

# BQ25758: I<sup>2</sup>C Controlled, Bidirectional Buck-Boost Controller with Wide Voltage Range

## 1 Features

- Wide input voltage operating range: 4.2V to 60V
- Synchronous buck-boost DC/DC controller with NFET drivers
  - Adjustable switching frequency from 200kHz to 600kHz
  - Optional synchronization to external clock
  - Integrated loop compensation with soft start
  - Selectable PFM operation for light load efficiency improvement (PFM or forced PWM option)
  - Optional gate driver supply input for optimized efficiency
- Support USB-PD Extended Power Range (EPR) in forward and reverse power direction
  - Adjustable input and output voltage regulation from 3.3V to 60V with 20mV/step
  - Adjustable input and output current regulation (RAC\_SNS, ROUT\_SNS) from 400mA to 20A with 50mA/step using 5mΩ resistor
- Bypass mode for highest efficiency with VOUT = VAC
- Buck-only mode
- High accuracy
  - ±2% output voltage regulation
  - ±3% output current regulation
  - ±2% input voltage regulation
  - ±3% input current regulation
- I<sup>2</sup>C controlled for optimal system performance with resistor-programmable option
  - Hardware adjustable input and output current limits
- Integrated 16-bit ADC for voltage, current, and temperature monitoring
- High safety integration
  - Adjustable input overvoltage and undervoltage protection
  - Output overvoltage and overcurrent protection
  - Thermal shutdown
- Status outputs
  - Adapter present status ( $\overline{\text{PG}}$ )
  - Switcher operation status (STAT)
- Package
  - 36-pin 5mm × 6mm QFN

## 2 Applications

- [Docking station](#)
- [Monitor](#)
- USB-PD EPR (Extended Power Range)
- Buck-Boost and Buck-only operation

## 3 Description

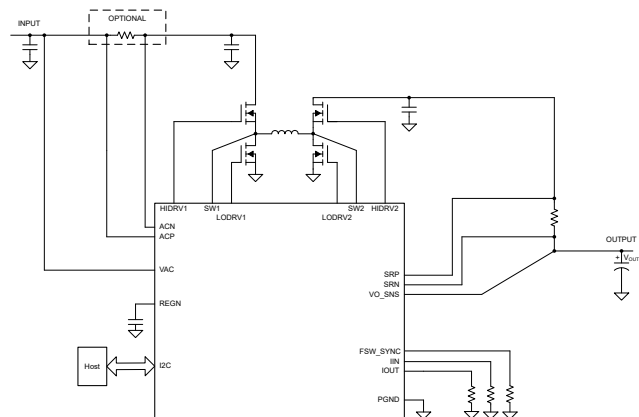

BQ25758 is a wide input voltage, bidirectional switched-mode buck-boost controller. The device offers high-efficiency power conversion over a wide voltage range with output CC-CV control. The device integrates all the loop compensation for the buck-boost converter, thereby providing a high density solution with ease of use. In reverse mode, the device draws power from the output supply and regulates the input terminal voltage with an added constant current loop for protection.

Besides the I<sup>2</sup>C host-controlled mode, the device also supports programmable hardware limits. Input current, and output current regulation targets can be set with single resistor on the IIN, and IOUT pins, respectively. By default, the device is programmed to provide 5V output, and the target output voltage can be adjusted via the VOUT\_REG register bits.

### Package Information

PART NUMBER	PACKAGE <sup>(1)</sup>	PACKAGE SIZE <sup>(2)</sup>	BODY SIZE (NOM)
BQ25758	RRV (VQFN 36)	6.0mm × 5.0mm	6.0mm × 5.0mm

- (1) For all available packages, see [Section 12](#).
- (2) The package size (length × width) is a nominal value and includes pins, where applicable.

**Simplified Schematic**

## 4 Pin Configuration and Functions

**Figure 4-1. BQ25758, RRV Package 36-pin VQFN Top View**

**Table 4-1. Pin Functions**

PIN		I/O	DESCRIPTION
NAME	NO.		
SCL	1	DI	<b>I<sup>2</sup>C Interface Clock</b> – Connect SCL to the logic rail through a 10-kΩ resistor.
SDA	2	DIO	<b>I<sup>2</sup>C Interface Data</b> – Connect SDA to the logic rail through a 10-kΩ resistor.
INT	3	DO	<b>Open Drain Interrupt Output</b> – Connect the INT pin to a logic rail via 10-kΩ resistor. The INT pin sends an active low, 256-μs pulse to host to report the controller device status and faults.
STAT	4	DO	<b>Open Drain Status Output</b> – Connect to the pull up rail via 10-kΩ resistor. The STAT pin function can be disabled when DIS_STAT_PIN bit is set to 1. When disabled, this pin can be used as a general purpose indicator via the FORCE_STAT_ON bit.
NC	5	-	<b>No Connect</b> - Leave this pin floating, do not tie to PGND
PG/STAT3	6	DO	<b>Open Drain Active Low Power Good Indicator</b> – Connect to the pull up rail via 10-kΩ resistor. LOW indicates a good input source if VAC is within the programmed ACUV / ACOV operating window. The PG pin function can be disabled when DIS_PG_PIN bit is set to 1. When disabled, this pin can be used as a general purpose indicator via the FORCE_STAT3_ON bit.
CE/STAT4	7	DIO	<b>Active Low Enable Pin</b> – Power conversion is enabled when EN_CHG bit is 1 and CE pin is LOW. CE pin must be pulled HIGH or LOW, do not leave floating. The CE pin function can be disabled when DIS_CE_PIN bit is set to 1. When disabled, this pin can be used as a general purpose indicator via the FORCE_STAT4_ON bit.

**Table 4-1. Pin Functions (continued)**

PIN		I/O	DESCRIPTION
NAME	NO.		
TS / NC	8	AI	<b>Temperature Qualification Voltage Input</b> – This pin's function is normally disabled. If not needed, leave this pin floating. To enable pin functionality, set EN_TS register bit to 1. Connect a negative temperature coefficient thermistor. Program temperature window with a resistor divider from REGN to TS to PGND. Power conversion suspends when TS pin voltage is out of range. Recommend 103AT-2 10-kΩ thermistor.
IOUT	9	AI	<b>Output Current Limit Setting</b> – IOUT pin sets the maximum output current, and can be used to monitor the output current. A programming resistor to PGND is used to set the output current limit as $I_{OUT} = K_{IOUT} / R_{IOUT}$ . When the device is under output current regulation, the voltage at IOUT pin is $V_{REF\_IOUT}$ . When IOUT pin voltage is less than $V_{REF\_IOUT}$ , the actual output current can be calculated as: $I_{OUT} = K_{IOUT} \times V_{IOUT} / (R_{IOUT} \times V_{REF\_IOUT})$ . The actual output current limit is the lower of the limits set by IOUT pin or the IOUT_REG register bits. This pin function can be disabled when EN_IOUT_PIN bit is 0. If IOUT pin is not used, this pin should be pulled to PGND, do not leave floating.
IIN	10	AI	<b>Input Current Limit Setting</b> – IIN pin sets the maximum input current, and can be used to monitor the input current. A programming resistor to PGND is used to set the input current limit as $I_{LIM} = K_{ILIM} / R_{IIN}$ . When the device is under input current regulation, the voltage at IIN pin is $V_{REF\_ILIM}$ . When IIN pin voltage is less than $V_{REF\_ILIM}$ , the actual input current can be calculated as: $IAC = K_{ILIM} \times V_{IIN} / (R_{IIN} \times V_{REF\_ILIM})$ . The actual input current limit is the lower of the limits set by IIN pin or the IAC_DPM register bits. This pin function can be disabled when EN_IIN_PIN bit is 0. If IIN pin is not used, this pin should be pulled to PGND, do not leave floating.
NC	11	-	<b>No Connect</b> - Leave this pin floating, do not tie to PGND
VO_SNS	12	AI	<b>Output Voltage Sensing</b> – Kelvin connect directly to the output voltage regulation point.
SRN	13	AI	<b>Current-Sense Resistor, Negative Input</b> – A 0.47-μF ceramic capacitor is placed from SRN to SRP to provide differential-mode filtering. An optional 0.1-μF ceramic capacitor is placed from the SRN pin to PGND for common-mode filtering.
SRP	14	AI	<b>Current-Sense Resistor, Positive Input</b> – A 0.47-μF ceramic capacitor is placed from SRN to SRP to provide differential-mode filtering. A 0.1-μF ceramic capacitor is placed from the SRP pin to PGND for common-mode filtering.
NC	15	-	<b>No Connect</b> - Leave this pin floating, do not tie to PGND
NC	16	-	<b>No Connect</b> - Leave this pin floating, do not tie to PGND
MODE	17	AI	<b>Mode Programming resistor</b> – Connect a resistor from this pin to PGND to select between buck-boost or buck-only operation. Refer to <a href="#">MODE Pin Configuration</a> section for more details.
SW2	18	AI	<b>Boost Side Half Bridge Switching Node</b> –
HIDRV2	19	AO	<b>Boost Side High-Side Gate Driver</b> – Connect to the boost high-side N-channel MOSFET gate.
BTST2	20	P	<b>Boost Side High-Side Power MOSFET Gate Driver Power Supply</b> – Connect a capacitor between BTST2 and SW2 to provide bias to the high-side MOSFET gate driver.
LODRV2	21	AO	<b>Boost Side Low-Side Gate Driver</b> – Connect to the boost low-side N-channel MOSFET gate.
PGND	22	-	<b>Power Ground Return</b> – The high current ground connection for the low-side gate drivers.
DRV_SUP	23	P	<b>Gate Drive Supply Input</b> – Voltage on this pin is used to drive the gates of buck-boost converter switching FET. Connect a 4.7-μF ceramic capacitor from DRV_SUP to power ground. REGN LDO voltage can be used as the gate driver supply for all switching FETs by connecting REGN to DRV_SUP pin. In high-voltage applications, it is possible to directly provide the DRV_SUP voltage with an external supply up to 12 V to achieve higher switching efficiency. See <a href="#">Section 6.3.3.3</a> for more details.
REGN	24	P	<b>Internal Linear Regulator Output</b> – Connect a 4.7-μF ceramic capacitor from REGN to power ground. REGN LDO voltage can be used as the gate driver supply for all switching FETs by connecting REGN to DRV_SUP pin. In high-voltage applications, it is possible to directly provide the DRV_SUP voltage with an external supply up to 12 V to achieve higher switching efficiency. See <a href="#">Section 6.3.3.3</a> for more details.
LODRV1	25	AO	<b>Buck Side Low-Side Gate Driver</b> – Connect to the buck low-side N-channel MOSFET gate.
BTST1	26	P	<b>Buck Side High-Side Power MOSFET Gate Driver Power Supply</b> – Connect a capacitor between BTST1 and SW1 to provide bias to the high-side MOSFET gate driver.
HIDRV1	27	AO	<b>Buck Side High-Side Gate Driver</b> – Connect to the buck high-side N-channel MOSFET gate.
SW1	28	AI	<b>Buck Side Half Bridge Switching Node</b> –

**Table 4-1. Pin Functions (continued)**

PIN		I/O	DESCRIPTION
NAME	NO.		
ACN	29	AI	<b>Adapter Current-Sense Resistor, Negative Input</b> A 0.47- $\mu$ F ceramic capacitor is placed from ACN to ACP to provide differential-mode filtering. An optional 0.1- $\mu$ F ceramic capacitor is placed from the ACN pin to PGND for common-mode filtering.
ACP	30	AI	<b>Adapter Current-Sense Resistor, Positive Input</b> A 0.47- $\mu$ F ceramic capacitor is placed from ACN to ACP to provide differential-mode filtering. A 0.1- $\mu$ F ceramic capacitor is placed from the ACP pin to PGND for common-mode filtering
NC	31	-	<b>No Connect</b> - Leave this pin floating, do not tie to PGND
VAC	32	P	<b>Input Voltage Detection and Power</b> VAC is the input bias to power the IC. Connect a 1 $\mu$ F capacitor from pin to PGND. When Reverse Mode is enabled, pin 32 is regulated to VAC_REV.
	33		
ACUV	34	AI	<b>VAC Undervoltage Comparator Input</b> – Connect a resistor divider from VAC to PGND to program the undervoltage protection. When this pin falls below $V_{REF\_ACUV}$ , the device stops operation. The hardware limit for input voltage regulation reference is $V_{ACUV\_DPM}$ . The actual input voltage regulation setting is the higher of the pin-programmed value and the VAC_DPM register value. If ACUV programming is not used, pull this pin to VAC, do not leave floating.
ACOV	35	AI	<b>VAC Overvoltage Comparator Input</b> – Connect a resistor divider from VAC to PGND to program the overvoltage protection. When this pin rises above $V_{REF\_ACOV}$ , the device stops operation. If ACOV programming is not used, pull this pin to PGND, do not leave floating.
FSW_SYNC	36	DAI	<b>Switching Frequency and Synchronization Input</b> – An external resistor is connected to the FSW_SYNC pin and PGND to set the nominal switching frequency. This pin can also be used to synchronize the PWM controller to an external clock.
Thermal Pad	37	-	<b>Exposed pad beneath the IC</b> – Always solder the thermal pad to the board, and have vias on the thermal pad plane star-connecting to PGND and ground plane for high-current power converter. It also serves as a thermal pad to dissipate the heat.

## 5 Specifications

### 5.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)<sup>(1)</sup>

		MIN	MAX	UNIT
Voltage	VAC, ACUV, ACOV, ACP, ACN,SRP, SRN, VO_SNS	-0.3	70	V
	SW1, SW2	-2	70	V
	SW1, SW2 (40ns transient)	-4	70	V
	PG	-0.3	40	V
	BTST1, HIDRV1 with respect to SW1	-0.3	14	V
	BTST2, HIDRV2 with respect to SW2	-0.3	14	V
	DRV_SUP, LODRV1, LODRV2	-0.3	14	V
	ACP - ACN, SRP - SRN	-0.3	0.3	V
	CE, FSW_SYNC, IOUT, IIN, INT, REGN, SCL, SDA, MODE, STAT, TS	-0.3	6	V
Output Sink Current	CE, PG, STAT		5	mA
T <sub>J</sub>	Junction temperature	-40	150	°C
T <sub>stg</sub>	Storage temperature	-65	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Rating* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Condition*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

### 5.2 ESD Ratings

			VALUE	UNIT
V <sub>(ESD)</sub>	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/ JEDEC JS-001, all pins <sup>(1)</sup>	±2000	V
		Charged device model (CDM), per ANSI/ESDA/ JEDEC JS-002, all pins <sup>(2)</sup>	±500	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.  
(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

### 5.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
V <sub>VAC</sub>	Input voltage	4.2		60	V
V <sub>OUT</sub>	Output voltage	0		60	V
V <sub>DRV_SUP</sub>	DRV_SUP pin direct drive voltage range	4.0		12	V
F <sub>SW</sub>	Switching Frequency	200		600	kHz
T <sub>J</sub>	Junction temperature	-40		125	°C
T <sub>A</sub>	Ambient temperature	-40		105	°C
C <sub>IN</sub>	Buck-boost input capacitance	160			µF
C <sub>OUT</sub>	Buck-boost output capacitance	160			µF
C <sub>REGN</sub>	REGN capacitor	4.7			µF
C <sub>DRV_SUP</sub>	DRV_SUP capacitor	4.7			µF
L	Switched Inductor	2.2		15	µH
R <sub>DCR</sub>	Inductor DC Resistance	1.75		60	mΩ
R <sub>AC_SNS</sub>	Input current sense resistor	0 <sup>(1)</sup>	5	10	mΩ

### 5.3 Recommended Operating Conditions (continued)

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
R <sub>OUT_SNS</sub>	Output current sense resistor		5		mΩ
R <sub>IOUT</sub>	IOUT programming pulldown resistor	0.0		100	kΩ
R <sub>IIN</sub>	IIN programming pulldown resistor	0.0		50	kΩ

(1) When R<sub>AC\_SNS</sub> is 0mΩ, input current limit function is disabled

### 5.4 Thermal Information

THERMAL METRIC <sup>(1)</sup>		BQ25758	
		RRV	
		36 PINS	
			UNIT
R <sub>θJA</sub>	Junction-to-ambient thermal resistance (JEDEC <sup>(1)</sup> )	29.4	°C/W
R <sub>θJC(top)</sub>	Junction-to-case (top) thermal resistance	18.8	°C/W
R <sub>θJB</sub>	Junction-to-board thermal resistance	9.9	°C/W
Ψ <sub>JT</sub>	Junction-to-top characterization parameter	0.2	°C/W
Ψ <sub>JB</sub>	Junction-to-board characterization parameter	9.8	°C/W
R <sub>θJC(bot)</sub>	Junction-to-case (bottom) thermal resistance	2.5	°C/W

(1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.

## 5.5 Electrical Characteristics

VAC = ACP = ACN = SYS = SRP = SRN = 28V, T<sub>J</sub> = -40°C to +125°C, and T<sub>J</sub> = 25°C for typical values (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
<b>QUIESCENT CURRENTS</b>						
I <sub>Q_VAC</sub>	Quiescent input current (I <sub>VAC</sub> )	Not switching		0.75	1	mA
I <sub>Q_REV</sub>	Quiescent battery current in Reverse mode (I <sub>SRN</sub> + I <sub>SRP</sub> )	Not switching		0.75	1	mA
<b>VAC / BAT POWER UP</b>						
V <sub>VAC_OP</sub>	VAC operating range		4.2		60	V
V <sub>VAC_OK</sub>	VAC converter enable threshold	VAC rising, no battery	4.2			V
V <sub>VAC_OKZ</sub>	VAC converter disable threshold	VAC falling, no battery			3.5	V
V <sub>REF_ACUV</sub>	ACUV comparator threshold to enter VAC_UVP	V <sub>ACUV</sub> falling	1.095	1.1	1.106	V
V <sub>REF_ACUV_HYS</sub>	ACUV comparator threshold hysteresis	V <sub>ACUV</sub> rising		50		mV
V <sub>VAC_INT_OV</sub>	VAC internal threshold to enter VAC_OVP	IN rising		66		V
V <sub>VAC_INT_OVZ</sub>	VAC internal thresholds to exit VAC_OVP	IN falling		63		V
V <sub>REF_ACOV</sub>	ACOV comparator threshold to enter VAC_OVP	V <sub>ACOV</sub> rising	1.184	1.2	1.206	V
V <sub>REF_ACOV_HYS</sub>	ACOV comparator threshold hysteresis	V <sub>ACOV</sub> falling		50		mV
<b>OUTPUT VOLTAGE REGULATION</b>

## 6 Detailed Description

### 6.1 Overview

BQ25758 is a wide voltage, bidirectional switched-mode synchronous buck-boost controller. The device offers high-efficiency voltage conversion over a wide voltage range with output CC-CV control. The device integrates all the loop compensation and 5-V gate drivers for the buck-boost converter, thereby providing a high density solution with ease of use. The switching frequency of the device can be programmed or forced to follow an external clock frequency via the FSW\_SYNC pin. While switching under light-load, the device offers an optional Pulse Frequency Modulation (PFM) scheme to increase efficiency. In reverse mode, the device draws power from the output supply and regulates the input terminal voltage with an added constant current loop for protection.

Besides the I<sup>2</sup>C host-controlled mode, the device also supports programmable hardware limits. Input current, and output current regulation targets can be set with single resistor on the IIN, and IOOUT pins, respectively. By default, the device is programmed to provide 5-V output, and the target output voltage can be adjusted via the VOUT\_REG register bits. Forward switching function is controlled via the  $\overline{\text{CE}}$  pin.

The input operating window is programmed via the ACUV and ACOV pins. When the input voltage is outside the programmed window, the device automatically stops switching, and the  $\overline{\text{PG}}$  pin pulls HIGH.

The BQ25758 provides various safety features including over-voltage and over-current protections on the input and the output. The thermal shutdown prevents operating when the junction temperature exceeds the T<sub>SHUT</sub> limit.

The device has two status pins (STAT, and  $\overline{\text{PG}}$ ) to indicate the switcher and input voltage status. These pins can be used to drive LEDs or communicate with a host processor. If needed, these pins can also be used as general purpose indicators and their status controlled directly by the I<sup>2</sup>C interface. In addition, the  $\overline{\text{CE}}$  pin can also be used as a general purpose indicator. The  $\overline{\text{INT}}$  pin immediately notifies host when the device status changes, including faults.

The device also provides a 16-bit analog-to-digital converter (ADC) for monitoring input current, output current and input/output/thermistor voltages (IAC, IOOUT, VAC, VOUT, TS).

The device comes with a 36-pin 5-mm × 6-mm QFN package with 0.5-mm pin pitch.

## 6.2 Functional Block Diagram

## 6.3 Feature Description

### 6.3.1 Device Power-On-Reset

The internal bias circuits are powered from either VAC or SRN. When VAC rises above  $V_{VAC\_OK}$ , converter operation is allowed. When BAT rises above 3 V, reverse mode operation is allowed.

A POR occurs when one of these supplies rises above its corresponding  $V_{OK}$  level, while the other supply is below its corresponding  $V_{OK}$  level. After the POR, I<sup>2</sup>C interface is ready for communication and all the registers are reset to default value. The host can access all the registers after POR.

### 6.3.2 Device Power-Up From Battery Without Input Source

If only battery is present and the voltage is above 3-V threshold, the device is ready for I<sup>2</sup>C communication, and the converter is ready to start operation in reverse mode. The REGN LDO stays off to minimize the quiescent current. The ADC can be used to monitor all system parameters.

### 6.3.3 Device Power Up from Input Source

When a valid input source ( $V_{VAC\_OK} < VAC$  and VAC within the ACUV and ACOV operating window) is detected, the  $\overline{PG}$  pin pulls LOW. If converter operation is enabled, the device proceeds to enable the REGN LDO and power up the buck-boost converter.

#### 6.3.3.1 VAC Operating Window Programming (ACUV and ACOV)

The VAC operating window can be programmed via the ACUV and ACOV pins using a three-resistor divider from VAC to PGND as shown in Figure 6-1.

**Figure 6-1. ACUV and ACOV Programming**

When  $V_{ACUV}$  falls and reaches  $V_{ACUV\_DPM}$ , the device enters input voltage regulation, thereby reducing the current.  $V_{ACUV}$  continues falling below  $V_{REF\_ACUV}$ , the device automatically stops the converter and the  $\overline{PG}$  pin pulls high.

**System Note:** if VAC\_DPM register is programmed to a value higher than POR, the device regulates the VAC voltage to the higher of VAC\_DPM register or  $V_{ACUV\_DPM}$  pin voltage. Refer to Section 6.3.4.3.2 for more information.

When  $V_{ACOV}$  rises above  $V_{REF\_ACOV}$ , the device automatically stops the converter and the  $\overline{PG}$  pin pulls high.

The following equations govern the relationship between the resistor divider and the target operating voltage window programmed by ACOV and ACUV pins:

$$V_{ACOV\_TARGET} = V_{REF\_ACOV} \times \frac{R_{AC1} + R_{AC2} + R_{AC3}}{R_{AC3}} \quad (1)$$

$$V_{ACUV\_TARGET} = V_{REF\_ACUV} \times \frac{R_{AC1} + R_{AC2} + R_{AC3}}{R_{AC2} + R_{AC3}} \quad (2)$$

If unused, tie ACUV to VAC and ACOV to PGND in order to apply the internal VAC operating window ( $V_{VAC\_OP}$ ).

### 6.3.3.2 MODE Pin Configuration

The MODE pin can be used to configure the device as either a buck-boost or buck-only configuration. When configured as buck-only typical inductor value used must be provided to appropriately compensate the converter. The closest inductor to the values presented below should be programmed via the MODE pin. When configured in buck-only mode, the device operates as a buck converter and MOSFETs Q3 and Q4 have to be removed. This is demonstrated in [Figure 7-25](#).

At POR, the device detects the MODE pin pull down resistance, then sets the device operating mode as shown below. The MODE pin resistance detection is only done one time at the device POR, after that, the converter will not sense the MODE pin voltage any more. Follow the resistance listed in the table below to set the desired operating mode. The surface mount resistor with  $\pm 1\%$  or  $\pm 2\%$  tolerance is recommended.

**Table 6-1. MODE Pin Resistance Configuration Options**

OPERATION	L (nom)	R <sub>DCR</sub> (min)	R <sub>DCR</sub> (max)	TYPICAL RESISTANCE AT MODE PIN
Buck-Boost, device detects inductance automatically	2.2 $\mu$ H - 15 $\mu$ H	L/DCR = 1260 $\mu$ s <sup>(1)</sup>	60 m $\Omega$	$\leq 3.0$ k $\Omega$
Buck-Only	3.3 $\mu$ H	2.6 m $\Omega$	60 m $\Omega$	4.7 k $\Omega$
Buck-Only	4.7 $\mu$ H	3.7 m $\Omega$	60 m $\Omega$	6.04 k $\Omega$
Buck-Only	5.6 $\mu$ H	4.4 m $\Omega$	60 m $\Omega$	8.2 k $\Omega$
Buck-Only	6.8 $\mu$ H	5.4 m $\Omega$	60 m $\Omega$	10.5 k $\Omega$
Buck-Only	8.2 $\mu$ H	6.5 m $\Omega$	60 m $\Omega$	13.7 k $\Omega$
Buck-Only	10 $\mu$ H	7.9 m $\Omega$	60 m $\Omega$	17.4 k $\Omega$
Buck-Only	15 $\mu$ H	11.9 m $\Omega$	60 m $\Omega$	$\geq 27.0$ k $\Omega$

(1) The minimum DCR varies as a function of selected inductor: for example, a 10- $\mu$ H inductor supports 7.9 m $\Omega$  as the minimum DCR.

### 6.3.3.3 REGN Regulator (REGN LDO)

The REGN LDO regulator provides a regulated bias supply for the IC and the TS external resistors. Additionally, REGN voltage can be used to drive the buck-boost switching FETs directly by tying the DRV\_SUP pin to REGN. The pull-up rail of  $\overline{PG}$ , STAT can be connected to REGN as well. The REGN LDO is enabled when below conditions are valid:

1. VAC voltage above  $V_{VAC\_OK}$  and converter operation is enabled in forward mode.
2. BAT voltage above 3 V in Reverse mode and Reverse Mode is enabled (EN\_REV = 1)

At high input voltages and/or large gate drive requirements, the power loss from gate driving via the REGN LDO can be excessive. This power for the gate drivers can be provided externally by directly driving the DRV\_SUP pin with a high efficiency supply ranging from 4.5 V to 12 V. This supply should be able to provide at least 50 mA or more as required to drive the switching FET gate charge.

The power dissipation for driving the gates via the REGN LDO is:  $P_{REGN} = (V_{AC} - V_{REGN}) \times Q_{G(TOT)1,2,3,4} \times f_{SW}$ , where  $Q_{G(TOT)1,2,3,4}$  is the sum of the total gate charge for all switching FETs and  $f_{SW}$  is the programmed switching frequency. The Safe Operating Area (SOA) below is based on a 1-W power loss limit.

**Figure 6-2. REGN LDO Safe Operating Area (SOA)**

#### 6.3.3.4 Compensation-Free Buck-Boost Converter Operation

The device integrates all the loop compensation, thereby providing a high density solution with ease of use.

The converter employs a synchronous buck-boost converter that allows conversion from a wide range of input voltage sources. The converter operates in buck, buck-boost or boost mode. The converter can operate uninterruptedly and continuously across the three operation modes. During buck-boost mode, the converter alternates a SW1 pulse with a SW2 pulse, with effective switching frequency interleaved among these pulses for highest efficiency operation.

During boost mode operation, the HS FET is forced to turn on for 225 ns in each switching cycle to ensure inductor energy is delivered to the output, effectively limiting the maximum boosting ratio. For example, when device is configured to switch at 500 kHz, the switching period is 2  $\mu$ s, yielding a duty cycle limit of  $(1 - 0.225 \mu\text{s}/2 \mu\text{s}) = 88.75\%$ . Given a 5-V input, this translates to a maximum 44-V output assuming 100% efficiency. The true output will be lower than this ideal limit. At lower switching frequencies, the maximum duty cycle increases, making the limitation less significant.

**Table 6-2. Switching MOSFET Operation**

MODE	BUCK	BUCK-BOOST	BOOST
HS BUCK FET	Switching at $f_{SW}$	Switching ( $f_{SW}$ interleaved between SW1 and SW2)	ON
LS BUCK FET	Switching at $f_{SW}$	Switching ( $f_{SW}$ interleaved between SW1 and SW2)	OFF
LS BOOST FET	OFF	Switching ( $f_{SW}$ interleaved between SW1 and SW2)	Switching at $f_{SW}$
HS BOOST FET	ON	Switching ( $f_{SW}$ interleaved between SW1 and SW2)	Switching at $f_{SW}$

##### 6.3.3.4.1 Light-Load Operation

In order to improve converter light-load efficiency, the device switches to Pulse Frequency Modulation (PFM) control at light load when the EN\_PFM bit is set to 1. The effective switching frequency will decrease accordingly when output load decreases.

EN\_PFM bit is automatically cleared to 0 every time the converter starts and a valid SYNC clock input is detected on the FSW\_SYNC pin, thereby ensuring fixed frequency operation regardless of output current. The bit can be overwritten to 1 to allow PFM after startup even when SYNC signal is present.

Light-load PFM mode can be disabled by clearing the EN\_PFM bit. In this case, the device switches in PWM mode at a fixed switching frequency.

### 6.3.3.5 Switching Frequency and Synchronization (FSW\_SYNC)

The device switching frequency can be programmed between 200 kHz to 600 kHz using a resistor from the FSW\_SYNC pin to PGND. The  $R_{FSW}$  resistor is related to the nominal switching frequency ( $f_{SW}$ ) by the equation:

$$R_{FSW} = \frac{1}{10 \times (f_{SW} \times 5 \times 10^{-12} - 500 \times 10^{-9})} \quad (3)$$

This pin must be pulled to PGND using a  $R_{FSW}$ , do not leave floating. In addition to programming the nominal switching frequency, the FSW\_SYNC pin can also be used to synchronize the internal oscillator to an external clock signal. The synchronization feature works over the same range as the switching frequency: 200-kHz to 600-kHz range.

**Table 6-3. Common  $R_{FSW}$  and Switching Frequency Values**

$R_{FSW}$ (k $\Omega$ )	SWITCHING FREQUENCY (kHz)
200	200
133	250
100	300
80	350
66.67	400
57.1	450
50	500
44.4	550
40	600

### 6.3.3.6 Device HIZ Mode

When a valid input supply is present, it is possible to force the device into HIZ Mode which disables switching, disables REGN LDO. The system load is provided by the battery in this mode. The controller enters HIZ Mode when EN\_HIZ bit is set to 1 or the IIN pin is pulled above  $V_{IH\_ILIM\_HIZ}$  (refer to [Section 6.3.4.3.1.1](#)).

If the device is operating in reverse mode with the converter turned on, and the device enters HIZ mode (EN\_HIZ bit is set to 1 or IIN pin is pulled above  $V_{IH\_ILIM\_HIZ}$ ), switching stops. Once HIZ mode condition is cleared by the host, the device resumes reverse mode operation.

The device exits HIZ Mode when the EN\_HIZ bit is cleared to 0 and the IIN pin is pulled below 0.4 V.

## 6.3.4 Power Management

The device accommodates a wide range of input sources from 4.2 V up to 60 V.

### 6.3.4.1 Output Voltage Programming (VOUT\_REG)

The output voltage at VO\_SNS pin can be programmed via the I2C register setting (VOUT\_REG). The output voltage range is from 3.3V to 60V with 20mV/step. The default VOUT\_REG is set to 5V.

### 6.3.4.2 Output Current Programming (IOUT pin and IOUT\_REG)

There are two distinct thresholds to limit the output current regulation point (if both are enabled, the lowest limit of these will apply):

1. IOUT pin pull down resistor (hardware control)
2. IOUT\_REG register bits (host software control)

To set the maximum output current using the IOUT pin, a pull-down resistor to PGND is used. It is required to use a 5-m $\Omega$   $R_{OUT\_SNS}$  sense resistor. The output current limit is controlled by:

$$I_{OUT\_MAX} = \frac{K_{IOUT}}{R_{IOUT}} \quad (4)$$

The actual output current limit is the lower value between IOUT pin setting and I2C register setting (IOUT\_REG). For example, if the register setting is 10A (0xC8), and ICHG pin has a 10-kΩ resistor ( $K_{ICHG} = 50 \text{ A-k}\Omega$ ) to ground for 5A, the actual output current limit is 5A. The device regulates IOUT pin at 2V. If ICHG pin voltage exceeds 2V, the device enters output current regulation (CC mode).

The IOUT pin can also be used to monitor output current when device is not in output current regulation. The voltage on IOUT pin ( $V_{IOUT}$ ) is proportional to the actual output current. IOUT pin can be used to monitor output current with the following relationship:

$$I_{OUT} = \frac{K_{IOUT} \times V_{IOUT}}{R_{IOUT} \times 2V} \quad (5)$$

For example, if IOUT pin is set with 10-kΩ resistor, and the IOUT voltage 1.0V, the actual output current is between 2.4A to 2.6A (based on  $K_{IOUT}$  specified).

If IOUT pin is shorted to PGND, the current limit is set by the IOUT\_REG register. If hardware output current limit function is not needed, it is recommended to short this pin to PGND. The IOUT pin function can be disabled by setting the EN\_IOUT\_PIN bit to 0 (recommended when pin is shorted to PGND). When the pin is disabled, output current limit and monitoring functions via IOUT pin are not available.

To set the maximum output current using the IOUT\_REG register bits, write to the IOUT\_REG register bits. The current limit range is from 400mA to 20,000mA with 50mA/step. The default IOUT\_REG is set to maximum code, allowing IOUT pin to limit the current in hardware.

### 6.3.4.3 Dynamic Power Management: Input Voltage and Input Current Regulation

The device features Dynamic Power Management (DPM), which continuously monitors the input current and input voltage. When input source is over-loaded, either the current exceeds the input current limit (lower of IAC\_DPM or IIN pin setting), or the voltage falls below the input voltage limit (higher of VAC\_DPM or ACUV pin setting,  $V_{ACUV\_DPM}$ ). The device then reduces the current until the input current falls below the input current limit and the input voltage rises above the input voltage limit.

When the current is reduced to zero, but the input source is still overloaded, the input voltage continues to drop. Once the input voltage drops below the ACUV limit ( $V_{ACUV} < V_{REF\_ACUV}$ ), the controller stops switching.

#### 6.3.4.3.1 Input Current Regulation

The total input current is a function of the system supply current and the current. System current normally fluctuates as portions of the systems are powered up or down. Without DPM, the source must be able to supply the maximum system current and the maximum input current simultaneously. By using DPM, the converter reduces the current when the input current exceeds the input current limit set by the lower of IAC\_DPM register bits, or IIN pin. This allows the current capability of the input source to be lowered, reducing system cost.

There are two thresholds to limit the input current (if both are enabled, the lower limit of these two will apply):

1. IAC\_DPM register bits (host software control)
2. IIN pull down resistor (hardware control)

To set the maximum current using the IAC\_DPM register bits, write to the IAC\_DPM register bits. When using a 2-mΩ resistor, the input current limit range is from 1 A to 50 A with 125 mA/step. The default IAC\_DPM is set to maximum code, allowing IIN pin to limit the current in hardware.

To set the maximum current using the IIN pin, refer to [Section 6.3.4.3.1.1](#).

Although both limits are referenced to a 2-mΩ sense resistor, other values can also be used. A larger sense resistor provides a larger sense voltage and higher regulation accuracy, but at the expense of higher conduction loss. For example, using a 5-mΩ resistor yields programmability from 400 mA to 20 A with 50 mA/step.

#### 6.3.4.3.1.1 IIN Pin

To set the maximum input current using the IIN pin, a pull-down resistor to PGND is used. When using a 2-m $\Omega$   $R_{AC\_SNS}$  resistor, the input current limit is controlled by:  $I_{AC\_MAX} = K_{ILIM} / R_{IIN}$ .

The actual input current limit is the lower value between IIN pin setting and register setting (IAC\_DPM). For example, if the register setting is 20 A, and IIN pin has a 5-k $\Omega$  resistor ( $K_{ILIM} = 50$  A-k $\Omega$ ) to ground for 10 A, the actual input current limit is 10 A. IIN pin can be used to set the input current limit when EN\_IIN\_PIN bit is set to 1. The device regulates the pin at  $V_{REF\_ILIM\_HIZ}$ . If pin voltage exceeds  $V_{REF\_ILIM\_HIZ}$ , the device enters input current regulation. Entering input current regulation through the pin sets the IAC\_DPM\_STAT and FLAG bits, and produces an interrupt to host. The interrupt can be masked via the IAC\_DPM\_MASK bit.

The IIN pin can also be used to monitor input current. When not in input current regulation, the voltage on IIN pin ( $V_{IIN}$ ) is proportional to the input current. Pin voltage can be used to monitor input current with the following relationship:  $IAC = K_{ILIM} \times V_{IIN} / (R_{IIN} \times V_{REF\_ILIM\_HIZ})$ .

For example, if the pin is set with 5-k $\Omega$  resistor, and the pin voltage is 1.0 V, the actual input current is between 4.8 A to 5.2 A (based on  $K_{ILIM}$  specified).

If IIN pin is shorted, the input current limit is set by the IAC\_DPM register. If hardware input current limit function is not needed, it is recommended to short this pin to GND. If IIN pin is pulled above  $V_{IH\_ILIM\_HIZ}$ , the device enters HIZ mode (refer to [Section 6.3.3.6](#)). The IIN pin function can be disabled by setting the EN\_IIN\_PIN bit to 0. When the pin is disabled, input current limit and monitoring functions as well as HIZ mode control via the pin are not available.

#### 6.3.4.3.2 Input Voltage Regulation

In addition to input current regulation, the device also offers input voltage regulation to limit the input power. This is especially useful when dealing with input sources such as solar panels, where the operating voltage must be controlled to extract the maximum power. Alternatively, if the input source current limitation is not known, input voltage regulation can be used to limit the power draw from the input source. By using input voltage regulation, the converter reduces the current when the input voltage falls below the input voltage limit set by the higher of VAC\_DPM register bits, or ACUV pin.

There are two thresholds to limit the input voltage (the higher limit of these will apply)

1. VAC\_DPM register bits (host software control)
2. ACUV pin falling threshold (hardware control)

To set the minimum input voltage using the VAC\_DPM register bits, write the desired value directly to the VAC\_DPM register bits. The default VAC\_DPM is set to minimum code, allowing ACUV pin to limit the input voltage in hardware.

To set the minimum input voltage using the ACUV pin, refer to [Section 6.3.3.1](#).

#### 6.3.4.4 Bypass Mode

The device supports bypass mode to allow  $V_{OUT} = V_{AC}$  without regulation and highest efficiency. In this operating mode, the buck and boost high-side FETs (Q1 and Q4) are both turned on, while the Buck and Boost low-side FETs (Q2 and Q3) remain off. The input power is directly passed through the power stage to the output. The switching losses of MOSFETs and the inductor core loss are eliminated, thereby providing highest efficiency. The bypass mode can be enabled by setting the EN\_BYPASS register bit to 1.

While device is in bypass mode, the current through  $R_{OUT\_SNS}$  is monitored and compared against the IOUT\_REG register setting. If the output current exceeds the register setting, the device automatically exits bypass mode and enters HIZ mode (completely disabling the power stage). The IBAT\_OCP\_STAT bit is set, and an INT pulse is asserted to signal the host. To recover from this fault, it is recommended to clear the EN\_HIZ bit.

**Figure 6-3. BQ25758 Bypass Mode Protection**

### 6.3.5 Bidirectional Power Flow and Programmability

The device supports buck-boost bidirectional power flow with programmable parameters via the I2C.

In the forward direction, the power flows from INPUT to OUTPUT, and the device controls the output current, output voltage, as well as the input current and input voltage. The IOUT\_REG register bits control the current across the sense resistor connected at SRP and SRN ( $R_{OUT\_SNS}$ ). The VOUT\_REG register bits control the voltage regulation setpoint at VO\_SNS pin. The IAC\_DPM register bits control the input current across the sense resistor connected at ACP and ACN ( $R_{AC\_SNS}$ ). The VAC\_DPM register bits control the input voltage at the VAC pin.

**Figure 6-4. Programmability in Forward Mode**

In the reverse direction, power flows from OUTPUT to INPUT, and the device control the input current as well as the input voltage. Reverse direction power flow can be enabled by setting the EN\_REV bit to 1. The IAC\_REV register bits control the reverse input current across the sense resistor connected at ACP and ACN ( $R_{AC\_SNS}$ ). The VAC\_REV register bits control the reverse input voltage at the VAC pin.

**Figure 6-5. Programmability in Reverse Mode**

The reverse mode operation can be stopped at any time by setting EN\_REV bit to 0; this action disables the switching converter.

**Note:** When operating as buck-only configuration via the MODE pin, it is recommended to set EN\_CHG = 0 before enabling reverse mode operation.

### 6.3.6 Integrated 16-Bit ADC for Monitoring

The device includes a 16-bit ADC to monitor critical system information based on the device's modes of operation. The ADC is allowed to operate if either the  $V_{VAC} > V_{VAC\_OK}$  or  $V_{BAT} > V_{REGN\_OK}$  is valid. The ADC\_EN bit provides the ability to enable and disable the ADC to conserve power. The ADC\_RATE bit allows continuous conversion or one-shot behavior. After a one-shot conversion finishes, the ADC\_EN bit is cleared, and must be re-asserted to start a new conversion.

The ADC\_SAMPLE bits control the resolution and sample speed of the ADC. By default, ADC channels will be converted in one-shot or continuous conversion mode unless disabled in the ADC Function Disable register. If an ADC parameter is disabled by setting the corresponding bit, then the read-back value in the corresponding register will be from the last valid ADC conversion or the default POR value (all zeros if no conversions have taken place). If an ADC parameter is disabled in the middle of an ADC measurement cycle, the device will finish the conversion of that parameter, but will not convert the parameter starting the next conversion cycle. If all channels are disabled in one-shot conversion mode, the ADC\_EN bit is cleared.

The ADC\_DONE\_STAT and ADC\_DONE\_FLAG bits signal when a conversion is complete in one-shot mode only. This event produces an INT pulse, which can be masked with ADC\_DONE\_MASK. During continuous conversion mode, the ADC\_DONE\_STAT bit has no meaning and will be '0'. The ADC\_DONE\_FLAG bit will remain unchanged in continuous conversion mode.

ADC conversion operates independently of the faults present in the device. ADC conversion will continue even after a fault has occurred (such as one that causes the power stage to be disabled), and the host must set ADC\_EN = '0' to disable the ADC. ADC readings are only valid for DC states and not for transients. When host writes ADC\_EN = 0, the ADC stops immediately, and ADC measurement values correspond to last valid ADC reading.

If the host wants to exit ADC more gracefully, it is possible to do either of the following:

1. Write ADC\_RATE to one-shot, and the ADC will stop at the end of a complete cycle of conversions, or
2. Disable all ADC conversion channels, and the ADC will stop at the end of the current measurement.

When system load is powered from the battery (input source is removed, or device in HIZ mode), enabling the ADC automatically powers up REGN and increases the quiescent current. To keep the battery leakage low, it is recommended to duty cycle or completely disable the ADC.

### 6.3.7 Status Outputs ( $\overline{PG}$ , STAT and $\overline{INT}$ )

#### 6.3.7.1 Power Good Indicator ( $\overline{PG}$ )

The PG\_STAT bit goes HIGH and the  $\overline{PG}$  pin pulls LOW to indicate a good input source when a valid VAC voltage is detected. The  $\overline{PG}$  pin can drive an LED. All conditions must be met to indicate power good:

1.  $V_{VAC\_OK} < V_{VAC} < V_{VAC\_INT\_OV}$
2.  $V_{ACUV} > V_{REF\_ACUV}$
3.  $V_{ACOV} < V_{REF\_ACOV}$
4. Device not in HIZ mode

The  $\overline{PG}$  pin can be disabled via the DIS\_PG\_PIN bit. When disabled, this pin can be controlled to pull LOW using the FORCE\_STAT3\_ON bit.

#### 6.3.7.2 Interrupt to Host ( $\overline{INT}$ )

In some applications, the host does not always monitor the controller operation. The  $\overline{INT}$  pin notifies the system host on the device operation. By default, the following events will generate an active-low, 256- $\mu$ s INT pulse.

1. Valid input source conditions detected (see conditions for  $\overline{PG}$  pin)

2. Valid input source conditions removed (see conditions for  $\overline{PG}$  pin)
3. Entering IAC\_DPM regulation through register or IIN pin
4. Entering VAC\_DPM regulation through register or ACUV pin
5. I<sup>2</sup>C Watchdog timer expired
6. TS\_STAT changes state (TS\_STAT value change)
7. Junction temperature shutdown (TSHUT)
8. A rising edge on any of the \*\_STAT bits

Each one of these INT sources can be masked off to prevent INT pulses from being sent out when they occur. Three bits exist for each one of these events:

- The STAT bit holds the *current status* of each INT source
- The FLAG bit holds information on which source produced an INT, regardless of the current status
- The MASK bit is used to prevent the device from sending out INT for each particular event

When one of the above conditions occurs (a rising edge on any of the \*\_STAT bits), the device sends out an INT pulse and keeps track of which source generated the INT via the FLAG registers. The FLAG register bits are automatically reset to zero after the host reads them, and a new edge on STAT bit is required to re-assert the FLAG.

**Figure 6-6. INT Generation Behavior Example**

### 6.3.8 Protections

The device closely monitors the input and battery voltage, as well as switching FET currents for safe switch-mode operation.

#### 6.3.8.1 Voltage and Current Monitoring

##### 6.3.8.1.1 VAC Over-voltage Protection (VAC\_OVP)

In order to protect downstream devices on the system rail, the input over-voltage threshold can be programmed with the ACOV pin as  $V_{VACOV} = V_{REF\_ACOV}$  (refer to [Section 6.3.3.1](#)). The device also features an internal over-voltage protection preset at  $V_{VAC\_INT\_OV}$ . When the input voltage rises above the lower of these two thresholds, the device disables the controller. During input over-voltage, an INT pulse is asserted to signal the host, and the VAC\_OV\_STAT, and \_FLAG bits are set. Additionally, the PG\_STAT bit is cleared and the  $\overline{PG}$  pin pulls HIGH. The device automatically resumes operation when the over-voltage condition goes away.

#### 6.3.8.1.2 VAC Under-voltage Protection (VAC\_UVP)

In order to maintain a minimum operating voltage on the system rail, the input under-voltage threshold can be programmed with the ACUV pin as  $V_{VACUV} = V_{REF\_ACUV}$  (refer to [Section 6.3.3.1](#)). The device also features an internal under-voltage protection preset at  $V_{VAC\_OK}$ . When the input voltage falls below the higher of these two thresholds, the device disables the controller. During input under-voltage, an INT pulse is asserted to signal the host, and the VAC\_UV\_STAT, and \_FLAG bits are set. Additionally, the PG\_STAT bit is cleared and the  $\overline{PG}$  pin pulls HIGH. The device automatically resumes operation when the under-voltage condition goes away.

#### 6.3.8.1.3 Reverse Mode Over-voltage Protection (REV\_OVP)

While operating the converter in reverse mode, the device monitors the reverse voltage,  $V_{VAC}$ . When  $V_{VAC}$  rises above regulation target and exceeds  $V_{REV\_OVP}$ , the device stops switching, and waits for the voltage to fall below the threshold to resume switching. An INT pulse is asserted to the host.

#### 6.3.8.1.4 Reverse Mode Under-voltage Protection (REV\_UVP)

While operating the converter in reverse mode, the device monitors the reverse voltage,  $V_{VAC}$ . When  $V_{VAC}$  falls below the undervoltage threshold (programmable via SYSREV\_UV register bit), the device stops switching, clears the EN\_REV bit, and exits Reverse mode. During the over-voltage event duration, the REVERSE\_STAT bit is cleared and the REVERSE\_FLAG bit is set to indicate a fault in reverse mode. An INT pulse is also asserted to the host

#### 6.3.8.1.5 DRV\_SUP Under-voltage and Over-voltage Protection (DRV\_OKZ)

The DRV\_SUP pin must maintain a valid voltage between DRV\_UVP and DRV\_OVP for proper operation of the switching power converter stage. This is true both in forward mode and in reverse mode.

When DRV\_SUP pin voltage falls below DRV\_UVP threshold, the switching converter stops operation, an INT pulse is asserted to signal the host, the DRV\_OKZ\_STAT, and DRV\_OKZ\_FLAG bits are set to signal the fault.

When DRV\_SUP pin voltage rises above DRV\_OVP threshold, the switching converter stops operation, an INT pulse is asserted to signal the host, the DRV\_OKZ\_STAT, and DRV\_OKZ\_FLAG bit are set to signal the fault.

When the DRV pin returns to normal operating range, the device automatically resumes switching in either forward or reverse mode as configured before the fault.

#### 6.3.8.1.6 REGN Under-voltage Protection (REGN\_OKZ)

The REGN pin is driven by an internal regulator, and must maintain a voltage above REGN\_OKZ for proper device operation. This is true both in forward mode and in reverse mode, and for the ADC to function in battery only mode.

If the internal regulator is overloaded externally, the pin voltage may drop. When REGN falls below REGN\_OKZ threshold, the switching converter stops operation. When the fault is removed, the REGN voltage recovers automatically and switching resumes in either forward or reverse mode as configured before the fault.

#### 6.3.8.2 Thermal Shutdown (TSHUT)

The device has thermal shutdown to turn off the converter when IC surface temperature exceeds TSHUT. The fault register bits TSHUT\_STAT and TSHUT\_FLAG are set and an INT pulse is asserted to the host. The converter turns back on when IC temperature is below TSHUT\_HYS. Note that TSHUT protection is active both in forward and reverse mode of operation.

### 6.3.9 Serial Interface

The device uses I<sup>2</sup>C compatible interface for flexible parameter programming and instantaneous device status reporting. I<sup>2</sup>C is a bi-directional 2-wire serial interface. Only two open-drain bus lines are required: a serial data line (SDA), and a serial clock line (SCL). Devices can be considered as controllers or targets when performing data transfers. A controller is a device which initiates a data transfer on the bus and generates the clock signals to permit that transfer. At that time, any device addressed is considered a target.

The device operates as a target device with address 0x6B, receiving control inputs from the controller device like a micro-controller or digital signal processor through the registers defined in the Register Map. Registers read

outside those defined in the map, return 0xFF. The I<sup>2</sup>C interface supports standard mode (up to 100 kbits/s), fast mode (up to 400 kbits/s), and fast mode plus (up to 1 Mbit/s). When the bus is free, both lines are HIGH. The SDA and SCL pins are open drain and must be connected to the positive supply voltage via a current source or pull-up resistor.

**System Note:** All 16-bit registers are defined as Little Endian, with the most-significant byte allocated to the higher address. 16-bit register writes must be done sequentially and are recommended to be programmed using multi-write approach described in the [Section 6.3.9.7](#).

### 6.3.9.1 Data Validity

The data on the SDA line must be stable during the HIGH period of the clock. The HIGH or LOW state of the data line can only change when the clock signal on SCL line is LOW. One clock pulse is generated for each data bit transferred.

**Figure 6-7. Bit Transfers on the I<sup>2</sup>C Bus**

### 6.3.9.2 START and STOP Conditions

All transactions begin with a START (S) and are terminated with a STOP (P). A HIGH to LOW transition on the SDA line while SCL is HIGH defines a START condition. A LOW to HIGH transition on the SDA line when the SCL is HIGH defines a STOP condition.

START and STOP conditions are always generated by the controller. The bus is considered busy after the START condition, and free after the STOP condition. When timeout condition is met, for example START condition is active for more than 2 seconds and there is no STOP condition triggered, the I<sup>2</sup>C communication will automatically reset and communication lines are free for another transmission.

**Figure 6-8. START and STOP Conditions on the I<sup>2</sup>C Bus**

### 6.3.9.3 Byte Format

Every byte on the SDA line must be 8 bits long. The number of bytes to be transmitted per transfer is unrestricted. Each byte has to be followed by an ACKNOWLEDGE (ACK) bit. Data is transferred with the Most Significant Bit (MSB) first. If a target cannot receive or transmit another complete byte of data until it has performed some other function, it can hold the SCL line low to force the controller into a wait state (clock

stretching). Data transfer then continues when the target is ready for another byte of data and releases the SCL line.

Figure 6-9. Data Transfer on the I<sup>2</sup>C Bus

**6.3.9.4 Acknowledge (ACK) and Not Acknowledge (NACK)**

The ACK signaling takes place after byte. The ACK bit allows the target to signal the controller that the byte was successfully received and another byte may be sent. All clock pulses, including the acknowledge 9<sup>th</sup> clock pulse, are generated by the controller.

The controller releases the SDA line during the acknowledge clock pulse so the target can pull the SDA line LOW and it remains stable LOW during the HIGH period of this 9<sup>th</sup> clock pulse.

A NACK is signaled when the SDA line remains HIGH during the 9<sup>th</sup> clock pulse. The controller can then generate either a STOP to abort the transfer or a repeated START to start a new transfer.

**6.3.9.5 Target Address and Data Direction Bit**

After the START signal, a target address is sent. This address is 7 bits long, followed by the 8 bit as a data direction bit (bit R/  $\bar{W}$ ). A zero indicates a transmission (WRITE) and a one indicates a request for data (READ). The device 7-bit address is defined as 1101 011' (0x6B) by default.

Figure 6-10. Complete Data Transfer on the I<sup>2</sup>C Bus

**6.3.9.6 Single Write and Read**

Figure 6-11. Single Write

Figure 6-12. Single Read

If the register address is not defined, the IC sends back NACK and returns to the idle state.

### 6.3.9.7 Multi-Write and Multi-Read

The device supports multi-read and multi-write of all registers.

**Figure 6-13. Multi-Write**

**Figure 6-14. Multi-Read**

## 6.4 Device Functional Modes

### 6.4.1 Host Mode and Default Mode

The device is a host controlled converter, but it can operate in default mode without host management. In default mode, the device can be used as an autonomous converter with no host or while host is in sleep mode. When the converter is in default mode, WD\_STAT bit becomes HIGH, WD\_FLAG is set to 1, and a  $\overline{INT}$  is asserted low to alert the host (unless masked by WD\_MASK). The WD\_FLAG bit would read as a '1' upon the first read and then '0' upon subsequent reads. When the converter is in host mode, WD\_STAT bit is LOW.

After power-on-reset, the device starts in default mode with watchdog timer expired. All the registers are in the default settings.

In default mode, the device regulates the output voltage to 5 V, with current limit as set by the IOOUT pin (refer to [Section 6.3.4.2](#)).

A write to any I<sup>2</sup>C register transitions the converter from default mode to host mode, and initiates the watchdog timer. All the device parameters can be programmed by the host. To keep the device in host mode, the host has to reset the watchdog timer by writing 1 to WD\_RST bit before the watchdog timer expires (WD\_STAT bit is set), or disable watchdog timer by setting WATCHDOG bits = 00.

When the watchdog timer is expired, the device returns to default mode and select registers are reset to default values as detailed in the Register Map section. The Watchdog timer will be reset on any write if the watchdog timer has expired. When watchdog timer expires, WD\_STAT and WD\_FLAG is set to 1, and  $\overline{INT}$  is asserted low to alert the host (unless masked by WD\_MASK).

**Figure 6-15. Watchdog Timer Flow Chart**

**6.4.2 Register Bit Reset**

Beside the register reset by the watchdog timer in the default mode, the register and the timer could be reset to the default value by writing the REG\_RST bit to 1. The register bits which can be reset by the REG\_RST bit, are noted in the Register Map section. After the register reset, the REG\_RST bit will go back from 1 to 0 automatically.

## 6.5 BQ25758 Registers

Table 6-4 lists the memory-mapped registers for the BQ25758 registers. All register offset addresses not listed in Table 6-4 should be considered as reserved locations and the register contents should not be modified.

**Table 6-4. BQ25758 Registers**

Address	Acronym	Register Name	Section
0x2	REG0x02_Output_Current_Limit	Output Current Limit	<a href="#">Go</a>

**Table 6-13. REG0x17\_Converter\_Control Register Field Descriptions (continued)**

Bit	Field	Type	Reset	Notes	Description
2	EN_HIZ	R/W	0x0	Reset by: REG_RESET WATCHDOG Adapter Plug In	HIZ mode enable: 0b = Disable 1b = Enable
1	EN_IBAT_LOAD	R/W	0x0	Sinks current from SRN to GND. Recommend to disable IBAT ADC (IBAT_ADC_DIS = 1) while this bit is active. Reset by: REG_RESET WATCHDOG	Battery Load (IBAT_LOAD) Enable: 0b = Disabled 1b = Enabled
0	EN_CHG	R/W	0x1	Reset by: REG_RESET WATCHDOG	Enable control: 0b = Disable 1b = Enable

### 6.5.9 REG0x18\_Pin\_Control Register (Address = 0x18) [Reset = 0xC0]

REG0x18\_Pin\_Control is shown in [Table 6-14](#).

Return to the [Summary Table](#).

**Table 6-14. REG0x18\_Pin\_Control Register Field Descriptions**

Bit	Field	Type	Reset	Notes	Description
7	EN_IOUT_PIN	R/W	0x1	Reset by: REG_RESET WATCHDOG	IOUT pin function enable: 0b = IOUT pin disabled 1b = IOUT pin enabled
6	EN_IIN_PIN	R/W	0x1	Reset by: REG_RESET WATCHDOG	IIN pin function enable: 0b = IIN pin disabled 1b = IIN pin enabled
5	DIS_PG_PIN	R/W	0x0	Reset by: REG_RESET	PG pin function disable: 0b = PG pin enabled 1b = PG pin disabled
4	DIS_STAT_PIN	R/W	0x0	Reset by: REG_RESET	STAT pin function disable: 0b = STAT pin enabled 1b = STAT pin disabled
3	FORCE_STAT4_ON	R/W	0x0	Reset by: REG_RESET	CE_STAT4 pin override: Can only be forced on if DIS_CE_PIN = 1 0b = CE_STAT4 open-drain off 1b = CE_STAT4 pulls LOW
2	FORCE_STAT3_ON	R/W	0x0	Reset by: REG_RESET	PG_STAT3 pin override: Can only be forced on if DIS_PG_PIN = 1 0b = PG_STAT3 open-drain off 1b = PG_STAT3 pulls LOW
1	RESERVED	R	0x0		Reserved
0	FORCE_STAT_ON	R/W	0x0	Reset by: REG_RESET	STAT pin override: Can only be forced on if DIS_STAT_PIN = 1 0b = STAT open-drain off 1b = STAT pulls LOW

### 6.5.10 REG0x19\_Power\_Path\_and\_Reverse\_Mode\_Control Register (Address = 0x19) [Reset = 0x00]

REG0x19\_Power\_Path\_and\_Reverse\_Mode\_Control is shown in [Table 6-15](#).

Return to the [Summary Table](#).

**Table 6-15. REG0x19\_Power\_Path\_and\_Reverse\_Mode\_Control Register Field Descriptions**

Bit	Field	Type	Reset	Notes	Description
7	REG_RST	R/W	0x0	Reset by: REG_RESET	Register reset to default values: 0b = Not reset 1b = Reset (bit goes back to 0 after register reset)
6	EN_IAC_LOAD	R/W	0x0	Reset by: REG_RESET WATCHDOG	VAC Load (IAC_LOAD) Enable: 0b = Disabled 1b = Enabled
5	EN_PFM	R/W	0x0	This bit is reset upon a valid SYNC signal detection on FSW_SYNC pin. Host can set this bit back to 1 to force PFM operation even with a valid SYNC input Reset by: REG_RESET	Enable PFM mode to improve light-load efficiency: 0b = Disable (Fixed-frequency DCM operation) 1b = Enable (PFM operation)
4	RESERVED	R	0x0		Reserved
3	PWRPATH_REDUCE_VDRV	R/W	0x0	Reset by: REG_RESET WATCHDOG	Bypass Mode Gate-Drive Voltage Select: 0b = 10V 1b = 7V
2	RESERVED	R	0x0		Reserved
1	RESERVED	R	0x0		
0	EN_REV	R/W	0x0	Reset by: REG_RESET WATCHDOG Adapter Plug In	Reverse Mode control: 0b = Disable 1b = Enable

### 6.5.11 REG0x1B\_TS\_Threshold\_Control Register (Address = 0x1B) [Reset = 0x82]

REG0x1B\_TS\_Threshold\_Control is shown in [Table 6-16](#).

Return to the [Summary Table](#).

## 7 Application and Implementation

### Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

### 7.1 Application Information

The BQ25758 controller is ideal for high current applications (up-to 20 A). The BQ25758EVM evaluation module is a complete module for evaluating the device performance. The application curves were taken using the BQ25758EVM.

### 7.2 Typical Applications

#### 7.2.1 Typical Application (Buck-Boost configuration)

The device is configured as a buck-boost with input range from 4.2 V to 60 V. An optional gate drive voltage can be provided using the DRV\_SUP pin to reduce switching losses. Figure 7-1 shows a typical schematic when using the device with 19.5-V or 48-V input, configurable output voltage for USB-PD EPR and 5-A output current.

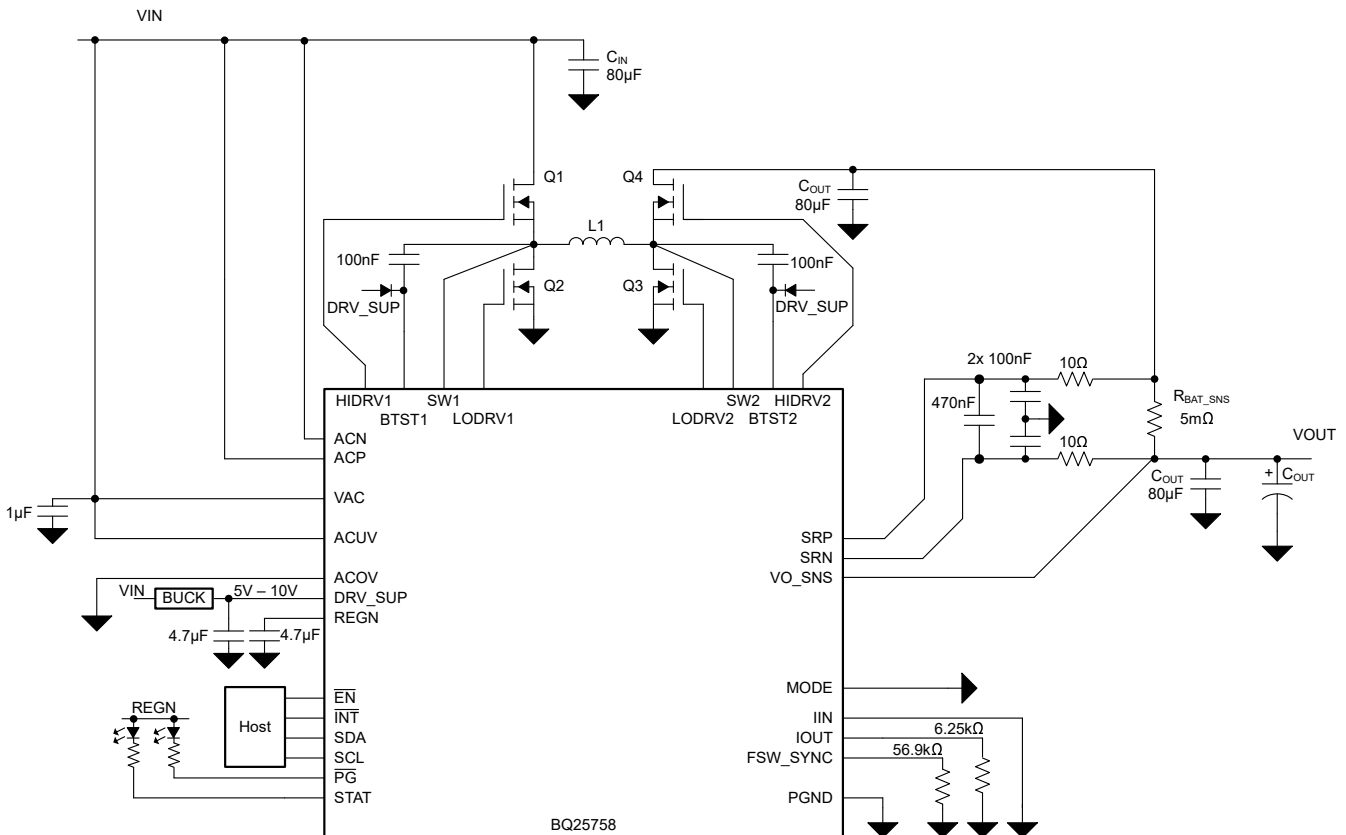

Figure 7-1. BQ25758: 19.5-V or 48-Vin, Buck-Boost with Configurable Output Voltage for USB-PD EPR, and 5-A Output Current

Table 7-1. Recommended Part Numbers for up-to 48-V EPR (5-A output):

COMPONENT	VALUE	RECOMMENDED PART NO.
Q1, Q2, Q3, Q4	80 V, 6.2 mΩ	SiR880BDP

**Table 7-1. Recommended Part Numbers for up-to 48-V EPR (5-A output): (continued)**

COMPONENT	VALUE	RECOMMENDED PART NO.
L1	10 $\mu$ H, 22 m $\Omega$	CMLB135T-100MS

**Table 7-2. Recommended Part Numbers for 28-V EPR only (5-A output):**

COMPONENT	VALUE	RECOMMENDED PART NO.
Q1, Q2, Q3, Q4	40 V, 3.5 m $\Omega$	AONS66408
L1	4.7 $\mu$ H, 22 m $\Omega$	CMLE104T-4R7MS

### 7.2.1.1 Design Requirements

For this design example, use the parameters shown in the table below.

**Table 7-3. Design Parameters**

PARAMETER	VALUE
Input voltage operating range ( $V_{AC}$ )	4.2 V to 60 V
Input current limit ( $I_{AC}$ )	No limit
Output current limit ( $I_{OUT}$ )	5 A
Output voltage ( $V_{OUT\_REG}$ )	5 V, 9 V, 15 V, 20 V, 28 V, 36 V, 48 V
Switching frequency	450 kHz

### 7.2.1.2 Detailed Design Procedure

#### 7.2.1.2.1 ACUV / ACOV Input Voltage Operating Window Programming

The input voltage operating window is programmed by an ACUV / ACOV window with a resistor divider from VAC to GND. The top resistor,  $R_{AC1}$  is typically selected as 1,000 k $\Omega$  to minimize the input voltage leakage current. Assuming the desired trip-points for under-voltage and over-voltage protection are labeled  $V_{VACUVP}$  and  $V_{VACOVVP}$ , the resistor divider required can be calculated as follows. The internal reference for the over-voltage threshold ( $V_{REF\_ACOV}$ ) is 1.2 V. The internal reference for the under-voltage threshold ( $V_{REF\_ACUV}$ ) is 1.1 V.

**Figure 7-2. ACUV and ACOV Resistor Divider**

$$V_{VACOVVP} = \frac{1.2V(1,000k\Omega + R_{AC2} + R_{AC3})}{R_{AC3}} \quad (6)$$

$$V_{VACUVVP} = \frac{1.1V(1,000k\Omega + R_{AC2} + R_{AC3})}{R_{AC2} + R_{AC3}} \quad (7)$$

For the default device operating window of 4.2 V to 60 V, the ACUV can be pulled up directly to VAC, while the ACOV can be pulled directly to GND.

#### 7.2.1.2.2 Switching Frequency Selection

The switching frequency is set by a resistor connected from the FSW\_SYNC pin to PGND. The RFSW resistor required to set the desired frequency is calculated using Equation 3 or Table 6-3. A 0.1% standard resistor of 56.9 k $\Omega$  is selected to set  $f_{SW} = 450$  kHz.

### 7.2.1.2.3 Inductor Selection

Higher switching frequency allows the use of smaller inductor and capacitor values. Inductor saturation current should be higher than the inductor current ( $I_L$ ) plus half the ripple current ( $I_{RIPPLE}$ ):

$$I_{SAT} \geq I_L + \frac{1}{2}I_{RIPPLE} \quad (8)$$

The inductor ripple current in buck operation depends on input voltage ( $V_{AC}$ ), duty cycle ( $D_{BUCK} = V_{BAT}/V_{AC}$ ), switching frequency ( $f_{SW}$ ) and inductance ( $L$ ):

$$I_{RIPPLE\_BUCK} = \frac{V_{AC} \times D_{BUCK} \times (1 - D_{BUCK})}{f_{SW} \times L} \quad (9)$$

During boost operation, the duty cycle is:  $D_{BOOST} = 1 - (V_{AC}/V_{BAT})$ . The inductor ripple current is:

$$I_{RIPPLE\_BOOST} = \frac{V_{AC} \times D_{BOOST}}{f_{SW} \times L} \quad (10)$$

The maximum inductor ripple current happens with  $D = 0.5$  or close to 0.5. Ripple calculations should be analyzed for both forward and reverse operating modes if applicable.

Usually inductor ripple is designed in the range of (20 – 40%) maximum inductor current (in either forward or reverse mode) as a trade-off between inductor size and efficiency for a practical design.

### 7.2.1.2.4 Input (VAC) Capacitor

Input capacitor should have enough ripple current rating to absorb input switching ripple current. The worst case RMS ripple current is half of the output when duty cycle is 0.5 in forward buck mode, or reverse boost mode. If the converter does not operate at 50% duty cycle, then the worst case capacitor RMS current occurs where the duty cycle is closest to 50% and can be estimated by [Equation 11](#):

$$I_{CIN} = I_{CHG} \times \sqrt{D \times (1 - D)} \quad (11)$$

A combination of ceramic and bulk capacitors should be used to provide a short path for high di/dt current and to reduce the voltage ripple. Ceramic capacitors should be placed close to the switching half-bridge. Given total bulk input capacitance, it is recommended to distribute equally on either side of  $R_{AC\_SNS}$ . The complete schematic is a good starting point for input capacitor for typical applications.

### 7.2.1.2.5 Output (VBAT) Capacitor

In forward boost mode or reverse buck mode, the output capacitor conducts high ripple current. The output capacitor RMS ripple current is given by where the minimum VAC corresponds to the maximum capacitor current.

$$I_{CBAT} = I_{BAT} \sqrt{\frac{V_{BAT}}{V_{AC}} - 1} \quad (12)$$

A 5-mΩ output capacitor ESR causes an output voltage ripple of 74 mV as given by:

$$\Delta V_{RIPPLE(ESR)} = I_{BAT} \times \frac{V_{BAT}}{V_{AC,min}} \times ESR \quad (13)$$

A 140-μF output capacitor causes a capacitive ripple voltage of 66 mV as given by:

$$\Delta V_{RIPPLE(CBAT)} = I_{BAT} \times \frac{\left(1 - \frac{V_{AC,min}}{V_{BAT}}\right)}{C_{BAT} \times f_{SW}} \quad (14)$$

A combination of ceramic and bulk capacitors should be used to provide low ESR and high ripple current capacity. Ceramic capacitors should be placed close to the switching half-bridge. Given total bulk output capacitance, it is recommended to distribute equally on either side of  $R_{BAT\_SNS}$ . The complete schematic is a good starting point for  $C_{BAT}$  for typical applications.

#### 7.2.1.2.6 Sense Resistor ( $R_{AC\_SNS}$ and $R_{BAT\_SNS}$ ) and Current Programming

The battery current sense resistor between SRP and SRN is fixed at 5 m $\Omega$ ; using a different value is not recommended. The input current sense resistor between ACP and ACN is typically 2 m $\Omega$ , but can be increased to achieve better accuracy at lower sensed currents. In USB-PD EPR applications, a 5-m $\Omega$  sense resistor is recommended to achieve programmability in 50 mA/step. In addition, if input current limit function is not desired, ACP and ACN may be shorted together. For both of these sense resistors, a filter network is recommended as shown in the Typical Application.

For both the input current and the output current, the limits may be programmed using the I<sup>2</sup>C interface or an external programming resistor on IIN and IOOUT pins, respectively.

**Table 7-4. Sense Resistor and Current Programming**

PARAMETER	FORMULA	VALUE
Input Current Hardware Limit	Unused	Pull IIN pin to GND
Input Current Software Limit	Unused	REG06 = 0x0640 (50 A with 2-m $\Omega$ $R_{AC\_SNS}$ )
Output Current Hardware Limit	$R_{IOOUT} = K_{I\text{CHG}} / 8 \text{ A}$	6.25 k $\Omega$ for 8 A with 5-m $\Omega$ $R_{BAT\_SNS}$
Output Current Software Limit	$I_{CHG} = 5 \text{ A}$	REG02 = 0x0190 (5 A)

The default input sense resistor ( $R_{AC\_SNS}$ ) is 2 m $\Omega$ , and the register allows for a range of up-to 50-A input current limit. If lower currents are desired, it is possible to use a higher resistor, such as 5 m $\Omega$ . In this case, the IAC\_DPM register value should be multiplied by a factor of 2/5 to program the correct current. For example, if a 5-m $\Omega$   $R_{AC\_SNS}$  is used, and the register is programmed to a value of 0x60, the true maximum current across the  $R_{AC\_SNS}$  will be:  $12\text{A} * 2/5 = 4.8 \text{ A}$ . Similarly, the  $K_{ILIM}$  parameter used to set the IIN pull-down resistor should be scaled by 2/5. For example, with a 5-m $\Omega$   $R_{AC\_SNS}$  resistor, a 6-A current limit would be achieved as:  $R_{ILIM} = K_{ILIM} * (2/5) / 6\text{A} = 3.3 \text{ k}\Omega$ .

#### 7.2.1.2.7 Converter Fast Transient Response

The device integrates all the loop compensation, thereby providing a high density solution with ease of use. For faster transient response, the EN\_CONV\_FAST\_TRANSIENT bit can be set to 1. If device is not used in boost mode operation, this section can be disregarded.

When the converter is operating in boost mode, the non-continuous inductor current flow to the load results in a right-half plane (RHP) zero. The RHP zero location is:

$$RHPz = \frac{V_{IN,boost}}{I_{IN,boost}} \frac{1}{2\pi L} \quad (15)$$

For good phase margin, the unity gain bandwidth (UGBW) of the converter should be about 1/3 of the RHPz. The boost output capacitor ( $C_{load}$ ), and the converter transient parameters ( $R_1$ ,  $gm_1$ ) need to be scaled to move the location of the UGBW of the converter.

$$1 \approx \frac{A_{div} \times gm_1 (sR_1 C_1 + 1)}{sC_1} \left[ \frac{V_i}{I_o \times 50m} \right] \left[ \frac{1}{1 + s \frac{C_{load} R_{load}}{2}} \right] \quad (16)$$

The device adjusts  $A_{div}$ ,  $gm_1$  and  $R_1$  based on the output voltage and the EN\_CONV\_FAST\_TRANSIENT bit setting per the table below. During some boost case scenarios, the  $C_{load}$  needs to be adjusted to limit the converter bandwidth.

**Table 7-5. Converter Fast Transient Response**

BOOST OUTPUT VOLTAGE	Adiv	C <sub>1</sub>	EN_CONV_FAST_TRANSIENT = 0		EN_CONV_FAST_TRANSIENT = 1	
			gm <sub>1</sub>	R <sub>1</sub>	gm <sub>1</sub>	R <sub>1</sub>
≤8 V	1/5	75 pF	0.4 μ	600 kΩ	2 μ	1.3 MΩ
8 V to 16 V	1/10	75 pF	0.47 μ	1 MΩ	2 μ	1.8 MΩ
16 V to 32 V	1/20	75 pF	0.67 μ	2.8 MΩ	2 μ	2.8 MΩ
>32 V	1/40	75 pF	2 μ	2.8 MΩ	2 μ	2.8 MΩ

As an example, assume the device operates in boost mode from a 5V supply to provide a 7V boost output voltage with load up-to 5A and 10μH inductor. The RHPz is approximately located at:

$$RHPz = \frac{V_{IN,boost}}{I_{IN,boost}} \frac{1}{2\pi L} = 11.4kHz \quad (17)$$

For best stability, the UGBW of the converter should be limited to 1/3 of the RHP zero, or 3.8kHz. If EN\_CONV\_FAST\_TRANSIENT = 1, the equation becomes:

$$1 \approx \frac{0.2 \times 2\mu (j\omega \times 1.3M\Omega \times 75pF + 1)}{j\omega \times 75pF} \left[ \frac{5V}{5A \times 50m} \right] \left[ \frac{1}{1 + j\omega \frac{C_{load} \times 1.4}{2}} \right] \quad (18)$$

Solving the above for C<sub>load</sub> gives ≥674 μF capacitor requirement.

Conversely, if EN\_CONV\_FAST\_TRANSIENT = 0, the UGBW equation becomes:

$$1 \approx \frac{0.2 \times 0.4\mu (j\omega \times 0.6M\Omega \times 75pF + 1)}{j\omega \times 75pF} \left[ \frac{5V}{5A \times 50m} \right] \left[ \frac{1}{1 + j\omega \frac{C_{load} \times 1.4}{2}} \right] \quad (19)$$

Solving the above for C<sub>load</sub> gives ≥51 μF capacitor requirement. However, the minimum recommended capacitor for converter stability is 80 μF, so this minimum value should be used.

### 7.2.1.3 Application Curves

$C_{VAC} = 160 \mu\text{F}$ ,  $C_{OUT} = 160 \mu\text{F}$ ,  $V_{VAC} = 20 \text{ V}$ ,  $V_{OUT} = 5 \text{ V}$  (unless otherwise specified)

### 7.2.2 Typical Application (Buck-only configuration)

The device can be configured as buck-only using the MODE pin as described in [MODE Pin Configuration](#) section. In this mode, the Q3 and Q4 FETs must be removed from the system. Please see the diagram below showing buck-only mode without the boost FETs Q3 and Q4. An optional gate drive voltage can be provided using the DRV\_SUP pin to reduce switching losses. [Figure 7-25](#) shows a typical schematic when using the device as a buck with 48-V input, configurable output voltage for USB-PD EPR and 5-A output current.

**BQ25758**

SLUSET4B – DECEMBER 2022 – REVISED MARCH 2024

**Figure 7-25. BQ25758: 48-Vin, Buck-Only with Configurable Output Voltage for USB-PD EPR, and 5-A Output Current**

**Table 7-6. Recommended Part Numbers:**

COMPONENT	VALUE	RECOMMENDED PART NO.
Q1, Q2	80 V, 6.2 mΩ	SiR880BDP
L1	10 μH, 22 mΩ	CMLB135T-100MS

**7.2.2.1 Design Requirements**

For this design example, use the parameters shown in the table below.

**Table 7-7. Design Parameters**

PARAMETER	VALUE
Input voltage operating range (V <sub>AC</sub> )	43 V to 53 V
Input current limit (I <sub>AC</sub> )	No limit
Output current limit (I <sub>OUT</sub> )	5 A
Output voltage (V <sub>OUT_REG</sub> )	5 V, 9 V, 15 V, 20 V, 28 V, 36 V
Switching frequency	450 kHz

## 8 Power Supply Recommendations

The power supply for the device is any DC voltage source within the specified input range. The supply should also be capable of supplying sufficient current based on the programmed input current limit. The input supply should be bypassed with a combination of electrolytic and ceramic capacitors to avoid ringing due to the parasitic impedance of the connecting cables.

When device is operating in the reverse direction, the supply at the OUTPUT should follow the same recommendations as the input supply mentioned above.

## 9 Layout

### 9.1 Layout Guidelines

Proper layout of the components to minimize high frequency current path loops is important to prevent electrical and magnetic field radiation and high frequency resonant problems. Here is a PCB layout priority list for proper layout.

**Table 9-1. PCB Layout Guidelines**

COMPONENTS	FUNCTION	IMPACT	GUIDELINES
Buck high side FET, Buck low side FET, input capacitors	Buck input loop	High frequency noise, ripple, efficiency	This path forms a high frequency switching loop due to the pulsating current at the input of the buck. Place components on the same side of the board. Minimize loop area to reduce parasitic inductance. Maximize trace width to reduce parasitic resistance. Place input ceramic capacitors close to the switching FETs.
Boost low side FET, boost high side FET, output capacitors	Boost output loop	High frequency noise, ripple, efficiency	This path forms a high frequency switching loop due to the pulsating current at the output of the boost. Place components on the same side of the board. Minimize loop area to reduce parasitic inductance. Maximize trace width to reduce parasitic resistance. Place output ceramic capacitors close to the switching FETs.
Sense resistors, switching FETs, inductor	Current path	Efficiency	The current path from input to output through the power stage and sense resistors has low impedance. Pay attention to via resistance if they are not on the same side. The number of vias can be estimated as 1- to 2-A per via for a 10-mil via with 1 oz. copper thickness.
Switching FETs, inductor	Power stage	Thermal, efficiency	The switching FETs and inductor are the components with highest power loss. Allow enough copper area for heat dissipation. Multiple thermal vias can be used to connect more copper layers together and dissipate more heat.
DRV_SUP, BTST1, BTST2 capacitors	Switching FET gate drive	High frequency noise, parasitic ringing, gate drive integrity	The DRV_SUP capacitor is used to supply the power to drive the low side FETs. The BTST capacitors are used to drive the high side FETs. It is recommended to place the capacitors as close as possible to the IC.
LODRV1, LODRV2	Low side gate drive	High frequency noise, parasitic ringing, gate drive integrity	LODRV1 and LODRV2 supplies the gate drive current to turn on the low side FETs. The return of LODRV1 and LODRV2 is PGND. As current take the path of least impedance, a ground plane close to the low side gate drive traces is recommended. Minimize gate drive length and aim for at least 20-mil gate drive trace width.
HIDRV1, HIDRV2, SW1 (pin trace), SW2 (pin trace)	High side gate drive	High frequency noise, parasitic ringing, gate drive integrity	HIDRV1 and HIDRV2 supplies the gate drive current to turn on the high side FETs. The return of HIDRV1 and HIDRV2 are SW1 and SW2, respectively. Route HIDRV1/SW1 and HIDRV2/SW2 pair next to each other to reduce gate drive parasitic inductance. Minimize gate drive length and aim for at least 20-mil gate drive trace width.

**Table 9-1. PCB Layout Guidelines (continued)**

COMPONENTS	FUNCTION	IMPACT	GUIDELINES
Current limit resistors, FSW_SYNC resistor	IC programmable settings	Regulation accuracy, switching integrity	Pin voltage determines the settings for input current limit, output current limit and switching frequency. Ground noise on these could lead to inaccuracy. Minimize ground return from these resistors to the IC ground pin.
Input (ACP, ACN) and output (SRP, SRN) current sense	Current regulation	Regulation accuracy	Use Kelvin-sensing technique for input and output current sense resistors. Connect the current sense traces to the center of the pads, and run current sense traces as differential pairs, away from switching nodes.
Input (ACUV), and output (FB, VO_SNS) voltage sensing	Voltage sense and regulation	Regulation accuracy	ACUV divider sets internal input voltage regulation in forward mode ( $V_{ACUV\_DPM}$ ). Route the top of the divider point to the target regulation location. VO_SNS sets the output voltage regulation in forward mode ( $V_{OUT\_REG\_ACC}$ ). Route directly to the target regulation location. Avoid routing close to high power switching nodes.
Bypass capacitors	Noise filter	Noise immunity	Place lowest value capacitors closest to the IC.

## 9.2 Layout Example

Based on the above layout guidelines, the buck-boost PCB layout example top view is shown below including all the key power components.

**Figure 9-1. PCB Layout Reference Example Top View**

For both input and output current sensing resistors, differential sensing and routing method are suggested and highlighted in figure below. Use wide trace for gate drive traces, minimum 20-mil trace width. Connect all analog grounds to a dedicated low-impedance copper plane, which is tied to the power ground underneath the IC exposed pad.

Figure 9-2. PCB Layout Gate Drive and Current Sensing Signal Layer Routing

## 10 Device and Documentation Support

### 10.1 Device Support

#### 10.1.1 Third-Party Products Disclaimer

TI'S PUBLICATION OF INFORMATION REGARDING THIRD-PARTY PRODUCTS OR SERVICES DOES NOT CONSTITUTE AN ENDORSEMENT REGARDING THE SUITABILITY OF SUCH PRODUCTS OR SERVICES OR A WARRANTY, REPRESENTATION OR ENDORSEMENT OF SUCH PRODUCTS OR SERVICES, EITHER ALONE OR IN COMBINATION WITH ANY TI PRODUCT OR SERVICE.

#### 10.2 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on [ti.com](https://www.ti.com). Click on *Notifications* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

#### 10.3 Support Resources

[TI E2E™ support forums](#) are an engineer's go-to source for fast, verified answers and design help — straight from the experts. Search existing answers or ask your own question to get the quick design help you need.

Linked content is provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

#### 10.4 Trademarks

TI E2E™ is a trademark of Texas Instruments.  
All trademarks are the property of their respective owners.

#### 10.5 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

#### 10.6 Glossary

[TI Glossary](#) This glossary lists and explains terms, acronyms, and definitions.

## 11 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

Changes from Revision A (July 2023) to Revision B (March 2024)	Page
• Changed from Private to Public release.....	1

Changes from Revision * (December 2022) to Revision A (July 2023)	Page
• Added Bidirectional/Reverse mode throughout the data sheet.....	1
• Added Buck-only mode throughout the data sheet.....	1
• Updated CIN/COUT requirement.....	6
• Improve 5V regulation accuracy.....	8
• Added KIOUT factor.....	8
• Updated VACUV_DPM limits.....	8
• Added Reverse Mode Regulation parameters to EC table.....	8
• Added IBYPASS_OCP.....	8
• Updated VREGN limits.....	8
• Increased IAC_LOAD and IBAT_LOAD values.....	8
• Updated t <sub>OVLD</sub> typical value.....	12
• Added <a href="#">Section 6.3.5</a> .....	22
• Added <a href="#">Section 6.3.8.1.3</a> .....	26
• Added <a href="#">Section 6.3.8.1.4</a> .....	26
• Added Reverse mode registers to <a href="#">Section 6.5</a> .....	30

## 12 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

**PACKAGING INFORMATION**

Orderable part number	Status (1)	Material type (2)	Package   Pins	Package qty   Carrier	RoHS (3)	Lead finish/ Ball material (4)	MSL rating/ Peak reflow (5)	Op temp (°C)	Part marking (6)
<a href="#">BQ25758RRVR</a>	Active	Production	VQFN (RRV)   36	3000   LARGE T&R	Yes	NIPDAU	Level-1-260C-UNLIM	-40 to 85	BQ25758

<sup>(1)</sup> **Status:** For more details on status, see our [product life cycle](#).

<sup>(2)</sup> **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

<sup>(3)</sup> **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

<sup>(4)</sup> **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

<sup>(5)</sup> **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

<sup>(6)</sup> **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "-" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

**TAPE AND REEL INFORMATION**

**QUADRANT ASSIGNMENTS FOR PIN 1 ORIENTATION IN TAPE**

\*All dimensions are nominal

Device	Package Type	Package Drawing	Pins	SPQ	Reel Diameter (mm)	Reel Width W1 (mm)	A0 (mm)	B0 (mm)	K0 (mm)	P1 (mm)	W (mm)	Pin1 Quadrant
BQ25758RRVR	VQFN	RRV	36	3000	330.0	12.4	5.3	6.3	1.15	8.0	12.0	Q1

**TAPE AND REEL BOX DIMENSIONS**

\*All dimensions are nominal

Device	Package Type	Package Drawing	Pins	SPQ	Length (mm)	Width (mm)	Height (mm)
BQ25758RRVR	VQFN	RRV	36	3000	367.0	367.0	35.0

## GENERIC PACKAGE VIEW

**RRV 36**

**VQFN - 1 mm max height**

5 x 6, 0.5 mm pitch

PLASTIC QUAD FLATPACK - NO LEAD

This image is a representation of the package family, actual package may vary.  
Refer to the product data sheet for package details.

4229484/A

NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. The package thermal pad must be soldered to the printed circuit board for optimal thermal and mechanical performance.

# EXAMPLE BOARD LAYOUT

## VQFN - 1 mm max height

RRV0036A

PLASTIC QUAD FLATPACK-NO LEAD

NOTES: (continued)

4. This package is designed to be soldered to a thermal pad on the board. For more information, see Texas Instruments literature number SLUA271 ([www.ti.com/lit/sluea271](http://www.ti.com/lit/sluea271)).
5. Vias are optional depending on application, refer to device data sheet. If any vias are implemented, refer to their locations shown on this view. It is recommended that vias under paste be filled, plugged or tented.

# EXAMPLE STENCIL DESIGN

VQFN - 1 mm max height

RRV0036A

PLASTIC QUAD FLATPACK-NO LEAD

NOTES: (continued)

6. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.

## IMPORTANT NOTICE AND DISCLAIMER

TI PROVIDES TECHNICAL AND RELIABILITY DATA (INCLUDING DATA SHEETS), DESIGN RESOURCES (INCLUDING REFERENCE DESIGNS), APPLICATION OR OTHER DESIGN ADVICE, WEB TOOLS, SAFETY INFORMATION, AND OTHER RESOURCES "AS IS" AND WITH ALL FAULTS, AND DISCLAIMS ALL WARRANTIES, EXPRESS AND IMPLIED, INCLUDING WITHOUT LIMITATION ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE OR NON-INFRINGEMENT OF THIRD PARTY INTELLECTUAL PROPERTY RIGHTS.

These resources are intended for skilled developers designing with TI products. You are solely responsible for (1) selecting the appropriate TI products for your application, (2) designing, validating and testing your application, and (3) ensuring your application meets applicable standards, and any other safety, security, regulatory or other requirements.

These resources are subject to change without notice. TI grants you permission to use these resources only for development of an application that uses the TI products described in the resource. Other reproduction and display of these resources is prohibited. No license is granted to any other TI intellectual property right or to any third party intellectual property right. TI disclaims responsibility for, and you will fully indemnify TI and its representatives against, any claims, damages, costs, losses, and liabilities arising out of your use of these resources.

TI's products are provided subject to [TI's Terms of Sale](#) or other applicable terms available either on [ti.com](https://www.ti.com) or provided in conjunction with such TI products. TI's provision of these resources does not expand or otherwise alter TI's applicable warranties or warranty disclaimers for TI products.

TI objects to and rejects any additional or different terms you may have proposed.
