm{MHz}$ | 12.5 |  |  |
|  |  | $\mathrm{f}_{\mathrm{IN}}=70 \mathrm{MHz}$ | 12.3 |  |  |
|  |  | $\mathrm{f}_{\mathrm{IN}}=100 \mathrm{MHz}$ | 12.0 |  |  |
| THD | Total Harmonic Distortion (First five harmonics) | $\mathrm{f}_{\mathrm{IN}}=5 \mathrm{MHz}$ | 71.580 |  | dBc |
|  |  | $\mathrm{f}_{\mathrm{IN}}=10 \mathrm{MHz}$ | 76 |  |  |
|  |  | $\mathrm{f}_{\mathrm{IN}}=40 \mathrm{MHz}$ | 74 |  |  |
|  |  | $\mathrm{f}_{\mathrm{IN}}=70 \mathrm{MHz}$ | 72 |  |  |
|  |  | $\mathrm{f}_{\mathrm{IN}}=100 \mathrm{MHz}$ | 76 |  |  |
| HD2 | Second Harmonic Distortion | $\mathrm{fin}^{\text {I }}=5 \mathrm{MHz}$ | $77 \quad 84$ |  | dBc |
|  |  | $\mathrm{f}_{\mathrm{IN}}=10 \mathrm{MHz}$ | 78 |  |  |
|  |  | $\mathrm{f}_{\mathrm{IN}}=40 \mathrm{MHz}$ | 75 |  |  |
|  |  | $\mathrm{f}_{\mathrm{IN}}=70 \mathrm{MHz}$ | 77 |  |  |
|  |  | $\mathrm{f}_{\mathrm{IN}}=100 \mathrm{MHz}$ | 79 |  |  |
| HD3 | Third Harmonic Distortion | $\mathrm{f}_{\mathrm{IN}}=5 \mathrm{MHz}$ | 73.584 |  | dBc |
|  |  | $\mathrm{f}_{\mathrm{IN}}=10 \mathrm{MHz}$ | 81 |  |  |
|  |  | $\mathrm{f}_{\mathrm{IN}}=40 \mathrm{MHz}$ | 88 |  |  |
|  |  | $\mathrm{f}_{\mathrm{IN}}=70 \mathrm{MHz}$ | 76 |  |  |
|  |  | $\mathrm{fiN}_{\mathrm{IN}}=100 \mathrm{MHz}$ | 81 |  |  |
| Non HD2,3 | Spur free dynamic range (excluding HD2 and HD3) | $\mathrm{f}_{\mathrm{IN}}=5 \mathrm{MHz}$ | $84 \quad 92$ |  | dBFS |
|  |  | $\mathrm{f}_{\mathrm{IN}}=10 \mathrm{MHz}$ | 93 |  |  |
|  |  | $\mathrm{f}_{\mathrm{IN}}=40 \mathrm{MHz}$ | 89 |  |  |
|  |  | $\mathrm{f}_{\mathrm{IN}}=70 \mathrm{MHz}$ | 84 |  |  |
|  |  | $\mathrm{f}_{\mathrm{IN}}=100 \mathrm{MHz}$ | 86 |  |  |
| IMD3 | Two tone inter-modulation distortion | $\mathrm{f}_{1}=10 \mathrm{MHz}, \mathrm{f}_{2}=12 \mathrm{MHz}, \mathrm{~A}_{\mathrm{IN}}=-7$ <br> dBFS/tone | 88 |  | dBc |

ADC3564

### 6.8 Timing Requirements

Typical values are over the operating free-air temperature range, at $\mathrm{T}_{\mathrm{A}}=25^{\circ} \mathrm{C}$, full temperature range is $\mathrm{T}_{\text {MIN }}=-40^{\circ} \mathrm{C}$ to $\mathrm{T}_{\mathrm{MAX}}=105^{\circ} \mathrm{C}, \mathrm{ADC}$ sampling rate $=125 \mathrm{MSPS}, 50 \%$ clock duty cycle, AVDD $=$ IOVDD $=1.8 \mathrm{~V}, 1.6 \mathrm{~V}$ external reference, and $-1-\mathrm{dBFS}$ differential input, unless otherwise noted

## 8 Detailed Description

### 8.1 Overview

The ADC3564 is a low noise, ultra-low power 14-bit 125 MSPS high-speed ADC. It offers DC precision together with IF sampling support which makes it suited for a wide range of applications. The ADC3564 is equipped with an on-chip internal reference option but it also supports the use of an external, high precision 1.6 V voltage reference or an external 1.2 V reference which is buffered and gained up internally. Because of the inherent low latency architecture, the digital output result is available after only one clock cycle. Single ended as well as differential input signaling is supported.

## Note

The ADC3564 supports the following sampling rates:

- External Reference: 10 to 125 MSPS
- Internal Reference: 100 to 125 MSPS

An optional, programmable digital down converter enables external anti-alias filter relaxation as well as output data rate reduction. The digital filter provides a 32-bit programmable NCO and supports both real or complex decimation.

The ADC3564 uses a serial LVDS (SLVDS) interface to output the data which minimizes the number of digital interconnects. The device supports a two-lane ( 2 -wire), a one-lane ( 1 -wire) and a half-lane ( $1 / 2$-wire) option. The ADC3564 includes a digital output formatter which supports output resolutions from 14 to 20-bit.
The device features and control options can be set up either through pin configurations or via SPI register writes.

### 8.2 Functional Block Diagram

SBAS887 - AUGUST 2022

### 8.3 Feature Description

### 8.3.1 Analog Input

The analog inputs of ADC3564 are intended to be driven differentially. Both AC coupling and DC coupling of the analog inputs is supported. The analog inputs are designed for an input common mode voltage of 0.95 V which must be provided externally on each input pin. DC-coupled input signals must have a common mode voltage that meets the device input common mode voltage range.

The equivalent input network diagram is shown in Figure 8-1. All four sampling switches, on-resistance shown in red, are in same position (open or closed) simultaneously.

Figure 8-1. Equivalent Input Network

### 8.3.1.1 Analog Input Bandwidth

Figure 8 -2 shows the analog full power input bandwidth of the ADC3664 with a $50 \Omega$ differential termination. The -3 dB bandwidth is approximately 1.4 GHz and the useful input bandwidth with good AC performance is approximately 200 MHz .
The equivalent differential input resistance $\mathrm{R}_{\mathrm{IN}}$ and input capacitance $\mathrm{C}_{\mathrm{IN}}$ vs frequency are shown in Figure 8-3.

Figure 8-2. ADC Analog Input bandwidth response

Figure 8-3. Equivalent $\mathrm{R}_{\mathrm{IN}} / \mathrm{C}_{\text {IN }}$ vs Input Frequency

### 8.3.1.2 Analog Front End Design

The ADC3564 is an unbuffered ADC and thus a passive kick-back filter is recommended to absorb the glitch from the sampling operation. Depending on if the input is driven by a balun or a differential amplifier with low output impedance, a termination network may be needed. Additionally a passive DC bias circuit is needed in AC-coupled applications which can be combined with the termination network.

### 8.3.1.2.1 Sampling Glitch Filter Design

The front end sampling glitch filter is designed to optimize the SNR and HD3 performance of the ADC. The filter performance is dependent on input frequency and therefore the following filter designs are recommended for different input frequency ranges as shown in Figure 8-4 and Figure 8-5.

Figure 8-4. Sampling glitch filter example for input frequencies from DC to $\mathbf{6 0} \mathbf{M H z}$

Figure 8-5. Sampling glitch filter example for input frequencies from $\mathbf{6 0}$ to 120 MHz

SBAS887 - AUGUST 2022

### 8.3.1.2.2 Analog Input Termination and DC Bias

Depending on the input drive circuitry, a termination network and/or DC biasing needs to be provided.

### 8.3.1.2.2.1 AC-Coupling

The ADC3564 requires external DC bias using the common mode output voltage (VCM) of the ADC together with the termination network as shown in Figure 8-6. The termination is located within the glitch filter network. When using a balun on the input, the termination impedance has to be adjusted to account for the turns ratio of the transformer. When using an amplifier, the termination impedance can be adjusted to optimize the amplifier performance.

Figure 8-6. AC-Coupling: termination network provides DC bias (glitch filter example for up to $\mathbf{6 0} \mathbf{M H z}$ )

### 8.3.1.2.2.2 DC-Coupling

In DC coupled applications the DC bias needs to be provided from the fully differential amplifier (FDA) using VCM output of the ADC as shown in Figure 8-7. The glitch filter in this case is located between the anti-alias filter and the ADC. No termination may be needed if amplifier is located close to the ADC or if the termination is part of the anti-alias filter.

Figure 8-7. DC-Coupling: DC bias provided by FDA (glitch filter example for DC - 60 MHz )

### 8.3.2 Clock Input

In order to maximize the ADC SNR performance, the external sampling clock should be low jitter and differential signaling with a high slew rate. This is especially important in IF sampling applications. For less jitter sensitive applications, the ADC3564 provides the option to operate with single ended signaling which saves additional power consumption.

### 8.3.2.1 Single Ended vs Differential Clock Input

The ADC3564 can be operated using a differential or a single ended clock input where the single ended clock consumes less power consumption. However clock amplitude impacts the ADC aperture jitter and consequently the SNR. For maximum SNR performance, a large clock signal with fast slew rates needs to be provided.

- Differential Clock Input: The clock input can be AC coupled externally. The ADC3564 provides internal biasing for that use case.
- Single Ended Clock Input: This mode needs to be configured using SPI register (0x0E, D2 and D0) or with the REFBUF pin. In this mode there is no internal clock biasing and thus the clock input needs to be DC coupled around a 0.9 V center. The unused input needs to be AC coupled to ground.

Figure 8-8. External and internal connection using differential (left) and single ended (right) clock input

### 8.3.3 Voltage Reference

The ADC3564 provides three different options for supplying the voltage reference to the ADC. An external 1.6 V reference can be directly connected to the VREF input; a voltage 1.2 V reference can be connected to the REFBUF input using the internal gain buffer or the internal 1.2 V reference can be enabled to generate a 1.6 V reference voltage. For best performance, the reference noise should be filtered by connecting a 10 uF and a 0.1 uF ceramic bypass capacitor to the VREF pin. The internal reference circuitry of the ADC3564 is shown in Figure 8-9.

## Note

The voltage reference mode can be selected using SPI writes or by using the REFBUF pin (default) as a control pin (Section 8.5.1). If the REFBUF pin is not used for configuration, the REFBUF pin should be connected to AVDD (even though the REFBUF pin has a weak internal pullup to AVDD) and the voltage reference option has to be selected using the SPI interface.

Figure 8-9. Different voltage reference options for ADC3564

### 8.3.3.1 Internal voltage reference

The 1.6 V reference for the ADC can be generated internal using the on-chip 1.2 V reference along with the internal gain buffer. A 10 uF and a 0.1 uF ceramic bypass capacitor ( $\mathrm{C}_{\mathrm{VREF}}$ ) should be connected between the VREF and REFGND pins as close to the pins as possible.

Figure 8-10. Internal reference

### 8.3.3.2 External voltage reference (VREF)

For highest accuracy and lowest temperature drift, the VREF input can be directly connected to an external 1.6 V reference. A 10 uF and a 0.1 uF ceramic bypass capacitor (CVREF) connected between the VREF and REFGND pins and placed as close to the pins as possible is recommended. The load current from the external reference is about 1 mA .

## Note

The internal reference is also used for other functions inside the device, therefore the reference amplifier should only be powered down in power down state but not during normal operation.

Figure 8-11. External 1.6V reference

### 8.3.3.3 External voltage reference with internal buffer (REFBUF)

The ADC3564 is equipped with an on-chip reference buffer that also includes gain to generate the 1.6 V reference voltage from an external 1.2 V reference. A 10 uF and a 0.1 uF ceramic bypass capacitor (CVREF) between the VREF and REFGND pins and a 10 uF and a 0.1 uF ceramic bypass capacitor between the REFBUF and REFGND pins are recommended. Both capacitors should be placed as close to the pins as possible. The load current from the external reference is less than 100 uA .

Figure 8-12. External 1.2V reference using internal reference buffer

SBAS887 - AUGUST 2022

### 8.3.4 Digital Down Converter

The ADC3564 includes an optional on-chip digital down conversion (DDC) decimation filter that can be enabled via SPI register setting. It supports complex decimation by $2,4,8,16$ and 32 using a digital mixer and a 32-bit numerically controlled oscillator (NCO) as shown in Figure 8-13. Furthermore it supports a mode with real decimation where the complex mixer is bypassed (NCO should be set to 0 for lowest power consumption) and the digital filter acts as a low pass filter.
Internally the decimation filter calculations are performed with a 20-bit resolution in order to avoid any SNR degradation due to quantization noise. The Section 8.3.5.1 truncates to the selected resolution prior to outputting the data on the digital interface.

Figure 8-13. Internal Digital Decimation Filter

### 8.3.4.1 DDC MUX for Dual Band Decimation

The ADC3564 includes a MUX in front of the digital decimation filter which allows the ADC to be connected to two digital down converters (see Figure 8-14). This enables dual band complex decimation. The NCO of each digital down converter can be tuned to an independent frequency across the Nyquist zone as illustrated in the example in Figure $8-15$. The second DDC is output using the DB0/1 SLVDS interface.

Figure 8-14. DDC MUX

Figure 8-15. Complex Decimation (by 8) with dual band illustration

### 8.3.4.2 Digital Filter Operation

The complex decimation operation is illustrated with an example in Figure 8-16. First the input signal (and the negative image) are frequency shifted by the NCO frequency as shown on the left. Next a digital filter is applied (centered around 0 Hz ) and the output data rate is decimated - in this example the output data rate $\mathrm{F}_{\mathrm{S}, \mathrm{OUT}}=$ $F_{S} / 8$ with a Nyquist zone of $F_{S} / 16$. During the complex mixing the spectrum (signal and noise) is split into real and complex parts and thus the amplitude is reduced by $6-\mathrm{dB}$. In order to compensate this loss, there is a $6-\mathrm{dB}$ digital gain option in the decimation filter block that can be enabled via SPI write.

Figure 8-16. Complex decimation illustration
The real decimation operation is illustrated with an example in Figure 8-17. There is no frequency shift happening and only the real portion of the complex digital filter is exercised. The output data rate is decimated a decimation of 8 would result in an output data rate $\mathrm{F}_{\mathrm{S}, \mathrm{OUT}}=\mathrm{F}_{\mathrm{S}} / 8$ with a Nyquist zone of $\mathrm{F}_{\mathrm{S}} / 16$.
During the real mixing the spectrum (signal and noise) amplitude is reduced by $3-\mathrm{dB}$. In order to compensate this loss, there is a $3-\mathrm{dB}$ digital gain option in the decimation filter block that can be enabled via SPI write.

Figure 8-17. Real decimation illustration

### 8.3.4.3 FS/4 Mixing with Real Output

In this mode, the output after complex decimation gets mixed with $\mathrm{FS} / 4$ ( $\mathrm{FS}=$ output data rate in this case). Instead of a complex output with the input signal centered around 0 Hz , the output is transmitted as a real output at twice the data rate and the signal is centered around FS/4 (Fout/4) as illustrated in Figure 8-18.

In this example, complex decimation by 8 is used. The output data is transmitted as a real output with an output rate of Fout $=\mathrm{FS}^{\prime} / 4$ ( $\mathrm{FS} \mathrm{S}^{\prime}=\mathrm{ADC}$ sampling rate). The input signal is now centered around FS/4 (Fout/4) or FS'/16.

Figure 8-18. FS/4 Mixing with real output

### 8.3.4.4 Numerically Controlled Oscillator (NCO) and Digital Mixer

The decimation block is equipped with a 32 -bit NCO and a digital mixer to fine tune the frequency placement prior to the digital filtering. The oscillator generates a complex exponential sequence of:
$\mathrm{e}^{\mathrm{j} \omega n}$ (default) or $\mathrm{e}^{-j \omega n}$
where: frequency $(\omega)$ is specified as a signed number by the 32-bit register setting
The complex exponential sequence is multiplied with the real input from the ADC to mix the desired carrier to a frequency equal to $f_{I N}+f_{N C O}$. The NCO frequency can be tuned from $-F_{S} / 2$ to $+F_{S} / 2$ and is processed as a signed, 2s complement number. After programming a new NCO frequency, the MIXER RESTART register bit or SYNC pin has to be toggled for the new frequency to get active. Additionally the ADC3564 provides the option via SPI to invert the mixer phase.
The NCO frequency setting is set by the 32-bit register value given and calculated as:
NCO frequency $=0$ to $+\mathrm{F}_{\mathrm{S}} / 2: \mathrm{NCO}=\mathrm{f}_{\mathrm{NCO}} \times 2^{32} / \mathrm{F}_{\mathrm{S}}$
NCO frequency $=-\mathrm{F}_{\mathrm{S}} / 2$ to $0: \mathrm{NCO}=\left(\mathrm{f}_{\mathrm{NCO}}+\mathrm{F}_{\mathrm{S}}\right) \times 2^{32} / \mathrm{F}_{\mathrm{S}}$
where:

- $\mathrm{NCO}=\mathrm{NCO}$ register setting (decimal value)
- $\mathrm{f}_{\mathrm{NCO}}=$ Desired NCO frequency $(\mathrm{MHz})$
- $\mathrm{F}_{\mathrm{S}}=\mathrm{ADC}$ sampling rate (MSPS)

The NCO programming is further illustrated with this example:

- ADC sampling rate $F_{S}=125$ MSPS
- Input signal $\mathrm{f}_{\mathrm{IN}}=10 \mathrm{MHz}$
- Desired output frequency $\mathrm{f}_{\text {OUt }}=0 \mathrm{MHz}$

For this example there are actually four ways to program the NCO and achieve the desired output frequency as shown in Table 8-1.

Table 8-1. NCO value calculations example

| Alias or negative image | $\mathrm{f}_{\mathrm{NCO}}$ | NCO Value | Mixer Phase | Frequency translation for fout |
| :---: | :---: | :---: | :---: | :---: |
| $\mathrm{f}_{\mathrm{IN}}=-10 \mathrm{MHz}$ | $\mathrm{f}_{\mathrm{NCO}}=10 \mathrm{MHz}$ | 343597384 | as is | $\mathrm{f}_{\mathrm{OUT}}=\mathrm{f}_{\mathrm{IN}}+\mathrm{f}_{\mathrm{NCO}}=-10 \mathrm{MHz}+10 \mathrm{MHz}=0 \mathrm{MHz}$ |
| $\mathrm{f}_{\mathrm{IN}}=10 \mathrm{MHz}$ | $\mathrm{f}_{\mathrm{NCO}}=-10 \mathrm{MHz}$ | 373475417 |  | $\mathrm{f}_{\text {OUT }}=\mathrm{f}_{\mathrm{IN}}+\mathrm{f}_{\mathrm{NCO}}=10 \mathrm{MHz}+(-10 \mathrm{MHz})=0 \mathrm{MHz}$ |
| $\mathrm{f}_{\mathrm{IN}}=10 \mathrm{MHz}$ | $\mathrm{f}_{\mathrm{NCO}}=10 \mathrm{MHz}$ | 343597384 | inverted | $\mathrm{f}_{\text {OUT }}=\mathrm{f}_{\mathrm{IN}}-\mathrm{f}_{\mathrm{NCO}}=10 \mathrm{MHz}-10 \mathrm{MHz}=0 \mathrm{MHz}$ |
| $\mathrm{f}_{\mathrm{IN}}=-10 \mathrm{MHz}$ | $\mathrm{f}_{\mathrm{NCO}}=-10 \mathrm{MHz}$ | 373475417 |  | $\mathrm{f}_{\text {OUT }}=\mathrm{f}_{\mathrm{IN}}-\mathrm{f}_{\text {NCO }}=-10 \mathrm{MHz}-(-10 \mathrm{MHz})=0 \mathrm{MHz}$ |

### 8.3.4.5 Decimation Filter

The ADC3564 supports complex decimation by $2,4,8,16$ and 32 with a pass-band bandwidth of $\sim 80 \%$ and a stopband rejection of at least 85 dB . Table 8-2 gives an overview of the pass-band bandwidth of the different decimation settings with respect to ADC sampling rate $F_{S}$. In real decimation mode the output bandwidth is half of the complex bandwidth.

Table 8-2. Decimation Filter Summary and Maximum Available Output Bandwidth

| REAL/COMPLEX DECIMATION | DECIMATION SETTING N | OUTPUT RATE | OUTPUT BANDWIDTH | OUTPUT RATE $\text { ( } \left.F_{S}=125 \text { MSPS }\right)$ | $\begin{aligned} & \text { OUTPUT BANDWIDTH } \\ & \text { (Fs = } 125 \mathrm{MSPS}) \end{aligned}$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Complex | 2 | $\mathrm{F}_{\text {S }} / 2$ complex | $0.8 \times \mathrm{F}_{\mathrm{S}} / 2$ | 62.5 MSPS complex | 50 MHz |
|  | 4 | $\mathrm{F}_{S} / 4$ complex | $0.8 \times \mathrm{F}_{\mathrm{S}} / 4$ | 31.25 MSPS complex | 25 MHz |
|  | 8 | $\mathrm{F}_{\mathrm{S}} / 8$ complex | $0.8 \times \mathrm{F}_{\mathrm{S}} / 8$ | 15.625 MSPS complex | 12.5 MHz |
|  | 16 | $\mathrm{F}_{\mathrm{S}} / 16$ complex | $0.8 \times \mathrm{F}_{\mathrm{S}} / 16$ | 7.8125 MSPS complex | 6.25 MHz |
|  | 32 | $\mathrm{F}_{\mathrm{S}} / 32$ complex | $0.8 \times \mathrm{F}_{\mathrm{S}} / 32$ | 3.90625 MSPS complex | 3.125 MHz |
| Real | 2 | $\mathrm{F}_{\mathrm{S}} / 2$ real | $0.4 \times \mathrm{F}_{\mathrm{S}} / 2$ | 62.5 MSPS | 25 MHz |
|  | 4 | $\mathrm{F}_{\mathrm{S}} / 4$ real | $0.4 \times \mathrm{F}_{\mathrm{S}} / 4$ | 31.25 MSPS | 12.5 MHz |
|  | 8 | $\mathrm{F}_{\mathrm{S}} / 8$ real | $0.4 \times \mathrm{F}_{\mathrm{S}} / 8$ | 15.625 MSPS | 6.25 MHz |
|  | 16 | $\mathrm{F}_{\mathrm{S}} / 16$ real | $0.4 \times \mathrm{F}_{\mathrm{S}} / 16$ | 7.8125 MSPS | 3.125 MHz |
|  | 32 | $\mathrm{F}_{\text {S }} / 32$ real | $0.4 \times \mathrm{F}_{\mathrm{S}} / 32$ | 3.90625 MSPS | 1.5625 MHz |

The decimation filter responses normalized to the ADC sampling clock frequency are illustrated in Figure 8-20 to Figure 8-29. They are interpreted as follows:

Each figure contains the filter pass-band, transition band(s) and alias or stop-band(s) as shown in Figure 8-19. The $x$-axis shows the offset frequency (after the NCO frequency shift) normalized to the ADC sampling rate $F_{s}$.

For example, in the divide-by-4 complex setup, the output data rate is $F_{S} / 4$ complex with a Nyquist zone of $F_{S} /$ 8 or $0.125 \times \mathrm{F}_{\mathrm{S}}$. The transition band (colored in blue) is centered around $0.125 \times \mathrm{F}_{\mathrm{S}}$ and the alias transition band is centered at $0.375 \times \mathrm{F}_{\mathrm{S}}$. The stop-bands (colored in red), which alias on top of the pass-band, are centered at $0.25 \times \mathrm{F}_{\mathrm{S}}$ and $0.5 \times \mathrm{F}_{\mathrm{S}}$. The stop-band attenuation is greater than 85 dB .

### 8.3.4.6 SYNC

The PDN/SYNC pin can be used to synchronize multiple devices using an external SYNC signal. The PDN/ SYNC pin can be configured via SPI (SYNC EN bit) from power down to synchronization functionality and is latched in by the rising edge of the sampling clock as shown in Figure 8-30.

Figure 8-30. External SYNC timing diagram
The synchronization signal is only required when using the decimation filter - either using the SPI SYNC register or the PDN/SYNC pin. It resets internal clock dividers used in the decimation filter and aligns the internal clocks as well as I and Q data within the same sample. If no SYNC signal is given, the internal clock dividers is not be synchronized, which can lead to a fractional delay across different devices. The SYNC signal also resets the NCO phase and loads the new NCO frequency (same as the MIXER RESTART bit).
When trying to resynchronize during operation, the SYNC toggle should occur at $64^{*} \mathrm{~K}$ clock cycles, where K is an integer. This provids the phase continuity of the clock divider.

### 8.3.4.7 Output Formatting with Decimation

When using decimation, the digital output data is formatted as shown in Figure 8-31 (complex decimation) and Figure 8-32 (real decimation). The output format is illustrated for 16-bit output resolution.

Figure 8-31. Output Data Format in Complex Decimation
Table 8-3 illustrates the output interface data rate along with the corresponding DCLK/DCLKIN and FCLK frequencies based on output resolution (R), number of SLVDS lanes (L) and complex decimation setting (N).
Furthermore the table shows an actual lane rate example for the 2-, 1- and 1/2-wire interface, 16 -bit output resolution and complex decimation by 4.

Table 8-3. Serial LVDS Lane Rate Examples with Complex Decimation and 16-bit Output Resolution

| DECIMATION SETTING | ADC SAMPLING RATE | OUTPUT RESOLUTION | \# of WIRES | FCLK | DCLKIN, DCLK | DA/B0,1 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| N | $\mathrm{F}_{\text {S }}$ | R | L | $\mathrm{F}_{\mathrm{S}} / \mathrm{N}$ | [DA/B0,1] / 2 | $\mathrm{F}_{S} \times 2 \times \mathrm{R} / \mathrm{L} / \mathrm{N}$ |
| 4 | 125 MSPS | 16 | 2 | 31.25 MHz | 250 MHz | 500 MHz |
|  |  |  | 1 |  | 500 MHz | 1000 MHz |
|  | 55 MSPS |  | 1/2 | 15.625 MHz | 500 MHz | 1000 MHz |

Figure 8-32. Output Data Format in Real Decimation
Table 8-4 illustrates the output interface data rate along with the corresponding DCLK/DCLKIN and FCLK frequencies based on output resolution (R), number of SLVDS lanes (L) and real decimation setting (M).
Furthermore the table shows an actual lane rate example for the 2 -, 1 - and $1 / 2$-wire interface, 16 -bit output resolution and real decimation by 4.

Table 8-4. Serial LVDS Lane Rate Examples with Real Decimation and 16-bit Output Resolution

| $\begin{aligned} & \text { DECIMATION } \\ & \text { SETTING } \end{aligned}$ | ADC SAMPLING RATE | OUTPUT RESOLUTION | \# of WIRES | FCLK | DCLKIN, DCLK | DA/B0,1 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| M | $\mathrm{F}_{\mathrm{S}}$ | R | L | $\begin{gathered} F_{S} / M / 2(L=2) \\ F_{S} / M(L=1,1 / 2) \end{gathered}$ | [DA/B0,1]/2 | $F_{s} \times R / L / M$ |
| 4 | 125 MSPS | 16 | 2 | 15.625 MHz | 125 MHz | 250 MHz |
|  |  |  | 1 | 31.25 MHz | 250 MHz | 500 MHz |
|  |  |  | 1/2 |  | 500 MHz | 1000 MHz |

### 8.3.5 Digital Interface

The serial LVDS interface supports the data output with 2 -wire, 1 -wire and $1 / 2$-wire operation. The actual data output rate depends on the output resolution and number of lanes used.

The ADC3564 requires an external serial LVDS clock input (DCLKIN), which is used to transmit the data out of the ADC along with the data clock (DCLK). The phase relationship between DCLKIN and the sampling clock is irrelevant but both clocks need to be frequency locked. The SLVDS interface is configured using SPI register writes.

### 8.3.5.1 Output Formatter

The digital output interface utilizes a flexible output bit mapper as shown in Figure 8-33. The bit mapper takes the 14-bit output directly from the ADC or from digital filter block and reformats it to a resolution of 14,16 , 18 or 20-bit. The output serialization factor gets adjusted accordingly for 2-, 1- and 1/2-wire interface modes. The maximum SLVDS interface output data rate can not be exceeded independent of output resolution or serialization factor.

When using a higher resolution like 16-bit output for example in non-decimation mode, the 2 LSBs are set to 0 .

Figure 8-33. Interface output bit mapper
Table 8-5 provides an overview for the resulting serialization factor depending on output resolution and output modes. Note that the DCLKIN frequency needs to be adjusted accordingly as well. Changing the output resolution to 16-bit, 2-wire mode for example would result in DCLKIN = $\mathrm{F}_{\mathrm{S}}{ }^{*} 4$ instead of * 3.5.

The output bit mapper can be used for bypass and decimation filter.
Table 8-5. Serialization factor vs output resolution for different output modes

| $\begin{gathered} \text { OUTPUT } \\ \text { RESOLUTION } \end{gathered}$ | Interface | SERIALIZATION | FCLK | DCLKIN | DCLK | D0/D1 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 14-bit (default) | 2-Wire | $7 x$ | $\mathrm{F}_{\mathrm{S}} / 2$ | $\mathrm{F}_{\text {s }}{ }^{*} 3.5$ | $\mathrm{F}_{\mathrm{S}}{ }^{*} 3.5$ | $\mathrm{F}_{\mathrm{S}}{ }^{*} 7$ |
|  | 1-Wire | 14x | $\mathrm{F}_{\mathrm{S}}$ | $\mathrm{Fs}^{*} 7$ | $\mathrm{Fs}^{*} 7$ | $\mathrm{F}_{S}{ }^{*} 14$ |
|  | 1/2-Wire | 28x | $\mathrm{F}_{\mathrm{S}}$ | $\mathrm{F}_{\mathrm{S}}{ }^{*} 14$ | $\mathrm{FS}^{*} 14$ | $\mathrm{F}_{S}{ }^{*} 28$ |
| 16-bit | 2-Wire | 8 x | $\mathrm{F}_{\mathrm{S}} / 2$ | $\mathrm{Fs}^{*} 4$ | $\mathrm{Fs}^{*} 4$ | $\mathrm{Fs}^{*} 8$ |
|  | 1-Wire | 16x | $\mathrm{F}_{\mathrm{S}}$ | $\mathrm{F}_{S}{ }^{*} 8$ | $\mathrm{F}_{S}{ }^{*} 8$ | $\mathrm{F}_{\mathrm{S}}{ }^{*} 16$ |
|  | 1/2-Wire | 32 x | $\mathrm{F}_{\mathrm{S}}$ | $\mathrm{FS}^{*} 16$ | $\mathrm{FS}^{*} 16$ | $\mathrm{FS}^{*} 32$ |
| 18-bit | 2-Wire | 9 x | $\mathrm{F}_{\mathrm{S}} / 2$ | $\mathrm{F}_{\mathrm{S}}{ }^{*} 4.5$ | $\mathrm{F}_{\mathrm{S}}{ }^{*} 4.5$ | $\mathrm{F}_{\mathrm{S}}{ }^{*} 9$ |
|  | 1-Wire | 18x | $\mathrm{F}_{\mathrm{S}}$ | $\mathrm{F}_{\mathrm{S}}{ }^{*} 9$ | $\mathrm{F}_{\mathrm{S}}{ }^{*} 9$ | $\mathrm{F}_{\mathrm{S}}{ }^{*} 18$ |
|  | 1/2-Wire | 36x | $\mathrm{F}_{\mathrm{S}}$ | $\mathrm{FS}^{*} 18$ | $\mathrm{FS}^{*} 18$ | $\mathrm{F}_{\mathrm{S}}{ }^{*} 36$ |
| 20-bit | 2-Wire | 10x | $\mathrm{F}_{\mathrm{S}} / 2$ | $\mathrm{F}_{\mathrm{S}}{ }^{*} 5$ | $\mathrm{F}_{S}{ }^{*} 5$ | $\mathrm{F}_{\mathrm{S}}{ }^{*} 10$ |
|  | 1-Wire | 20x | $\mathrm{F}_{\mathrm{S}}$ | $\mathrm{Fs}^{*} 10$ | $\mathrm{Fs}^{*} 10$ | $\mathrm{FS}^{*} 20$ |
|  | 1/2-Wire | 40x | $\mathrm{F}_{\mathrm{S}}$ | $\mathrm{F}_{\text {S }}{ }^{*} 20$ | $\mathrm{F}_{S}{ }^{*} 20$ | $\mathrm{F}_{S}{ }^{*} 40$ |

The programming sequence to change the output interface and/or resolution from default settings is shown in Section 8.3.5.3.

### 8.3.5.2 Output Bit Mapper

The output bit mapper allows to change the output bit order for any selected interface mode.

Figure 8-34. Output Bit Mapper
It is a two step process to change the output bit mapping and assemble the output data bus:

1. Both channel $A$ and $B$ can have up to 20-bit output. Each output bit of either channel has a unique identifier bit as shown in Table 8-6. The MSB starts with bit D19 - depending on output resolution chosen the LSB would be D6 (14-bit) to D0 (20-bit). The previous sample is only needed in 2-w mode.
2. The bit mapper is then used to assemble the output sample. The following sections detail how to remap the serial output format.

Table 8-6. Unique identifier of each data bit

| Bit | Channel A |  | Channel B |  |
| :---: | :---: | :---: | :---: | :---: |
|  | Previous sample (2w only) | Current sample | Previous sample (2w only) | Current sample |
| D19 (MSB) | $0 \times 2 \mathrm{D}$ | $0 \times 6 \mathrm{D}$ | $0 \times 29$ | $0 \times 69$ |
| D18 | $0 \times 2 \mathrm{C}$ | $0 \times 6 \mathrm{C}$ | $0 \times 28$ | $0 \times 68$ |
| D17 | $0 \times 27$ | $0 \times 67$ | $0 \times 23$ | $0 \times 63$ |
| D16 | $0 \times 26$ | $0 \times 66$ | $0 \times 22$ | $0 \times 62$ |
| D15 | $0 \times 25$ | $0 \times 65$ | $0 \times 21$ | $0 \times 61$ |
| D14 | $0 \times 24$ | $0 \times 64$ | $0 \times 1 \mathrm{~B}$ | $0 \times 60$ |
| D13 | $0 \times 1 \mathrm{~F}$ | $0 \times 5 \mathrm{~F}$ | $0 \times 1 \mathrm{~A}$ | $0 \times 5 \mathrm{~B}$ |
| D12 | $0 \times 1 \mathrm{E}$ | $0 \times 5 \mathrm{E}$ | $0 \times 19$ | $0 \times 5 \mathrm{~A}$ |
| D11 | $0 \times 1 \mathrm{D}$ | $0 \times 5 \mathrm{D}$ | $0 \times 18$ | $0 \times 59$ |
| D10 | $0 \times 1 \mathrm{C}$ | $0 \times 5 \mathrm{C}$ | $0 \times 13$ | $0 \times 58$ |
| D9 | $0 \times 17$ | $0 \times 57$ | $0 \times 12$ | $0 \times 53$ |
| D8 | $0 \times 16$ | $0 \times 56$ | $0 \times 11$ | $0 \times 52$ |
| D7 | $0 \times 15$ | $0 \times 55$ | $0 \times 0 \mathrm{~B}$ | $0 \times 51$ |
| D6 | $0 \times 14$ | $0 \times 54$ | $0 \times 0 \mathrm{~A}$ | $0 \times 50$ |
| D5 | $0 \times 0 \mathrm{~F}$ | $0 \times 4 \mathrm{~F}$ | $0 \times 09$ | $0 \times 4 \mathrm{~B}$ |
| D4 | $0 \times 0 \mathrm{E}$ | $0 \times 4 \mathrm{E}$ | $0 \times 08$ | $0 \times 4 \mathrm{~A}$ |
| D3 | $0 \times 0 \mathrm{D}$ | $0 \times 4 \mathrm{D}$ | $0 \times 03$ | $0 \times 49$ |
| D2 | $0 \times 0 \mathrm{C}$ | $0 \times 4 \mathrm{C}$ | $0 \times 48$ |  |
| D1 | $0 \times 07$ | $0 \times 06$ | $0 \times 46$ | $0 \times 43$ |
| D0 (LSB) |  |  | 0 | 0 |

In the serial output mode, a data bit (with unique identifier) needs to be assigned to each location within the serial output stream. There are a total of 40 addresses available per channel. Channel A spans from address $0 x 39$ to $0 x 60$ and channel B from address $0 x 61$ to $0 x 88$. When using complex decimation, the output bit mapper is applied to both the "l" and the "Q" sample.

ADC3564
2-wire mode: in this mode both the current and the previous sample have to be used in the address space as shown in Figure $8-35$. The address order is different for $14 / 18$-bit and $16 / 20$-bit. Note: there are unused addresses between samples for resolution less than 20-bit (grey back ground), which can be skipped if not used.

| DA1 |  | 14-bit |  |  |  |  |  |  | 16-bit 18-bit 20 -bit |  |  | 14-bit |  |  |  |  |  | 16-bit 18 -bit 20 -bit |  |  |  |

Figure 8-36. Example: 2-wire output bit mapping
1-wire mode: Only the current sample needs to programmed in the address space. If desired, it can be duplicated on DA1/DB1 as well (using addresses shown below) in order to have a redundant output. Lane DA1/DB1 needs to be powered up in that case.

Figure 8-37. 1-wire output bit mapping
$1 / 2$-wire mode: The output is only lane DAO and the sample order is programmed into the 40 addresses of chA (from $0 \times 39$ to $0 \times 60$ ). It covers 2 samples (one for chA, one for chB) as shown below. If desired it can be duplicated on DB0 as well (using addresses shown Figure 8-38) in order to have a redundant output. Lane DB0 needs to be powered up in that case.

Figure 8-38. 1/2-wire output bit mapping

### 8.3.5.3 Output Interface/Mode Configuration

The following sequence summarizes all the relevant registers for changing the output interface and/or enabling the decimation filter. Steps 1 and 2 must come first since the E-Fuse load reset the SPI writes, the remaining steps can come in any order.

Table 8-7. Configuration steps for changing interface or decimation

| STEP | FEATURE | ADDRESS | DESCRIPTION |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1 |  | $0 \times 07$ | Select the output interface bit mapping depending on resolution and output interface. |  |  |  |  |
|  |  |  | Output | esolution | 2-wire | 1-wire | 1/2-wire |
|  |  |  |  | -bit | 0x2B | $0 \times 6 \mathrm{C}$ | 0x8D |
|  |  |  |  | -bit | $0 \times 4 \mathrm{~B}$ |  |  |
|  |  |  |  | -bit | $0 \times 2 \mathrm{~B}$ |  |  |
|  |  |  |  | -bit | 0x4B |  |  |
| 2 |  | 0x13 | Load the output interface bit mapping using the E-fuse loader ( $0 \times 13, \mathrm{D} 0$ ). Program register $0 \times 13$ to $0 \times 01$, wait $\sim 1 \mathrm{~ms}$ so that bit mapping is loaded properly followed by $0 \times 130 \times 00$. |  |  |  |  |
| 3 | Output Interface | 0x19 | Configure the FCLK frequency based on bypass/decimation and number of lanes used. |  |  |  |  |
|  |  |  | Bypass/Dec | SLVDS | FCLK SRC <br> (D7) | FCLK DIV <br> (D4) | TOG FCLK <br> (DO) |
|  |  |  | Bypass/ Real <br> Decimation | 2-wire | 0 | 1 | 0 |
|  |  |  |  | 1-wire | 0 | 0 | 0 |
|  |  |  |  | 1/2-wire | 0 | 0 | 0 |
|  |  |  | Complex Decimation | 2-wire | 1 | 0 | 0 |
|  |  |  |  | 1-wire | 1 | 0 | 0 |
|  |  |  |  | 1/2-wire | 0 | 0 | 1 |
| 4 |  | 0x1B | Select the output interface resolution using the bit mapper (D5-D3). |  |  |  |  |
| 5 |  | $\begin{aligned} & 0 \times 20 \\ & 0 \times 21 \\ & 0 \times 22 \end{aligned}$ | Select the FCLK pattern for decimation for proper duty cycle output of the frame clock. |  |  |  |  |
|  |  |  |  | Output Resolution | 2-wire | 1-wire | 1/2-wire |
|  |  |  | Real Decimation | 14-bit | use default | 0xFE000 | use default |
|  |  |  |  | 16-bit |  | 0xFF000 |  |
|  |  |  |  | 18-bit |  | 0xFF800 |  |
|  |  |  |  | 20-bit |  | 0xFFC00 |  |
|  |  |  | Complex Decimation | 14-bit |  | 0xFFFFF | 0xFFFFF |
|  |  |  |  | 16-bit |  |  |  |
|  |  |  |  | 18-bit |  |  |  |
|  |  |  |  | 20-bit |  |  |  |
| 6 |  | $\begin{aligned} & \hline 0 \times 39 . .0 \times 60 \\ & 0 \times 61 . .0 \times 88 \end{aligned}$ | Change output bit mapping for chA and chB if desired. This works also with the default interface selection. |  |  |  |  |
| 7 | DecimationFilter | 0x24 | Enable the decimation filter |  |  |  |  |
| 8 |  | $0 \times 25$ | Configure the decimation filter |  |  |  |  |
| 9 |  | $\begin{gathered} \hline 0 \times 2 \mathrm{~A} / \mathrm{B} / \mathrm{C} / \mathrm{D} \\ 0 \times 31 / 2 / 3 / 4 \end{gathered}$ | Program the NCO frequency for complex decimation (can be skipped for real decimation) |  |  |  |  |
| 10 |  | $\begin{aligned} & 0 \times 27 \\ & 0 \times 2 E \end{aligned}$ | Configure the complex output data stream (set both bits to 0 for real decimation) |  |  |  |  |
|  |  |  | SLVDS |  |  | OP-Order (D4) | Q-Delay (D3) |
|  |  |  | 2-wire |  |  | 1 | 0 |
|  |  |  | 1-wire |  |  | 0 | 1 |
|  |  |  | 1/2-wire |  |  | 1 | 1 |
| 11 |  | 0x26 | Set the mixer gain and toggle the mixer reset bit to update the NCO frequency. |  |  |  |  |

### 8.3.5.3.1 Configuration Example

The following is a step by step programming example to configure the ADC3564 to complex decimation by 8 with 1-wire SLVDS and 16-bit output.

1. $0 \times 07$ (address) $0 \times 6 \mathrm{C}$ (load bit mapper configuration for 16-bit output with 1 -wire SLVDS)
2. $0 \times 130 \times 01$ (load e-fuse), wait $1 \mathrm{~ms}, 0 \times 130 \times 00$
3. $0 \times 190 \times 80$ (configure FCLK)
4. $0 \times 1$ B $0 \times 88$ (select 16-bit output resolution)
5. $0 \times 200 \times F F, 0 \times 210 x F F, 0 \times 220 \times 0 F$ (configure FCLK pattern)
6. $0 \times 240 \times 06$ (enable decimation filter)
7. $0 \times 250 \times 30$ (configure complex decimation by 8 )
8. $0 x 2 \mathrm{~A} / \mathrm{B} / \mathrm{C} / \mathrm{D}$ and $0 \times 31 / 32 / 33 / 34$ (program NCO frequency)
9. $0 x 27 / 0 x 2 E 0 x 08$ (configure Q-delay register bit)
10. $0 \times 260 \times A A, 0 \times 260 \times 88$ (set digital mixer gain to $6-\mathrm{dB}$ and toggle the mixer update)

### 8.3.5.4 Output Data Format

The output data can be configured to two's complement (default) or offset binary formatting using SPI register writes (register 0x8F and $0 \times 92$ ). Table 8-8 provides an overview for minimum and maximum output codes for the two formatting options. The actual output resolution is set by the output bit mapper.
Table 8-8. Overview of minimum and maximum output codes vs output resolution for different formatting

|  | Two's Complement (default) |  | Offset Binary |  |
| :---: | :---: | :---: | :---: | :---: |
| RESOLUTION (BIT) | $\mathbf{1 4}$ | $\mathbf{1 6}$ | $\mathbf{1 4}$ | $\mathbf{1 6}$ |
| $\mathrm{V}_{\text {IN,MAX }}$ | $0 \times 1$ FFF | $0 \times 7 \mathrm{FFF}$ | $0 \times 3 F F F$ | $0 \times F F F F$ |
| 0 | $0 \times 0000$ |  | $0 \times 2000$ | $0 \times 8000$ |
| $\mathrm{~V}_{\mathrm{IN,MIN}}$ | $0 \times 2000$ | $0 \times 8000$ | $0 \times 0000$ |  |

### 8.3.6 Test Pattern

In order to enable in-circuit testing of the digital interface, the following test patterns are supported and enabled via SPI register writes ( $0 \times 14 / 0 \times 15 / 0 \times 16$ ). The test pattern generator is located after the decimation filter as shown in Figure 8-39. In decimation mode (real and complex), the test patterns replace the output data of the DDC - however channel A controls the test patterns for both channels.

Figure 8-39. Test Pattern Generator

- RAMP Pattern: The step size needs to be configured in the CUSTOM PAT register according to the native resolution of the ADC. When selecting a higher output resolution then the additional LSBs will still be 0 in RAMP pattern mode.
- 00001: 18-bit output resolution
- 00100: 16-bit output resolution
- 10000: 14-bit output resolution
- Custom Pattern: Configured in the CUSTOM PAT register

### 8.4 Device Functional Modes

### 8.4.1 Normal operation

In normal operating mode, the entire ADC full scale range gets converted to a digital output with 14 -bit resolution. The output is available in as little as 1 clock cycle with 1 -wire SLVDS interface.

### 8.4.2 Power Down Options

A global power down mode can be enabled via SPI as well as using the power down pin (PDN/SYNC). There is an internal pull-down $21 \mathrm{k} \Omega$ resistor on the PDN/SYNC input pin and the pin is active high - so the pin needs to be pulled high externally to enter global power down mode.

The SPI register map provides the capability to enable/disable individual blocks directly or via PDN pin mask in order to trade off power consumption vs wake up time as shown in Table 8-9.

Figure 8-40. Power Down Configurations
Table 8-9. Overview of Power Down Options

| Function/ Register | PDN via SPI | Mask for Global PDN | Feature Default | Power Impact | Wake-up time | Comment |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| ADC | Yes | - | Enabled |  |  | ADC is included in Global PDN automatically |
| Reference gain amplifier | Yes | Yes | Enabled | $\sim 0.4 \mathrm{~mA}$ | $\sim 3$ us | Should only be powered down in power down state. |
| Internal 1.2V reference | Yes |  | External ref | $\sim 1-3.5 \mathrm{~mA}$ | $\sim 3 \mathrm{~ms}$ | Internal/external reference selection is available through SPI and REFBUF pin. |
| Clock buffer | Yes |  | Differential clock | $\sim 1 \mathrm{~mA}$ | n/a | Single ended clock input saves $\sim 1 \mathrm{~mA}$ compared to differential. Some programmability is available through the REFBUF pin. |
| Output interface drivers | Yes | - | Enabled | varies | n/a | Depending on output interface mode, unused output drivers can be powered down for maximum power savings |
| Decimation filter | Yes | - | Disabled | see electrical table | n/a |  |

ADC3564

### 8.5 Programming

The device is primarily configured and controlled using the serial programming interface (SPI) however it can operate in a default configuration without requiring the SPI interface. Furthermore the power down function as well as internal/external reference configuration is possible via pin control (PDN/SYNC and REFBUF pin).

## Note

The power down command (via PIN or SPI) only goes in effect with the ADC sampling clock present.
After initial power up, the default operating configuration is shown in Table 8-10.
Table 8-10. Default device configuration after power up

| FEATURE | DEFAULT |
| :---: | :---: |
| Signal Input | Differential |
| Clock Input | Differential |
| Reference | External |
| Decimation | DDC bypass |
| Interface | 2-wire |
| Output Format | 2s complement |

### 8.5.1 Configuration using PINs only

The ADC voltage reference can be selected using the REFBUF pin. Even though there is an internal $100 \mathrm{k} \Omega$ pull-up resistor to AVDD, the REFBUF pin should be set to a voltage externally and not left floating.
When using a voltage divider to set the REFBUF voltage ( R 1 and R 2 in Table $8-11$ ), resistor values $<5 \mathrm{k} \Omega$ should be used.

Figure 8-41. Configuration of external voltage on REFBUF pin
Table 8-11. REFBUF voltage levels control voltage reference selection

| REFBUF VOLTAGE | VOLTAGE REFERENCE OPTION | CLOCKING OPTION |
| :---: | :---: | :---: |
| $>1.7 \mathrm{~V}$ (Default) | External reference | Differential clock input |
| $1.2 \mathrm{~V}(1.15-1.25 \mathrm{~V})$ | External 1.2 V input on REFBUF pin using internal gain buffer | Differential clock input |
| $0.5-0.7 \mathrm{~V}$ | Internal reference | Differential clock input |
| $<0.1 \mathrm{~V}$ | Internal reference | Single ended clock input |

### 8.5.2 Configuration using the SPI interface

The device has a set of internal registers that can be accessed by the serial interface formed by the SEN (serial interface enable), SCLK (serial interface clock) and SDIO (serial interface data input/output) pins. Serially shifting bits into the device is enabled when SEN is low. Serial data input are latched at every SCLK rising edge when SEN is active (low). The serial data are loaded into the register at every 24th SCLK rising edge when SEN is low. When the word length exceeds a multiple of 24 bits, the excess bits are ignored. Data can be loaded in multiples of 24-bit words within a single active SEN pulse. The interface can function with SCLK frequencies from 12 MHz down to very low speeds (of a few hertz) and also with a non-50\% SCLK duty cycle.

### 8.5.2.1 Register Write

The internal registers can be programmed following these steps:

1. Drive the SEN pin low
2. Set the R/W bit to 0 (bit A15 of the 16 -bit address) and bits $\mathrm{A}[14: 12]$ in address field to 0 .
3. Initiate a serial interface cycle by specifying the address of the register (A[11:0]) whose content is written and
4. Write the 8 -bit data that are latched in on the SCLK rising edges

Figure 8-42 shows the timing requirements for the serial register write operation.

Figure 8-42. Serial Register Write Timing Diagram

### 8.5.2.2 Register Read

The device includes a mode where the contents of the internal registers can be read back using the SDIO pin. This readback mode can be useful as a diagnostic check to verify the serial interface communication between the external controller and the ADC. The procedure to read the contents of the serial registers is as follows:

1. Drive the SEN pin low
2. Set the R/W bit (A15) to 1 . This setting disables any further writes to the registers. Set $A[14: 12]$ in address field to 0 .
3. Initiate a serial interface cycle specifying the address of the register ( $\mathrm{A}[11: 0]$ ) whose content must be read
4. The device launches the contents ( $\mathrm{D}[7: 0]$ ) of the selected register on the SDIO pin on SCLK falling edge
5. The external controller can capture the contents on the SCLK rising edge

Figure 8-43. Serial Register Read Timing Diagram

### 8.6 Register Maps

Table 8-12. Register Map Summary

| REGISTER ADDRESS | REGISTER DATA |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

Table 8-14. Register 0x07 Field Descriptions

| Bit | Field | Type | Reset | Description |
| :---: | :---: | :---: | :---: | :---: |
| 7-5 | OP IF MAPPER | R/W | 000 | Output interface mapper. This register contains the proper output interface bit mapping for the different interfaces. The interface bit mapping is internally loaded from e-fuses and also requires a fuse load command to go into effect ( $0 \times 13, \mathrm{DO}$ ). Register 0x07 along with the E-Fuse Load ( $0 \times 13, \mathrm{D} 0$ ) needs to be loaded first in the programming sequence since the E-Fuse load resets the SPI writes. <br> After initial reset the default output interface variant is loaded automatically from fuse internally. However when reading back this register reads 000 until a value is written using SPI. <br> 001: 2-wire, 18 and 14-bit <br> 010: 2-wire, 16-bit <br> 011: 1-wire <br> 100: 0.5 -wire <br> others: not used |
| 4 | 0 | R/W | 0 | Must write 0 |
| 3 | OP IF EN | R/W | 0 | Enables changing the default output interface mode (D2-D0). |
| 2-0 | OP IF SEL | R/W | 000 | Selection of the output interface mode. OP IF EN (D3) needs to be enabled also. <br> After initial reset the default output interface is loaded automatically from fuse internally. However when reading back this register reads 000 until a value is written using SPI. <br> 011: 2-wire <br> 100: 1-wire <br> 101: 0.5-wire <br> others: not used |

| R/W-0 | R/W-0 | R/W-0 | R/W-0 | R/W-0 | R/W-0 | R/W-0 | R/W-0 |

Table 8-18. Register 0x0E Field Descriptions

| Bit | Field | Type | Reset | Description |
| :---: | :---: | :---: | :---: | :---: |
| 7 | SYNC PIN EN | R/W | 0 | This bit controls the functionality of the SYNC/PDN pin. 0 : SYNC/PDN pin exercises global power down mode when pin is pulled high. <br> 1: SYNC/PDN pin issues the SYNC command when pin is pulled high. |
| 6 | SPI SYNC | R/W | 0 | Toggling this bit issues the SYNC command using the SPI register write. SYNC using SPI must be enabled as well (D5). This bit doesn't self reset to 0 . <br> 0 : Normal operation <br> 1: SYNC command issued. |
| 5 | SPI SYNC EN | R/W | 0 | This bit enables synchronization using SPI instead of the SYNC/PDN pin. <br> 0 : Synchronization using SPI register bit disabled. <br> 1: Synchronization using SPI register bit enabled. |
| 4 | 0 | R/W | 0 | Must write 0 |
| 3 | REF CTL | R/W | 0 | This bit determines if the REFBUF pin controls the voltage reference selection or the SPI register (D2-D1). <br> 0 : The REFBUF pin selects the voltage reference option. <br> 1: Voltage reference is selected using SPI (D2-D1) and single ended clock using DO. |
| 2-1 | REF SEL | R/W | 00 | Selects of the voltage reference option. REF CTRL (D3) must be set to 1 . <br> 00: Internal reference <br> 01: External voltage reference ( 1.2 V ) using internal reference buffer (REFBUF) <br> 10: External voltage reference <br> 11: not used |
| 0 | SE CLK EN | R/W | 0 | Selects single ended clock input and powers down the differential sampling clock input buffer. REF CRTL (D3) must be set to 1 . <br> 0: Differential clock input <br> 1: Single ended clock input |

## 9 Application Information Disclaimer

## Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. Tl's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

### 9.1 Typical Application

A spectrum analyzer is a typical frequency domain application for the ADC3564 and its front end circuitry is very similar to several other systems such as software defined radio (SDR), radar or communications. Some applications require frequency coverage including DC or near DC so it's included in this example.

Figure 9-1. Typical configuration for a spectrum analyzer with DC support

### 9.1.1 Design Requirements

Frequency domain applications cover a wide range of frequencies from low input frequencies at or near DC in the 1st Nyquist zone to undersampling in higher Nyquist zones. If very low input frequency is supported then the input has to be DC coupled and the ADC driven by a fully differential amplifier (FDA). If low frequency support is not needed then AC coupling and use of a balun may be more suitable.
The internal reference is used since DC precision is not needed. However the ADC AC performance is highly dependent on the quality of the external clock source. If in-band interferers can be present then the ADC SFDR performance will be a key care about as well. A higher ADC sampling rate is desirable in order to relax the external anti-aliasing filter - an internal decimation filter can be used to reduce the digital output rate afterwards.

Table 9-1. Design key care-abouts

| FEATURE | DESCRIPTION |
| :--- | :--- |
| Signal Bandwidth | DC to 30 MHz |
| Input Driver | Single ended to differential signal conversion and DC coupling |
| Clock Source | External clock with low jitter |

When designing the amplifier/filter driving circuit, the ADC input full-scale voltage needs to be taken into consideration. For example, the ADC3564 input full-scale is 3.2 Vpp . When factoring in $\sim 1 \mathrm{~dB}$ for insertion loss of the filter, then the amplifier needs to deliver close to 3.6 Vpp . The amplifier distortion performance will degrade with a larger output swing and considering the ADC common mode input voltage the amplifier may not be able
to deliver the full swing. The ADC3564 provides an output common mode voltage of 0.95 V and the THS4541 for example can only swing within 250 mV of its negative supply. A unipolar 3.3 V amplifier power supply will thus limit the maximum voltage swing to $\sim 2.8 \mathrm{Vpp}$. Hence if a larger output swing is required (factoring in filter insertion loss) then a negative supply for the amplifier is needed in order to eliminate that limitation. Additionally input voltage protection diodes may be needed to protect the ADC from over-voltage events.

Table 9-2. Output voltage swing of THS4541 vs power supply

| DEVICE | MIN OUTPUT VOLTAGE | MAX SWING WITH 3.3 V/ 0 V SUPPLY | MAX SWING WITH 3.3 V/ -1.0 V SUPPLY |
| :---: | :---: | :---: | :---: |
| THS4541 | VS- +250 mV | 2.8 Vpp | 6.8 Vpp |

### 9.1.2 Detailed Design Procedure

### 9.1.2.1 Input Signal Path

The THS4541 provides a very good low power option to drive the ADC inputs. Table 9-3 provides an overview of the THS4541 with power consumption and usable frequency.

Table 9-3. Fully Differential Amplifier Options

| DEVICE | CURRENT (IQ) PER CHANNEL | USABLE FREQUENCY RANGE |
| :---: | :---: | :---: |
| THS4541 | 10 mA | $<70 \mathrm{MHz}$ |

The low pass filter design (topology, filter order) is driven by the application itself. However, when designing the low pass filter, the optimum load impedance for the amplifier should be taken into consideration as well. Between the low pass filter and the ADC input the sampling glitch filter needs to added as well as shown in Section 8.3.1.2.1. In this example the DC - 30 MHz glitch filter is selected.

### 9.1.2.2 Sampling Clock

Applications operating with low input frequencies (such as DC to 30 MHz ) typically are less sensitive to performance degradation due to clock jitter. The internal ADC aperture jitter improves with faster rise and fall times (i.e. square wave vs sine wave). Table 9-4 provides an overview of the estimated SNR performance of the ADC3564 based on different amounts of jitter of the external clock source. The SNR is estimated based on ADC3564 thermal noise of 77 dBFS and input signal at -1 dBFS .
Table 9-4. ADC SNR performance across vs input frequency for different amounts of external clock jitter

| INPUT FREQUENCY | $\mathbf{T}_{\mathbf{J}, \mathbf{E X T}}=\mathbf{1 0 0} \mathbf{f s}$ | $\mathbf{T}_{\mathbf{J}, \mathbf{E X T}}=\mathbf{2 5 0} \mathbf{~ f s}$ | $\mathbf{T}_{\mathbf{J , E X T}}=\mathbf{5 0 0} \mathbf{f s}$ | $\mathbf{T}_{\mathbf{J}, \mathbf{E X T}}=\mathbf{1} \mathbf{~ \mathbf { s }}$ |
| :---: | :---: | :---: | :---: | :---: |
| 10 MHz | 76.5 | 76.4 | 76.3 | 75.9 |
| 20 MHz | 76.3 | 76.2 | 75.8 | 74.5 |
| 30 MHz | 76.2 | 75.9 | 75.1 | 72.8 |

Termination of the clock input should be considered for long clock traces.

### 9.1.2.3 Voltage Reference

The ADC3564 is configured to internal reference operation by applying 0.6 V to the REFBUF pin.

### 9.1.3 Application Curves

The following FFT plots show the performance of THS4541 driving the ADC3564 operated at 125 MSPS with a full-scale input at -1 dBFS with input frequencies at 5,10 and 20 MHz .

Figure 9-2. Single Tone FFT at $\mathrm{F}_{\text {IN }}=5 \mathrm{MHz}$

SNR $=75.6 \mathrm{dBFS}, \mathrm{HD} 23=74 \mathrm{dBc}$, Non HD23 $=94 \mathrm{dBFS}$
Figure 9-4. Single Tone FFT at $\mathrm{F}_{\mathrm{IN}}=\mathbf{2 0} \mathbf{~ M H z}$

SNR $=75.2 \mathrm{dBFS}$, HD23 $=81 \mathrm{dBc}$, Non HD23 $=91 \mathrm{dBFS}$
Figure 9-3. Single Tone FFT at $\mathrm{F}_{\text {IN }}=10 \mathrm{MHz}$

Figure 9-5. Single Tone FFT at $\mathrm{F}_{\text {IN }} \mathbf{=} \mathbf{2 0} \mathbf{~ M H z}$

### 9.2 Initialization Set Up

After power-up, the internal registers must be initialized to their default values through a hardware reset by applying a high pulse on the RESET pin, as shown in Figure 9-6.

1. Apply AVDD and IOVDD (no specific sequence required). After AVDD is applied the internal bandgap reference will power up and settle out in $\sim 2 \mathrm{~ms}$.
2. Configure REFBUF pin (pull high or low even if configured via SPI later on) and apply the sampling clock.
3. Apply hardware reset. After hardware reset is released, the default registers are loaded from internal fuses and the internal power up capacitor calibration is initiated. The calibration takes approximately 200000 clock cycles.
4. Begin programming using SPI interface.

Figure 9-6. Initialization of serial registers after power up
Table 9-5. Power-up timing

|  |  | MIN | TYP | MAX |
| :---: | :--- | :---: | :---: | :---: |
| $t_{1}$ | Power-on delay: delay from power up to logic level of REFBUF pin | 2 |  |  |
| $t_{2}$ | Delay from REFBUF pin logic level to RESET rising edge | 100 |  |  |
| $t_{3}$ | RESET pulse width | 1 |  |  |
| $t_{4}$ | Delay from RESET disable to SEN active | $\sim 200000$ |  | ns |

### 9.2.1 Register Initialization During Operation

If required, the serial interface registers can be cleared and reset to default settings during operation either:

- through a hardware reset or
- by applying a software reset. When using the serial interface, set the RESET bit (D0 in register address 0x00) high. This setting initializes the internal registers to the default values and then self-resets the RESET bit low. In this case, the RESET pin is kept low.

After hardware or software reset the wait time is also ~ 200000 clock cycles before the SPI registers can be programmed.

SBAS887 - AUGUST 2022

### 9.3 Power Supply Recommendations

The ADC3564 requires two different power-supplies. The AVDD rail provides power for the internal analog circuits and the ADC itself while the IOVDD rail powers the digital interface and the internal digital circuits like decimation filter or output interface mapper. Power sequencing is not required.
The AVDD power supply must be low noise to achieve data sheet performance. In applications operating near DC, the $1 / \mathrm{f}$ noise contribution of the power supply must also be considered. The ADC is designed for good PSRR which aides with the power supply filter design.

Figure 9-7. Power Supply Rejection Ratio (PSRR) vs Frequency
There are two recommended power-supply architectures:

1. Step down using high-efficiency switching converters, followed by a second stage of regulation using a low noise LDO to provide switching noise reduction and improved voltage accuracy.
2. Directly step down the final ADC supply voltage using high-efficiency switching converters. This approach provides the best efficiency, but care must be taken to make sure the switching noise is minimized to prevent degraded ADC performance.
TI WEBENCH® Power Designer can be used to select and design the individual power-supply elements needed: see the WEBENCH® Power Designer

Recommended switching regulators for the first stage include the TPS62821, and similar devices.
Recommended low dropout (LDO) linear regulators include the TPS7A4701, TPS7A90, LP5901, and similar devices.
For the switch regulator only approach, the ripple filter must be designed with a notch frequency that aligns with the switching ripple frequency of the DC/DC converter. Note the switching frequency reported from WEBENCH® and design the EMI filter and capacitor combination to have the notch frequency centered as needed. Figure 9-8 and Figure 9-9 illustrate the two approaches.

AVDD and IOVDD supply voltages should not be shared in order to prevent digital switching noise from coupling into the analog signal chain.

Figure 9-8. Example: LDO Linear Regulator Approach

Ripple filter notch frequency to match switching frequency of the DC/DC regulator FB = Ferrite bead filter

Figure 9-9. Example Switcher-Only Approach

### 9.4 Layout

### 9.4.1 Layout Guidelines

There are several critical signals which require specific care during board design:

1. Analog input and clock signals

- Traces should be as short as possible and vias should be avoided where possible to minimize impedance discontinuities.
- Traces should be routed using loosely coupled $100-\Omega$ differential traces.
- Differential trace lengths should be matched as close as possible to minimize phase imbalance and HD2 degradation.

2. Digital output interface

- Traces should be routed using tightly coupled $100-\Omega$ differential traces.

3. Voltage reference

- The bypass capacitor should be placed as close to the device pins as possible and connected between VREF and REFGND - on top layer avoiding vias.
- Depending on configuration an additional bypass capacitor between REFBUF and REFGND may be recommended and should also be placed as close to pins as possible on top layer.

4. Power and ground connections

- Provide low resistance connection paths to all power and ground pins.
- Use power and ground planes instead of traces.
- Avoid narrow, isolated paths which increase the connection resistance.
- Use a signal/ground/power circuit board stackup to maximize coupling between the ground and power plane.

### 9.4.2 Layout Example

The following screen shot shows the top layer of the ADC3564/3664 EVM.

- Signal and clock inputs are routed as differential signals on the top layer avoiding vias.
- SLVDS output interface lanes are routed differential and length matched
- Bypass caps are close to the VREF pin on the top layer avoiding vias.

Figure 9-10. Layout example: top layer of ADC3564 EVM

## 10 Device and Documentation Support

TI offers an extensive line of development tools. Tools and software to evaluate the performance of the device, generate code, and develop solutions are listed below.

### 10.1 Device Support

### 10.2 Documentation Support

### 10.2.1 Related Documentation

### 10.3 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on ti.com. Click on Subscribe to updates to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

### 10.4 Support Resources

TI E2E ${ }^{\text {TM }}$ support forums are an engineer's go-to source for fast, verified answers and design help - straight from the experts. Search existing answers or ask your own question to get the quick design help you need.
Linked content is provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's Terms of Use.

### 10.5 Trademarks

TI E2E ${ }^{\text {TM }}$ is a trademark of Texas Instruments.
All trademarks are the property of their respective owners.

### 10.6 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.
ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

### 10.7 Glossary

TI Glossary This glossary lists and explains terms, acronyms, and definitions.

## 11 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

INSTRUMENTS

## PACKAGING INFORMATION

| Orderable Device | Status <br> (1) | Package Type | Package Drawing | Pins | Package Qty | Eco Plan <br> (2) | Lead finish/ Ball material <br> (6) | MSL Peak Temp <br> (3) | Op Temp ( ${ }^{\circ} \mathrm{C}$ ) | Device Marking <br> (4/5) | Samples |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| ADC3564IRSBR | ACTIVE | WQFN | RSB | 40 | 3000 | RoHS \& Green | NIPDAU | Level-3-260C-168 HR | -40 to 105 | AZ3564 | Samples |
| ADC3564IRSBT | ACTIVE | WQFN | RSB | 40 | 250 | RoHS \& Green | NIPDAU | Level-3-260C-168 HR | -40 to 105 | AZ3564 | Samples |

${ }^{(1)}$ The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but Tl does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.
${ }^{(2)}$ RoHS: TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed $0.1 \%$ by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".
RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption
Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement
${ }^{(3)}$ MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature
${ }^{(4)}$ There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.
${ }^{(5)}$ Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a " $\sim$ " will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.
${ }^{(6)}$ Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer:The information provided on this page represents Tl's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

TAPE AND REEL INFORMATION

TAPE DIMENSIONS

| A0 | Dimension designed to accommodate the component width |
| :---: | :--- |
| B0 | Dimension designed to accommodate the component length |
| K0 | Dimension designed to accommodate the component thickness |
| W | Overall width of the carrier tape |
| P1 | Pitch between successive cavity centers |

QUADRANT ASSIGNMENTS FOR PIN 1 ORIENTATION IN TAPE

*All dimensions are nominal

| Device | Package <br> Type | Package <br> Drawing | Pins | SPQ | Reel <br> Diameter <br> $(\mathbf{m m})$ | Reel <br> Width <br> W1 $(\mathbf{m m})$ | A0 <br> $(\mathbf{m m})$ | B0 <br> $(\mathbf{m m})$ | K0 <br> $(\mathbf{m m})$ | P1 <br> $(\mathbf{m m})$ | W <br> $(\mathbf{m m})$ | Pin1 <br> Quadrant |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| ADC3564IRSBR | WQFN | RSB | 40 | 3000 | 330.0 | 12.4 | 5.3 | 5.3 | 1.5 | 8.0 | 12.0 | Q2 |

*All dimensions are nominal

| Device | Package Type | Package Drawing | Pins | SPQ | Length (mm) | Width (mm) | Height (mm) |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| ADC3564IRSBR | WQFN | RSB | 40 | 3000 | 350.0 | 350.0 | 43.0 |

Images above are just a representation of the package family, actual package may vary. Refer to the product data sheet for package details.

NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. The package thermal pad must be soldered to the printed circuit board for thermal and mechanical performance.

LAND PATTERN EXAMPLE
EXPOSED METAL SHOWN
SCALE:15X

NON SOLDER MASK DEFINED (PREFERRED)

SOLDER MASK DEFINED

SOLDER MASK DETAILS

NOTES: (continued)
4. This package is designed to be soldered to a thermal pad on the board. For more information, see Texas Instruments literature number SLUA271 (www.ti.com/lit/slua271).
5. Vias are optional depending on application, refer to device data sheet. If any vias are implemented, refer to their locations shown on this view. It is recommended that vias under paste be filled, plugged or tented.

SOLDER PASTE EXAMPLE
BASED ON 0.1 mm THICK STENCIL
EXPOSED PAD 41
75\% PRINTED SOLDER COVERAGE BY AREA UNDER PACKAGE SCALE:20X

NOTES: (continued)
6. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.

## IMPORTANT NOTICE AND DISCLAIMER

TI PROVIDES TECHNICAL AND RELIABILITY DATA (INCLUDING DATA SHEETS), DESIGN RESOURCES (INCLUDING REFERENCE DESIGNS), APPLICATION OR OTHER DESIGN ADVICE, WEB TOOLS, SAFETY INFORMATION, AND OTHER RESOURCES "AS IS" AND WITH ALL FAULTS, AND DISCLAIMS ALL WARRANTIES, EXPRESS AND IMPLIED, INCLUDING WITHOUT LIMITATION ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE OR NON-INFRINGEMENT OF THIRD PARTY INTELLECTUAL PROPERTY RIGHTS.
These resources are intended for skilled developers designing with TI products. You are solely responsible for (1) selecting the appropriate TI products for your application, (2) designing, validating and testing your application, and (3) ensuring your application meets applicable standards, and any other safety, security, regulatory or other requirements.
These resources are subject to change without notice. TI grants you permission to use these resources only for development of an application that uses the TI products described in the resource. Other reproduction and display of these resources is prohibited. No license is granted to any other Tl intellectual property right or to any third party intellectual property right. TI disclaims responsibility for, and you will fully indemnify TI and its representatives against, any claims, damages, costs, losses, and liabilities arising out of your use of these resources.

Tl's products are provided subject to Tl's Terms of Sale or other applicable terms available either on ti.com or provided in conjunction with such TI products. TI's provision of these resources does not expand or otherwise alter Tl's applicable warranties or warranty disclaimers for TI products.
TI objects to and rejects any additional or different terms you may have proposed.
