documentation

## AFE539F1-Q1 Automotive, 10-Bit Smart Analog Front End for Constant Power Discharge With PWM Output

## 1 Features

- AEC-Q100 qualified for automotive applications:
- Temperature grade 1: $-40^{\circ} \mathrm{C}$ to $+125^{\circ} \mathrm{C}, \mathrm{T}_{\mathrm{A}}$
- Constant power-dissipation control state-machine
- 10-bit analog-to-digital converter (ADC) input
- 7-bit duty-cycle pulse-width modulation (PWM) output
- Standalone operation from nonvolatile memory (NVM)
- Automatically detects $\mathrm{I}^{2} \mathrm{C}$ or SPI
$-1.62-V V_{I H}$ with $V_{D D}=5.5 \mathrm{~V}$
- VREF/MODE pin selects between programming and standalone modes
- User-programmable NVM
- Internal, external, or VDD reference
- Wide operating range
- Power supply: 1.8 V to 5.5 V
- Tiny package: 16-pin WQFN ( $3 \mathrm{~mm} \times 3 \mathrm{~mm}$ )

## 2 Applications

- Automotive DC-link capacitor discharge circuit
- Elevator main control panel

## 3 Description

The AFE539F1-Q1 is a 10-bit smart analog front end (AFE) targeted for constant power-dissipation control. The AFE539F1-Q1 can be used everywhere where constant power dissipation is desired on a resistive load independently on applied voltage. The AFE539F1-Q1 has an ADC input and a PWM output. This device has an integrated state machine that is preprogrammed as a constant power-dissipation controller. The AFE539F1-Q1 is an excellent choice for automotive DC-link capacitor discharge circuit and general constant-power-heating applications. The AFE539F1-Q1 works independently from parameters programmed into the NVM, which enable this smart AFE for processor-less applications and design reuse. This device also automatically detects $I^{2} \mathrm{C}$ or SPI, and has an internal reference.

## Package Information

| PART NUMBER | PACKAGE $^{(1)}$ | PACKAGE SIZE $^{(2)}$ |
| :--- | :--- | :--- |
| AFE539F1-Q1 | RTE (WQFN, 16) | $3 \mathrm{~mm} \times 3 \mathrm{~mm}$ |

(1) For all available packages, see the orderable addendum at the end of the data sheet.
(2) The package size (length $\times$ width) is a nominal value and includes pins, where applicable.

Constant Power Discharge Circuit Using AFE539F1-Q1

## 5 Pin Configuration and Functions

Figure 5-1. RTE Package, 16-pin WQFN (Top View)
Table 5-1. Pin Functions

| PIN |  | TYPE | DESCRIPTION |
| :---: | :---: | :---: | :---: |
| NO. | NAME |  |  |
| 1 | FB0 | Input | Connect this pin to VDD with a pullup resistor. |
| 2 | AINO | Input | Analog input for ADC0. |
| 3 | NC | - | Not connected. |
| 4 | NC | - | Not connected. |
| 5 | NC/SDO | Input/ Output | This pin is configurable as SDO. For SDO function, connect this pin to the IO voltage with an external pullup resistor. Leave this pin unconnected if not configured as SDO. |
| 6 | SCL/SYNC | Output | $\mathrm{I}^{2} \mathrm{C}$ serial interface clock or SPI chip select input. Connect this pin to the IO voltage using an external pullup resistor. |
| 7 | A0/SDI | Input | Address configuration input for $\mathrm{I}^{2} \mathrm{C}$ or serial data input for SPI . In A0 function, connect this pin to VDD, AGND, SDA, or SCL for address configuration. In SDI function, this pin does not need to be pulled up or pulled down. |
| 8 | SDA/ SCLK/PWM | Input/ Output | Bidirectional $\mathrm{I}^{2} \mathrm{C}$ serial data bus or SPI clock input. Connect this pin to the IO voltage using an external pullup resistor. This pin acts as the PWM output for constant power-dissipation control. Pull the VREF/ MODE pin high to enable PWM output. |
| 9 | NC | - | Not connected. |
| 10 | NC | - | Not connected. |
| 11 | NC | - | Not connected. |
| 12 | NC | - | Not connected. |
| 13 | CAP | Power | External bypass capacitor for the internal LDO. Connect a capacitor (approximately $1.5 \mu \mathrm{~F}$ ) between CAP and AGND. |
| 14 | AGND | Ground | Ground reference point for all circuitry on the device. |
| 15 | VDD | Power | Supply voltage: 1.8 V to 5.5 V |

## Table 5-1. Pin Functions (continued)

| PIN |  | TYPE | DESCRIPTION |
| :---: | :---: | :---: | :---: |
| NO. | NAME |  |  |
| 16 | VREF/ <br> MODE | Input | External reference or interface mode select input. Connect a capacitor (approximately $0.1 \mu \mathrm{~F}$ ) between VREF/MODE and AGND. Use a pullup resistor to VDD when the external reference is not used. Make sure that this pin does not ramp up before VDD. In case an external reference is used or when in interface select mode, make sure the reference ramps up after VDD. In interface select mode. Pull this pin low to enable $\mathrm{I}^{2} \mathrm{C} / \mathrm{SPI}$ communication. Pull this pin high to enable PWM output. |
| Thermal pad | Thermal Pad | Ground | Connect the thermal pad to AGND. |

AFE539F1-Q1

## 6 Specifications

### 6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted) ${ }^{(1)}$

|  | UNIT |  |  |
| :--- | :--- | :---: | :---: |
| $\mathrm{V}_{\mathrm{DD}}$ | Supply voltage, $\mathrm{V}_{\mathrm{DD}}$ to AGND | MIN | MAX |
|  | Digital inputs to AGND | -0.3 | 6 |
|  | $\mathrm{~V}_{\text {FBX }}$ to AGND | -0.3 | $\mathrm{~V}_{\mathrm{DD}}+0.3$ |
|  | A $_{\text {INO }}$ to AGND | -0.3 | $\mathrm{~V}_{\mathrm{DD}}+0.3$ |
|  | External reference, $\mathrm{V}_{\text {REF }}$ to AGND | V |  |
| $\mathrm{V}_{\text {REF }}$ | Current into any pin except the AIN0, VDD, and AGND pins | -0.3 | $\mathrm{~V}_{\mathrm{DD}}+0.3$ |
|  | Junction temperature | -0.3 | $\mathrm{~V}_{\mathrm{DD}}+0.3$ |
| $\mathrm{~T}_{\mathrm{J}}$ | Storage temperature | -10 | V |
| $\mathrm{~T}_{\text {stg }}$ |  | -40 | 10 |

(1) Operation outside the Absolute Maximum Ratings may cause permanent device damage. Absolute Maximum Ratings do not imply functional operation of the device at these or any other conditions beyond those listed under Recommended Operating Conditions. If used outside the Recommended Operating Conditions but within the Absolute Maximum Ratings, the device may not be fully functional, and this may affect device reliability, functionality, performance, and shorten the device lifetime.

### 6.2 ESD Ratings

|  |  |  |  | VALUE | UNIT |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathrm{V}_{\text {(ESD) }}$ | Electrostatic discharge | Human body model (HBM), per AEC Q100-002 ${ }^{(1)}$ HBM ESD classification level 2 |  | $\pm 2000$ | V |
|  |  | Charged device model (CDM), per AEC Q100-011 CDM ESD classification level C4B | Corner pins (1, 4, 5, 8, 9, 12, 13, and 16) | $\pm 750$ |  |
|  |  |  | All pins | $\pm 500$ |  |

(1) AEC Q100-002 indicates that HBM stressing shall be in accordance with the ANSI/ESDA/JEDEC JS-001 specification.

### 6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

|  |  | MIN | NOM |
| :--- | :--- | :---: | :---: |
| $V_{D D}$ | Positive supply voltage to ground (AGND) | 1.7 | 5.5 |
| $\mathrm{~V}_{\mathrm{REF}}$ | External reference to ground (AGND) | V |  |
| $\mathrm{V}_{\mathrm{IH}}$ | Digital input high voltage, $1.7 \mathrm{~V}<\mathrm{V}_{\mathrm{DD}} \leq 5.5 \mathrm{~V}$ | 1.7 | V |
| $\mathrm{~V}_{\mathrm{IL}}$ | Digital input low voltage | 1.62 | V |
| $\mathrm{C}_{\mathrm{CAP}}$ | External capacitor on CAP pin | 0.5 | V |
| $\mathrm{~T}_{\mathrm{A}}$ | Ambient temperature | -40 | 15 |

### 6.4 Thermal Information

| THERMAL METRIC ${ }^{(1)}$ |  | AFE539F1-Q1 | UNIT |
| :---: | :---: | :---: | :---: |
|  |  | RTE (WQFN) |  |
|  |  | 16 PINS |  |
| $\mathrm{R}_{\text {өJA }}$ | Junction-to-ambient thermal resistance | 49 | ${ }^{\circ} \mathrm{C} / \mathrm{W}$ |
| $\mathrm{R}_{\text {өJC(top) }}$ | Junction-to-case (top) thermal resistance | 50 | ${ }^{\circ} \mathrm{C} / \mathrm{W}$ |
| $\mathrm{R}_{\text {өJB }}$ | Junction-to-board thermal resistance | 24.1 | ${ }^{\circ} \mathrm{C} / \mathrm{W}$ |
| $\Psi_{\text {JT }}$ | Junction-to-top characterization parameter | 1.1 | ${ }^{\circ} \mathrm{C} / \mathrm{W}$ |
| $\Psi_{\text {JB }}$ | Junction-to-board characterization parameter | 24.1 | ${ }^{\circ} \mathrm{C} / \mathrm{W}$ |
| $\mathrm{R}_{\text {өJC(bot) }}$ | Junction-to-case (bottom) thermal resistance | 8.7 | ${ }^{\circ} \mathrm{C} / \mathrm{W}$ |

[^0]
### 6.5 Electrical Characteristics: ADC Input

minimum and maximum specifications at $-40^{\circ} \mathrm{C} \leq \mathrm{T}_{\mathrm{A}} \leq+125^{\circ} \mathrm{C}$ and typical specifications at $\mathrm{T}_{\mathrm{A}}=25^{\circ} \mathrm{C}, 1.7 \mathrm{~V} \leq \mathrm{V}_{\mathrm{DD}} \leq 5.5 \mathrm{~V}$, reference input tied to VDD, gain = $1 \times$, and digital inputs at VDD or AGND (unless otherwise noted)

|  | PARAMETER | TEST CONDITIONS | MIN | TYP | MAX | UNIT |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| STATIC PERFORMANCE |  |  |  |  |  |  |
|  | Resolution |  | 10 |  |  | Bits |
| INL | Integral nonlinearity ${ }^{(1)(2)}$ |  | -2 |  | 2 | LSB |
| DNL | Differential nonlinearity ${ }^{(1)(2)}$ |  | -1 |  | 1 | LSB |
|  | Offset error ${ }^{(1)(2)}$ | $1.7 \mathrm{~V} \leq \mathrm{V}_{\mathrm{DD}}<2.7 \mathrm{~V}$ | -5 | 0 | 5 | mV |
|  |  | $2.7 \mathrm{~V} \leq \mathrm{V}_{\mathrm{DD}} \leq 5.5 \mathrm{~V}$ | -5 | 0 | 5 |  |
|  | Gain error ${ }^{(1)}{ }^{(2)}$ |  | -1 |  | 1 | \%FSR |
| INPUT |  |  |  |  |  |  |
|  | Input voltage range | External $\mathrm{V}_{\mathrm{REF}}=\mathrm{V}_{\mathrm{DD}}$ | 0 |  | $\mathrm{V}_{\mathrm{DD}}$ | V |
| DYNAMIC PERFORMANCE |  |  |  |  |  |  |
|  | Data rate ${ }^{(2)}$ | ADC averaging setting is 4 samples | 1406 |  | 2008 | SPS |
|  | Sampling capacitor |  |  | 10 |  | pF |

(1) For external reference and internal reference $V_{D D} \geq 1.21 \times$ gain +0.2 V , between end-point codes: 8 d to 1016 d .
(2) Specified by design and characterization, not production tested.

### 6.6 Electrical Characteristics: General

minimum and maximum specifications at $-40^{\circ} \mathrm{C} \leq \mathrm{T}_{\mathrm{A}} \leq+125^{\circ} \mathrm{C}$ and typical specifications at $\mathrm{T}_{\mathrm{A}}=25^{\circ} \mathrm{C}, 1.7 \mathrm{~V} \leq \mathrm{V}_{\mathrm{DD}} \leq 5.5 \mathrm{~V}$, reference input tied to VDD, gain $=1 \times$ and digital inputs at VDD or AGND (unless otherwise noted)

|  | PARAMETER | TEST CONDITIONS | MIN | TYP | MAX | UNIT |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| INTERNAL REFERENCE |  |  |  |  |  |  |
|  | Initial accuracy | $\mathrm{T}_{\mathrm{A}}=25^{\circ} \mathrm{C}$ for all measurements | 1.1979 | 1.212 | 1.224 | V |
|  | Reference output temperature coefficient ${ }^{(1)}{ }^{(2)}$ |  |  |  | 60 | ppm $/{ }^{\circ} \mathrm{C}$ |
| EXTERNAL REFERENCE |  |  |  |  |  |  |
|  | External reference input range |  | 1.7 |  | $\mathrm{V}_{\mathrm{DD}}$ | V |
|  | $\mathrm{V}_{\text {REF }}$ input impedance ${ }^{(1)}$ |  |  | 192 |  | k ת |
| EEPROM |  |  |  |  |  |  |
|  | Endurance ${ }^{(1)}$ | $-40^{\circ} \mathrm{C} \leq \mathrm{T}_{\mathrm{A}} \leq+85^{\circ} \mathrm{C}$ |  | 20000 |  | Cycles |
|  |  | $\mathrm{T}_{\mathrm{A}}=125^{\circ} \mathrm{C}$ |  | 1000 |  |  |
|  | Data retention ${ }^{(1)}$ |  |  | 50 |  | Years |
|  | EEPROM programming write cycle time ${ }^{(1)}$ |  |  |  | 200 | ms |
|  | Device boot-up time ${ }^{(1)}$ | Time taken from power valid ( $\mathrm{V}_{\mathrm{DD}} \geq 1.7 \mathrm{~V}$ ) to output valid state (output state as programmed in EEPROM), $0.5-\mu \mathrm{F}$ capacitor on the CAP pin |  | 5 |  | ms |
| DIGITAL INPUTS |  |  |  |  |  |  |
|  | Pin capacitance | Per pin |  | 10 |  | pF |
| POWER |  |  |  |  |  |  |
| ${ }^{\text {DD }}$ | Current flowing into VDD | Sleep mode, internal reference powered down, external reference at 5.5 V |  |  | 28 | $\mu \mathrm{A}$ |
|  | Current flowing into VDD ${ }^{(1)}$ | Sleep mode, internal reference enabled, additional current through internal reference |  | 10 |  |  |
|  |  | ADC channel enabled, internal reference enabled, additional current through internal reference |  | 12.5 |  | $\mu \mathrm{A}$-ch |
|  |  | Normal operation, state-machine enabled |  | 900 |  | $\mu \mathrm{A}$ |

(1) Specified by design and characterization, not production tested.
(2) Measured at $-40^{\circ} \mathrm{C}$ and $+125^{\circ} \mathrm{C}$ and calculated the slope.

### 6.7 Timing Requirements: $I^{2} \mathrm{C}$ Standard Mode

|  |  | MIN | NOM MAX | UNIT |
| :---: | :---: | :---: | :---: | :---: |
| f SCLK | SCL frequency |  | 100 | kHz |
| $\mathrm{t}_{\text {BUF }}$ | Bus free time between stop and start conditions | 4.7 |  | $\mu \mathrm{s}$ |
| $\mathrm{t}_{\text {HDSTA }}$ | Hold time after repeated start | 4 |  | $\mu \mathrm{s}$ |
| tsusta | Repeated start setup time | 4.7 |  | $\mu \mathrm{s}$ |
| $\mathrm{t}_{\text {Susto }}$ | Stop condition setup time | 4 |  | $\mu \mathrm{s}$ |
| $\mathrm{t}_{\text {HDDAT }}$ | Data hold time | 0 |  | ns |
| $\mathrm{t}_{\text {SUDAT }}$ | Data setup time | 250 |  | ns |
| tıow | SCL clock low period | 4700 |  | ns |
| $\mathrm{t}_{\text {HIGH }}$ | SCL clock high period | 4000 |  | ns |
| $\mathrm{t}_{\mathrm{F}}$ | Clock and data fall time |  | 300 | ns |
| $\mathrm{t}_{\mathrm{R}}$ | Clock and data rise time |  | 1000 | ns |
| $\mathrm{t}_{\text {VDDAT }}$ | Data valid time, $\mathrm{R}=360 \Omega, \mathrm{C}_{\text {trace }}=23 \mathrm{pF}, \mathrm{C}_{\text {probe }}=10 \mathrm{pF}$ |  | 3.45 | $\mu \mathrm{s}$ |
| $t_{\text {VDACK }}$ | Data valid acknowledge time, $\mathrm{R}=360 \Omega, \mathrm{C}_{\text {trace }}=23 \mathrm{pF}, \mathrm{C}_{\text {probe }}=10 \mathrm{pF}$ |  | 3.45 | $\mu \mathrm{s}$ |

### 6.8 Timing Requirements: $I^{2} C$ Fast Mode

all input signals are timed from VIL to $70 \%$ of $\mathrm{V}_{\text {pull-up }}, 1.7 \mathrm{~V} \leq \mathrm{V}_{\mathrm{DD}} \leq 5.5 \mathrm{~V},-40^{\circ} \mathrm{C} \leq \mathrm{T}_{\mathrm{A}} \leq+125^{\circ} \mathrm{C}$, and $1.7 \mathrm{~V} \leq \mathrm{V}_{\text {pull-up }} \leq \mathrm{V}_{\mathrm{DD}}$

|  |  | MIN | NOM MAX | UNIT |
| :---: | :---: | :---: | :---: | :---: |
| $\mathrm{f}_{\text {SCLK }}$ | SCL frequency |  | 400 | kHz |
| $\mathrm{t}_{\text {BUF }}$ | Bus free time between stop and start conditions | 1.3 |  | $\mu \mathrm{s}$ |
| $\mathrm{t}_{\text {HDSTA }}$ | Hold time after repeated start | 0.6 |  | $\mu \mathrm{s}$ |
| $\mathrm{t}_{\text {SUSTA }}$ | Repeated start setup time | 0.6 |  | $\mu \mathrm{s}$ |
| tsusto | Stop condition setup time | 0.6 |  | $\mu \mathrm{s}$ |
| $\mathrm{t}_{\text {HDDAT }}$ | Data hold time | 0 |  | ns |
| $\mathrm{t}_{\text {SUDAT }}$ | Data setup time | 100 |  | ns |
| t Low | SCL clock low period | 1300 |  | ns |
| $\mathrm{t}_{\text {HIGH }}$ | SCL clock high period | 600 |  | ns |
| $\mathrm{t}_{\mathrm{F}}$ | Clock and data fall time |  | 300 | ns |
| $\mathrm{t}_{\mathrm{R}}$ | Clock and data rise time |  | 300 | ns |
| $\mathrm{t}_{\text {VIDAT }}$ | Data valid time, $\mathrm{R}=360 \Omega$, $\mathrm{C}_{\text {trace }}=23 \mathrm{pF}, \mathrm{C}_{\text {probe }}=10 \mathrm{pF}$ |  | 0.9 | $\mu \mathrm{s}$ |
| tvdack | Data valid acknowledge time, $\mathrm{R}=360 \Omega, \mathrm{C}_{\text {trace }}=23 \mathrm{pF}, \mathrm{C}_{\text {probe }}=10 \mathrm{pF}$ |  | 0.9 | $\mu \mathrm{s}$ |

### 6.9 Timing Requirements: $I^{2} \mathrm{C}$ Fast Mode Plus

| all input signals are timed from VIL to $70 \%$ of $\mathrm{V}_{\text {pull-up }}, 1.7 \mathrm{~V} \leq \mathrm{V}_{\mathrm{DD}} \leq 5.5 \mathrm{~V},-40^{\circ} \mathrm{C} \leq \mathrm{T}_{\mathrm{A}} \leq+125^{\circ} \mathrm{C}, \mathrm{and} 1.7 \mathrm{~V} \leq \mathrm{V}_{\text {pull-up }} \leq \mathrm{V}_{\mathrm{DD}}$ |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  |  | MIN | NOM MAX | UNIT |
| fSCLK | SCL frequency |  | 1 | MHz |
| $\mathrm{t}_{\text {BUF }}$ | Bus free time between stop and start conditions | 0.5 |  | $\mu \mathrm{s}$ |
| $\mathrm{t}_{\text {HDSTA }}$ | Hold time after repeated start | 0.26 |  | $\mu \mathrm{s}$ |
| $\mathrm{t}_{\text {Susta }}$ | Repeated start setup time | 0.26 |  | $\mu \mathrm{s}$ |
| $\mathrm{t}_{\text {susto }}$ | Stop condition setup time | 0.26 |  | $\mu \mathrm{s}$ |
| $\mathrm{t}_{\text {HDDAT }}$ | Data hold time | 0 |  | ns |
| $\mathrm{t}_{\text {SUDAT }}$ | Data setup time | 50 |  | ns |
| t Low | SCL clock low period | 0.5 |  | $\mu \mathrm{s}$ |
| $\mathrm{t}_{\text {HIGH }}$ | SCL clock high period | 0.26 |  | $\mu \mathrm{s}$ |
| $\mathrm{t}_{\mathrm{F}}$ | Clock and data fall time |  | 120 | ns |
| $\mathrm{t}_{\mathrm{R}}$ | Clock and data rise time |  | 120 | ns |
| $t_{\text {VDDAT }}$ | Data valid time, $\mathrm{R}=360 \Omega, \mathrm{C}_{\text {trace }}=23 \mathrm{pF}, \mathrm{C}_{\text {probe }}=10 \mathrm{pF}$ |  | 0.45 | $\mu \mathrm{s}$ |
| tvdack | Data valid acknowledge time, $\mathrm{R}=360 \Omega, \mathrm{C}_{\text {trace }}=23 \mathrm{pF}, \mathrm{C}_{\text {probe }}=10 \mathrm{pF}$ |  | 0.45 | $\mu \mathrm{s}$ |

INSTRUMENTS

### 6.10 Timing Requirements: SPI Write Operation

all input signals are specified with $\mathrm{t}_{\mathrm{r}}=\mathrm{t}_{\mathrm{f}}=1 \mathrm{~V} / \mathrm{ns}\left(10 \%\right.$ to $90 \%$ of $\left.\mathrm{V}_{\mathrm{IO}}\right)$ and timed from a voltage level of (VIL + VIH) / 2 , $1.7 \mathrm{~V} \leq \mathrm{V}_{\mathrm{IO}} \leq 5.5 \mathrm{~V}, 1.7 \mathrm{~V} \leq \mathrm{V}_{\mathrm{DD}} \leq 5.5 \mathrm{~V}$, and $-40^{\circ} \mathrm{C} \leq \mathrm{T}_{\mathrm{A}} \leq+125^{\circ} \mathrm{C}$

|  |  | MIN | NOM MAX | UNIT |
| :---: | :---: | :---: | :---: | :---: |
| $\mathrm{f}_{\text {SCLK }}$ | Serial clock frequency |  | 50 | MHz |
| tsCLKHIGH | SCLK high time | 9 |  | ns |
| tsclkLow | SCLK low time | 9 |  | ns |
| $\mathrm{t}_{\text {SDIS }}$ | SDI setup time | 8 |  | ns |
| $\mathrm{t}_{\text {SDIH }}$ | SDI hold time | 8 |  | ns |
| $\mathrm{t}_{\text {css }}$ | $\overline{\text { SYNC to SCLK falling edge setup time }}$ | 18 |  | ns |
| $\mathrm{t}_{\text {CSH }}$ | SCLK falling edge to $\overline{\text { SYNC }}$ rising edge | 10 |  | ns |
| tcSHIGH | SYNC high time | 50 |  | ns |
| $t_{\text {DACWAIT }}$ | Sequential update wait time (time between subsequent $\overline{\text { SYNC }}$ rising edges) for same channel | 2 |  | $\mu \mathrm{s}$ |

### 6.11 Timing Requirements: SPI Read and Daisy Chain Operation (FSDO = 0)

all input signals are specified with $\mathrm{t}_{\mathrm{r}}=\mathrm{t}_{\mathrm{f}}=1 \mathrm{~V} / \mathrm{ns}\left(10 \%\right.$ to $90 \%$ of $\left.\mathrm{V}_{1 \mathrm{O}}\right)$ and timed from a voltage level of (VIL + VIH) / 2 , $1.7 \mathrm{~V} \leq \mathrm{V}_{I O} \leq 5.5 \mathrm{~V}, 1.7 \mathrm{~V} \leq \mathrm{V}_{\mathrm{DD}} \leq 5.5 \mathrm{~V},-40^{\circ} \mathrm{C} \leq \mathrm{T}_{\mathrm{A}} \leq+125^{\circ} \mathrm{C}$, and FSDO $=0$

|  |  | MIN | NOM MAX | UNIT |
| :---: | :---: | :---: | :---: | :---: |
| $\mathrm{f}_{\text {SCLK }}$ | Serial clock frequency |  | 1.25 | MHz |
| $\mathrm{t}_{\text {SCLKHIGH }}$ | SCLK high time | 350 |  | ns |
| tsclkLow | SCLK low time | 350 |  | ns |
| $\mathrm{t}_{\text {SDIS }}$ | SDI setup time | 8 |  | ns |
| $\mathrm{t}_{\text {SDIH }}$ | SDI hold time | 8 |  | ns |
| $\mathrm{t}_{\mathrm{Css}}$ | $\overline{\text { SYNC }}$ to SCLK falling edge setup time | 400 |  | ns |
| $\mathrm{t}_{\mathrm{CSH}}$ | SCLK falling edge to $\overline{\text { SYNC }}$ rising edge | 400 |  | ns |
| $\mathrm{t}_{\text {CSHIGH }}$ | $\overline{\text { SYNC high time }}$ | 1 |  | $\mu \mathrm{s}$ |
| $\mathrm{t}_{\text {SDODLY }}$ | SCLK rising edge to SDO falling edge, $\mathrm{I}_{\mathrm{OL}} \leq 5 \mathrm{~mA}, \mathrm{C}_{\mathrm{L}}=20 \mathrm{pF}$ |  | 300 | ns |

### 6.12 Timing Requirements: SPI Read and Daisy Chain Operation (FSDO = 1)

all input signals are specified with $\mathrm{t}_{\mathrm{r}}=\mathrm{t}_{\mathrm{f}}=1 \mathrm{~V} / \mathrm{ns}\left(10 \%\right.$ to $90 \%$ of $\left.\mathrm{V}_{1 \mathrm{O}}\right)$ and timed from a voltage level of (VIL +VIH$) / 2$, $1.7 \mathrm{~V} \leq \mathrm{V}_{I O} \leq 5.5 \mathrm{~V}, 1.7 \mathrm{~V} \leq \mathrm{V}_{\mathrm{DD}} \leq 5.5 \mathrm{~V},-40^{\circ} \mathrm{C} \leq \mathrm{T}_{\mathrm{A}} \leq+125^{\circ} \mathrm{C}$, and $\mathrm{FSDO}=1$

|  |  | MIN | NOM MAX | UNIT |
| :---: | :---: | :---: | :---: | :---: |
| $\mathrm{f}_{\text {SCLK }}$ | Serial clock frequency |  | 2.5 | MHz |
| $\mathrm{t}_{\text {SCLKHIGH }}$ | SCLK high time | 175 |  | ns |
| tsclkLow | SCLK low time | 175 |  | ns |
| $\mathrm{t}_{\text {SDIS }}$ | SDI setup time | 8 |  | ns |
| $\mathrm{t}_{\text {SDIH }}$ | SDI hold time | 8 |  | ns |
| $\mathrm{t}_{\text {css }}$ | $\overline{\text { SYNC }}$ to SCLK falling edge setup time | 300 |  | ns |

## 7 Detailed Description

### 7.1 Overview

The AFE539F1-Q1 is a 10-bit smart analog front end (AFE) with PWM output and ADC input. The SDA/SCLK pin is re-purposed as the PWM output when the VREF/MODE pin is held high.

The AFE539F1-Q1 provides a preprogrammed state machine that functions as a constant power-dissipation or heating controller. This device contains nonvolatile memory (NVM), an internal reference, automatically detects $I^{2} \mathrm{C}$ and SPI, and a general-purpose input. The device supports Hi-Z power-down modes by default, which can be configured to $10 \mathrm{k} \Omega-$-AGND or $100 \mathrm{k} \Omega-A G N D$ using the NVM. The AFE539F1-Q1 has a power-on-reset (POR) circuit that makes sure all the registers start with default or user-programmed settings using NVM. The AFE539F1-Q1 operates with either an internal reference, external reference, or with power supply as the reference.

The AFE539F1-Q1 supports $I^{2} \mathrm{C}$ standard mode ( 100 Kbps ), fast mode ( 400 Kbps ), and fast mode plus ( 1 Mbps ). The $1^{2} \mathrm{C}$ interface can be configured with four device addresses using the A0 pin. The SPI mode supports a three-wire interface by default, with up to $25-\mathrm{MHz}$ SCLK input. The NC/SDO input can be configured as SDO in the NVM for SPI read capability. The AFE539F1-Q1 is designed for constant power dissipation in automotive DC-link capacitor discharge circuits and constant power heating applications. The state machine and NVM enable processor-less operation. Because of the smart feature set, the AFE539F1-Q1 is called a smart AFE.

### 7.2 Functional Block Diagram

### 7.3 Feature Description

### 7.3.1 Smart Analog Front End (AFE) Architecture

The AFE539F1-Q1 smart analog front end (AFE) consists of a 10-bit analog-to-digital converter (ADC) input and a 7 -bit duty-cycle pulse-width modulation (PWM) output. The ADC uses a successive-approximation register (SAR) architecture. The DAC inside the ADC uses a string architecture. The PWM output is multiplexed with one of the digital interface pins. Section 7.2 shows the smart AFE architecture within the block diagram, which operates from a $1.8-\mathrm{V}$ to $5.5-\mathrm{V}$ power supply. The device has an internal voltage reference of 1.21 V . There is an option to select an external reference on the VREF/MODE pin or use the power supply as a reference. The ADC uses one of these three reference options.

The AFE539F1-Q1 features a preprogrammed state machine supporting constant power-dissipation control operation. Figure 7-1 shows the digital architecture of the smart AFE with the interconnections between different functional blocks. This state machine allows the user to program the coefficients and input-output parameters. The state machine can be disabled by writing to the STATE-MACHINE-CONFIGO register. The user configurations are stored in the NVM and the state machine can be operated in standalone mode without interfacing to a processor (processor-less operation).

Figure 7-1. Smart AFE Architecture

### 7.3.2 Programming Interface

The AFE539F1-Q1 have five digital I/O pins that control ${ }^{2} \mathrm{C}$, SPI, PWM, and mode selection. The VREF/MODE pin must be at logic low to enable the programming interface. These devices automatically detect ${ }^{2} \mathrm{C}$ and SPI protocols at the first successful communication after power-on, and then connect to the detected interface. After an interface protocol is connected, any change in the protocol is ignored. The $I^{2} \mathrm{C}$ interface uses the A0 pin to select from among four address options. The SPI is a three-wire interface by default. No readback capability is available in three-wire SPI mode. The NC/SDO pin can be configured as the SDO function in the register map and then programmed into the NVM. With the NC/SDO pin acting as SDO, the SPI works as a four-wire interface. The SPI readback mode is slower than the write mode. The programming interface pins are:

- $\mathrm{I}^{2} \mathrm{C}: ~ S C L, S D A, A 0$
- SPI: SCLK, SDI, SYNC, NC/SDO

All the digital pins are open drain when used as outputs. Therefore, all the output pins must be pulled up to the desired I/O voltage using external resistors.

### 7.3.3 Nonvolatile Memory (NVM)

The AFE539F1-Q1 contain nonvolatile memory (NVM) bits. These memory bits are user programmable and erasable, and retain set values in the absence of a power supply. The highlighted gray cells in the Register Map show all the register bits that can be stored in the NVM by setting NVM-PROG $=1$ in the COMMON-TRIGGER register. The NVM-PROG bit autoresets. The NVM-BUSY bit in the GENERAL-STATUS register is set to 1 by the device when an NVM write or reload operation is ongoing. During this time, the device blocks all read and write operations from and to the device. The NVM-BUSY bit is set to 0 after the write or reload operation is complete; at this point, all read and write operations from and to the device are allowed. The default value for all the registers in the AFE539F1-Q1 is loaded from NVM as soon as a POR event is issued.
The AFE539F1-Q1 also implements a NVM-RELOAD bit in the COMMON-TRIGGER register. Set this bit to 1 for the device to start an NVM-reload operation. The NVM-reload operation overwrites the register map with the stored data from the NVM. After completion, the device autoresets this bit to 0 . During the NVM-RELOAD operation, the NVM-BUSY bit is set to 1 .

### 7.3.3.1 NVM Cyclic Redundancy Check (CRC)

The AFE539F1-Q1 implements a cyclic redundancy check (CRC) feature for the NVM to make sure that the data stored in the NVM is uncorrupted. There are two types of CRC alarm bits implemented in the AFE539F1-Q1:

- NVM-CRC-FAIL-USER
- NVM-CRC-FAIL-INT

The NVM-CRC-FAIL-USER bit indicates the status of user-programmable NVM bits, and the NVM-CRC-FAILINT bit indicates the status of internal NVM bits. The CRC feature is implemented by storing a 16 -bit CRC (CRC-16-CCITT) along with the NVM data each time the NVM program operation (write or reload) is performed and during the device boot up. The device reads the NVM data and validates the data with the stored CRC. The CRC alarm bits (NVM-CRC-FAIL-USER and NVM-CRC-FAIL-INT in the GENERAL-STATUS register) report any errors after the data are read from the device NVM. The alarm bits are set only at boot up.

### 7.3.3.1.1 NVM-CRC-FAIL-USER Bit

A logic 1 on NVM-CRC-FAIL-USER bit indicates that the user-programmable NVM data are corrupt. During this condition, all registers in the device are initialized with factory reset values, and any registers can be written to or read from. To reset the alarm bits to 0 , issue a software reset (see Section 7.3.5) command, or cycle power to the device. A software reset or power-cycle also reloads the user-programmable NVM bits. In case the failure persists, reprogram the NVM.

### 7.3.3.1.2 NVM-CRC-FAIL-INT Bit

A logic 1 on NVM-CRC-FAIL-INT bit indicates that the internal NVM data are corrupt. During this condition, all registers in the device are initialized with factory reset values, and any registers can be written to or read from. In case of a temporary failure, to reset the alarm bits to 0 , issue a software reset (see Section 7.3.5) command or cycle power to the device. A permanent failure in the NVM makes the device unusable.

### 7.3.4 Power-On Reset (POR)

The AFE539F1-Q1 includes a power-on reset (POR) function that controls the output voltage at power up. After the $V_{D D}$ supply has been established, a POR event is issued. The POR causes all registers to initialize to default values, and communication with the device is valid only after a POR (boot-up) delay. The default value for all the registers in the AFE539F1-Q1 is loaded from NVM as soon as the POR event is issued.
When the device powers up, a POR circuit sets the device to the default mode. The POR circuit requires specific $V_{D D}$ levels, as indicated in Figure 7-2, to make sure that the internal capacitors discharge and reset the device at power up. To make sure that a POR occurs, $\mathrm{V}_{\mathrm{DD}}$ must be less than 0.7 V for at least 1 ms . When $\mathrm{V}_{\mathrm{DD}}$ drops to less than 1.65 V , but remains greater than 0.7 V (shown as the undefined region), the device may or may not reset under all specified temperature and power-supply conditions. In this case, initiate a POR. When $V_{D D}$ remains greater than 1.65 V , a POR does not occur.

Figure 7-2. Threshold Levels for $\mathrm{V}_{\mathrm{DD}}$ POR Circuit

### 7.3.5 External Reset

An external reset to the device can be triggered through the register map. To initiate a device software reset event, write the reserved code 1010b to the RESET field in the COMMON-TRIGGER register. A software reset initiates a POR event.

### 7.3.6 Register-Map Lock

The AFE539F1-Q1 implements a register-map lock feature that prevents an accidental or unintended write to the registers. The device locks all the registers when the DEV-LOCK bit in the COMMON-CONFIG register is set to 1. However, the software reset function through the COMMON-TRIGGER register is not blocked when using $I^{2} \mathrm{C}$ interface. To bypass the DEV-LOCK setting, write 0101b to the DEV-UNLOCK bits in the COMMON-TRIGGER register.

### 7.4 Device Functional Modes

### 7.4.1 Analog-to-Digital Converter (ADC) Mode

Channel 0 of the AFE539F1-Q1 acts as an ADC. The ADC is controlled by the state-machine in this device. The transfer function of the ADC is given in Equation 1.

$$
\begin{equation*}
\text { ADC_DATA }=(\operatorname{INTEGER})\left(\frac{V_{\mathrm{IN}}}{V_{\mathrm{FS}}}\right) \times 2^{\mathrm{N}} \tag{1}
\end{equation*}
$$

where:

- ADC_DATA is the output of the ADC available to the state machine and is limited to $\left(2^{\mathrm{N}}-1\right)$.
- $\mathrm{V}_{\text {IN }}$ is the input voltage at the AINO pin.
- $\mathrm{V}_{\text {FS }}$ is the full-scale input voltage, as provided in Table 7-1.
- N is the number of ADC bits $=10$.
- INTEGER denotes integer division.

Table 7-1. Full Scale Analog Input (VFS)

| REFERENCE (VREF) | GAIN | V $_{\text {FS }}$ |
| :--- | :---: | :---: |
| Power supply | $1 \times$ | $\mathrm{VDD} / 3$ |
| External | $1 \times$ | $\mathrm{VREF} / 3$ |
|  | $1.5 \times$ | $($ VREF $\times$ GAIN) $/ 3$ |
|  | $2 \times$ | $($ VREF $\times$ GAIN) $/ 3$ |
|  | $3 \times$ | $($ VREF $\times$ GAIN) $/ 6$ |
|  | $4 \times$ | $($ VREF $\times$ GAIN $/ 6$ |

### 7.4.1.1 Voltage Reference Selection

Figure 7-3 shows the three possible voltage reference options with the AFE539F1-Q1: the power supply as reference, internal reference, or external reference (VREF/MODE pin). The REF-GAIN field in the REF-GAINCONFIG register selects the reference and the respective gain. The full scale ADC voltage changes based on the voltage reference selection.

Figure 7-3. Voltage Reference Selection and Power-Down Logic

### 7.4.1.1.1 Power-Supply as Reference

By default, the AFE539F1-Q1 operates with the power-supply pin (VDD) as a reference. The gain at the output stage is always $1 \times$.

### 7.4.1.1.2 Internal Reference

The AFE539F1-Q1 contains an internal reference. To enable the internal reference, write 1 to the EN-INT-REF bit in the COMMON-CONFIG register. The internal reference generates a fixed $1.21-\mathrm{V}$ voltage (typical). Use the REF-GAIN field in the REF-GAIN-CONFIG register to select the internal reference and also to achieve gains of $1.5 \times, 2 \times, 3 \times$, or $4 \times$ for the ADC full scale voltage $\left(\mathrm{V}_{\mathrm{FS}}\right)$.

### 7.4.1.1.3 External Reference

The AFE539F1-Q1 provides an external reference input. Select the external reference option by configuring the REF-GAIN field in the REF-GAIN-CONFIG register appropriately. The external reference can be between 1.8 V and VDD.

## Note

The external reference must be less than VDD in both transient and steady-state conditions. Therefore, the external reference must ramp up after VDD and ramp down before VDD.

### 7.4.2 Pulse-Width Modulation (PWM) Mode

The AFE539F1-Q1 provides the 7-bit duty-cycle PWM output on the SDA/SCLK/PWM pin. Pull the VREF/MODE pin high to enable PWM functionality. Table 7-2 lists all the possible PWM frequency configurations using the PWM-FREQ bits in the PWM-FREQUENCY SRAM register.

Table 7-2. PWM Frequency Configuration

| SRAM REGISTER | PWM-FREQ BIT FIELD | PWM FREQUENCY (kHz) | DUTY CYCLE (\%) FOR <br> CODE 1 | DUTY CYCLE (\%) FOR <br> CODE 126 |
| :---: | :---: | :---: | :---: | :---: |
|  | 0 | Invalid | N/A | N/A |
|  |  | 1 | 48.828 | 4.88 |

The duty cycle of the PWM is proportional to the 7 -bit code, 0 d to 126 d . As Table $7-3$ shows, the code 127 d corresponds to $100 \%$ duty cycle. The duty cycle $99.22 \%$ ( $127 \mathrm{~d} / 128 \mathrm{~d}$ ) is skipped to achieve $100 \%$ duty cycle using a 7 -bit code. The PWM duty-cycle setting is done by the state machine and is not exposed to the user.

Table 7-3. PWM Duty Cycle Setting

| CODE | DUTY-CYCLE | DESCRIPTION |
| :---: | :---: | :--- |
| 0 | $0 \%$ | Always 0 |
| 1 | $0.78 \%$ | Minimum linear duty cycle |
| $x$ | $(x / 128) \%$ | $x$ is the code between 2d and 125 d, both included |
| 126 | $98.44 \%$ | Maximum linear duty cycle |
| 127 | $100 \%$ | Always 1. The duty cycle $99.22 \%(127 \mathrm{~d} / 128 \mathrm{~d})$ is skipped. |

### 7.4.3 Constant Power-Dissipation Control

The AFE539F1-Q1 can be used in applications where constant power dissipation is desired on a resistive load independently on applied voltage. Power dissipation in a fixed resistive load is inversely proportional to the resistance. When the voltage across the resistance varies, for example, in a discharging circuit, constant power can be achieved by modulating the effective resistance seen by the discharge circuit. Figure 7-4 shows an example circuit to create a variable effective resistance from a fixed resistive load using a PWM signal. The effective resistance is the load resistance divided by the PWM duty cycle.

Figure 7-4. PWM-modulated Resistor
The AFE539F1-Q1 generates a PWM signal with a duty cycle dependent on the voltage applied to the ADC input. The AFE539F1-Q1 has a 10-bit ADC input with selectable reference voltage ( $\mathrm{V}_{\mathrm{REF}}$ ). The AFE539F1-Q1 calculates the PWM duty cycle so that a constant dissipated power of the resistor is maintained.

The AFE539F1-Q1 runs a PWM duty cycle update loop that sets the duty cycle (D) according to Equation 2.

$$
\begin{equation*}
\mathrm{D}=\frac{\mathrm{K} \times 2^{15}}{(\text { ADC_DATA })^{2}}=\frac{\mathrm{K} \times\left(\mathrm{V}_{\mathrm{FS}}\right)^{2}}{\left(\mathrm{~V}_{\mathrm{IN}}\right)^{2} \times 2^{5}} \tag{2}
\end{equation*}
$$

where:

- ADC_DATA is the decimal equivalent of the output from the ADC available to the state machine.
- $\mathrm{V}_{\mathrm{IN}}$ is the ADC input voltage.
- $\mathrm{V}_{\text {FS }}$ is the full-scale ADC input voltage, as listed in Table 7-1.
- K is a user-configurable function-coefficient with a value of 16-bit integer (range: 1 to 65535) as programmed in the FUNCTION-COEFFICIENT register.

The duty cycle of the PWM output of the AFE539F1-Q1 has 7-bit resolution which means the minimum duty cycle as well as the step size is about $0.78 \%$. The PWM can achieve $100 \%$ saturation, the lower and upper PWM value limit is user-configurable as well to accommodate specific application requirements. The constant power achieved with this pulse-width modulated resistor can be expressed accordingly as Equation 3.

$$
\begin{equation*}
\mathrm{P}_{\text {const }}=\frac{\mathrm{K}_{2} \times\left(\mathrm{V}_{\mathrm{FS}}\right)^{2}}{\mathrm{R}_{\mathrm{L}}} \tag{3}
\end{equation*}
$$

where:

- $R_{L}$ is the load resistance.
- $\mathrm{K}_{2}$ is a constant that is a function of the function-coefficient, K and the attenuation factor between the bus voltage and the full-scale ADC input.

Equation 3 expresses that the theoretical constant power is independent on the input voltage. The power depends on the load resistance value and value of the constant, $\mathrm{K}_{2}$. However, the PWM is updated in discrete steps, the calculated constant power is in reality a power limit.

SLASFA1 - JULY 2023

### 7.5 Programming

### 7.5.1 SPI Programming Mode

An SPI access cycle for AFE539F1-Q1 is initiated by asserting the SYNC pin low. The serial clock, SCLK, can be a continuous or gated clock. SDI data are clocked on SCLK falling edges. The SPI frame for AFE539F1-Q1 is 24 bits long. Therefore, the SYNC pin must stay low for at least 24 SCLK falling edges. The access cycle ends when the SYNC pin is deasserted high. If the access cycle contains less than the minimum clock edges, the communication is ignored. By default, the SDO pin is not enabled (three-wire SPI). In the three-wire SPI mode, if the access cycle contains more than the minimum clock edges, only the first 24 bits are used by the device. When SYNC is high, the SCLK and SDI signals are blocked, and SDO becomes Hi-Z to allow data readback from other devices connected on the bus.

Table 7-4 and Figure 7-5 describe the format for the 24-bit SPI access cycle. The first byte input to SDI is the instruction cycle. The instruction cycle identifies the request as a read or write command and the 7 -bit address that is to be accessed. The last 16 bits in the cycle form the data cycle.

Table 7-4. SPI Read/Write Access Cycle

| BIT | FIELD |  |
| :--- | :--- | :--- |
| 23 | $R / \bar{W}$ | Identifies the communication as a read or write command to the address register: $R / \bar{W}=0$ <br> sets a write operation. $R / \bar{W}=1$ sets a read operation |
| $22-16$ | A[6:0] | Register address: specifies the register to be accessed during the read or write operation |
| $15-0$ | DI[15:0] | Data cycle bits: If a write command, the data cycle bits are the values to be written to the <br> register with address $A[6: 0]$. If a read command, the data cycle bits are don't care values. |

Figure 7-5. SPI Write Cycle
Read operations require that the SDO pin is first enabled by setting the SDO-EN bit in the INTERFACE-CONFIG register. This configuration is called four-wire SPI. A read operation is initiated by issuing a read command access cycle. After the read command, a second access cycle must be issued to get the requested data. The output data format is shown in Table 7-5 and Figure 7-6. Data are clocked out on the SDO pin either on the falling edge or rising edge of SCLK according to the FSDO bit, as shown in Figure 6-3.

Table 7-5. SDO Output Access Cycle

| BIT | FIELD |  |
| :---: | :---: | :--- |
| 23 | R/W | Echo $R / \bar{W}$ from previous access cycle |
| $22-16$ | A[6:0] | Echo register address from previous access cycle |
| $15-0$ | DI[15:0] | Readback data requested on previous access cycle |

Figure 7-6. SPI Read Cycle
The daisy-chain operation is also enabled with the SDO pin. In daisy-chain mode, multiple devices are connected in a chain with the SDO pin of one device is connected to SDI pin of the following device, as shown in Figure 7-7. The SPI host drives the SDI pin of the first device in the chain. The SDO pin of the last device in the chain is connected to the POCI pin of the SPI host. In four-wire SPI mode, if the access cycle contains multiples of 24 clock edges, only the last 24 bits are used by the device first device in the chain. If the access cycle contains clock edges that are not in multiples of 24, the SPI packet is ignored by the device. Figure 7-8 describes the packet format for the daisy-chain write cycle.

Figure 7-7. SPI Daisy-Chain Connection

Figure 7-8. SPI Daisy-Chain Write Cycle

### 7.5.2 $I^{2} \mathrm{C}$ Programming Mode

The AFE539F1-Q1 has a 2 -wire serial interface (SCL and SDA), and one address pin (A0), as shown in the pin diagram in the Pin Configuration and Functions section. The $I^{2} \mathrm{C}$ bus consists of a data line (SDA) and a clock line (SCL) with pullup structures. When the bus is idle, both SDA and SCL lines are pulled high. All the $1^{2} \mathrm{C}$-compatible devices connect to the $\mathrm{I}^{2} \mathrm{C}$ bus through the open drain I/O pins, SDA and SCL.
The $I^{2} \mathrm{C}$ specification states that the device that controls communication is called a controller, and the devices that are controlled by the controller are called targets. The controller generates the SCL signal. The controller also generates special timing conditions (start condition, repeated start condition, and stop condition) on the bus to indicate the start or stop of a data transfer. Device addressing is completed by the controller. The controller on an $I^{2} \mathrm{C}$ bus is typically a microcontroller or digital signal processor (DSP). The AFE539F1-Q1 operates as a target on the $I^{2} \mathrm{C}$ bus. A target acknowledges controller commands, and upon controller control, receives or transmits data.

Typically, the AFE539F1-Q1 operates as a target receiver. A controller writes to the AFE539F1-Q1, a target receiver. However, if a controller requires the AFE539F1-Q1 internal register data, the AFE539F1-Q1 operates as a target transmitter. In this case, the controller reads from the AFE539F1-Q1. According to $I^{2} \mathrm{C}$ terminology, read and write refer to the controller.
The AFE539F1-Q1 supports the following data transfer modes:

- Standard mode ( 100 Kbps )
- Fast mode (400Kbps)
- Fast mode plus (1.0Mbps)

The data transfer protocol for standard and fast modes is exactly the same; therefore, both modes are referred to as $F / S$-mode in this document. The fast mode plus protocol is supported in terms of data transfer speed, but not output current. The low-level output current is 3 mA ; similar to the case of standard and fast modes. The AFE539F1-Q1 supports 7-bit addressing. The 10-bit addressing mode is not supported. The device supports the general call reset function. Sending the following sequence initiates a software reset within the device: start or repeated start, $0 \times 00,0 \times 06$, stop. The reset is asserted within the device on the rising edge of the ACK bit, following the second byte.
Other than specific timing signals, the $I^{2} \mathrm{C}$ interface works with serial bytes. At the end of each byte, a ninth clock cycle generates and detects an acknowledge signal. An acknowledge is when the SDA line is pulled low during the high period of the ninth clock cycle. A not-acknowledge is when the SDA line is left high during the high period of the ninth clock cycle, as shown in Figure 7-9.

Figure 7-9. Acknowledge and Not Acknowledge on the $\mathrm{I}^{2} \mathrm{C}$ Bus

### 7.5.2.1 F/S Mode Protocol

The following steps explain a complete transaction in F/S mode.

1. The controller initiates data transfer by generating a start condition. The start condition is when a high-to-low transition occurs on the SDA line while SCL is high, as shown in Figure 7-10. All $I^{2} \mathrm{C}$-compatible devices recognize a start condition.
2. The controller then generates the SCL pulses, and transmits the 7 -bit address and the read/write direction bit $(R / \bar{W})$ on the SDA line. During all transmissions, the controller makes sure that data are valid. A valid data condition requires the SDA line to be stable during the entire high period of the clock pulse, as shown in Figure 7-11. All devices recognize the address sent by the controller and compare the address to the respective internal fixed address. Only the target device with a matching address generates an acknowledge by pulling the SDA line low during the entire high period of the 9th SCL cycle, as shown in Figure 7-9. When the controller detects this acknowledge, the communication link with a target has been established.
3. The controller generates further SCL cycles to transmit ( $R / \bar{W}$ bit 0 ) or receive ( $R / \bar{W}$ bit 1 ) data to the target. In either case, the receiver must acknowledge the data sent by the transmitter. The acknowledge signal can be generated by the controller or by the target, depending on which is the receiver. The 9-bit valid data sequences consists of eight data bits and one acknowledge-bit, and can continue as long as necessary.
4. To signal the end of the data transfer, the controller generates a stop condition by pulling the SDA line from low-to-high while the SCL line is high, as shown in Figure 7-10. This action releases the bus and stops the communication link with the addressed target. All ${ }^{2} \mathrm{C}$-compatible devices recognize the stop condition. Upon receipt of a stop condition, the bus is released, and all target devices then wait for a start condition followed by a matching address.

Figure 7-10. Start and Stop Conditions

Figure 7-11. Bit Transfer on the $I^{2} \mathrm{C}$ Bus

SLASFA1 - JULY 2023

### 7.5.2.2 $I^{2} C$ Update Sequence

For a single update, the AFE539F1-Q1 requires a start condition, a valid $\mathrm{I}^{2} \mathrm{C}$ address byte, a command byte, and two data bytes, as listed in Table 7-6.

Table 7-6. Update Sequence

| MSB | .... | LSB | ACK | MSB | ... | LSB | ACK | MSB | $\ldots$ | LSB | ACK | MSB | ... | LSB | ACK |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Address (A) byte Section 7.5.2.2.1 |  |  |  | Command byte Section 7.5.2.2.2 |  |  |  | Data byte - MSDB |  |  |  | Data byte - LSDB |  |  |  |
| DB [31:24] |  |  |  | DB [23:16] |  |  |  | DB [15:8] |  |  |  | DB [7:0] |  |  |  |

After each byte is received, the AFE539F1-Q1 acknowledges the byte by pulling the SDA line low during the high period of a single clock pulse, as shown in Figure 7-12. These four bytes and acknowledge cycles make up the 36 clock cycles required for a single update to occur. A valid $\mathrm{I}^{2} \mathrm{C}$ address byte selects the AFE539F1-Q1.

Figure 7-12. $1^{2} \mathrm{C}$ Bus Protocol
The command byte sets the operating mode of the selected AFE539F1-Q1 device. For a data update to occur when the operating mode is selected by this byte, the AFE539F1-Q1 device must receive two data bytes: the most significant data byte (MSDB) and least significant data byte (LSDB). The AFE539F1-Q1 device performs an update on the falling edge of the acknowledge signal that follows the LSDB.
When using fast mode (clock $=400 \mathrm{kHz}$ ), the maximum update rate is limited to 10 Ksps . Using fast mode plus (clock $=1 \mathrm{MHz}$ ), the maximum update rate is limited to 25 Ksps . When a stop condition is received, the AFE539F1-Q1 device releases the ${ }^{2} \mathrm{C}$ bus and awaits a new start condition.

### 7.5.2.2.1 Address Byte

The address byte, as shown in Table 7-7, is the first byte received from the controller device following the start condition. The first four bits (MSBs) of the address are factory preset to 1001. The next three bits of the address are controlled by the A0 pin. The A0 pin input can be connected to VDD, AGND, SCL, or SDA. The A0 pin is sampled during the first byte of each data frame to determine the address. The device latches the value of the address pin, and consequently responds to that particular address according to Table 7-8.

Table 7-7. Address Byte

| COMMENT | MSB |  |  |  |  |  |  | LSB |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| - | AD6 | AD5 | AD4 | AD3 | AD2 | AD1 | AD0 | $\mathrm{R} / \overline{\mathrm{W}}$ |
| General address | 1 | 0 | 0 | 1 | See Table 7-8 (target address column) |  |  | 0 or 1 |
| Broadcast address | 1 | 0 | 0 | 0 | 1 | 1 | 1 | 0 |

Table 7-8. Address Format

| TARGET ADDRESS | A0 PIN |
| :---: | :---: |
| 000 | AGND |
| 001 | VDD |
| 010 | SDA |
| 011 | SCL |

The AFE539F1-Q1 supports broadcast addressing, which is used for synchronously updating or powering down multiple AFE539F1-Q1 devices. When the broadcast address is used, the AFE539F1-Q1 responds regardless of the address pin state. Broadcast is supported only in write mode.

### 7.5.2.2.2 Command Byte

The Register Names table in the Register Map section lists the command byte in the ADDRESS column.

### 7.5.2.3 $I^{2} C$ Read Sequence

To read any register the following command sequence must be used:

1. Send a start or repeated start command with a target address and the $R / \bar{W}$ bit set to 0 for writing. The device acknowledges this event.
2. Send a command byte for the register to be read. The device acknowledges this event again.
3. Send a repeated start with the target address and the R/V/W bit set to 1 for reading. The device acknowledges this event.
4. The device writes the MSDB byte of the addressed register. The controller must acknowledge this byte.
5. Finally, the device writes out the LSDB of the register.

The broadcast address cannot be used for reading.
Table 7-9. Read Sequence

| S | MSB | $\ldots$ | $\begin{aligned} & \mathrm{R} / \overline{\mathrm{W}} \\ & (0) \end{aligned}$ | ACK | MSB | $\ldots$ | LSB | ACK | Sr | MSB | $\ldots$ | R/W <br> (1) | ACK | MSB | $\ldots$ | LSB | ACK | MSB | ... | LSB | ACK |

## 8 Application and Implementation

## Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. Tl's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

### 8.1 Application Information

The AFE539F1-Q1 is a smart analog front end (AFE) that includes an ADC channel, PWM output, NVM, internal reference, and are available in a tiny $3-\mathrm{mm} \times 3-\mathrm{mm}$ package. The AFE539F1-Q1 have an integrated state machine that is pre-programmed as a constant power output controller. The ADC has a full-scale of VDD/3. Use an external attenuator when the input exceeds this range. The PWM provides a 7 -bit duty-cycle output on the SDA/SCLK/PWM pin. Pull the VREF/MODE pin high to enable the PWM output. Pulling the VREF/MODE pin low enables the $I^{2} \mathrm{C}$ or SPI programming mode. The application parameters are programmed in the device using $I^{2} \mathrm{C}$ or SPI and stored in the NVM.

### 8.2 Typical Application

This design uses the AFE539F1-Q1 to maintain constant power dissipation on a restive load, independent of the applied voltage. Modulating the power resistor via a switch can change the effective resistance and maintain constant power as the supply voltage ( $\mathrm{V}_{\mathrm{BUS}}$ ) changes. The AFE539F1-Q1 has an integrated state machine that converts the ADC input to a PWM output based on the transfer function in Equation 2. Parameters such as the PWM frequency, maximum and minimum duty cycle outputs, and the K term in Equation 2 are user programmable and can be saved in the NVM. The control loop runs standalone without the need for a processor after initial programming. Use this circuit in constant power heating, or automotive DC-link capacitor discharge applications. Figure 8-1 shows an example schematic for this application.

## Constant Power Discharge Circuit

### 8.2.1 Design Requirements

Table 8-1. Design Parameters

| PARAMETER | VALUE |
| :--- | :---: |
| PWM Frequency | 3.052 kHz |
| Bus voltage $\left(\mathrm{V}_{\mathrm{BUS}}\right)$ | 48 V |
| Load resistance $\left(\mathrm{R}_{\mathrm{L}}\right)$ | $5 \Omega$ |
| Power dissipation limit | 50 W |
| Maximum duty cycle | $100 \%$ |
| Minimum duty cycle | $0 \%$ |

### 8.2.2 Detailed Design Procedure

Use VDD $(5 \mathrm{~V})$ as reference with gain $1 \times$ to achieve an input range of $(\mathrm{VDD} / 3)=1.67 \mathrm{~V}$, using Table $7-1$. With a bus voltage of 48 V and ADC input range of 1.67 V , the external attenuation required is 28.74 . Therefore, the attenuation resistors can be chosen as $R_{A}=100 \mathrm{k} \Omega$ and $R_{B}=3.6 \mathrm{k} \Omega$. To limit the power dissipation to 50 W , the effective load resistance ( $R_{L \text {-eff }}$ ) is calculated as $\left(V_{B U S}{ }^{2 / P}\right)=46.08 \Omega$. That means a minimum duty-cycle of ( $R_{L} /$ $\left.R_{\text {Leeff }}\right)=10.85 \%$ is required. In a 7 -bit scale, $10.85 \%$ corresponds to 13.89 d . The required function coefficient, K can be calculated using Equation 4 to be 443.6 d ( $0 \times 01 \mathrm{BC}$ ).

$$
\begin{equation*}
\mathrm{K}=\frac{\mathrm{D}_{\mathrm{MIN}} \times\left(\mathrm{ADC}-\mathrm{DATA}_{\mathrm{MAX}}\right)^{2}}{2^{15}} \tag{4}
\end{equation*}
$$

The PWM output pin is an open drain output. The PWM output pin must be pulled up to the desired IO voltage using an external resistor. The PWM frequency is set in the PWM-FREQUENCY SRAM location (SRAM: $0 \times 23$ ). Table 7-2 defines the codes for each available frequency. This example uses a PWM frequency of 3.052 kHz . Set the maximum and minimum PWM duty cycles limits in the MAX-OUTPUT and MIN-OUTPUT SRAM locations. The PWM duty cycle output is configured by a 7 -bit code. The maximum code is 127 d . 127d sets the PWM duty cycle to $100 \%$. Table 7-3 provides more details about PWM duty cycle computation in AFE539F1-Q1.

Follow these guidelines to setup the registers on AFE539F1-Q1:

- Set the VREF/MODE pin low to enable the digital pins for programming mode.
- Stop the state machine before updating the application parameters by writing 0 to the STATE-MACHINECONFIGO register.
- If the PWM generator is already running, stop the PWM generator before any changes to the PWM frequency take effect. Write a 0 to the START-FUNCTION field in the COMMON-PWM-TRIG register (0x21) to stop the PWM generator. The PWM generator automatically starts when the state machine is enabled.
- Set all of the application parameters shown in Table 8-2. Use these locations to save the settings in NVM.
- Configure the reference for the ADC in the REF-GAIN-CONFIG register.
- Power on the ADC channel using the COMMON-CONFIG register.
- Start the state machine by writing $0 \times 3$ to the STATE-MACHINE-CONFIGO.
- Trigger an NVM write by setting the NVM-PROG bit in the COMMON-TRIGGER register ( $0 \times 20$ ) to 1 .
- Set the VREF/MODE pin high to enable the digital pins for standalone mode. This is required to see the PWM output on the digital pin.

Table 8-2. Application Parameters

| REGISTER FIELD NAME | ADDRESS[FIELD] | ADDRESS LOCATION |
| :--- | :---: | :---: |
| MAX-OUTPUT | $0 \times 20[6: 0]$ | SRAM |
| MIN-OUTPUT | $0 \times 21[6: 0]$ | SRAM |
| FUNCTION-COEFFICIENT | $0 \times 22[15: 0]$ | SRAM |
| PWM-FREQUENCY | $0 \times 23[4: 0]$ | SRAM |
| REF-GAIN-CONFIG | $0 \times 15[12: 10][4: 0]$ | Register |
| COMMON-CONFIG | $0 \times 1 F[15: 0]$ | Register |
| STATE-MACHINE-CONFIG0 | $0 \times 27[2: 0]$ | Register |

The pseudocode for this application example is as follows:

```
//SYNTAX: WRITE <REGISTER NAME(Hex Code)>, <MSB DATA>, <LSB DATA>
//Stop the state machine
WRITE STATE-MACHINE-CONFIGO(0x27), 0x00, 0x01
//Stop the PWM generator
WRITE COMMON-PWM-TRIG(0x21), 0x00, 0x00
//Set the PWM frequncy to 3.052 kHz
WRITE PWM-FREQUENCY(SRAM 0x23), 0x00, 0x07
//Set the maximim and minimum PWM duty cycles
WRITE MAX-OUTPUT(SRAM 0x20), 0x00, 0x7F
WRITE MIN-OUTPUT(SRAM 0x21), 0x00, 0x00
//Set the function coefficient (K)
WRITE FUNCTION-COEFFICIENT(SRAM 0x22), 0x01, 0xBC
//Set the ADC reference to VDD (this is the device default)
WRITE REF-GAIN-CONFIG(0x15), 0x04, 0x01
//Power on ADC
WRITE COMMON-CONFIG(0x1F), 0x03, 0xFF
//Start the state machine
WRITE STATE-MACHINE-CONFIGO(0x27), 0x00, 0x03
//Save settings to NVM
WRITE COMMON-TRIGGER(0x20), 0x00, 0x02
//Pul1 the VREF/MODE pin high to enter standalone mode
```

### 8.2.3 Application Curve

Figure 8-1. PWM Duty Cycle vs Input Voltage

### 8.3 Power Supply Recommendations

The AFE539F1-Q1 do not require specific power-supply sequencing. These devices require a single power supply, $\mathrm{V}_{\mathrm{DD}}$. However, make sure the external voltage reference is applied after VDD powers on. Use a $0.1-\mu \mathrm{F}$ decoupling capacitor for the $\mathrm{V}_{\mathrm{DD}}$ pin. Use a bypass capacitor with a value approximately $1.5 \mu \mathrm{~F}$ for the CAP pin.

### 8.4 Layout

### 8.4.1 Layout Guidelines

The AFE539F1-Q1 pin configuration separates the analog, digital, and power pins for an optimized layout. For signal integrity, separate the digital and analog traces, and place decoupling capacitors close to the device pins.

### 8.4.2 Layout Example

Figure 8-2. Layout Example
Note: The ground and power planes have been omitted for clarity. Connect the thermal pad to ground.

## 9 Device and Documentation Support

TI offers an extensive line of development tools. Tools and software to evaluate the performance of the device, generate code, and develop solutions are listed below.

### 9.1 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on ti.com. Click on Subscribe to updates to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

### 9.2 Support Resources

TI E2E ${ }^{\text {TM }}$ support forums are an engineer's go-to source for fast, verified answers and design help - straight from the experts. Search existing answers or ask your own question to get the quick design help you need.
Linked content is provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect Tl's views; see TI's Terms of Use.

### 9.3 Trademarks

TI E2E ${ }^{\text {TM }}$ is a trademark of Texas Instruments.
All trademarks are the property of their respective owners.

### 9.4 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.
ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

### 9.5 Glossary

TI Glossary This glossary lists and explains terms, acronyms, and definitions.

## 10 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

INSTRUMENTS

## PACKAGING INFORMATION

| Orderable Device | Status <br> (1) | Package Type | Package Drawing | Pins | Package Qty | Eco Plan <br> (2) | Lead finish/ Ball material <br> (6) | MSL Peak Temp <br> (3) | Op Temp ( ${ }^{\circ} \mathrm{C}$ ) | Device Marking <br> (4/5) | Samples |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| AFE539F1RTERQ1 | ACTIVE | WQFN | RTE | 16 | 3000 | RoHS \& Green | NIPDAU | Level-2-260C-1 YEAR | -40 to 125 | A59F1Q | Samples |

${ }^{(1)}$ The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.
${ }^{(2)}$ RoHS: TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed $0.1 \%$ by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".
RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.
Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.
${ }^{(3)}$ MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature
${ }^{(4)}$ There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.
${ }^{(5)}$ Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.
${ }^{(6)}$ Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
