DRV8145-Q1 Automotive Half Bridge Driver with Integrated Current Sense and Diagnostics

1 Features

- AEC-Q100 qualified for automotive applications:
  - Temperature grade 1: –40°C to +125°C, T_A
- Functional Safety-Capable
  - Documentation available to aid functional safety system design
- 4.5-V to 35-V (40-V abs. max) operating range
- SPI(S) or HW(H) variant in VQFN-HR package: R_{ON_LS} + R_{ON_HS}: 16mΩ
- SPI(P) variant in HTSSOP package: R_{ON_LS} + R_{ON_HS}: 19mΩ
- I_{OUT} Max = 46A
- PWM frequency operation up to 125KHz with automatic dead time assertion
- Configurable slew rate and spread spectrum clocking for low electromagnetic interference (EMI)
- Integrated current sense (eliminates shunt resistor)
- Proportional load current output on IPROPI pin
- Configurable current regulation
- Protection and diagnostic features with configurable fault reaction (latched or retry)
  - Load diagnostics in both the off-state and on-state to detect open load and short circuit
  - Voltage monitoring on supply (VM) and charge pump (VCP)
  - Over current protection
  - Over temperature protection
  - Fault indication on nFAULT pin
- Supports 3.3V, 5V logic inputs
- Low sleep current - 1µA typical at 25°C
- Device family comparison table

2 Applications

- Automotive brushed DC motors, Solenoids
- Door modules , wiper modules , trunk and seat modules
- Body control module (BCM)
- Fuel, water, oil pumps
- On board charger

3 Description

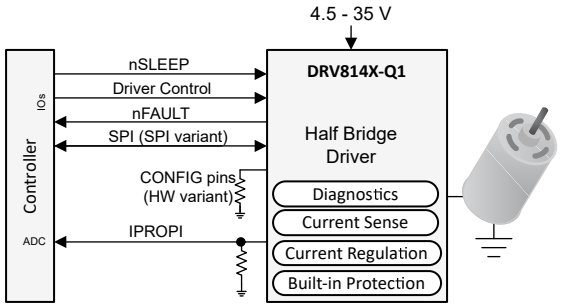
The DRV814x-Q1 family of devices is a fully integrated half-bridge driver intended for a wide range of automotive applications. Designed in a BiCMOS high power process technology node, this monolithic family of devices in a power package offer excellent power handling and thermal capability while providing compact package size, ease of layout, EMI control, accurate current sense, robustness, and diagnostic capability. This family provides an identical pin function with scalable R_{ON} (current capability) to support different loads.

The devices integrate a N-channel half-bridge, charge pump regulator, high-side current sensing with regulation, current proportional output, and protection circuitry. A low-power sleep mode is provided to achieve low quiescent current. The devices offer voltage monitoring and load diagnostics as well as protection features against over current and over temperature. Fault conditions are indicated on nFAULT pin. DRV8143 and DRV8145 are available in three variants - hardwired interface: HW (H) and two SPI interface variants: SPI(P) and SPI(S), with SPI (P) for externally supplied logic supply and SPI (S) for internally generated logic supply. DRV8144 is available only in two variants: SPI(S) and HW(H). The SPI interface variants offer more flexibility in device configuration and fault observability.

Device Information(1)

PART NUMBER	PACKAGE	BODY SIZE (nominal)
DRV8145-Q1	VQFN-HR (16)	3.5mm X 5.5mm
DRV8145-Q1	HTSSOP (28)	4.4mm X 9.7mm

(1) For all available packages, see the orderable addendum at the end of the data sheet



Simplified Schematic

Table of Contents

4 Device Comparison

Table 4-1 summarizes the R_{ON} and package differences between devices in the DRV814x-Q1 family.

Table 4-1. Device Comparison

PART NUMBER(1)	(LS + HS) R_{ON}	I_{OUT} MAX	PACKAGE	BODY SIZE (nominal)	Variants
DRV8143-Q1	42mΩ	20A	VQFN-HR (14)	3mm X 4.5mm	HW (H), SPI (S)
DRV8143-Q1	49mΩ	20A	HVSSOP (28)	3mm X 7.3mm	HW (H), SPI (P)
DRV8144-Q1	23.6mΩ	30A	VQFN-HR (16)	3mm X 6mm	HW (H), SPI (S)
DRV8145-Q1	16mΩ	46A	VQFN-HR (16)	3.5mm X 5.5mm	HW (H), SPI (S)
DRV8145-Q1	19mΩ	46A	HTSSOP (28)	4.4mm X 9.7mm	SPI (P)

(1) This is the product datasheet for the DRV8145-Q1. Please reference other device variant data sheets for additional information.

Table 4-2 summarizes the feature differences between the SPI and HW interface variants in the DRV814x-Q1 family. In general, the SPI variant offers more configurability, bridge control options, diagnostic feedback, redundant driver shutoff, improved Pin FMEA, and additional features.

In addition, the SPI variant has two options - **SPI (S) variant and SPI (P) variant**. The SPI (P) variant supports an external, low voltage 5V supply to the device through the VDD pin for the device logic, whereas in the SPI (S) variant, this supply is internally derived from the VM pin. With this external logic supply, the SPI (P) variant avoids device brown out (reset of device) during VM under voltage transients.

Note

DRV8144-Q1 is NOT available in SPI(P) variant.

Table 4-2. SPI Variant vs HW Variant Comparison

FUNCTION	HW (H) Variant	SPI (S) Variant	SPI (P) Variant
Bridge control	Pin only	Individual pin **"and/or"** register bit with pin status indication (Refer Register Pin control)	
Sleep function	Available through nSLEEP pin		Not available
External logic supply to the device	Not supported	Not supported	Supported through VDD pin
Clear fault command	Reset pulse on nSLEEP pin	SPI CLR_FAULT command	
Slew rate	6 levels	8 levels	
Over current protection (OCP)	Fixed at the highest setting	3 choices for thresholds, 4 choices for filter time	
ITRIP regulation	5 levels with disable & fixed TOFF time	7 levels with disable & indication, with programmable TOFF time	
Individual fault reaction configuration between retry or latched behavior	Not supported, either all latched or all retry	Supported	
Detailed fault logging and device status feedback	Not supported, nFAULT pin monitoring necessary	Supported, nFAULT pin monitoring optional	
VM over voltage	Fixed	4 threshold choices	
On-state (Active) diagnostics	Not supported	Supported for high-side loads	
Spread spectrum clocking (SSC)	Not supported	Supported	

Table 4-3. Differentiating between devices in the family

Device	Package Symbolization	DEVICE_ID Register
DRV8143H-Q1	8143H	Not applicable
DRV8144H-Q1	8144H	Not applicable
DRV8145H-Q1	8145H	Not applicable
DRV8143S-Q1	8143S	0 x BA
DRV8144S-Q1	8144S	0 x CA

Table 4-3. Differentiating between devices in the family (continued)

Device	Package Symbolization	DEVICE_ID Register
DRV8145S-Q1	8145S	0 x DA
DRV8143P-Q1	8143P	0 x BE
DRV8145P-Q1	8145P	0 x DE

5 Pin Configuration and Functions

5.1 HW Variant

5.1.1 VQFN-HR(16) package

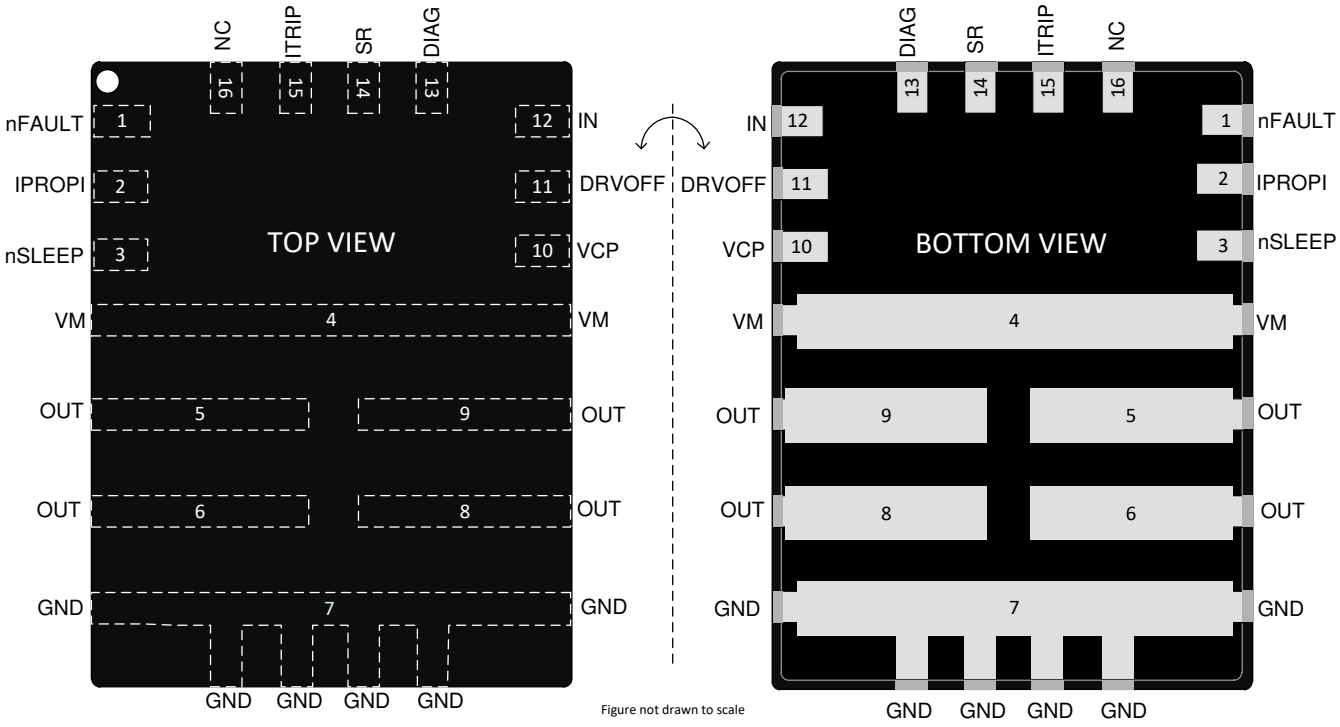


Figure 5-1. DRV8145H-Q1 HW variant in VQFN-HR(16) package

Table 5-1. Pin Functions

PIN		TYPE (1)	DESCRIPTION
NO.	NAME		
1	nFAULT	OD	Fault indication to the controller. For details, refer to nFAULT in the Device Configuration section.
2	IPROPI	I/O	Driver load current analog feedback. For details, refer to IPROPI in the Device Configuration section.
3	nSLEEP	I	Controller input pin for SLEEP. For details, see the Bridge Control section.
4	VM	P	Power supply. This pin is the motor supply voltage. Bypass this pin to GND with a 0.1-µF ceramic capacitor and a bulk capacitor.
5, 6, 8, 9	OUT	P	Half-bridge output. Connect this pin to the motor or load. Must combine with the other OUT pins (4 total) to support device current capability.
7	GND	G	Ground pin
10	VCP	P	Charge Pump pin for storage cap. Connect a 6.3V, 1µF capacitor to VM supply.
11	DRVOFF	I	Controller input pin for bridge Hi-Z. For details, see the Bridge Control section.
12	IN	I	Controller input pin for bridge operation. For details, see the Bridge Control section.
13	DIAG	I	Device configuration pin for load type indication. For details, refer to DIAG in the Device Configuration section
14	SR	I	Device configuration pin for Slew Rate control . For details, refer to Slew Rate in the Device Configuration section.
15	ITRIP	I	Device configuration pin for ITRIP level for high-side current limiting . For details, refer to ITRIP in the Device Configuration section.

Table 5-1. Pin Functions (continued)

PIN		TYPE (1)	DESCRIPTION
NO.	NAME		
16	NC	I	No connect

(1) I = input, O = output, I/O = input/output, G = ground, P = power, OD = open-drain output, PP = push-pull output

5.2 SPI Variant

5.2.1 HTSSOP (28) package

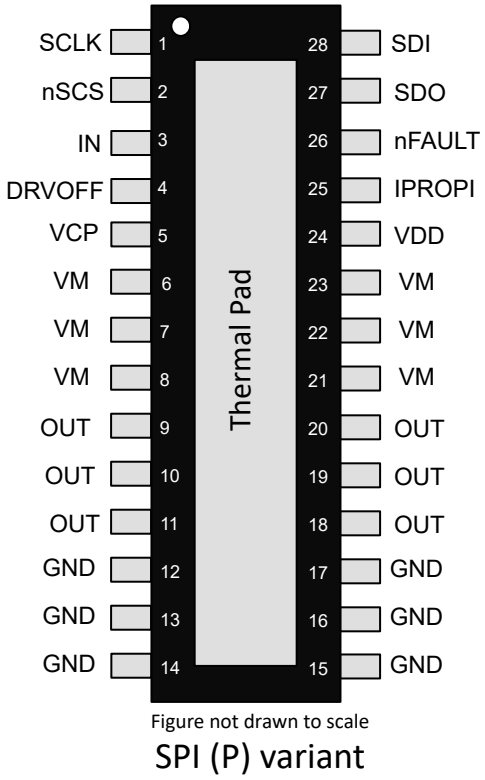

Figure 5-2. DRV8145P-Q1 SPI(P) variant in HTSSOP (28) package

Table 5-2. Pin Functions

PIN		TYPE(1)	DESCRIPTION
NO.	NAME		
1	SCLK	I	SPI - Serial Clock input.
2	nSCS	I	SPI - Chip Select. An active low on this pin enables the serial interface communication.
3	IN	I	Controller input pin for bridge operation. For details, see the Bridge Control section.
4	DRVOFF	I	Controller input pin for bridge Hi-Z. For details, see the Bridge Control section.
5	VCP	P	Charge Pump pin for storage cap. Connect a 6.3V, 1µF capacitor to VM supply.
6, 7, 8, 21, 22, 23	VM	P	Power supply. This pin is the motor supply voltage. Must combine with the rest of VM pins (6 total) to support device current capability. Bypass this pin to GND with a 0.1-µF ceramic capacitor and a bulk capacitor.
9, 10, 11, 18, 19, 20	OUT	P	Half-bridge output. Connect this pin to the motor or load. Must combine with the rest of OUT pins (6 total) to support device current capability.
12, 13, 14, 15, 16, 17	GND	G	Ground pin. Must combine with the rest of GND pins (6 total) to support device current capability.
24	VDD	P	Logic power supply to the device.

Table 5-2. Pin Functions (continued)

PIN		TYPE(1)	DESCRIPTION
NO.	NAME		
25	IPROPI	I/O	Driver load current analog feedback. For details, refer to IPROPI in the Device Configuration section.
26	nFAULT	OD	Fault indication to the controller. For details, refer to nFAULT in the Device Configuration section.
27	SDO	PP	SPI - Serial Data Output. Data is updated at the rising edge of SCLK.
28	SDI	I	SPI - Serial Data Input. Data is captured at the falling edge of SCLK.

(1) I = input, O = output, I/O = input/output, G = ground, P = power, OD = open-drain output, PP = push-pull output

5.2.2 VQFN-HR(16) package

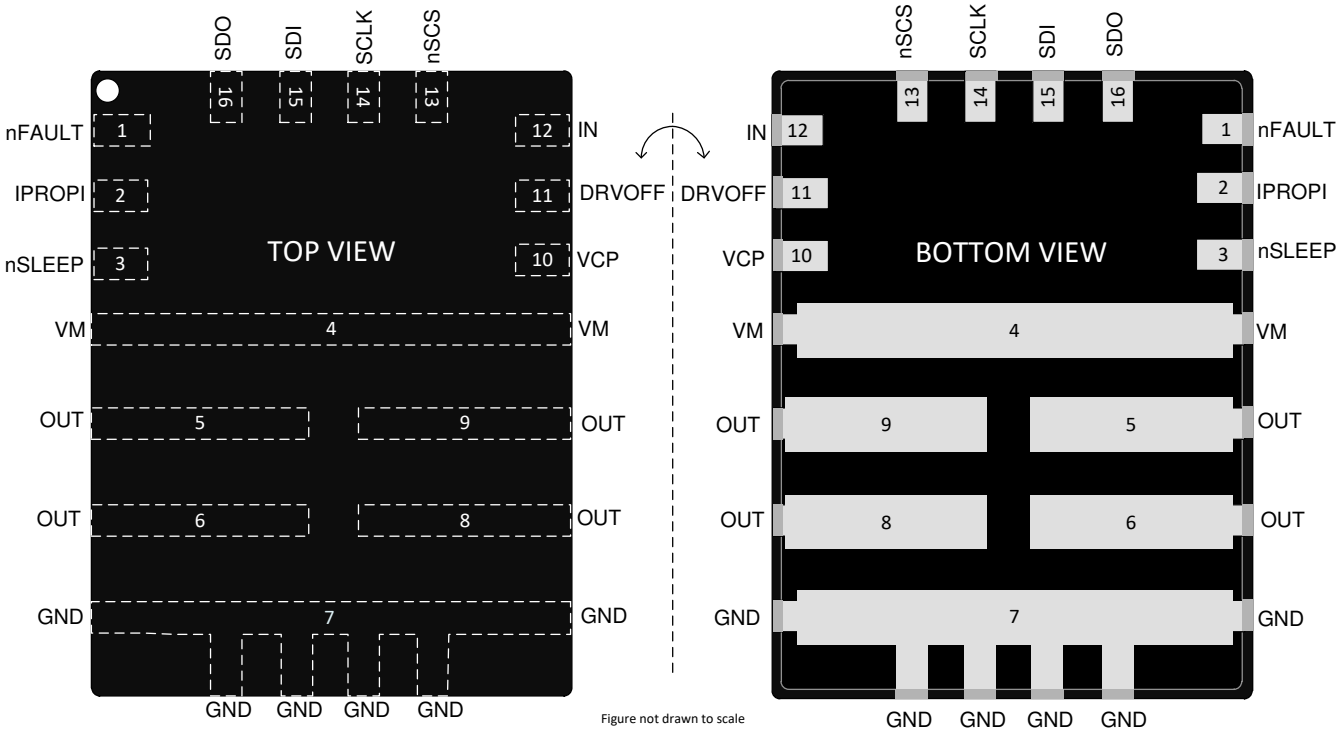

Figure 5-3. DRV8145S-Q1 SPI(S) variant in VQFN-HR(16) package

Table 5-3. Pin Functions

PIN		TYPE (1)	DESCRIPTION
NO.	NAME		
1	nFAULT	OD	Fault indication to the controller. For details, refer to nFAULT in the Device Configuration section.
2	IPROPI	I/O	Driver load current analog feedback. For details, refer to IPROPI in the Device Configuration section.
3	nSLEEP	I	Controller input pin for SLEEP. For details, see the Bridge Control section. Also VIO logic level for SDO.
4	VM	P	Power supply. This pin is the motor supply voltage. Bypass this pin to GND with a 0.1-µF ceramic capacitor and a bulk capacitor.
5, 6, 8, 9	OUT	P	Half-bridge output. Connect this pin to the motor or load. Must combine with the other OUT pins (4 total) to support device current capability.
7	GND	G	Ground pin
10	VCP	P	Charge Pump pin for storage cap. Connect a 6.3V, 1µF capacitor to VM supply.
11	DRVOFF	I	Controller input pin for bridge Hi-Z. For details, see the Bridge Control section.

Table 5-3. Pin Functions (continued)

PIN		TYPE (1)	DESCRIPTION
NO.	NAME		
12	IN	I	Controller input pin for bridge operation. For details, see the Bridge Control section.
13	nSCS	I	SPI - Chip Select. An active low on this pin enables the serial interface communication.
14	SCLK	I	SPI - Serial Clock input.
15	SDI	I	SPI - Serial Data Input. Data is captured at the falling edge of SCLK.
16	SDO	PP	SPI - Serial Data Output. Data is updated at the rising edge of SCLK.

(1) I = input, O = output, I/O = input/output, G = ground, P = power, OD = open-drain output, PP = push-pull output

6 Specifications

6.1 Absolute Maximum Ratings

Over operating temperature range (unless otherwise noted)(1)

		MIN	MAX	UNIT
Power supply pin voltage	VM	–0.3(3)	40	V
Power supply transient voltage ramp	VM		2	V/µs
Charge pump pin voltage	VCP	V_{VM} – 0.3	V_{VM} + 7	V
Output pin voltage	OUT	-0.9	V_{VM} + 0.9	V
Output pin current	OUT	Internally limited(2)		A
Driver disable pin voltage	DRVOFF	–0.3	40	V
Logic I/O voltage	IN, nFAULT	–0.3	5.75	V
HW variant - Configuration pins voltage	ITRIP, SR, DIAG	–0.3	5.75	V
Analog feedback pin voltage	IPROPI	–0.3	5.75	V
Sleep pin voltage (Not applicable for SPI (P) variant)	nSLEEP	–0.3	40	V
SPI I/O voltage - SPI variant	SDI, SDO, nSCS, SCLK	–0.3	5.75	V
SPI (P) variant - Logic supply	VDD	-0.3	5.75	V
SPI (P) variant - Logic supply transient voltage ramp	VDD		5	V/µs
Ambient temperature, T_A		–40	125	°C
Junction temperature, T_J		–40	150	°C
Storage temperature, T_{stg}		–65	150	°C

(1) Stresses beyond those listed under *Absolute Maximum Rating* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
(2) Limited by the over current and over temperature protection functions of the device
(3) With external component support, short duration violation of this limit can be tolerated during ISO 7637 transient pulse testing

6.2 ESD Ratings

				VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human body model (HBM), per AEC Q100-002(1) HBM ESD Classification Level 2	VM, OUT, GND	±4000	V
			All other pins	±2000	
		Charged device model (CDM), per AEC Q100-011 CDM ESD Classification Level C4B	Corner pins	±750	
			Other pins	±500	

(1) AEC Q100-002 indicates that HBM stressing shall be in accordance with the ANSI/ESDA/JEDEC JS-001 specification.

6.3 Recommended Operating Conditions

over operating temperature range (unless otherwise noted)

			MIN	MAX	UNIT
V_{VM}	Power supply voltage	VM	4.5	35(1)	V
V_{VDD}	SPI (P) variant - Logic supply voltage	VDD	4.5	5.5	V
V_{VCP}	Charge pump pin voltage	VCP	V_{VM}	V_{VM}+5.5	V
V_{LOGIC}	Logic pin voltage	IN, nSLEEP, DRVOFF, nFAULT	0	5.5	V
f_{PWM}	PWM frequency	IN	0	125	KHz
V_{CONFIG}	HW variant - Configuration pin voltage	ITRIP, SR, DIAG	0	5.5	V
V_{IPROPI}	Analog feedback voltage	IPROPI	0	5.5	V
V_{SPI_IOS}	SPI (S) variant - SPI pin voltage	SDI, SDO, nSCS, SCLK	0	V_{nSLEEP} + 0.5	V
	SPI (P) variant - SPI pin voltage	SDI, SDO, nSCS, SCLK	0	V_{VDD} + 0.5	V
T_A	Operating ambient temperature		–40	125	°C
T_J	Operating junction temperature		–40	150	°C

(1) The over current protection function does not support short on OUT to VM or GND above 28 V for short inductance < 1 µH.

6.4 Thermal Information

Refer Transient thermal impedance table for application related use case.

THERMAL METRIC(1)		HTSSOP package	VQFN-HR package	UNIT
$R_{\theta JA}$	Junction-to-ambient thermal resistance	27.7	41.3	°C/W
$R_{\theta JC(top)}$	Junction-to-case(top) thermal resistance	13.8	14.4	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	7.1	5.5	°C/W
Ψ_{JT}	Junction-to-top characterization parameter	0.6	0.3	°C/W
Ψ_{JB}	Junction-to-board characterization parameter	7.1	5.4	°C/W
$R_{\theta JC(bot)}$	Junction-to-case(bottom) thermal resistance	0.9	N/A	°C/W

(1) For more information about traditional and new thermal metrics, see the Semiconductor and IC Package Thermal Metrics application report.

6.5 Electrical Characteristics

4.5 V (falling) ≤ V_{VM} ≤ 35 V, -40°C ≤ T_J ≤ 150°C (unless otherwise noted)
For SPI (P) variant only: 4.5 V ≤ V_{VDD} ≤ 5.5 V (unless otherwise noted)

6.5.1 Power Supply & Initialization

Refer wake up transient waveforms

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
V_{VM_REV}	Supply pin voltage during reverse current	I_{VM} = - 5A, device in unpowered state		1.4		V
I_{VMQ}	VM current in SLEEP state	V_{VM} = 13.5V, V_{nSLEEP} = 0V or V_{VDD} < POR_{VDD_FALL}, T_A = 25°C		1		µA
		V_{VM} = 13.5V, V_{nSLEEP} = 0V or V_{VDD} < POR_{VDD_FALL}, T_A = 125°C			13	µA
I_{VMS}	VM current in STANDBY state	V_{VM} = 13.5V		3	5	mA
I_{VDD}	VDD current in ACTIVE state	SPI (P) variant			10	mA
t_{RESET}	RESET pulse filter time	Reset signal on nSLEEP pin for HW (H) variant	5		20	µs
t_{SLEEP}	SLEEP command filter time	Sleep signal on nSLEEP pin for HW (H) variant	40		120	µs

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
t_{SLEEP_SPI}	SLEEP command filter time	Sleep signal on nSLEEP pin for SPI (S) variant	5		20	µs
t_{WAKEUP}	Wake-up command filter time	Wake-up signal on nSLEEP pin for HW (H) and SPI (S) variants		10		µs
t_{COM}	Time for communication to be available after wake-up or power-up through VM or VDD supply pin	Wake-up signal on nSLEEP pin or power cycle - V_{VM} > VM_{POR_RISE} or V_{VDD} > VDD_{POR_RISE}			400	µs
t_{READY}	Time for driver ready to be driven after wake-up through nSLEEP pin or power-up through VM or VDD supply pin	Wake-up signal on nSLEEP pin or power cycle - V_{VM} > VM_{POR_RISE} or V_{VDD} > VDD_{POR_RISE}, 1 µF cap on VCP pin			3.5	ms
V_{VCP}	Charge pump regulator voltage	V_{VM} > 7 V		V_{VM}+5		V
f_{VCP}	Average Charge pump switching frequency			20		MHz

6.5.2 Logic I/Os

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
V_{IL_nSLEEP}	Input logic low voltage	nSLEEP pin			0.65	V
V_{IH_nSLEEP}	Input logic high voltage	nSLEEP pin	1.55			V
V_{IHYS_nSLEEP}	Input hysteresis	nSLEEP pin		200		mV
V_{IL}	Input logic low voltage	DRVOFF, IN pins			0.7	V
V_{IH}	Input logic high voltage	DRVOFF, IN pins	1.5			V
V_{IHYS}	Input hysteresis	DRVOFF, IN pins		100		mV
R_{PD_nSLEEP}	Internal pull-down resistance on nSLEEP to GND	Measured at min VIL level	100		400	KΩ
R_{PU}	Internal pull-up resistance to VDD (reverse current blocked) on DRVOFF	Measured at min VIH level	200		550	KΩ
R_{PD}	Internal pull-down resistance to GND on IN	Measured at max VIL level	200		500	KΩ
I_{nFAULT_PD}	Sink current to GND on nFAULT pin when asserted low	V_{nFAULT} = 0.3 V	5			mA

6.5.3 SPI I/Os

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
R_{PU_nSCS}	Internal pull-up resistance to VDD (reverse current blocked) on nSCS	Measured at min VIH level	200		500	KΩ
R_{PD_SPI}	Internal pull-down resistance to GND on SDI, SCLK	Measured at max VIL level	150		500	KΩ
V_{IL}	Input logic low voltage	SDI, SCLK, nSCS pins			0.7	V
V_{IH}	Input logic high voltage	SDI, SCLK, nSCS pins	1.5			V
V_{IHYS}	Input hysteresis	SDI, SCLK, nSCS pins		100		mV
V_{OL_SDO}	Output logic low voltage	0.5 mA sink into SDO			0.4	V
V_{OH_SDO}	Output logic high voltage for SPI (S) variant	0.5 mA source from SDO, V_{nSLEEP} = 5 V, V_{VM} > 7 V	4.1			V
		0.5 mA source from SDO, V_{nSLEEP} = 3.3 V, V_{VM} > 5 V	2.7			V
	Output logic high voltage for SPI (P) variant	0.5 mA source from SDO, V_{VDD} = 5 V	4.5			V

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
$V_{OH\_SDO\_NL}$	Output logic high voltage at no load on SDO, valid only for SPI (S) variant	No current from SDO, V_{nSLEEP} = 5 V, V_{VM} > 7 V			5.5	V
		No current from SDO, V_{nSLEEP} = 3.3 V, V_{VM} > 5 V			3.8	V

6.5.4 Configuration Pins - HW Variant Only

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
6 level setting for ITRIP, SR and DIAG						
$R_{LVL1OF6}$	Level 1 of 6	Connect to GND			10	Ω
$R_{LVL2OF6}$	Level 2 of 6	+/- 10% resistor to GND	7.4	8.2	9	KΩ
$R_{LVL3OF6}$	Level 3 of 6	+/- 10% resistor to GND	19.8	22	24.2	KΩ
$R_{LVL4OF6}$	Level 4 of 6	+/- 10% resistor to GND	42.3	47	51.7	KΩ
$R_{LVL5OF6}$	Level 5 of 6	+/- 10% resistor to GND	90	100	110	KΩ
$R_{LVL6OF6}$	Level 6 of 6	Hi-Z (no connect)	250			KΩ

6.5.5 Power FET Parameters

Measured at V_{VM} = 13.5 V

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
R_{HS_ON}	High-side FET on resistance, HTSSOP package	I_{OUT} = 18 A, T_J = 25°C		9.5		mΩ
		I_{OUT} = 18 A, T_J = 150°C			19	mΩ
	High-side FET on resistance, VQFN-HR package	I_{OUT} = 18 A, T_J = 25°C		8		mΩ
		I_{OUT} = 18 A, T_J = 150°C			15.2	mΩ
R_{LS_ON}	Low-side FET on resistance, HTSSOP package	I_{OUT} = 18 A, T_J = 25°C		9.5		mΩ
		I_{OUT} = 18 A, T_J = 150°C			19	mΩ
	Low-side FET on resistance, VQFN-HR package	I_{OUT} = 18 A, T_J = 25°C		8		mΩ
		I_{OUT} = 18 A, T_J = 150°C			15.2	mΩ
V_{SD}	Low-side & High-side FET source-drain voltage when body diode is forward biased	I_{OUT} = +/- 18 A (both directions)	0.4	0.9	1.5	V
R_{Hi-Z}	OUT resistance to GND in SLEEP or STANDBY state	V_{OUTx} = V_{VM} = 13.5 V	0.4		23	KΩ

6.5.6 Switching Parameters with High-Side Recirculation

Load = 1.5mH / 4.7 Ohm, V_{VM} = 13.5 V, refer high-side recirculation waveform

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
SR_{LSOFF}	Output voltage rise time, 10% - 90%	SR = 3'b000 or LVL2		1.5		V/µs
		SR = 3'b001 (SPI only)		4.7		V/µs
		SR = 3'b010 (SPI only)		9.6		V/µs
		SR = 3'b011 or LVL3		14.4		V/µs
		SR = 3'b100 or LVL4		20.6		V/µs
		SR = 3'b101 or LVL1		26.5		V/µs
		SR = 3'b110 or LVL6		37.9		V/µs
		SR = 3'b111 or LVL5		47.1		V/µs

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
t_{PD_LSOFF}	Propagation time during output voltage rise	SR = 3'b000 or LVL2		1.5		µs
		SR = 3'b001 (SPI only)		0.9		µs
		SR = 3'b010 (SPI only)		0.8		µs
		SR = 3'b011 or LVL3		0.7		µs
		SR = 3'b100 & 3'b101 or LVL4 & LVL1		0.6		µs
		SR = 3'b110 & 3'b111 or LVL6 & LVL5		0.5		µs
t_{DEAD_LSOFF}	Dead time during output voltage rise	All SRs		0.9		µs
SR_{LSON}	Output voltage fall time, 90% - 10%	SR = 3'b000 or LVL2		1.5		V/µs
		SR = 3'b001 (SPI only)		4.7		V/µs
		SR = 3'b010 (SPI only)		9.6		V/µs
		SR = 3'b011 or LVL3		14.4		V/µs
		SR = 3'b100 or LVL4		20.6		V/µs
		SR = 3'b101 or LVL1		26.5		V/µs
		SR = 3'b110 or LVL6		37.9		V/µs
		SR = 3'b111 or LVL5		47.1		V/µs
t_{PD_LSON}	Propagation time during output voltage fall	SR = 3'b000 or LVL2		1.7		µs
		SR = 3'b001 (SPI only)		0.9		µs
		SR = 3'b010 (SPI only)		0.7		µs
		SR = 3'b011 or LVL3		0.6		µs
		SR = 3'b100 or LVL4		0.4		µs
		SR = 3'b101 or LVL1		0.35		µs
		SR = 3'b110 & 3'b111 or LVL6 & LVL5		0.3		µs
t_{DEAD_LSON}	Dead time during output voltage fall	SR = 3'b000 or LVL2		2.7		µs
		SR = 3'b001 (SPI only)		1.2		µs
		SR = 3'b010 (SPI only)		0.9		µs
		SR = 3'b011 or LVL3		0.8		µs
		All other SRs		0.6		µs
$Match_{SRLS}$	Output voltage rise and fall slew rate matching	All SRs	-20		+20	%

6.5.7 Switching Parameters with Low-Side Recirculation

Load = 1.5 mH / 4.7 Ohm, V_{VM} = 13.5 V, refer low-side recirculation waveform

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
SR_{HSON}	Output voltage rise time, 10% - 90%	SR = 3'b000 or LVL2		1.7		V/µs
		SR = 3'b001 (SPI only)		4.4		V/µs
		SR = 3'b010 (SPI only)		6.1		V/µs
		SR = 3'b011 or LVL3		10.8		V/µs
		SR = 3'b100 or LVL4		17.2		V/µs
		SR = 3'b101 or LVL1		23.2		V/µs
		SR = 3'b110 or LVL6		34.1		V/µs
		SR = 3'b111 or LVL5		43.8		V/µs
t_{PD_HSON}	Propagation time during output voltage rise	SR = 3'b000 or LVL2		4.3		µs
		SR = 3'b001 (SPI only)		2.2		µs
		SR = 3'b010 (SPI only)		1.6		µs
		SR = 3'b011 or LVL3		1.3		µs
		All other SRs		1.1		µs
t_{DEAD_HSON}	Dead time during output voltage rise	SR = 3'b000 or LVL2		3.5		µs
		SR = 3'b001 (SPI only)		5.2		µs
		SR = 3'b010 (SPI only)		1		µs
		All other SRs		0.5		µs
SR_{HSOFF}	Output voltage fall time, 90% - 10%	SR = 3'b000 or LVL2		2		V/µs
		SR = 3'b001 (SPI only)		5.4		V/µs
		SR = 3'b010 (SPI only)		10.4		V/µs
		SR = 3'b011 or LVL3		15.1		V/µs
		SR = 3'b100 or LVL4		21.2		V/µs
		SR = 3'b101 or LVL1		27.1		V/µs
		SR = 3'b110 or LVL6		38.5		V/µs
		SR = 3'b111 or LVL5		48.5		V/µs
t_{PD_HSOFF}	Propagation time during output voltage fall	All SRs		0.3		µs
t_{DEAD_HSOFF}	Dead time during output voltage fall	All SRs		0.23		µs
t_{BLANK}	Current regulation blanking time after OUT slewing for current sense output to settle (Valid for only for LS recirculation)	SR = 3'b000 or LVL2		10.8		µs
		SR = 3'b001 or 3'b010 (SPI only)		3.6		µs
		All other SRs		2.7		µs

6.5.8 IPROPI & ITRIP Regulation

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
A_{IPROPI}	Current scaling factor, HTSSOP package			5980		A/A
	Current scaling factor, VQFN-HR package			6230		A/A
A_{I_ERR}	Current scaling factor	4 A < I_{OUT} < 21.8 A	-5		+5	%
		1 A < I_{OUT} ≤ 4 A	-20		+20	%
		0.4 A < I_{OUT} ≤ 1 A	-50		+50	%
$Offset_{IPROPI}$	Offset current on IPROPI at no load current	I_{OUT} = 0 A			15	µA
BW_{IPROPI}	Bandwidth of the IPROPI internal sense circuit	No external capacitor on IPROPI.	400			KHz
V_{IPROPI_LIM}	Internal clamping voltage on IPROPI		4.5		5.5	V
V_{ITRIP_LVL}	Voltage limit on V_{IPROPI} to trigger TOFF cycle for ITRIP regulation	ITRIP = 3'b001 or LVL2	1.06	1.18	1.3	V
		ITRIP = 3'b010 (SPI only)	1.27	1.41	1.55	V
		ITRIP = 3'b011 (SPI only)	1.49	1.65	1.82	V
		ITRIP = 3'b100 or LVL3	1.78	1.98	2.18	V
		ITRIP = 3'b101 or LVL4	2.08	2.31	2.54	V
		ITRIP = 3'b110 or LVL5	2.38	2.64	2.9	V
		ITRIP = 3'b111 or LVL6	2.67	2.97	3.27	V
t_{OFF}	ITRIP regulation - off time	TOFF = 2'b00 (SPI only)	16	20	25	µs
		TOFF = 2'b01 (SPI). Only choice for HW	24	30	36	µs
		TOFF = 2'b10 (SPI only)	33	40	48	µs
		TOFF = 2'b11 (SPI only)	41	50	61	µs

6.5.9 Over Current Protection (OCP)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
I_{OCP_HS}	Over current protection threshold on the high side	OCP_SEL = 2'b00 (SPI), Only choice for HW	64		128	A
		OCP_SEL = 2'b10 (SPI only)	48		98	A
		OCP_SEL = 2'b01 (SPI only)	32		68	A
I_{OCP_LS}	Over current protection threshold on the low side	OCP_SEL = 2'b00 (SPI), Only choice for HW	64		128	A
		OCP_SEL = 2'b10 (SPI only)	48		98	A
		OCP_SEL = 2'b01 (SPI only)	32		68	A
t_{OCP}	Over current protection deglitch time	TOCP_SEL = 2'b00 (SPI), Only choice for HW	4.5	6	7.3	µs
	Over current protection deglitch time	TOCP_SEL = 2'b01 (SPI only)	2.2	3	4.1	µs
	Over current protection deglitch time	TOCP_SEL = 2'b10 (SPI only)	1.1	1.5	2.3	µs
	Over current protection deglitch time	TOCP_SEL = 2'b11 (SPI only)	0.15	0.2	0.4	µs

6.5.10 Over Temperature Protection (TSD)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
T_{TSD}	Thermal shutdown temperature		155	170	185	°C
T_{HYS}	Thermal shutdown hysteresis			30		°C
t_{TSD}	Thermal shutdown deglitch time		10	12	19	µs

6.5.11 Voltage Monitoring

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
V_{VMOV}	VM over voltage threshold while rising	VMOV_SEL = 2'b00 (SPI), Only choice in HW variant	33.6		37	V
		VMOV_SEL = 2'b01 (SPI only)	28		31	V
		VMOV_SEL = 2'b10 (SPI only)	18		21	V
V_{VMOV_HYS}	VM over voltage hysteresis			0.6		V
t_{VMOV}	VM over voltage deglitch time		10	12	19	µs
V_{VMUV}	VM under voltage threshold while falling		4.2		4.5	V
V_{VMUV_HYS}	VM under voltage hysteresis			200		mV
t_{VMUV}	VM under voltage deglitch time		8	12	19	µs
VM_{POR_FALL}	VM voltage at which device goes into POR	Applicable for HW & SPI (S) variant			3.6	V
VM_{POR_RISE}	VM voltage at which device comes out of POR	Applicable for HW & SPI (S) variant			3.9	V
VDD_{POR_FALL}	VDD voltage at which device goes into POR	Applicable for SPI (P) variant			3.5	V
VDD_{POR_RISE}	VDD voltage at which device comes out of POR	Applicable for SPI (P) variant			3.8	V
V_{CPUV}	Charge pump under-voltage threshold while falling			V_{VM}+2.5		V
t_{CPUV}	Charge pump deglitch time		10	12	19	µs

6.5.12 Load Monitoring

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
Off-state diagnostics (OLP)						
R_{S_GND}	Resistance on OUT to GND that will be detected as short				1	KΩ
R_{S_VM}	Resistance on OUT to VM that will be detected as short				1	KΩ
R_{OPEN_LS}	Resistance on OUT to GND that will be detected as open	Valid for low-side load	2			KΩ
R_{OPEN_HS}	Resistance on OUT to VM that will be detected as open	Valid for high-side load, V_{VM} = 13.5 V	10			KΩ
V_{OLP_REFH}	OLP Comparator Reference High			2.65		V
V_{OLP_REFL}	OLP Comparator Reference Low			2		V
R_{OLP_PU}	Internal pull-up resistance on OUT to VDD during OLP	V_{OUTx} = V_{OLP_REFH} + 0.1V		1		KΩ
R_{OLP_PD}	Internal pull-down resistance on OUT to GND during OLP	V_{OUTx} = V_{OLP_REFL} - 0.1V		1		KΩ
SPI variant only - On-state diagnostics (OLA)						
I_{PD_OLA}	Internal sink current on OUT to GND during dead-time in high-side recirculation		0.36		25	mA
V_{OLA_REF}	Comparator Reference with respect to VM used for OLA			0.25		V

6.5.13 Fault Retry Setting

Refer to retry setting waveform

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
t_{RETRY}	Automatic driver retry time	Fault reaction set to RETRY	4.1	5	6.1	ms

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
t_{CLEAR}	Fault free operation time to auto-clear from over current event	Fault reaction set to RETRY	85		200	µs
t_{CLEAR_TSD}	Fault free operation time to auto-clear from over temperature event	Fault reaction set to RETRY	4.2		6.7	ms

6.5.14 Transient Thermal Impedance & Current Capability

Information based on thermal simulations

Table 6-1. Transient Thermal Impedance ($R_{\theta JA}$) and Current Capability - half-bridge

PART NUMBER	PACKAGE	$R_{\theta JA}$ [°C/W](1)				Current [A](2)					
		without PWM(3)								with PWM(4)	
		0.1 sec	1 sec	10 sec	DC	0.1 sec	1 sec	10 sec	DC	10 sec	DC
DRV8145-Q1	VQFN-HR	3.8	8.8	13.1	29.7	33.5	22.0	18.1	12.0	13.6	7.9
DRV8145-Q1	HTSSOP	2.6	6.5	11.5	28.3	36.3	22.9	17.2	11.0	13.6	7.6

(1) Based on thermal simulations using 40 mm x 40 mm x 1.6 mm 4 layer PCB – 2 oz Cu on top and bottom layers, 1 oz Cu on internal planes with 0.3 mm thermal via drill diameter, 0.025 mm Cu plating, 1 minimum mm via pitch.
(2) Estimated transient current capability at 85 °C ambient temperature for junction temperature rise up to 150°C
(3) Only conduction losses (I^2R) considered
(4) Switching loss roughly estimated by the following equation:

$$P_{SW} = V_{VM} \times I_{Load} \times f_{PWM} \times V_{VM}/SR, \text{ where } V_{VM} = 13.5\ V,\ f_{PWM} = 20\ KHz,\ SR = 23\ V/\mu s \quad (1)$$

6.6 SPI Timing Requirements

		MIN	TYP	MAX	UNIT
t_{SCLK}	SCLK minimum period(1)	100			ns
t_{SCLKH}	SCLK minimum high time	50			ns
t_{SCLKL}	SCLK minimum low time	50			ns
t_{HI_nSCS}	nSCS minimum high time	300			ns
t_{SU_nSCS}	nSCS input setup time	25			ns
t_{H_nSCS}	nSCS input hold time	25			ns
t_{SU_SDI}	SDI input data setup time	25			ns
t_{H_SDI}	SDI input data hold time	25			ns
t_{EN_SDO}	SDO enable delay time(1)			35	ns
t_{DIS_SDO}	SDO disable delay time(1)			100	ns

(1) SPI (S) variant: SDO delay times are valid only with SDO external load of 5 pF. With a 20 pF load on SDO, there is an additional delay on SDO, which results in a 25% increase in SCLK minimum time, limiting the SCLK to a maximum of 8 MHz. There is NO such limitation for the SPI (P) variant.

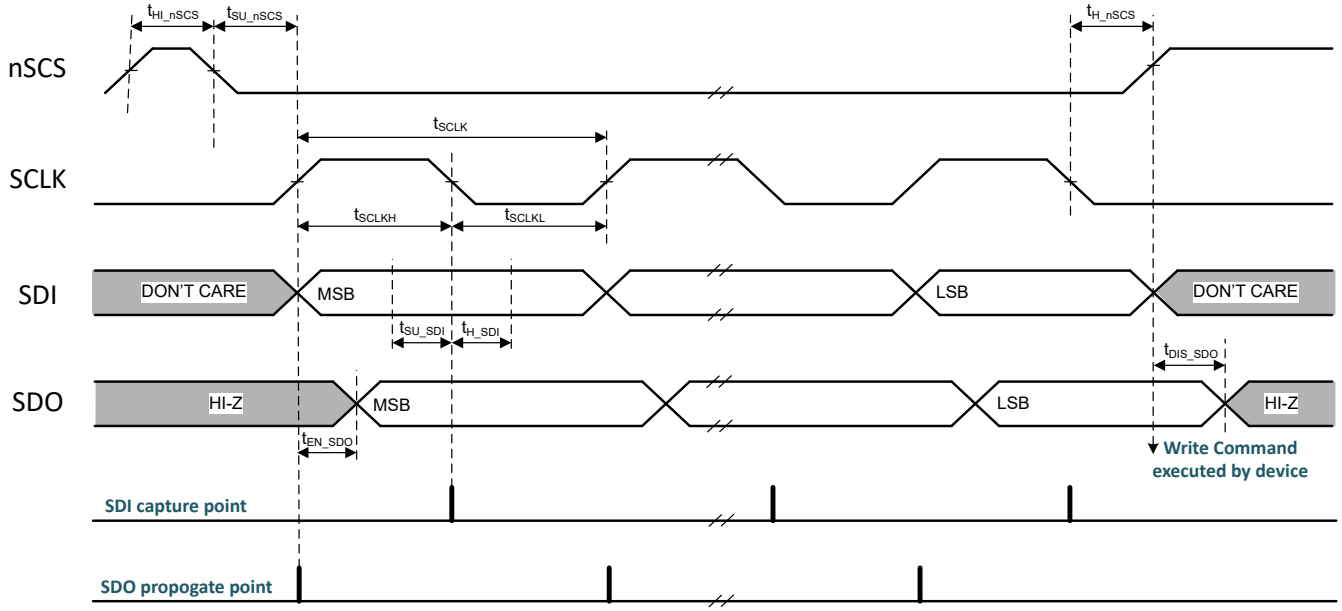

Figure 6-1. SPI Peripheral-Mode Timing Definition

6.7 Switching Waveforms

This section illustrates the switching transients for an inductive load due to external PWM or internal ITRIP regulation.

6.7.1.1 High-Side Recirculation

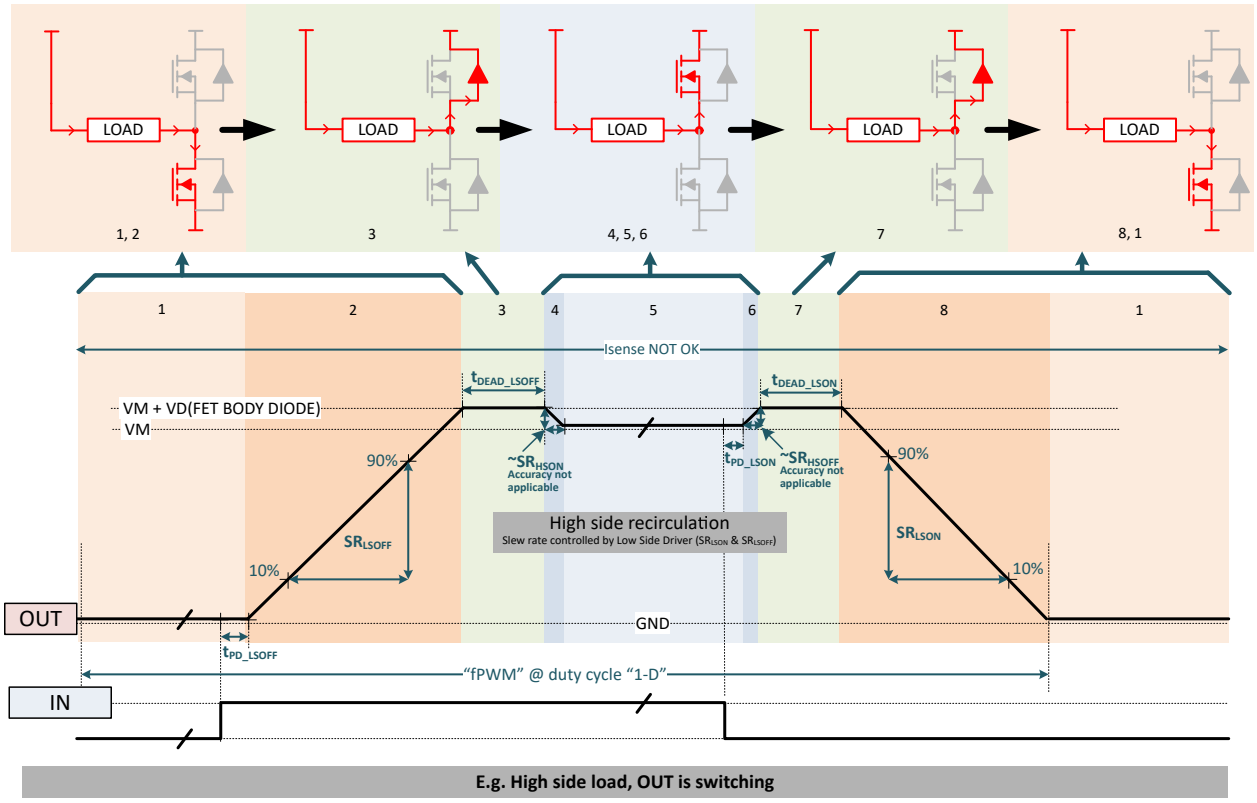

Figure 6-2. Output Switching Transients with High-Side Recirculation

6.7.1.2 Low-Side Recirculation

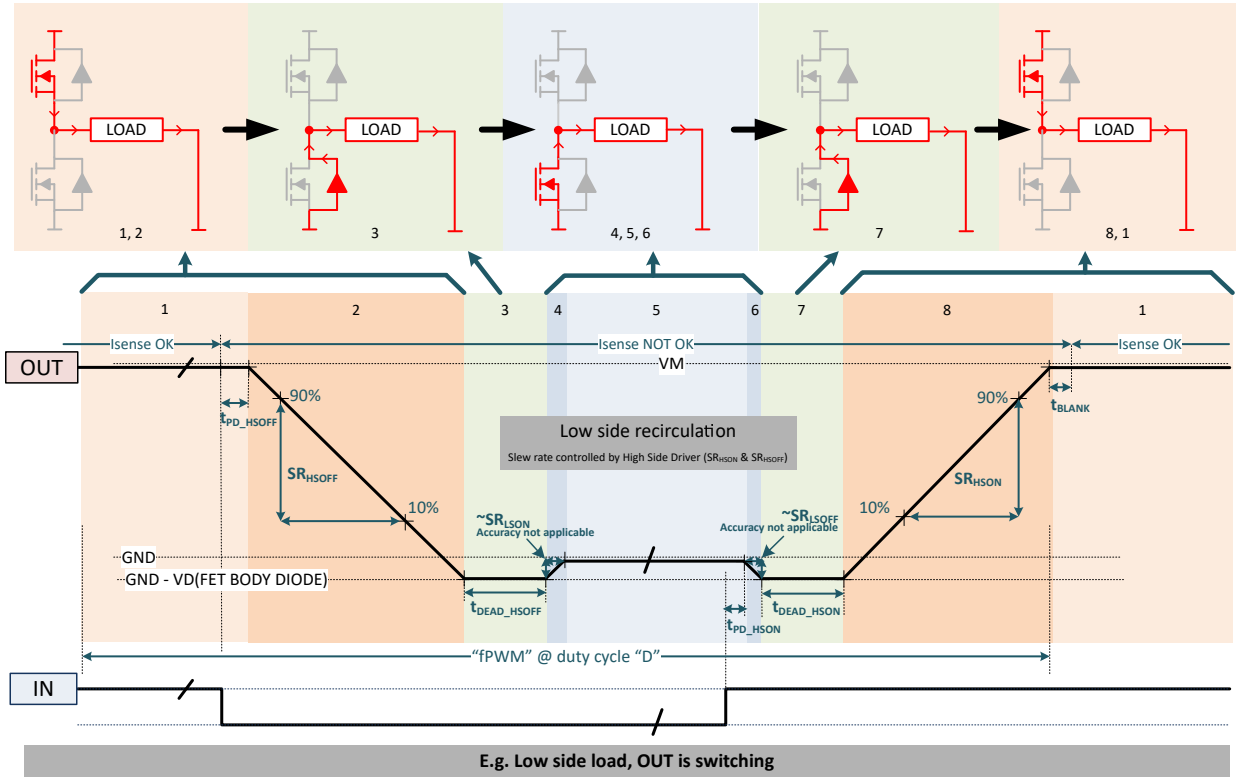

Figure 6-3. Output Switching Transients with Low-Side Recirculation

6.7.2 Wake-up Transients

6.7.2.1 HW Variant

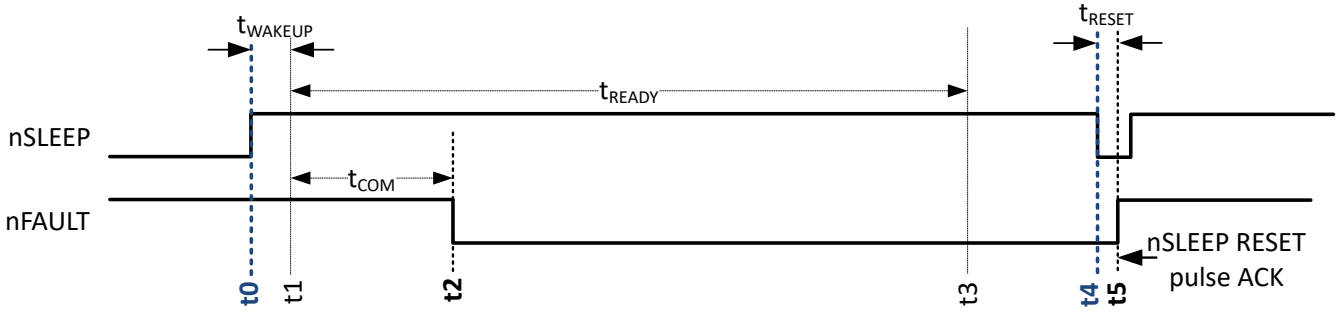

Figure 6-4. Wake-up from SLEEP State to STANDBY State Transition for HW Variant

Hand shake between controller and device during wake-up as follows:

- t0: Controller - nSLEEP asserted high to initiate device wake-up
- t1: Device internal state - Wake-up command registered by device (end of Sleep state)
- t2: Device – nFAULT asserted low to acknowledge wake-up and indicate device ready for communication
- t3: Device internal state - Initialization complete
- t4 (any time after t2): **Controller – Issue nSLEEP reset pulse** to acknowledge device wake-up
- t5: Device - nFAULT de-asserted as an acknowledgment of nSLEEP reset pulse. Device in STANDBY state

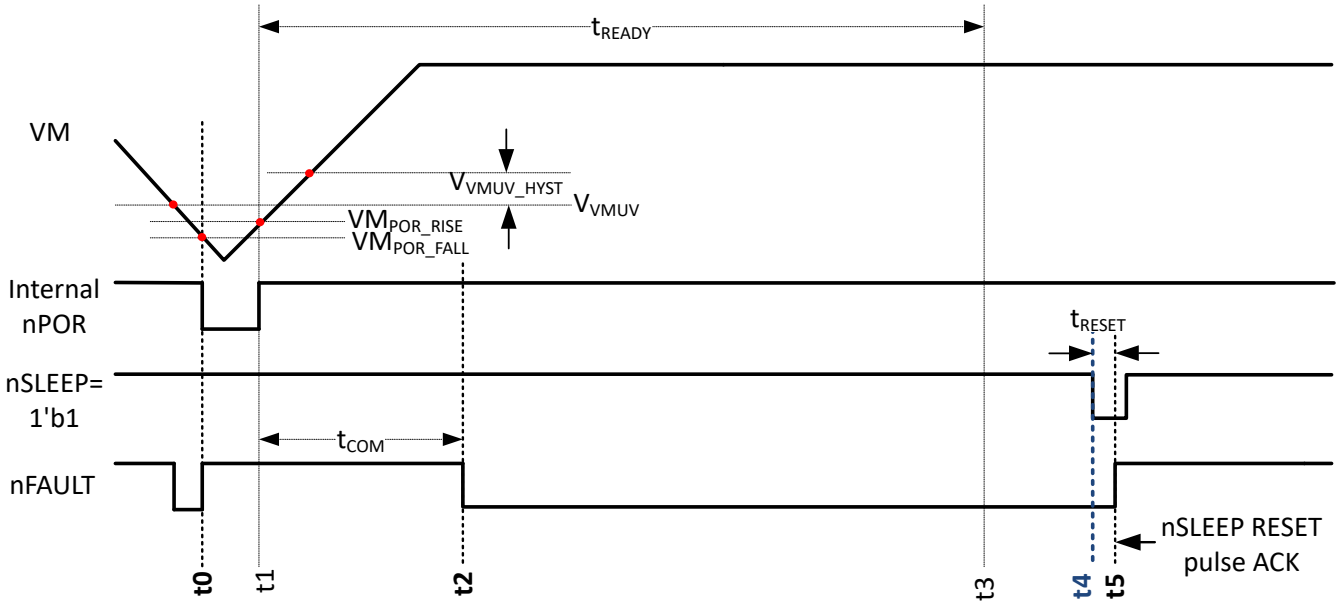

Figure 6-5. Power-up to STANDBY State Transition for HW Variant

Hand shake between controller and device during power-up as follows:

- t0: Device internal state - POR asserted based on under voltage of internal LDO (VM dependent)
- t1: Device internal state – POR de-asserted based on recovery of internal LDO voltage
- t2: Device – nFAULT asserted low to acknowledge wake-up and indicate device ready for communication
- t3: Device internal state - Initialization complete
- t4 (any time after t2): **Controller – Issue nSLEEP reset pulse** to acknowledge device power-up
- t5: Device - nFAULT de-asserted as an acknowledgment of nSLEEP reset pulse. Device in STANDBY state

6.7.2.2 SPI Variant

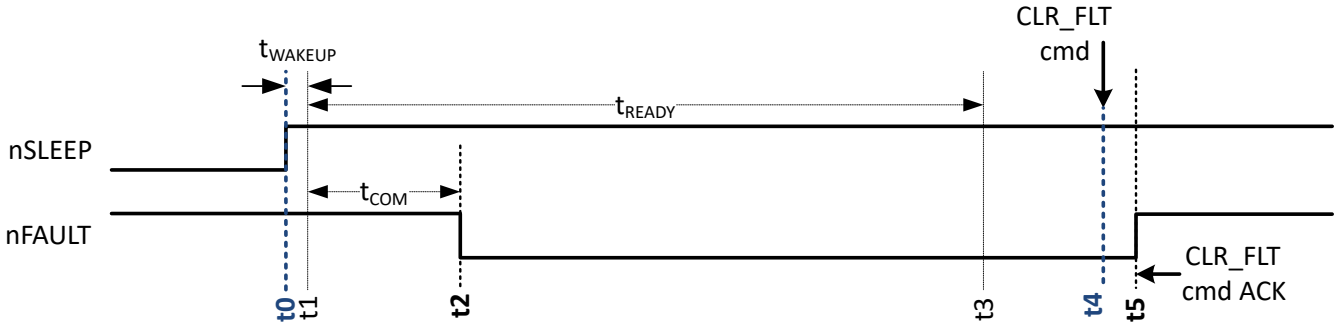

Figure 6-6. Wake-up from SLEEP State to STANDBY State Transition for SPI (S) Variant

Hand shake between controller and device during a wake-up transient as follows:

- t0: Controller - nSLEEP asserted high to initiate device wake-up
- t1: Device internal state - Wake-up command registered by device (end of Sleep state)
- t2: Device – nFAULT asserted low to acknowledge wake-up and indicate device ready for communication
- t3: Device internal state - Initialization complete
- t4 (Any time after t2): **Controller – Issue CLR_FLT command** through SPI to acknowledge device wake-up
- t5: Device - nFAULT de-asserted as an acknowledgment of nSLEEP reset pulse. Device in STANDBY state

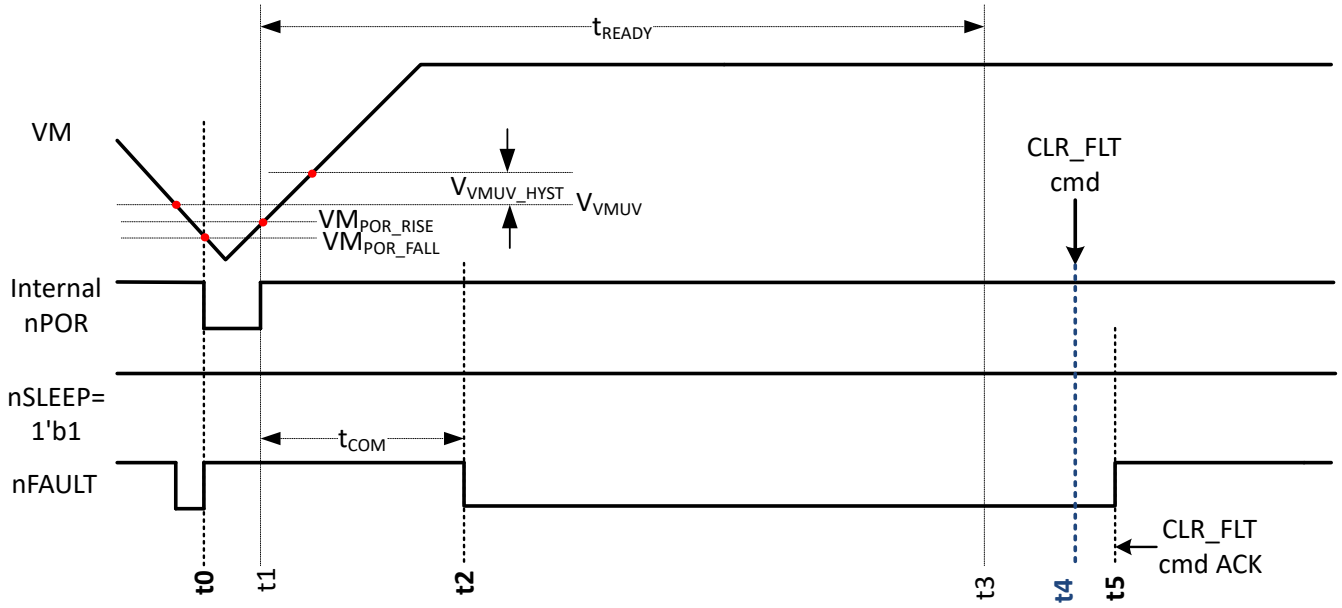

Figure 6-7. Power-up to STANDBY State Transition for SPI (S) Variant

Hand shake between controller and device during power-up as follows:

- t0: Device internal state - POR asserted based on under voltage of internal LDO (VM dependent)
- t1: Device internal state – POR de-asserted based on recovery of internal LDO voltage
- t2: Device – nFAULT asserted low to acknowledge wake-up and indicate device ready for communication
- t3: Device internal state - Initialization complete
- t4 (Any time after t2): **Controller – Issue CLR_FLT command** through SPI to acknowledge device power-up
- t5: Device - nFAULT de-asserted as an acknowledgment of nSLEEP reset pulse. Device in STANDBY state

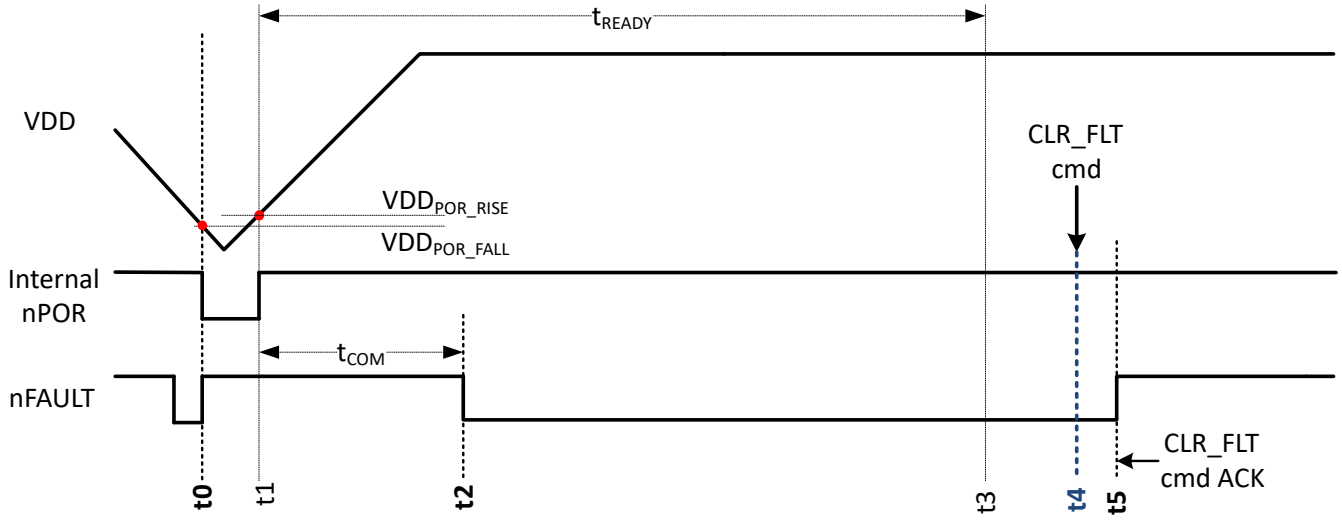

Figure 6-8. Power-up to STANDBY State Transition for SPI (P) Variant

Hand shake between controller and device during power-up as follows:

- t0: Device internal state - POR asserted based on under voltage on VDD (external supply)
- t1: Device internal state – POR de-asserted based on recovery of voltage on VDD (external supply)
- t2: Device – nFAULT asserted low to acknowledge wake-up and indicate device ready for communication
- t3: Device internal state - Initialization complete
- t4 (Any time after t2): **Controller – Issue CLR_FLT command** through SPI to acknowledge device power-up

- t5: Device - nFAULT de-asserted as an acknowledgment of nSLEEP reset pulse. Device in STANDBY state

6.7.3 Fault Reaction Transients

6.7.3.1 Retry setting

Valid for both SPI and HW variants

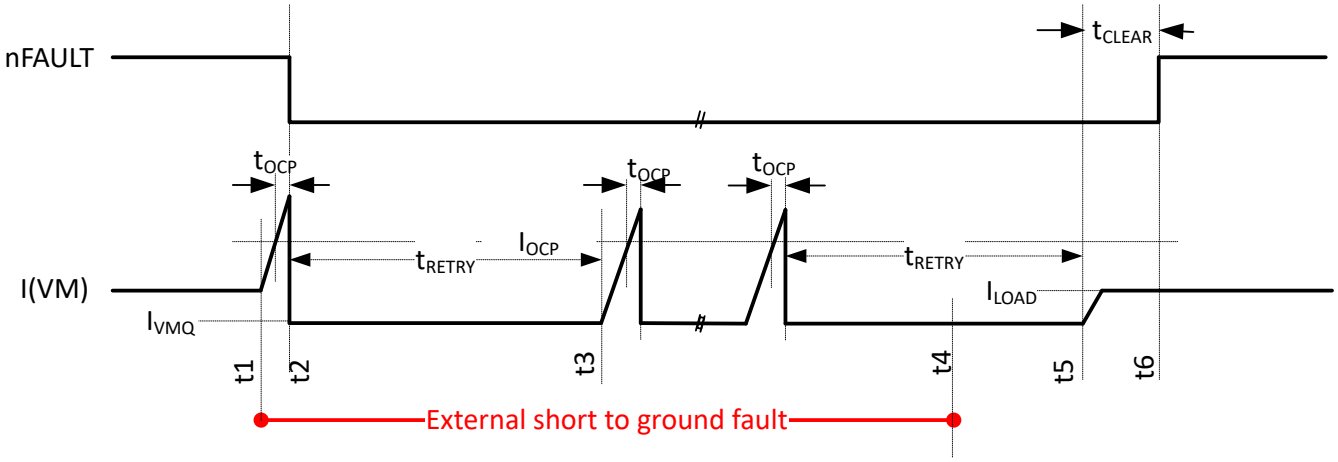

Figure 6-9. Fault reaction with RETRY setting (shown for OCP occurrence on high-side when OUT is shorted to ground)

Short occurrence and recovery scenario with RETRY setting:

- t1: An external short occurs.
- t2: OCP (Over Current Protection) fault confirmed after t_{OCP}, output disabled, nFAULT asserted low to indicate fault.
- t3: Device automatically attempts retry (auto retry) after t_{RETRY}. Each time output is briefly turned on to confirm short occurrence and then immediately disabled after t_{OCP}. nFAULT remains asserted low through out. Cycle repeats till driver is disabled by the user or external short is removed, as illustrated further. Note that, in case of a TSD (Thermal Shut Down) event, automatic retry time depends on the cool off based on thermal hysteresis.
- t4: The external short is removed.
- t5: Device attempts auto retry. But this time, no fault occurs and device continues to keep the output enabled.
- t6: After a fault free operation for a period of t_{CLEAR} is confirmed, nFAULT is de-asserted.
- SPI variant only – Fault status remains latched till a CLR_FLT command is issued.

Note that, in the event of an output short to ground causing the high-side OCP fault detection, IPROPI pin will continue to be pulled up to V_{IPROPI_LIM} voltage to indicate this type of short, while the output is disabled. This is especially useful for the HW (H) variant to differentiate the indication of a short to ground fault from the other faults.

6.7.3.2 Latch setting

Valid for both SPI and HW variants

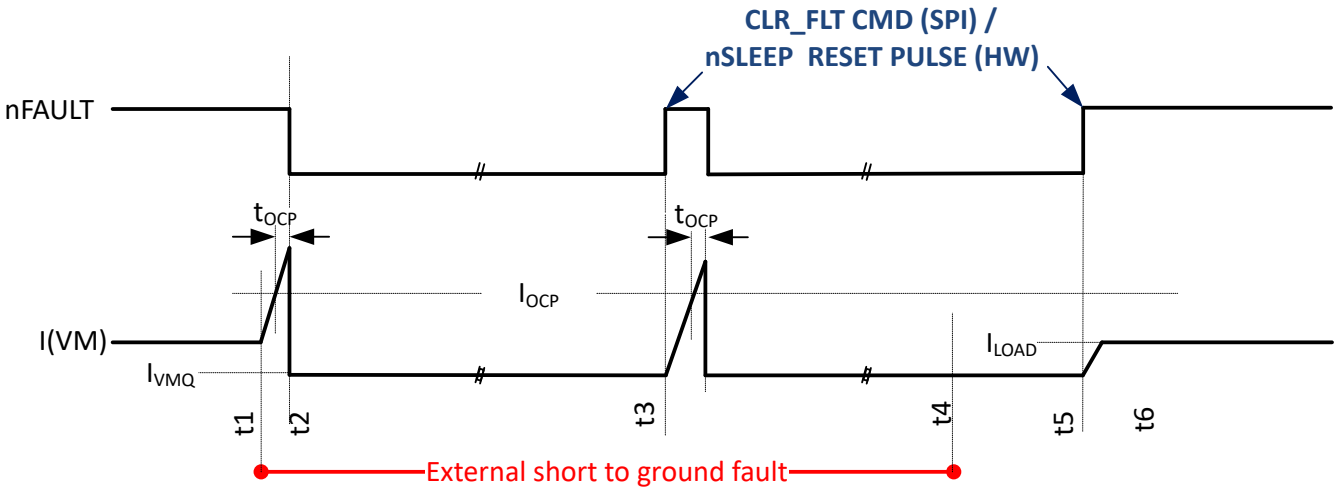

Figure 6-10. Fault reaction with Latch setting (shown for OCP occurrence on high-side when OUT is shorted to ground)

Short occurrence and recovery scenario with LATCH setting:

- t1: An external short occurs.
- t2: OCP (Over Current Protection) fault confirmed after t_{OCP}, output disabled, nFAULT asserted low to indicate fault.
- t3: A CLR_FLT command (SPI variant) or nSLEEP RESET Pulse (HW variant) issued by controller. nFAULT is de-asserted and output is enabled. OCP fault is detected again and output is disabled with nFAULT asserted low.
- t4: The external short is removed.
- t5: A CLR_FLT command (SPI variant) or nSLEEP RESET Pulse (HW variant) issued by controller. nFAULT is de-asserted and output is enabled. Normal operation resumes.
- SPI variant only – Fault status remains latched till a CLR_FLT command is issued.

Note that, in the event of an output short to ground causing the high-side OCP fault detection, IPROPI pin will continue to be pulled up to V_{IPROPI_LIM} voltage to indicate this type of short, while the output is disabled. This is especially useful for the HW (H) variant to differentiate the indication of a short to ground fault from the other faults.

6.8 Typical Characteristics

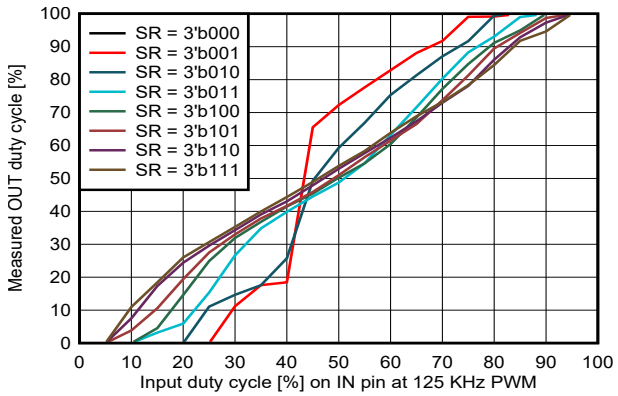

Figure 6-20. Measured Duty Cycle vs Input Duty Cycle at PWM frequency of 125 KHz at V_{VM} = 13.5 V for HS recirculation

7 Detailed Description

7.1 Overview

The DRV814x-Q1 family of devices are brushed DC motor drivers that operate from 4.5 to 35-V supporting a wide range of output load currents for various types of motors and loads. The devices integrate a charge pump regulator to support efficient high-side N-channel MOSFETs with 100% duty cycle operation. The devices operate from a single power supply input (VM) which can be directly connected to a battery or DC voltage supply. The devices also provide a low power mode to minimize current draw during system inactivity.

The devices are available in two interface variants -

1. HW variant - Hardwired interface variant is available for easy device configuration. Due to the limited number of available pins in the device, this variant offers fewer configuration and fault reporting capability compared to the SPI variant.
2. SPI variant - A standard 4-wire serial peripheral interface (SPI) with daisy chain capability allows flexible device configuration and detailed fault reporting to an external controller. The feature differences of the SPI and HW variants can be found in the device comparison section. The SPI interface is available in two device variant choices, as stated below:
   a. SPI (S) variant - The power supply for the digital block is provided by an internal LDO regulator sourced from VM supply. The nSLEEP pin is a high impedance input pin.
   b. SPI (P) variant (N/A for DRV8144-Q1) - This allows for an external supply input to the digital block of the device through a VDD pin. The nSLEEP pin is replaced by this VDD supply pin. This prevents device reset (brown out) during a VM under voltage condition.

The DRV814x family of devices provide a load current sense output using current mirrors on the high-side power MOSFETs. The IPROPI pin sources a small current that is proportional to the current in the high-side MOSFETs (current sourced out of the OUTx pin). This current can be converted to a proportional voltage using an external resistor (R_{IPROPI}). Additionally, the devices also support a fixed off-time PWM chopping scheme for limiting current to the load. The current regulation level can be configured through the ITRIP function.

A variety of protection features and diagnostic functions are integrated into the device. These include supply voltage monitors (VMOV & VMUV), charge pump undervoltage (CPUV), off-state (Passive) diagnostics (OLP), on-state (Active) diagnostics (OLA) - SPI variant only, overcurrent protection (OCP) for each power FET and over-temperature shutdown (TSD). Fault conditions are indicated on the nFAULT pin. The SPI variant has additional communication protection features such as frame errors and lock features for configuration register bits and driver control bits.

7.2 Functional Block Diagram

7.2.1 HW Variant

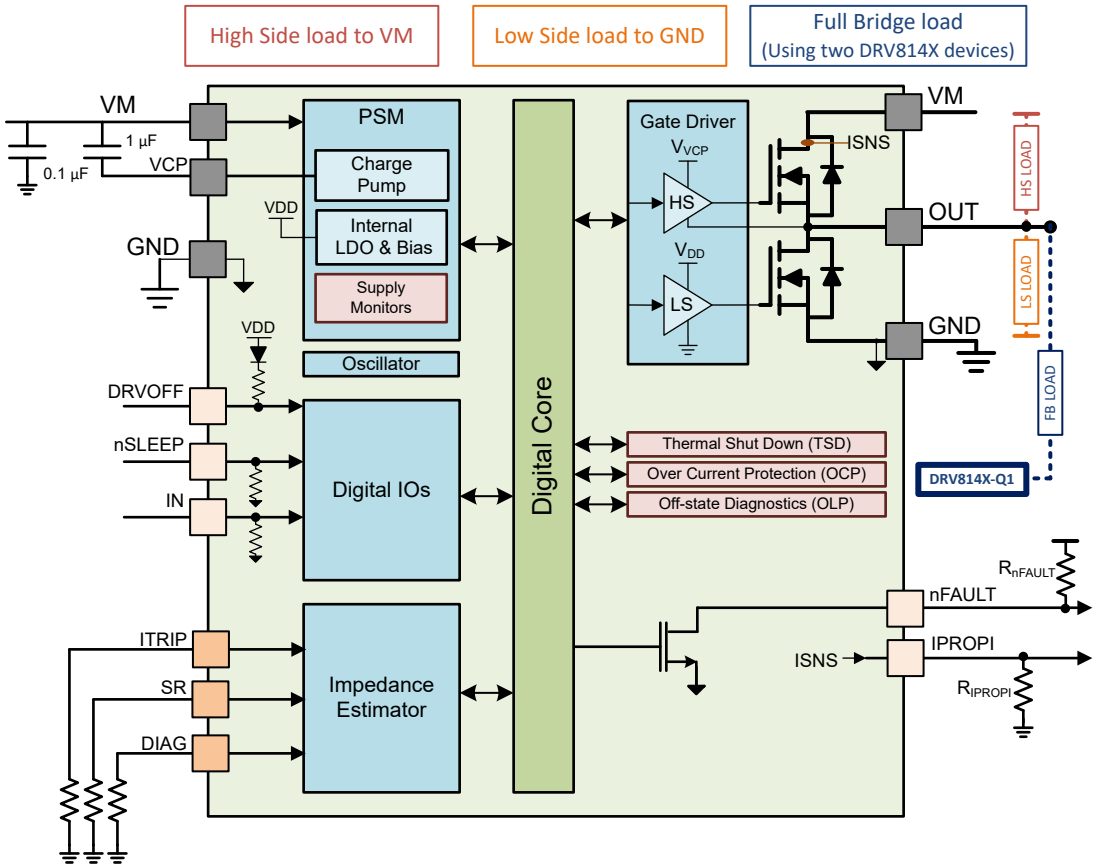

Figure 7-1. Functional Block Diagram - HW Variant

7.2.2 SPI Variant

There are two variants for the SPI interface - SPI (S) variant and SPI (P) variant as shown below.

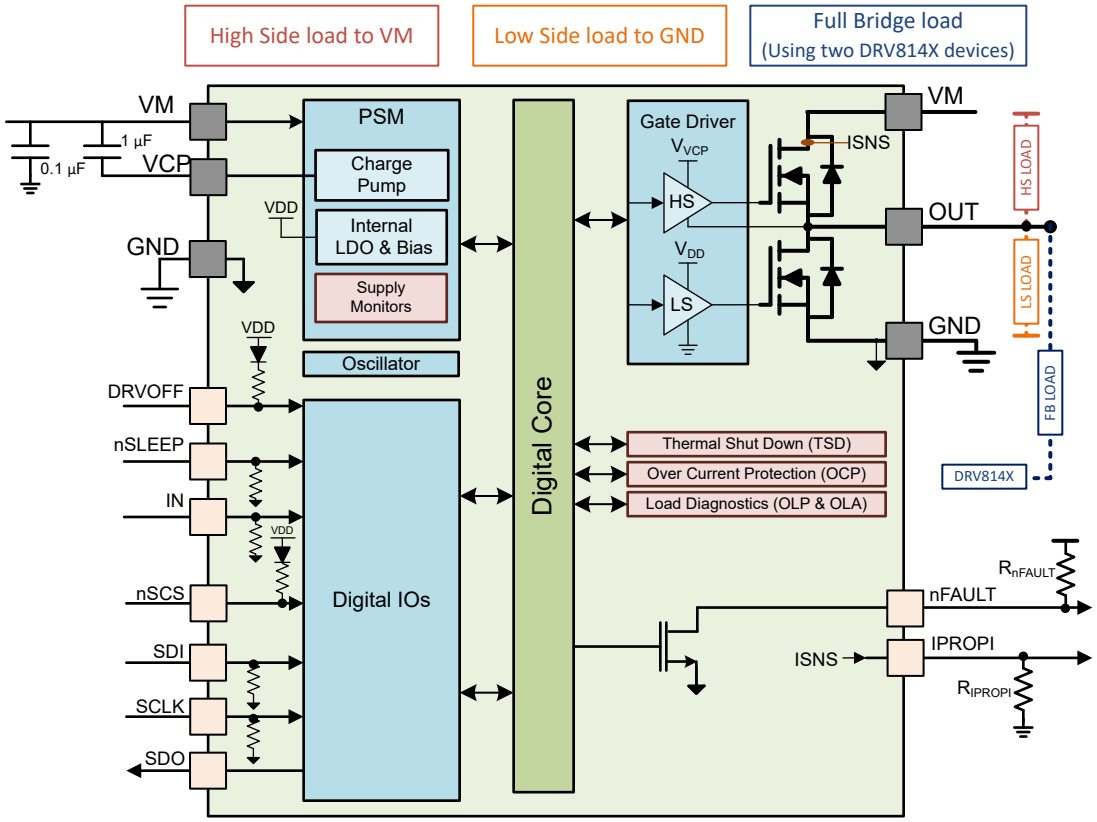

Figure 7-2. Functional Block Diagram - SPI (S) Variant

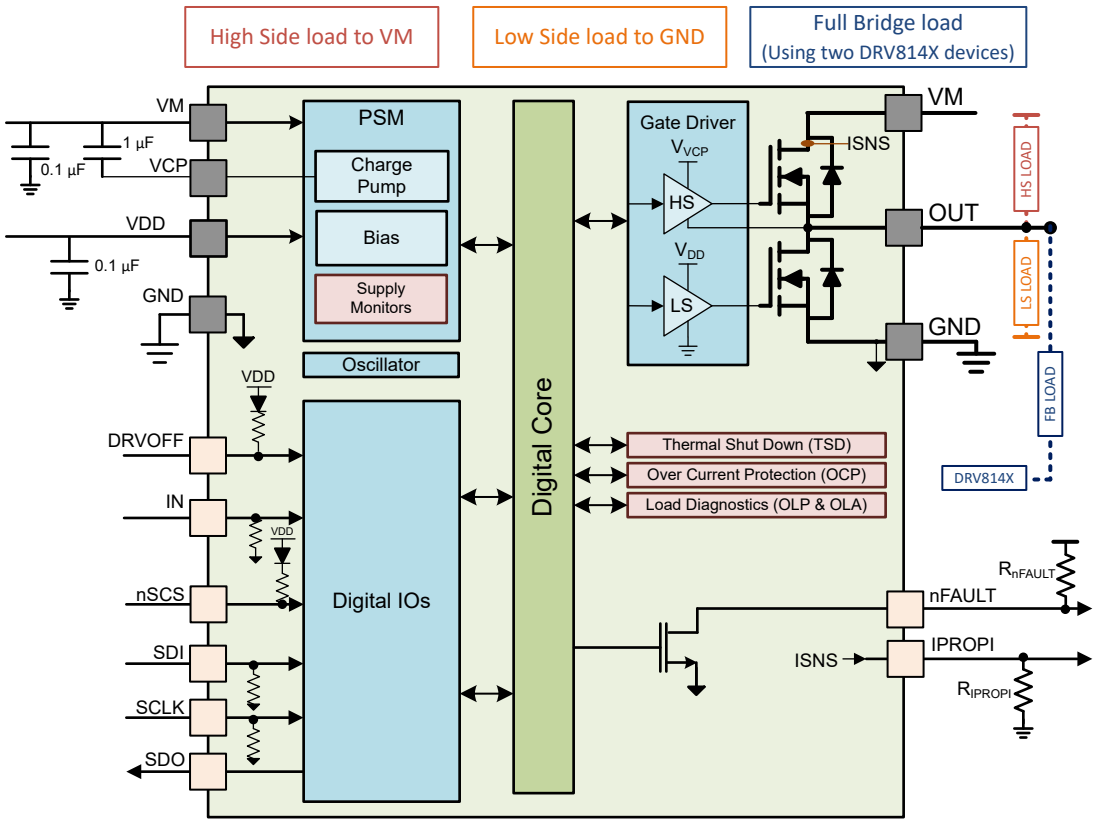

Figure 7-3. Functional Block Diagram - SPI (P) variant

7.3 Feature Description

7.3.1 External Components

Section 7.3.1.1 and Section 7.3.1.2 contain the recommended external components for the device.

7.3.1.1 HW Variant

Table 7-1. External Components Table for HW Variant

Component	PIN	Recommendation
C_{VM1}	VM	0.1 µF, low ESR ceramic capacitor to GND rated for VM
C_{VM2}	VM	Local bulk capacitor to GND, 10 µF or higher, rated for VM to handle load transients. Refer the section on bulk capacitor sizing.
C_{VCP}	VCP	1µF, 6.3 V low ESR ceramic capacitor to VM
R_{IPROPI}	IPROPI	Typically 500 - 5000 Ω 0.063 W resistor to GND, depending on the controller ADC dynamic range. Pin can be shorted to GND if ITRIP and IPROPI function is not needed.
C_{IPROPI}	IPROPI	Optional 10 - 100nF, 6.3 V capacitor to GND to slow down the ITRIP regulation loop. Refer Over Current Protection (OCP) section.
R_{nFAULT}	nFAULT	Typically 1KΩ - 10 KΩ, 0.063 W pull-up resistor to controller supply.
R_{SR}	SR	Open or short to GND or 0.063 W 10% resistor to GND depending on setting. Refer SR section.
R_{ITRIP}	ITRIP	Open or short to GND or 0.063 W 10% resistor to GND depending on setting. Refer ITRIP table.
R_{DIAG}	DIAG	Open or short to GND or 0.063 W 10% resistor to GND depending on setting. Refer DIAG section.

7.3.1.2 SPI Variant

Table 7-2. External Components Table for SPI Variant

Component	PIN	Recommendation
C_{VM1}	VM	0.1 µF, low ESR ceramic capacitor to GND rated for VM
C_{VM2}	VM	Local bulk capacitor to GND, 10 µF or higher, rated for VM to handle load transients. Refer the section on bulk capacitor sizing.
C_{VCP}	VCP	1µF, 6.3 V low ESR ceramic capacitor to VM
R_{IPROPI}	IPROPI	Typically 500 - 5000 Ω 0.063 W resistor to GND, depending on the controller ADC dynamic range. Pin can be shorted to GND if ITRIP and IPROPI function is not needed.
C_{IPROPI}	IPROPI	Optional 10 - 100nF, 6.3 V capacitor to GND to slow down the ITRIP regulation loop. Refer Over Current Protection (OCP) section.
R_{nFAULT}	nFAULT	Typically 1KΩ - 10 KΩ, 0.063 W pull-up resistor to controller supply. If nFAULT signaling is not used, this pin can be short to GND or left open.
C_{VDD}	VDD	0.1 µF, 6.3 V, low ESR ceramic capacitor to GND. This is applicable for the SPI (P) variant only.

7.3.2 Bridge Control

The DRV814x-Q1 family of devices provides a simple two pin control of the output through the pins, DRVOFF and IN.

The inputs can accept static or pulse-width modulated (PWM) voltage signals for either 100% or PWM drive modes. The device input pins can be powered before VM is applied. By default, the nSLEEP and DRVOFF pins have an internal pull-down and pull-up resistor respectively, to ensure the outputs are Hi-Z if no inputs are present. The IN pin also has an internal pull down resistor.

The device automatically generates the optimal dead-time needed during transitioning between the high-side and low-side FET on the switching half-bridge. This timing is based on internal FET gate-source voltage feedback. No external timing is required. This scheme ensures minimum dead time, while guaranteeing no shoot-through current.

Note

1. The SPI variant also provides additional control through the SPI_IN register bits. Refer to - Register - Pin control.
2. For the SPI (P) variant, ignore the nSLEEP column in the control table as there is no nSLEEP pin. Internally, nSLEEP = 1, always. The control table is valid when VDD > VDD_{POR} level.

The table below shows the logic table for bridge control. For load illustration, refer the Load Summary section.

Table 7-3. Control table

nSLEEP	DRVOFF	IN	OUT	IPROPI	Device State
0	X	X	Hi-Z	No current	SLEEP
1	1	0	Hi-Z	No current	STANDBY
1	1	1	Refer Off-state diagnostics table	No current	STANDBY
1	0	0	L	No current	ACTIVE
1	0	1	H(2)	ISNS(1)	ACTIVE

(1) Current sourcing out of device (VM → OUTx → Load)
(2) If internal ITRIP regulation is enabled and ITRIP level is reached, then OUTx is forced "L" for a fixed time

7.3.2.1 Register - Pin Control - SPI Variant Only

The SPI variant allows control of the bridge through the specific register bits, S_DRVOFF, S_IN in the SPI_IN register, provided the **SPI_IN register has been unlocked**. The user can unlock this register by writing the right combination to the SPI_IN_LOCK bits in the COMMAND register.

Additionally, the user can configure between an AND / OR logic combination of each of external input pin with their equivalent register bit in the SPI_IN register. This logical configuration is done through the equivalent selects bits in the CONFIG4 register:

- DRVOFF_SELand IN_SEL

The control of the output is similar to the truth tables described in the section before, but with these logically combined inputs. These combined inputs are listed as follows:

- Combined input = Pin input **OR** equivalent SPI_IN register bit, if equivalent CONFIG4 select bit = 1'b0
- Combined input = Pin input **AND** equivalent SPI_IN register bit, if equivalent CONFIG4 select bit = 1'b1

Note that external nSLEEP pin is still needed for sleep function.

This logical combination offers more configurability to the user as shown in the table below.

Table 7-4. Register - Pin Control Examples

Example	CONFIG4: xxx_SEL Bit	PIN status	SPI_IN Bit Status	Comment
DRVOFF as redundant shutoff	DRVOFF_SEL = 1'b0	DRVOFF active	S_DRVOFF active	Either DRVOFF pin = 1 or S_DRVOFF bit = 1 will shutoff the output
Pin only control	DRVOFF_SEL = 1'b1	DRVOFF active	S_DRVOFF = 1'b1	Only DRVOFF pin function is available
Register only control	IN_SEL = 1'b0	IN - short to GND or float	S_IN active	IN function will be controlled by the register bit alone

7.3.3 Device Configuration

This section describes the various device configurations to enable the user to configure the device to suit their use case.

7.3.3.1 Slew Rate (SR)

The SR pin (HW variant) or S_SR bits in the CONFIG3 register (SPI variant) determines the voltage slew rate of the driver output. This enables the user to optimize the PWM switching losses while meeting the EM conformance requirements. For the HW variant, SR is a 6-level **setting**, while the SPI variant has 8 settings. For an inductive load, the slew rate control of the device depends on whether the recirculation path is through the high-side path to VM or through the low-side path to GND. Depending on the use-case, refer to the switching parameters table for either high-side recirculation or low-side recirculation in the Electrical Characteristics section for the slew rate range and values.

Note

The SPI variant also offers an **optional** spread spectrum clocking (SSC) feature that spreads the internal oscillator frequency +/- 12% around its mean with a period triangular function of ~1.3MHz to reduce emissions at higher frequencies. There is **no** spread spectrum clocking (SSC) feature in the HW variant.

In the HW variant, the SR pin is **latched** during device initialization following power-up or wake-up from sleep. Update during operation is blocked.

In the SPI variant, the slew rate setting can be changed at any time when SPI communication is available by writing to the S_SR bits. This change is immediately reflected.

7.3.3.2 IPROPI

The device integrates a current sensing feature with a proportional analog current output on the IPROPI pin that can be used for load current regulation. This eliminates the need of an external sense resistor or sense circuitry reducing system size, cost, and complexity.

The device senses the load current by using a shunt-less high-side current mirror topology. This way the device can only sense an uni-directional high-side current from VM → OUT → Load through the high-side FET when it is fully turned ON (linear mode). The IPROPI pin outputs an analog current proportional to this sensed current scaled by A_{IPROPI} as follows:

$I_{IPROPI} = I_{HS}$ [A] / A_{IPROPI}

The IPROPI pin must be connected to an external resistor (R_{IPROPI}) to ground in order to generate a proportional voltage V_{IPROPI}. This allows for the load current to be measured as a voltage-drop across the R_{IPROPI} resistor with an analog to digital converter (ADC). The R_{IPROPI} resistor can be sized based on the expected load current in the application so that the full range of the controller ADC is utilized.

7.3.3.3 ITRIP Regulation

The device offers an optional internal load current regulation feature using fixed TOFF time method. This is done by comparing the voltage on the IPROPI pin against a reference voltage determined by ITRIP setting. TOFF time is fixed at 30µsec for HW variant, while it is configurable between or 20 to 50µsec for the SPI variant using TOFF_SEL bits in the CONFIG3 register.

The ITRIP regulation, when enabled, comes into action only when the HS FET is enabled and current sensing is possible. In this scenario, when the voltage on the IPROPI pin exceeds the reference voltage set by the ITRIP setting, the internal current regulation loop forces the following action:

- OUT = L for a fixed TOFF time

Note

The user inputs always takes **precedence** over the internal control. That means that if the inputs change during the TOFF time, the remainder of the TOFF time is ignored and the outputs will follow the inputs as commanded.

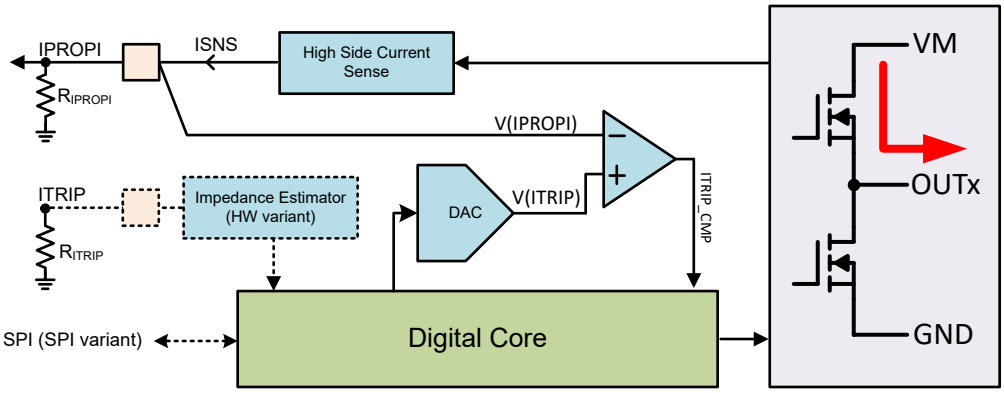

Figure 7-4. ITRIP Implementation

Current limit is set by the following equation:

$$\text{ITRIP regulation level} = (V_{ITRIP} / R_{IPROPI}) \times A_{IPROPI} \quad (2)$$

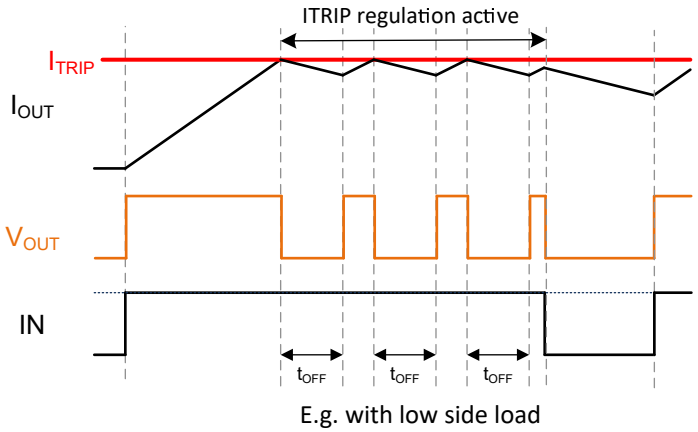

Figure 7-5. Fixed TOFF ITRIP Current Regulation

The ITRIP comparator output (ITRIP_CMP) is ignored during output slewing to avoid false triggering of the comparator output due to current spikes from the load capacitance. Additionally, in the event of transition from low-side recirculation, an additional blanking time t_{BLANK} is needed for the sense loop to stabilize before the ITRIP comparator output is valid.

ITRIP is a 6-level **setting** for the HW variant. The SPI variant offers two more settings. This is summarized in the table below:

Table 7-5. ITRIP Table

ITRIP Pin	S_ITRIP Register Bits	V_{ITRIP} [V]
$R_{LVL1OF6}$	3'b000	Regulation Disabled
$R_{LVL2OF6}$	3'b001	1.18
Not available	3'b010	1.41
Not available	3'b011	1.65
$R_{LVL3OF6}$	3'b100	1.98
$R_{LVL4OF6}$	3'b101	2.31
$R_{LVL5OF6}$	3'b110	2.64
$R_{LVL6OF6}$	3'b111	2.97

In the HW variant of the device, the ITRIP pin changes are **transparent** and changes are reflected immediately.

In the SPI variant of the device, the ITRIP setting can be changed at any time when SPI communication is available by writing to the S_ITRIP bits. This change is immediately reflected in the device behavior.

SPI variant only - If the ITRIP regulation levels are reached, the ITRIP_CMP bit in the STATUS1 register is set. There is no nFAULT pin indication. This bit can be cleared with a CLR_FLT command.

Note

If the application requires a linear ITRIP control with multiple steps beyond the choices provided by the device, an external DAC can be used to force the voltage on the bottom side of the IPROPI resistor, instead of terminating it to GND. With this modification, the ITRIP current can be controlled by the external DAC setting as follows:

$$\text{ITRIP regulation level} = [(V_{ITRIP} - V_{DAC}) / R_{IPROPI}] \text{ X } A_{IPROPI} \quad (3)$$

7.3.3.4 DIAG

The DIAG is a pin (HW variant) or register (SPI variant) setting that is used in both ACTIVE and STANDBY operation of the device, as follows:

- STANDBY state
  - Enable or disable Off-state diagnostics (OLP), as well as select the OLP combinations when enabled. Refer to the tables in the Off-state diagnostics (OLP) section for details on this.
- ACTIVE state
  - Mask ITRIP regulation function if the load type is indicated as high-side load.
  - SPI variant only - Mask active open load detection (OLA) if the load type is indicated as low-side. load
  - HW variant only - Configure fault reaction between retry and latch settings

7.3.3.4.1 HW variant

For the HW variant, the DIAG pin is a 6-level **setting**. Depending on the mode, its configurations are summarized in the table below.

Table 7-6. DIAG table for HW variant

DIAG pin	STANDBY state	ACTIVE state		
	Off-state diagnostics	Fault reaction	IPROPI / ITRIP	Comment
$R_{LVL1OF6}$	Disabled	Retry	Available	Use for low-side load
$R_{LVL2OF6}$	Enabled(1)	Latch	Available	
$R_{LVL3OF6}$	Enabled(1)	Latch	Disabled	Use for high-side load
$R_{LVL4OF6}$	Enabled(1)	Retry	Disabled	
$R_{LVL5OF6}$	Disabled	Latch	Available	Use for low-side load
$R_{LVL6OF6}$	Enabled(1)	Retry	Available	

(1) Refer to the tables in the Off-state diagnostics (OLP) section for combination details

Note

HW variant only - Option to disable off-state diagnostics for a high-side load use case is not supported. In this case, setting DRVOFF pin high and IN pin low is only way to disable off-state diagnostics.

In the HW variant, the DIAG pin is **latched** during device initialization following power-up or wake-up from sleep. Update during operation is blocked.

7.3.3.4.2 SPI variant

For the SPI variant, S_DIAG is a 2-bit setting in the CONFIG2 register. Depending on the mode, its configurations are summarized in the table below.

Table 7-7. DIAG table for the SPI variant

S_DIAG bits	STANDBY state	ACTIVE state		
	Off-state diagnostics	On-state diagnostics	IPROPI / ITRIP	Comment
2'b00	Disabled	Disabled	Available	Use for low-side load
2'b01	Enabled(1)	Disabled	Available	
2'b10	Disabled	Available	Disabled	Use for high-side load
2'b11	Enabled(1)	Available	Disabled	

(1) Refer to the tables in the Off-state diagnostics (OLP) section for combination details

In the SPI variant of the device, the settings can be changed anytime when SPI communication is available by writing to the S_DIAG bits. This change is immediately reflected.

7.3.4 Protection and Diagnostics

The driver is protected against over-current and over-temperature events to ensure device robustness. Additionally, the device also offers load monitoring (on-state and off-state), over/ under voltage monitoring on VM pin as well as under voltage monitoring on the VCP pin to signal any unexpected voltage conditions. Fault signaling is done through a low-side open drain nFAULT pin which gets pulled to GND by I_{nFAULT_PD} current on detection of a fault condition. Transition to SLEEP state automatically de-asserts nFAULT.

Note

In the SPI variant, nFAULT pin logic level is the inverted copy of the FAULT bit in the FAULT SUMMARY register. Only exception is when off-state diagnostics are enabled and SPI_IN register is locked (Refer OLP section) .

For the SPI variant, whenever nFAULT is asserted low, the device logs the fault into the FAULT SUMMARY and STATUS registers. These registers can be cleared only by

- CLR FLT command or
- SLEEP command through the nSLEEP pin

It is possible to get all the useful diagnostic information for periodic software monitoring in a single 16 bit SPI frame by:

- Reading the STATUS1 register during ACTIVE state
- Reading the STATUS2 register during STANDBY state

All the diagnosable fault events can be uniquely identified by reading the STATUS registers.

7.3.4.1 Over Current Protection (OCP)

- Device state: ACTIVE
- Mechanism & thresholds: An analog current limit circuit on each MOSFET limits the peak current out of the device even in hard short circuit events. If the output current exceeds the overcurrent threshold, I_{OCP}, for longer than t_{OCP}, then an over current fault is detected.
- Action:
  - nFAULT pin is asserted low
  - OUT is Hi-Z
  - For a short to GND fault (over current detected on the high-side FET), the IPROPI pin continues to be pulled up to V_{IPROPI_LIM} even if the FET has been disabled. For the HW variant, this helps differentiate a short to GND fault during ACTIVE state from other fault types, as the IPROPI pin is pulled high while the nFAULT pin is asserted low.
- Reaction configurable between latch setting and retry setting based on t_{RETRY} and t_{CLEAR}
- User can add a capacitor in the range of 10nF to 100nF on the IPROPI pin to ensure OCP detection in case of a load short condition when internal ITRIP regulation is enabled. This is especially true where there is enough inductance in the short that causes ITRIP regulation to trigger ahead of the OCP detection, resulting in the device missing the short detection. To ensure that OCP detection wins this race condition, a small

capacitance added on the IPROPI pin slows down the ITRIP regulation loop enough to allow the OCP detection circuit to work as intended.

The SPI variant offers configurable I_{OCP} levels and t_{OCP} filter times. Refer CONFIG4 register for these settings.

7.3.4.2 Over Temperature Protection (TSD)

- Device state: STANDBY, ACTIVE
- Mechanism & thresholds: The device has several temperature sensors spread around the die. If any of the sensors detect an over temperature event, set by T_{TSD} for a time greater than t_{TSD}, then an over temperature fault is detected.
- Action:
  - nFAULT pin is asserted low
  - OUT is Hi-Z
  - IPROPI pin is Hi-Z
- Reaction configurable between latch setting and retry setting based on T_{HYS} and t_{CLEAR_TSD}

7.3.4.3 Off-State Diagnostics (OLP)

The user can determine the impedance on the OUT node using off-state diagnostics in the STANDBY state when the power FETs are off. With this diagnostics, it is possible to detect the following fault conditions passively in the STANDBY state:

- Output short to VM or GND < 100Ω
- Open load > 1KΩ for low-side load
- Open load > 10KΩ for high-side load, VM = 13.5V

Note

It is NOT possible to detect a **load short** with this diagnostic. However, the user can deduce this logically if an over current fault (OCP) occurs during ACTIVE operation, but OLP diagnostics do not report any fault in the STANDBY state. Occurrence of both OCP in the ACTIVE state and OLP in the STANDBY state would imply a terminal short (short on OUT node).

- The user can configure the following combinations
  - Internal pull up resistor (R_{OLP_PU}) on OUT
  - Internal pull down resistor (R_{OLP_PD}) on OUT
  - Comparator reference level
- This combination is determined by the controller inputs (pins only for the HW variant) or equivalent bits in the SPI_IN register for the SPI variant if the SPI_IN register has been unlocked.
- HW variant - When off-state diagnostics are enabled, comparator output (OLP_CMP) is available on nFAULT pin.
- SPI variant - The off-state diagnostics comparator output (OLP_CMP) is available on OLP_CMP bit in STATUS2 register. Additionally, if the SPI_IN register has been locked, this comparator output is also available on the nFAULT pin when off-state diagnostics are enabled.
- The user is expected to toggle through all the combinations and record the comparator output after its output is settled.
- Based on the input combinations and comparator output, the user can determine if there is a fault on the output.

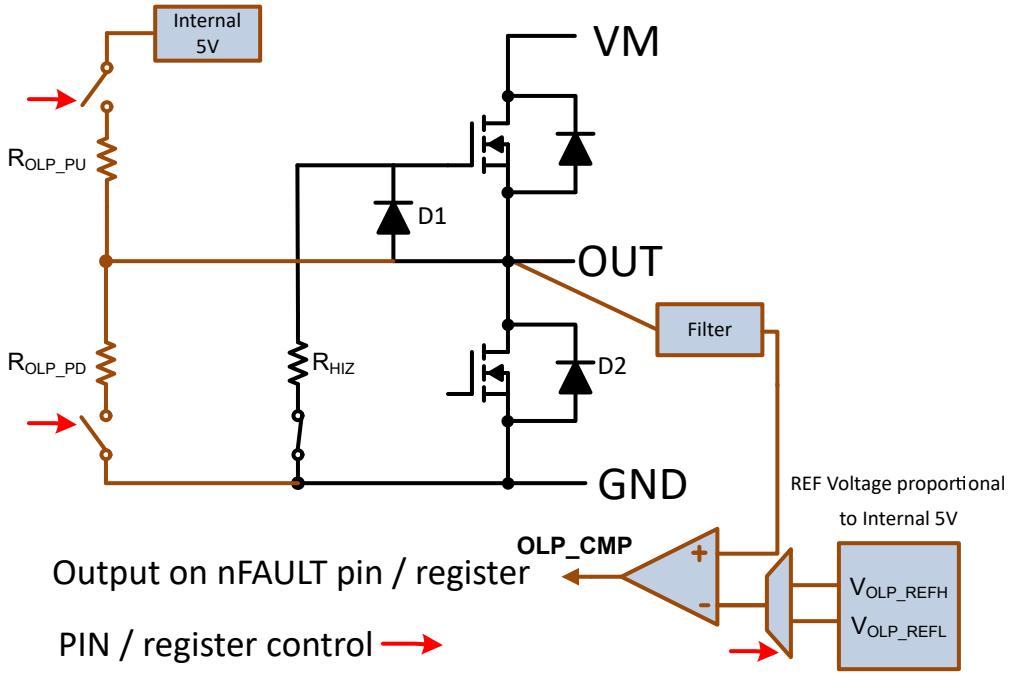

Figure 7-6. Off-State (Passive) Diagnostics

The OLP combinations and truth table for a no fault scenario vs. fault scenario for a low-side load is shown in Table 7-8.

Table 7-8. Off-State Diagnostics Table for a Low-Side Load

User Inputs					OLP Set-Up		OLP_CMP Output		
DIAG Pin	S_DIAG Bits	nSLEEP	DRVOFF	IN	OUT	CMP REF	Normal	Open	Short
LVL2, LVL6	2'b01	1	1	1	R_{OLP_PU}	V_{OLP_REFH}	L	H	H
LVL3, LVL4	2'b11	1	1	1	R_{OLP_PD}	V_{OLP_REFL}	L	L	H

The OLP combinations and truth table for a no fault scenario vs. fault scenario for a high-side load is shown in Table 7-9.

Table 7-9. Off-State Diagnostics Table for a High-Side Load

User Inputs					OLP Set-Up		OLP_CMP Output		
DIAG Pin	S_DIAG Bits	nSLEEP	DRVOFF	IN	OUT	CMP REF	Normal	Open	Short
LVL2, LVL6	2'b01	1	1	1	R_{OLP_PU}	V_{OLP_REFH}	H	H	L
LVL3, LVL4	2'b11	1	1	1	R_{OLP_PD}	V_{OLP_REFL}	H	L	L

7.3.4.4 On-State Diagnostics (OLA) - SPI Variant Only

- Device state: ACTIVE - high-side recirculation
- Mechanism and threshold: On-state diagnostics (OLA) can detect an open load detection in the ACTIVE state during high-side recirculation. This includes high-side load connected directly to VM or through a high-side FET on the other half-bridge. During a PWM switching transition, the inductive load current re-circulates into VM through the HS body diode when the LS FET is turned OFF. The device looks for a voltage spike on OUTx above VM during the brief dead time, before the HS FET is turned ON. To observe the voltage spike, this load current needs to be higher than the pull down current (I_{PD_OLA}) on the output asserted by the FET

driver. Absence of this voltage spike for "3" consecutive re-circulation switching cycles indicates a loss of load inductance or increase in load resistance and is detected as an OLA fault.

- Action:
  - nFAULT pin is asserted low
  - Output - normal function maintained
  - IPROPI pin - normal function maintained
- Reaction configurable between latch setting and retry setting. In retry setting, OLA fault is automatically cleared with the detection of "3" consecutive voltage spikes during re-circulation switching cycles.

This monitoring is optional and can be disabled.

Note

1. OLA is not supported for low-side loads (low-side recirculation).

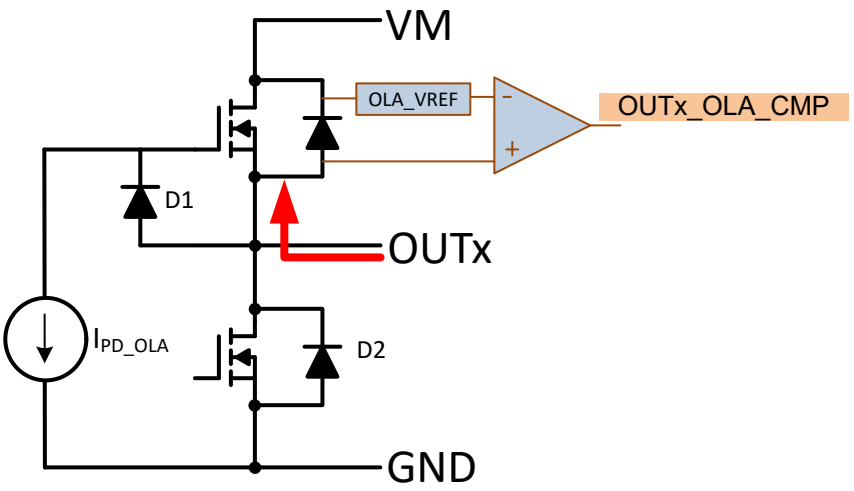

Figure 7-7. On-State Diagnostics

7.3.4.5 VM Over Voltage Monitor

- Device state: STANDBY, ACTIVE
- Mechanism & thresholds: If the supply voltage on the VM pin exceeds the threshold, set by V_{VMOV} for a time greater than t_{VMOV}, then an VM over voltage fault is detected.
- Action:
  - nFAULT pin is asserted low
  - Output - normal function maintained
  - IPROPI pin - normal function maintained
- Reaction configurable between retry and latch setting

In the SPI variant, this monitoring is optional and can be disabled. Also the thresholds are configurable. Refer CONFIG1 register.

7.3.4.6 VM Under Voltage Monitor

- Device state: STANDBY, ACTIVE
- Mechanism & thresholds: If the supply voltage on the VM pin drops below the threshold, set by V_{VMUV} for a time greater than t_{VMUV}, then an VM under voltage fault is detected.
- Action:
  - nFAULT pin is asserted low
  - OUT is Hi-Z
  - IPROPI pin is Hi-Z

- HW and SPI (S) variant: Reaction fixed to retry setting
- Only for SPI (P) variant: Reaction configurable between retry and latch setting
- Note that retry time is only dependent on recovery of VM under voltage condition and is independent of t_{RETRY} / t_{CLEAR} times

7.3.4.7 Charge pump under voltage monitor

- Device state: ACTIVE
- Mechanism & thresholds: If the voltage on the VCP pin falls below the threshold, set by V_{VCPUV} for a time greater than t_{VCPUV}, then a VCP under voltage fault is detected.
- Action:
  - nFAULT pin is asserted low
  - Output - normal function maintained. However, the high-side FET between VM and OUT becomes resistive in this charge pump under voltage condition to a point where it may even appear to Hi-Z due to lack of voltage headroom.
  - IPROPI pin - normal function maintained. However, current sense is affected in this charge pump voltage condition to a point where it may even appear to be Hi-Z due to lack of voltage headroom.
- Reaction fixed to retry based on V_{VCPUV_HYS}

7.3.4.8 Power On Reset (POR)

- Device state: ALL
- Mechanism & thresholds: If logic supply drops below VDD_{POR_FALL} for a time greater than t_{POR}, then a power on reset will occur that will hard reset the device.
- Action:
  - nFAULT pin is de-asserted
  - OUT is Hi-Z
  - IPROPI pin is Hi-Z.
  - When this supply recovers above the VDD_{POR_RISE} level, the device will go through a wake-up initialization and nFAULT pin will be asserted low to notify the user on this reset (Refer Wake-up transients).
- HW and SPI (S) variant: These thresholds translate to VM_{POR_FALL} and VM_{POR_RISE} as the logic supply is internally derived from the VM supply
- Only for SPI (P) variant: These thresholds directly map to the VDD pin voltage (VDD_{POR_FALL} and VDD_{POR_RISE})
- Fault reaction: Always retry, retry time depends on the external supply condition to initiate a device wake-up

7.3.4.9 Event Priority

In the ACTIVE state, in a scenario where two or more events occur simultaneously, the device assigns control of the driver based on the following priority table.

Table 7-10. Event Priority Table

Event	Priority
User SLEEP command	1
User input: DRVOFF	2
Over temperature detection (TSD)	3
Over current detection (OCP)(1)	4
VM under voltage detection (VMUV)	5
Under input: IN	6
Internal PWM control from ITRIP regulation	7
VM over voltage detection (VMOV)(2)	8
Charge pump under voltage (CPUV)(2)	9

(1) If the device is waiting for an OCP event to be confirmed (waiting for t_{OCP}) when any of events with lower priority than OCP occur, then the device may delay servicing the other events up to a maximum time of t_{OCP} to enable detection of the OCP event.
(2) Priority is "don't care" in this case as this fault event does not cause a change in OUTx

7.4 Programming - SPI Variant Only

7.4.1 SPI Interface

The SPI variant has full-duplex, 4-wire synchronous communication that is used to set device configurations, operating parameters, and read out diagnostic information from the device. The SPI operates in peripheral mode and connects to a controller. The serial data input (SDI) word consists of a 16-bit word, with an 8-bit command (A1), followed by 8-bit data (D1). The serial data output (SDO) word consists of the FAULT_SUMMARY byte (S1), followed by a report byte (R1). The report byte is either the register data being accessed by read command or null for a write command. The data sequence between the MCU and the SPI peripheral driver is shown in Figure 7-8.

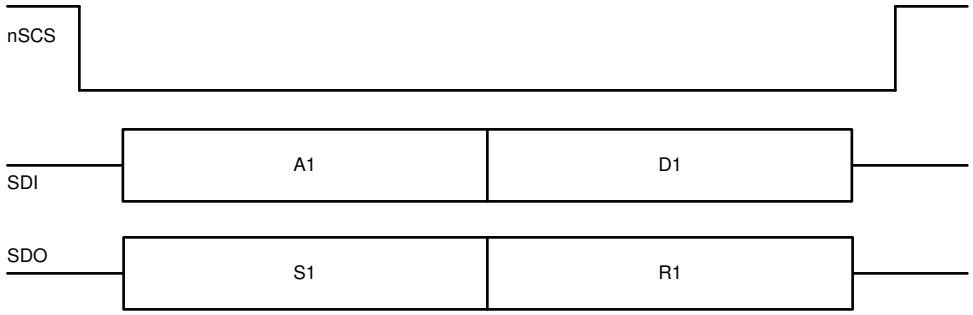

Figure 7-8. SPI Data - Standard "16-bit" Frame

A valid frame must meet the following conditions:

- SCLK pin should be low when the nSCS pin transitions from high to low and from low to high.
- nSCS pin should be pulled high between words.
- When nSCS pin is pulled high, any signals at the SCLK and SDI pins are ignored and the SDO pin is placed in the Hi-Z state.
- Data on SDO from the device is propagated on the rising edge of SCLK, while data on SDI is captured by the device on the subsequent falling edge of SCLK.
- The most significant bit (MSB) is shifted in and out first.
- A full 16 SCLK cycles must occur for a valid transaction for a standard frame, or alternately, for a daisy chain frame with "n" number of peripheral devices, 16 + (n x 16) SCLK cycles must occur for a valid transaction. Else, a frame error (SPI_ERR) is reported and the data is ignored if it is a WRITE operation.

7.4.2 Standard Frame

The SDI input data word is 2 bytes long and consists of the following format:

- Command byte (first byte)
  - MSB bit indicates frame type (bit B15 = 0 for standard frame).
  - Next to MSB bit, W0, indicates read or write operation (bit B14, write = 0, read = 1)
  - Followed by 6 address bits, A[5:0] (bits B13 through B8)
- Data byte (second byte)
  - Second byte indicates data, D[7:0] (bits B7 through B0). For a read operation, these bits are typically set to null values, while for a write operation, these bits have the data value for the addressed register.

Table 7-11. SDI - Standard Frame Format

	Command Byte								Data Byte							
Bit	B15	B14	B13	B12	B11	B10	B9	B8	B7	B6	B5	B4	B3	B2	B1	B0
Data	0	W0	A5	A4	A3	A2	A1	A0	D7	D6	D5	D4	D3	D2	D1	D0

The SDO output data word is 2 bytes long and consists of the following format:

- Status byte (first byte)
  - 2 MSB bits are forced high (B15, B14 = 1)
  - Following 6 bits are from the FAULT SUMMARY register (B13:B8)
- Report byte (second byte)
  - The second byte (B7:B0) is either the data currently in the register being read for a read operation (W0 = 1), or, existing data in the register being written to for a write command (W0 = 0)

Table 7-12. SDO - Standard Frame Format

	Status Byte								Report Byte							
Bit	B15	B14	B13	B12	B11	B10	B9	B8	B7	B6	B5	B4	B3	B2	B1	B0
Data	1	1	FAULT	VMOV	VMUV	OCP	TSD	SPI_ERR	D7	D6	D5	D4	D3	D2	D1	D0

7.4.3 SPI Interface for Multiple Peripherals

Multiple devices can be connected to the controller with and without the daisy chain. For connecting a 'n' number of devices to a controller without using a daisy chain, 'n' number of I/O resources from controller has to utilized for nSCS pins as shown in Figure 7-9. Whereas, if the daisy chain configuration is used, then a single nSCS line can be used for connecting multiple devices. Figure 7-10

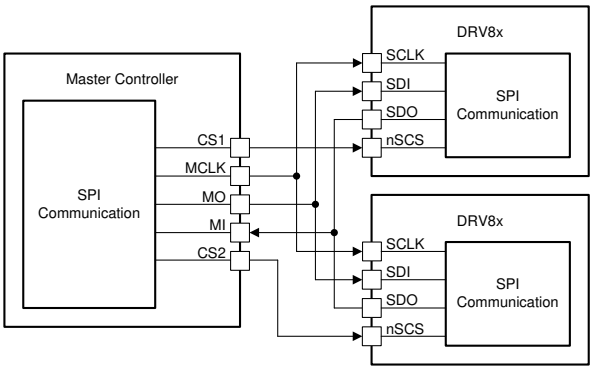

Figure 7-9. SPI Operation Without Daisy Chain

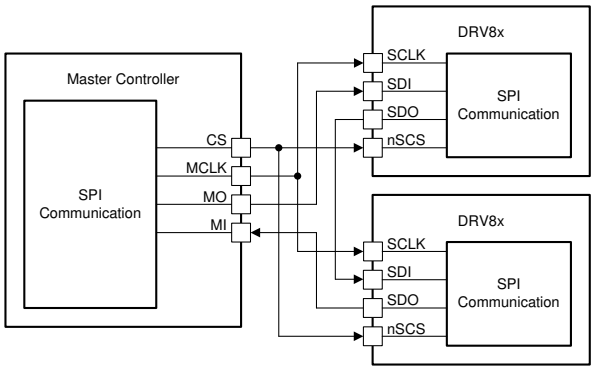

Figure 7-10. SPI Operation With Daisy Chain

7.4.3.1 Daisy Chain Frame for Multiple Peripherals

The device can be connected in a daisy chain configuration to save GPIO ports when multiple devices are communicating to the same MCU. Figure 7-11 shows the topology with waveforms, where, number of peripherals connected in a daisy chain "n" is set to 3. A maximum of up to 63 devices can be connected in this manner.

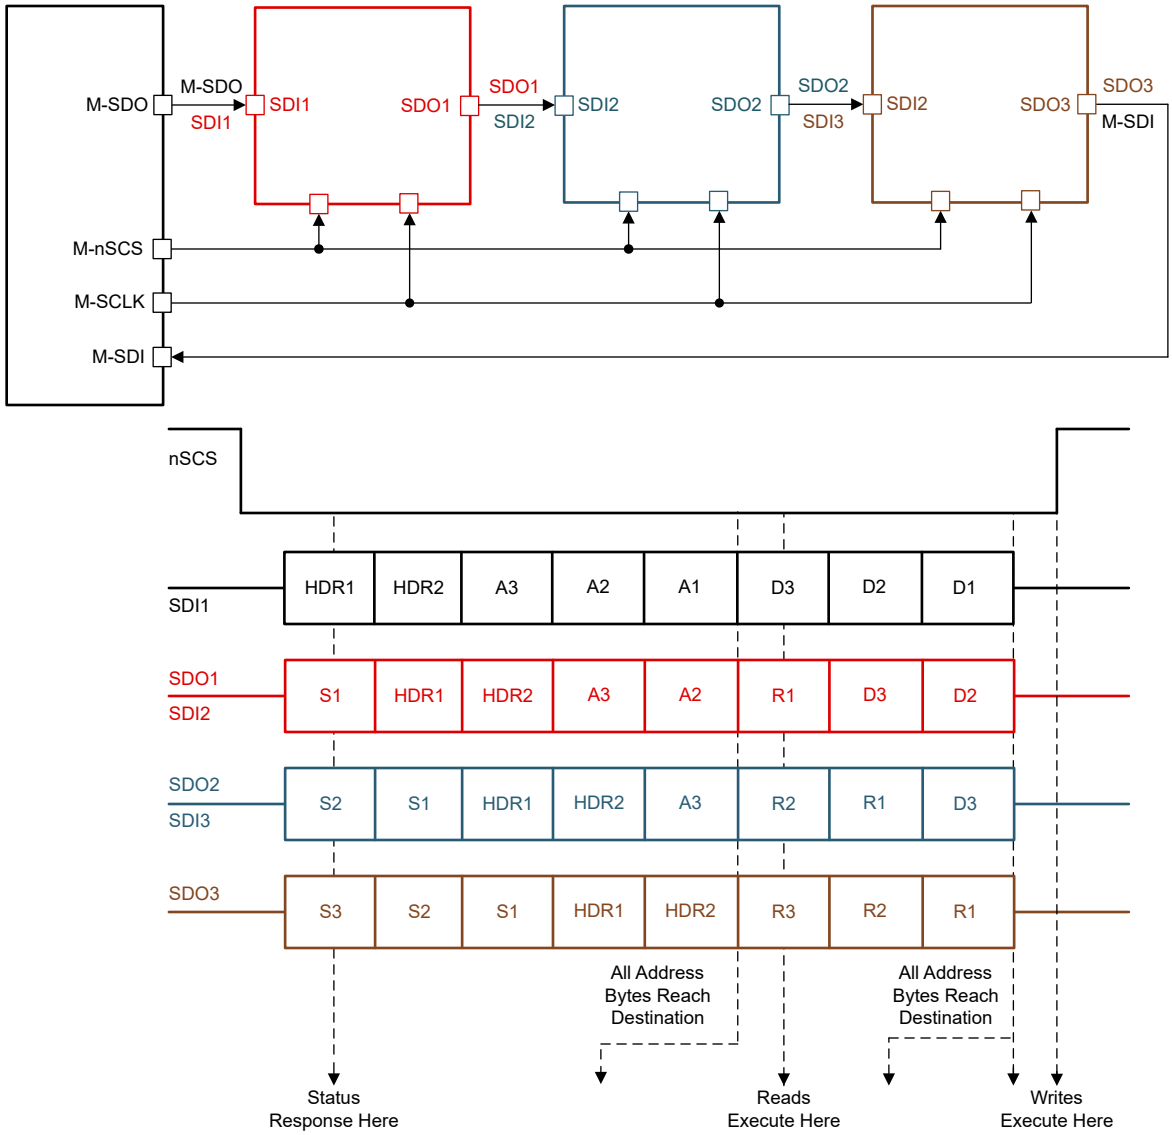

Figure 7-11. Daisy Chain SPI Operation

The SDI sent by the controller in this case would be in the following format (see SDI1 in Figure 7-11):

- 2 bytes of header (HDR1, HDR2)
- "n" bytes of command byte starting with furthest peripheral in the chain (for this example, this is A3, A2, A1)
- "n" bytes of data byte starting with furthest peripheral in the chain (for this example, this is D3, D2, D1)
- Total of 2 x "n" + 2 bytes

While the data is being transmitted through the chain, the controller receives it in the following format (see SDO3 in Figure 7-11):

- 3 bytes of status byte starting with furthest peripheral in the chain (for this example, this is S3, S2, S1)
- 2 bytes of header that were transmitted before (HDR1, HDR2)

- 3 bytes of report byte starting with furthest peripheral in the chain (for this example, this is R3, R2, R1)

The Header bytes are special bytes asserted at the beginning of a daisy chain SPI communication. **Header bytes must start with 1 and 0 for the two leading bits.**

The first header byte (HDR1) contains information of the total number of peripheral devices in the daisy chain. N5 through N0 are 6 bits dedicated to show the number of device in the chain as shown in Figure 7-12. Up to 63 devices can be connected in series per daisy chain connection. Number of peripheral = 0 is not permitted and will result in a SPI_ERR flag.

The second header byte (HDR2) contains a global CLR FAULT command that will clear the fault registers of all the devices on the rising edge of the chip select (nSCS) signal. The 5 trailing bits of the HDR2 register are marked as SPARE (don't care bits). These can be used by the MCU to determine integrity of the daisy chain connection.

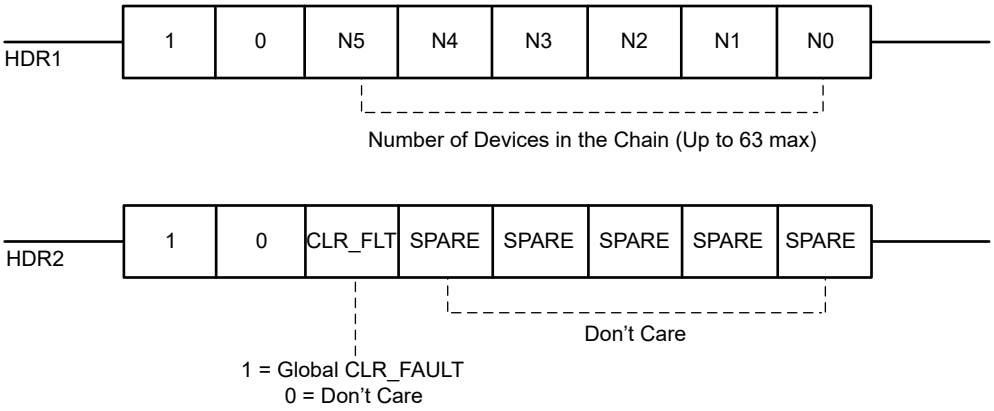

Figure 7-12. Header bytes

In addition, the device recognizes bytes that start with 1 and 1 for the two leading bits as a "pass" byte. These "pass" bytes are NOT processed by the device, but they are simply transmitted out on SDO in the following byte.

When data passes through a device, it determines the position of itself in the chain by counting the number of Status bytes it receives following by the first Header byte. For example, in this 3 device configuration, device 2 in the chain will receive two status bytes before receiving the two header bytes.

From the two status bytes it knows that its position is second in the chain, and from HDR1 byte it knows how many devices are connected in the chain. That way it only loads the relevant address and data byte in its buffer and bypasses the other bits. This protocol allows for faster communication without adding latency to the system for up to 63 devices in the chain.

The command, data, status and report bytes remain the same as described in the standard frame format.

8 Register Map - SPI Variant Only

This section describes the user configurable registers in the device.

Note

While the device allows register writes at any time SPI communication is available, it is recommended to exercise caution while updating registers in the ACTIVE state while the load is being driven. This is especially important for settings such as S_DIAG which control the critical device configuration. In order to prevent accidental register writes, the device offers a locking mechanism through the REG_LOCK bits in the COMMAND register to lock the contents of all configurable registers. Best practice would be to write all the configurable registers during initialization and then lock these settings. Run-time register writes for output control are handled by the SPI_IN register, which offers its own separate locking mechanism through the SPI_IN_LOCK bits.

8.1 User Registers

The following table lists all the registers that can be accessed by the user. All register addresses NOT listed in this table should be considered as "reserved" locations and access is blocked to this space. Accessing them will cause a SPI_ERR.

Table 8-1. User Registers

Name	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0	Type (2)	Addr
DEVICE_ID	DEV_ID[5]	DEV_ID[4]	DEV_ID[3]	DEV_ID[2]	DEV_ID[1]	DEV_ID[0]	REV_ID[1]	REV_ID[0]	R	00h
FAULT_SUMMARY	SPI_ERR(3)	POR	FAULT	VMOV	VMUV	OCP	TSD	VCPUV (3)	R	01h
STATUS1	OLA(6)	OLA(6)	ITRIP_CMP	ACTIVE	OCP_H(7)	OCP_L(8)	OCP_H(7)	OCP_L(8)	R	02h
STATUS2	DRVOFF_STAT	N/A(4)	N/A(4)	ACTIVE	N/A(4)	N/A(4)	N/A(4)	OLP_CMP	R	03h
COMMAND	CLR_FLT	N/A(4)	N/A(4)	SPI_IN_LOCK[1]	SPI_IN_LOCK[0] (1)	N/A(4)	REG_LOCK[1]	REG_LOCK[0] (1)	R/W	08h
SPI_IN	N/A(4)	N/A(4)	N/A(4)	N/A(4)	S_DRVOFF (1)	SPARE(5) (1)	SPARE(5)	S_IN	R/W	09h

(1) Defaulted to 1b on reset, others are defaulted to 0b on reset
(2) R = Read Only, R/W = Read/Write
(3) VCPUV replaced by SPI_ERR in the first SDO byte response, common to all SPI frames. Refer SDO - Standard frame format.
(4) N/A = Not available (read back of this bit will be 0b)
(5) SPARE = Don't care bits. These are available to USER as scratch bits.
(6) OLA is indicated if either of the two OLA bits is set
(7) OCP_L is indicated if either of the two OCP_L bits is set
(8) OCP_H is indicated if either of the two OCP_H bits is set

8.1.1 DEVICE_ID register (Address = 00h)

Return to the User Register table.

Device	DEVICE_ID value
DRV8143S-Q1	BAh
DRV8144S-Q1	CAh
DRV8145S-Q1	DAh
DRV8143P-Q1	BEh
DRV8145P-Q1	DEh

8.1.2 FAULT_SUMMARY Register (Address = 01h) [reset = 40h]

Return to the User Register table.

Bit	Field	Type	Reset	Description
7	SPI_ERR	R	0b	1b indicates that a SPI communication fault has occurred in the previous SPI frame.
6	POR	R	1b	1b indicates that a power-on-reset has been detected.
5	FAULT	R	0b	Logic OR of SPI_ERR, POR, VMOV, VMUV, OCP, TSD, OLA & VCPUV
4	VMOV	R	0b	1b indicates that a VM over voltage has been detected. Refer VMOV_SEL to change thresholds or disable diagnostic, VMOV_RETRY to configure fault reaction.
3	VMUV	R	0b	1b indicates that a VM under voltage has been detected.
2	OCP	R	0b	1b indicates that an over current has been detected in either one or more power FETs. Refer OCP_SEL, TOCP_SEL to change thresholds & filter times. Refer OCP_RETRY to configure fault reaction.
1	TSD	R	0b	1b indicates that an over temperature has been detected. Refer TSD_RETRY to configure fault reaction.
0	VCPUV	R	0b	1b indicates that a charge pump under voltage has been detected.

8.1.3 STATUS1 Register (Address = 02h) [reset = 00h]

Return to the User Register table.

Bit	Field	Type	Reset	Description
7	OLA	R	0b	1b indicates that an open load condition has been detected in the ACTIVE state on OUT
6	OLA	R	0b	1b indicates that an open load condition has been detected in the ACTIVE state on OUT
5	ITRIP_CMP	R	0b	1b indicates that load current has reached the ITRIP regulation level.
4	ACTIVE	R	0b	1b indicates that the device is in the ACTIVE state

Bit	Field	Type	Reset	Description
3	OCP_H	R	0b	1b indicates that an over current has been detected on the high-side FET (short to GND) on OUT
2	OCP_L	R	0b	1b indicates that an over current has been detected on the low-side FET (short to VM) on OUT
1	OCP_H	R	0b	1b indicates that an over current has been detected on the high-side FET (short to GND) on OUT
0	OCP_L	R	0b	1b indicates that an over current has been detected on the low-side FET (short to VM) on OUT

8.1.4 STATUS2 Register (Address = 03h) [reset = 80h]

Return to the User Register table.

Bit	Field	Type	Reset	Description
7	DRVOFF_STAT	R	1b	This bit shows the status of the DRVOFF pin. 1b implies the pin status is high.
6, 5	N/A	R	0b	Not available
4	ACTIVE	R	0b	1b indicates that the device is in the ACTIVE state (Copy of bit4 in STATUS1)
3, 2, 1	N/A	R	0b	Not available
0	OLP_CMP	R	0b	This bit is the output of the off-state diagnostics (OLP) comparator.

8.1.5 COMMAND Register (Address = 08h) [reset = 09h]

Return to the User Register table.

Bit	Field	Type	Reset	Description
7	CLR_FLT	R/W	0b	Clear Fault command - Write 1b to clear all faults reported in the fault registers and de-assert the nFAULT pin
6-5	N/A	R	0b	Not available
4-3	SPI_IN_LOCK	R/W	01b	Write 10b to **unlock** the SPI_IN register Write 01b or 00b or 11b to **lock** the SPI_IN register SPI_IN register is **locked** by default.
2	N/A	R	0b	Not available
1-0	REG_LOCK	R/W	01b	Write 10b to **lock** the CONFIG registers Write 01b or 00b or 11b to **unlock** the CONFIG registers CONFIG registers are **unlocked** by default.

8.1.6 SPI_IN Register (Address = 09h) [reset = 0Ch]

Return to the User Register table.

Bit	Field	Type	Reset	Description
7-4	N/A	R	0b	Not available
3	S_DRVOFF	R/W	1b	Register bit equivalent of DRVOFF pin when SPI_IN is unlocked. Refer Register Pin control section.
2-1	N/A	R	10b	Not available
0	S_IN	R/W	0b	Register bit equivalent of IN pin when SPI_IN is unlocked. Refer Register Pin control section

8.1.7 CONFIG1 Register (Address = 0Ah) [reset = 10h]

Return to the User Register table.

Bit	Field	Type	Reset	Description
7	EN_OLA	R/W	0b	Write 1b to enable open load detection in the active state. In Independent mode, OLA is always disabled for low-side load. Refer DIAG section.
6-5	VMOV_SEL	R/W	0b	Determines the thresholds for the VM over voltage diagnostics 00b = VM > 35V 01b = VM > 28V 10b = VM > 18V 11b = VMOV disabled
4	SSC_DIS	R/W	1b	0b: Enables the spread spectrum clocking feature
3	OCP_RETRY	R/W	0b	Write 1b to configure fault reaction to retry setting on the detection of over current, else the fault reaction is latched
2	TSD_RETRY	R/W	0b	Write 1b to configure fault reaction to retry setting on the detection of over temperature, else the fault reaction is latched
1	VMOV_RETRY	R/W	0b	Write 1b to configure fault reaction to retry setting on the detection of VMOV, else the fault reaction is latched. **Note** For the SPI (P) variant, this bit also controls the fault reaction for a VM under voltage detection.
0	OLA_RETRY	R/W	0b	Write 1b to configure fault reaction to retry setting on the detection of open load during active, else the fault reaction is latched.

8.1.8 CONFIG2 Register (Address = 0Bh) [reset = 00h]

Return to the User Register table.

Bit	Field	Type	Reset	Description
7	SPARE	R/W	0b	Don't care
6-5	S_DIAG	R/W	0b	Load type indication - refer to DIAG table
4-3	N/A	R	0b	Not available
2-0	S_ITRIP	R/W	0b	ITRIP level configuration - refer ITRIP table

8.1.9 CONFIG3 Register (Address = 0Ch) [reset = 40h]

Return to the User Register table.

Bit	Field	Type	Reset	Description
7-6	TOFF	R/W	1b	TOFF time used for ITRIP current regulation 00b = 20µsec 01b = 30µsec 10b = 40µsec 11b = 50µsec
5	N/A	R	0b	Not available
4-2	S_SR	R/W	0b	Slew Rate configuration - refer to Section 7.3.3.1
1-0	SPARE	R/W	0b	Don't care

8.1.10 CONFIG4 Register (Address = 0Dh) [reset = 04h]

Return to the User Register table.

Bit	Field	Type	Reset	Description
7-6	TOCP_SEL	R/W	0b	Filter time for over current detection configuration 00b = 6µsec 01b = 3µsec 10b = 1.5µsec 11b = Minimum (~0.2µsec)
5	N/A	R	0b	Not available

Bit	Field	Type	Reset	Description
4-3	OCP_SEL	R/W	0b	Threshold for over current detection configuration 00b = 100% setting 01b, 11b = 50% setting 10b = 75% setting
2	DRVOFF_SEL	R/W	1b	DRVOFF pin - register logic combination, when SPI_IN is unlocked 0b = OR 1b = AND
1	SPARE	R/W	0b	Don't care
0	IN_SEL	R/W	0b	IN pin - register logic combination, when SPI_IN is unlocked 0b = OR 1b = AND

9 Application and Implementation

Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

9.1 Application Information

The DRV814x-Q1 family of devices can be used in a variety of applications that require either a half-bridge or H-bridge power stage configuration. Common application examples include brushed DC motors, solenoids, and actuators. The device can also be utilized to drive many common passive loads such as LEDs, resistive elements, relays, etc. The application examples below will highlight how to use the device in bidirectional current control applications requiring an H-bridge driver and dual unidirectional current control applications requiring two half-bridge drivers.

9.1.1 Load Summary

summarizes the utility of the device features for different type of inductive loads.

Table 9-1. Load Summary Table

LOAD	Configuration		Device Feature		
	Device	Recirculation Path	Slew Rate control	Current sense	ITRIP regulation
Bi-directional motor or solenoid(1)	Full-Bridge with two DRV814x	High-side	Full range	Continuous	Not useful(3)
Bi-directional motor or solenoid(1)	Full-Bridge with two DRV814x	Low-side	Full range	Discontinuous(2)	Useful
Uni-directional motor or Low-side solenoid (one side connected to GND)	DRV814x	Low-side	Full range	Discontinuous(2)	Useful
High-side solenoid (one side connected to VM)	DRV814x	High-side	Full range	Not available, need external solution	

(1) Solenoid - clamping or quick demagnetization possible, but clamping level will be VM dependent
(2) Not sensed during recirculation and during OUT voltage slew times including t_{blank}
(3) SPI variant - Controller can poll ITRIP_CMP bit for external coordination between the two Half-Bridges

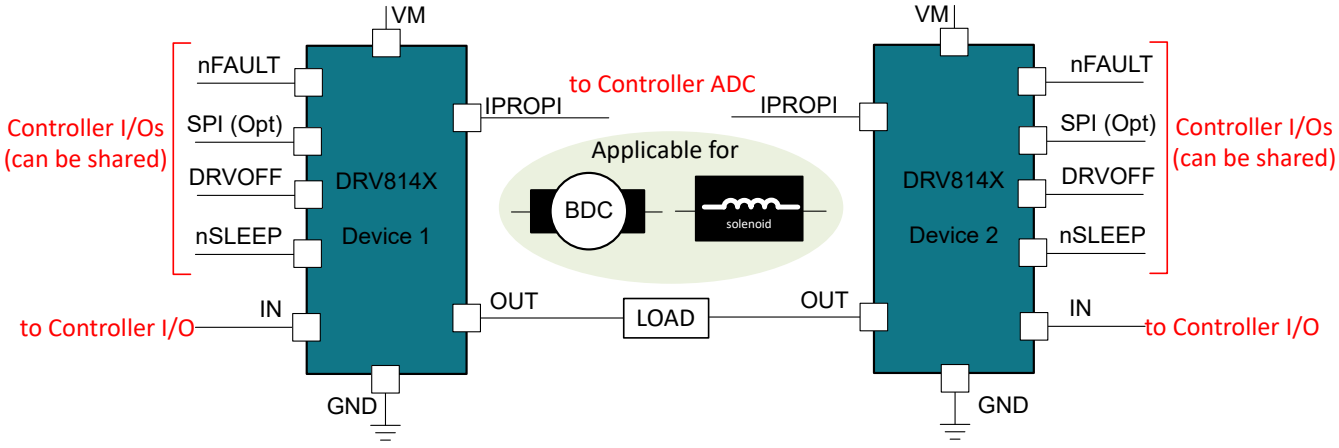

Figure 9-1. Illustration Showing a Full-Bridge Topology With Two DRV814X-Q1 Devices

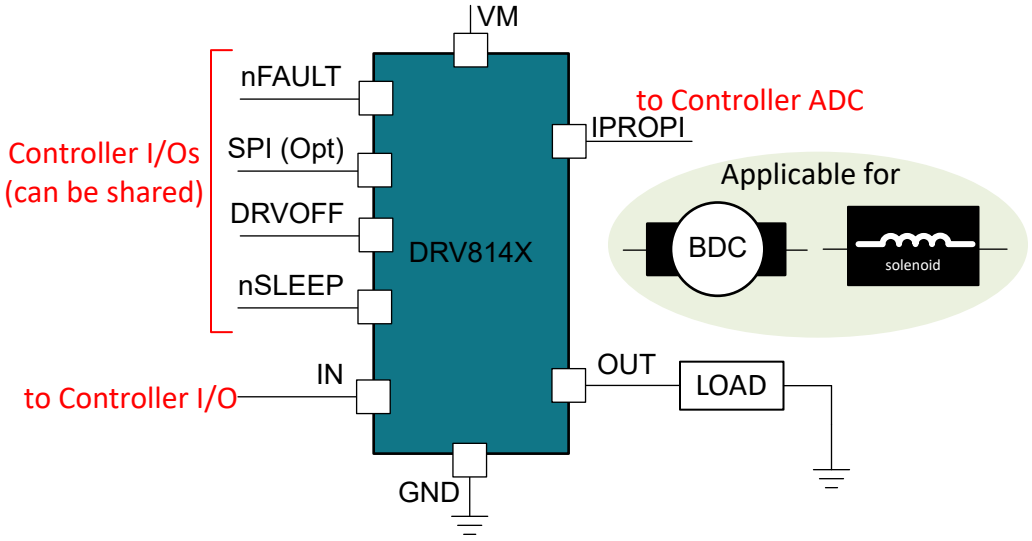

Figure 9-2. Illustration Showing a Half-Bridge Topology to Drive Low-side Load With DRV814X-Q1 Device

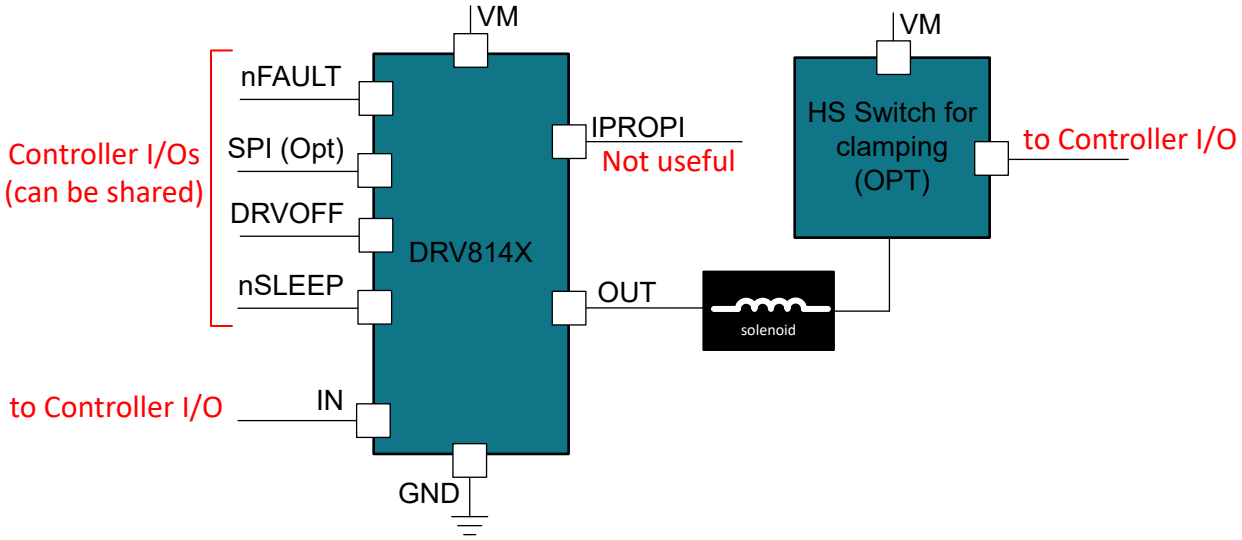

Figure 9-3. Illustration showing a Half-Bridge topology to drive high-side load with DRV814X-Q1 device

9.2 Typical Application

The figures below show the typical application schematic for driving a brushed DC motor or any inductive load. There are several optional connections shown in these schematics, which are listed as follows:

- nSLEEP pin
  - SPI (S) variant - This pin can be tied off high in the application if SLEEP function is not needed.
  - SPI (P) variant - N/A
  - HW (H) variant - Pin control is **mandatory** even if SLEEP function is not needed. The controller needs to issue a reset pulse (typical: 30µsec bounded between t_{reset} max and t_{sleep} min) during wake-up to acknowledge wake-up or power-up.
- DRVOFF pin
  - Both SPI (P) and SPI (S) variants - This pin can be tied off low in the application if shutoff through **pin** function is not needed. The equivalent register bit can be used.
- IN pin

  - Both SPI (P) and SPI (S) variants - This pin can be tied off low or left floating if register only control is needed.
- NC pin
  - All variants - This pin can be left floating or tied off low.
- OUT pin
  - Recommend to add a PCB footprint for capacitor from OUT to GND close to the load for EMC purposes.
- IPROPI pin
  - All variants - Monitoring of this output is optional. Also IPROPI pin can be tied low if ITRIP feature & IPROPI function is not needed. Recommend to add a PCB footprint for a small capacitor (10nF to 100nF) if needed.
- nFAULT pin
  - Both SPI (P) and SPI (S) variants - Monitoring of this output is optional. All diagnostic information can be read from the STATUS registers.
- SPI input pins
  - Both SPI (P) and SPI (S) variants - Inputs (SDI, nSCS, SCLK) are compatible with 3.3V / 5V levels.
- SPI SDO pin
  - SPI (S) variant - SDO tracks the nSLEEP pin voltage.
  - SPI (P) variant - SDO tracks the VDD pin voltage. To interface with a 3.3V level controller input, a level shifter or a current limiting series resistor is recommended.
- CONFIG pins
  - HW (H) variant - Resistor is not needed for short to GND and Hi-Z level selections
    - LVL1 and LVL6 for SR, ITRIP, DIAG pins

9.2.1 HW Variant

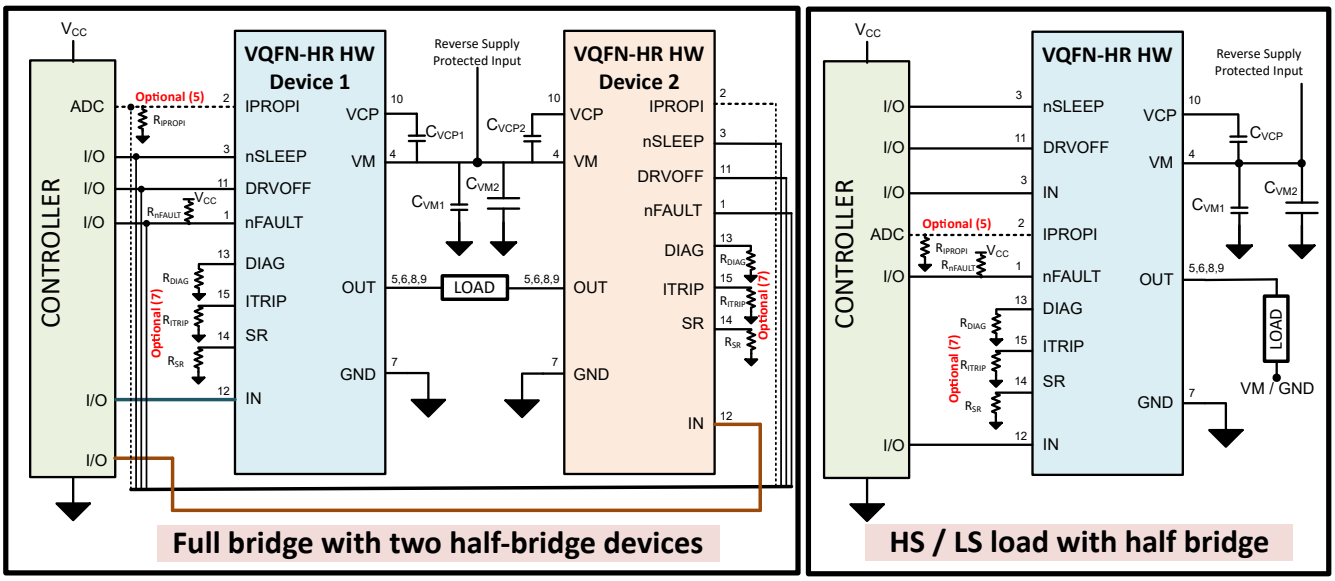

Figure 9-4. Typical Application schematic - HW variant in VQFN-HR package

9.2.2 SPI Variant

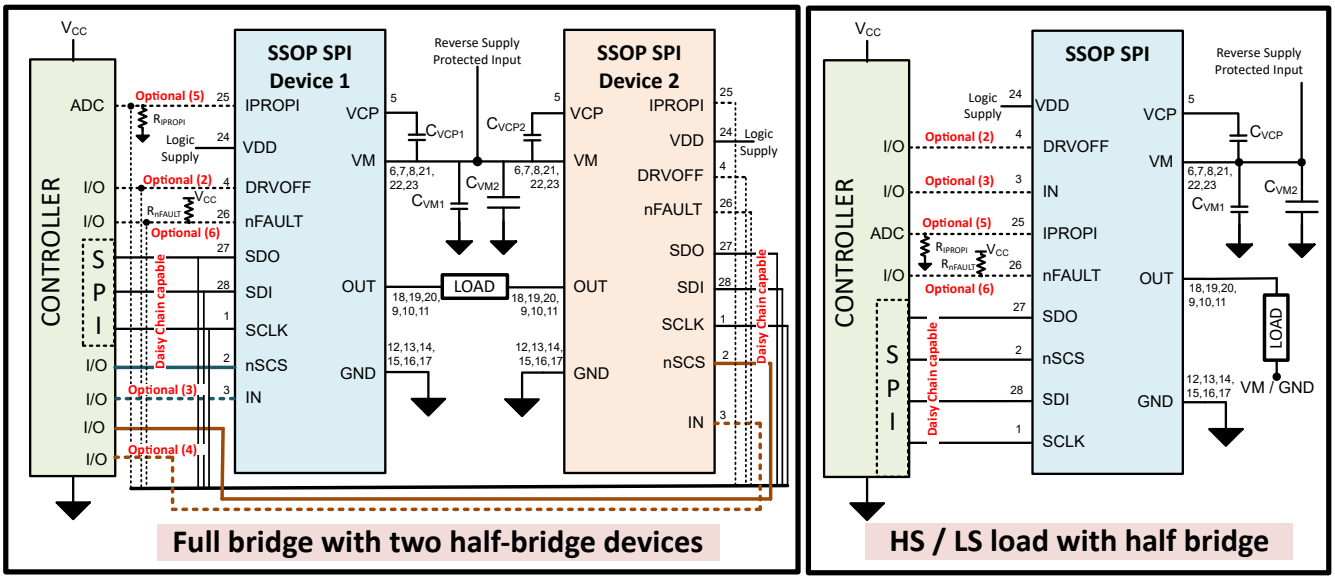

Figure 9-5. Typical Application Schematic - SPI (P) Variant in HTSSOP Package

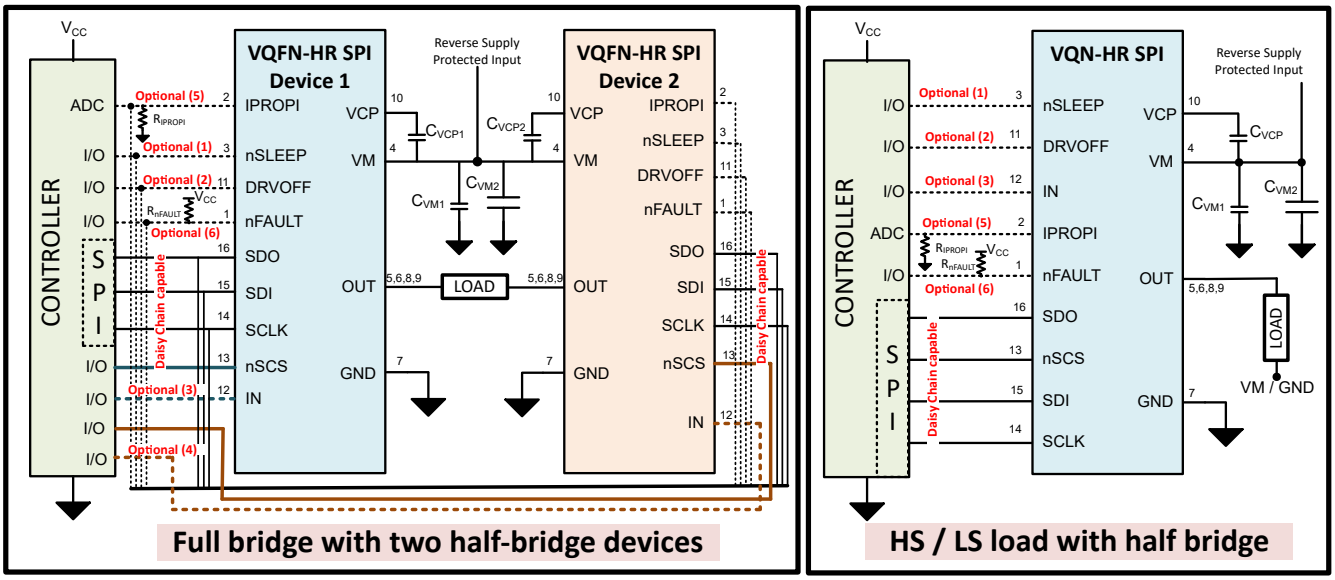

Figure 9-6. Typical Application Schematic - SPI (S) Variant in VQFN-HR Package

9.3 Power Supply Recommendations

The device is designed to operate with an input voltage supply (VM) range from 4.5V to 40V. A 0.1-µF ceramic capacitor rated for VM must be placed as close to the device as possible. Also, an appropriately sized bulk capacitor must be placed on the VM pin.

9.3.1 Bulk Capacitance Sizing

Bulk capacitance sizing is an important factor in motor drive system design. It is beneficial to have more bulk capacitance, while the disadvantages are increased cost and physical size.

The amount of local capacitance needed depends on a variety of factors including:

- The highest current required by the motor system.

- The capacitance of the power supply and the ability of the power supply to source current.
- The amount of parasitic inductance between the power supply and motor system.
- The acceptable voltage ripple.
- The type of motor used (brushed DC, brushless DC, and stepper).
- The motor braking method.

The inductance between the power supply and motor drive system limits the rate that current can change from the power supply. If the local bulk capacitance is too small, the system responds to excessive current demands or dumps from the motor with a change in voltage. When sufficient bulk capacitance is used, the motor voltage remains stable, and high current can be quickly supplied.

The data sheet provides a recommended value, but system-level testing is required to determine the appropriate sized bulk capacitor.

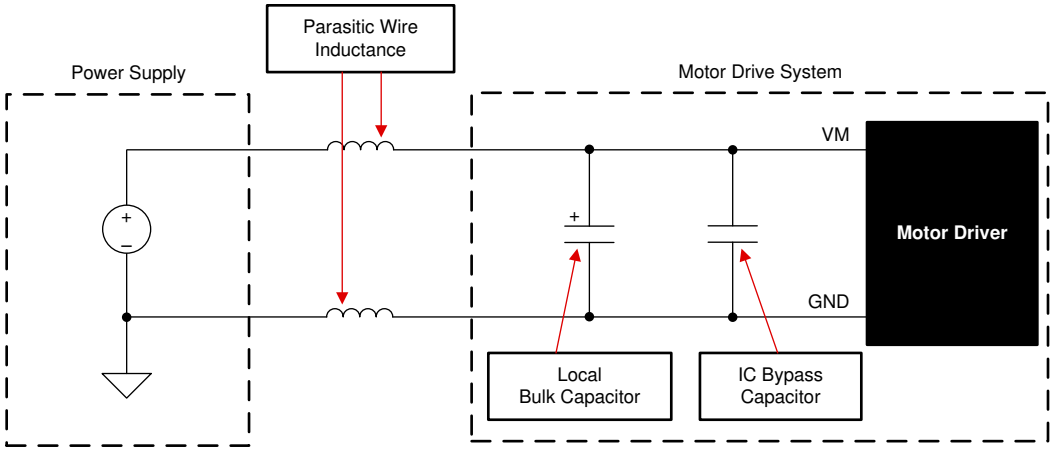

Figure 9-7. Example Setup of Motor Drive System With External Power Supply

The voltage rating for bulk capacitors should be higher than the operating voltage to provide a margin for cases when the motor transfers energy to the supply.

9.4 Layout

9.4.1 Layout Guidelines

Each VM pin must be bypassed to ground using low-ESR ceramic bypass capacitors with recommended values of 0.1µF rated for VM. These capacitors should be placed as close to the VM pins as possible with a thick trace or ground plane connection to the device GND pin.

Additional bulk capacitance is required to bypass the high current path. This bulk capacitance should be placed such that it minimizes the length of any high current paths. The connecting metal traces should be as wide as possible, with numerous vias connecting PCB layers. These practices minimize inductance and allow the bulk capacitor to deliver high current.

Place a low-ESR ceramic capacitor between the VCP and VM pins. This capacitor should be 1µF, rated for 6.3V, and be of type X5R or X7R.

For the SPI (P) device variant, VDD pin may be bypassed to ground using low-ESR ceramic 6.3V bypass capacitor with recommended values of 0.1µF.

9.4.2 Layout Example

The following figure shows a layout example for a 4cm X 4cm x 1.6mm, 4 layer PCB for a leaded package device. The 4 layers uses 2oz copper on top/ bottom signal layers and 1oz copper on internal supply layers, with 0.3mm thermal via drill diameter, 0.025mm Cu plating, 1mm minimum via pitch. The same layout can be adopted for the non-leaded VQFN-HR package as well. The Section 6.5.14 for the 4cm X 4cm X 1.6mm is based on a similar layout.

Note: The layout example shown is for a full-bridge topology using DRV814xQ1 device in VQFN-HR package.

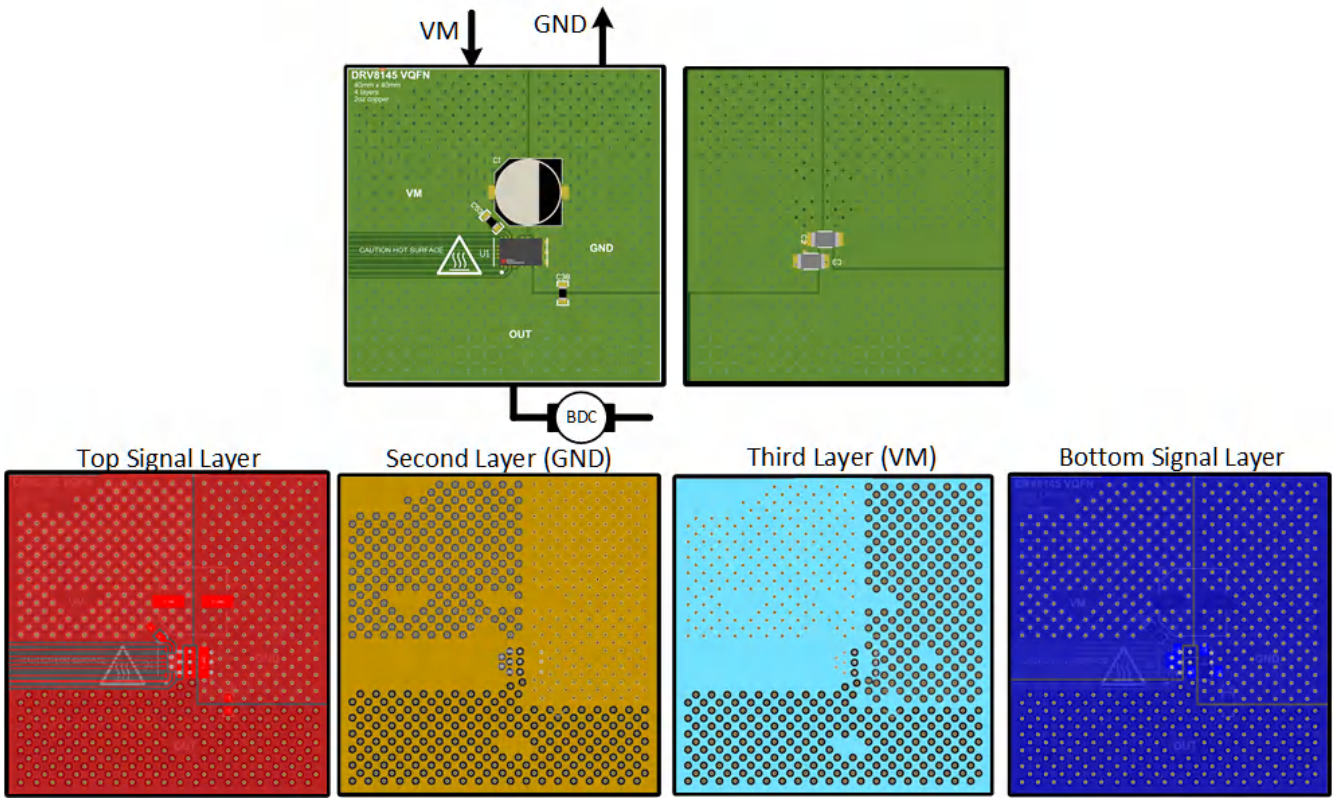

Figure 9-8. Layout example: 4cm x 4 cm x 1.6mm, 4 layer PCB

10 Device and Documentation Support

10.1 Documentation Support

10.1.1 Related Documentation

11 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

Changes from Revision A (June 2023) to Revision B (March 2024)	Page
• Added HVSSOP device package option for DRV8143H	3

Changes from Revision * (January 2023) to Revision A (June 2023)	Page
• EC table - Reduced I_{PD_OLA} lower limit from 1.75 mA to 0.36 mA	16

12 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and order-able information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
DRV8145HQRXZRQ1	ACTIVE	VQFN-HR	RXZ	16	3000	RoHS & Green	NIPDAU	Level-2-260C-1 YEAR	-40 to 125	DRV8145H	Samples
DRV8145PQPWPRQ1	ACTIVE	HTSSOP	PWP	28	2500	RoHS & Green	NIPDAU	Level-3-260C-168 HR	-40 to 125	DRV8145P	Samples
DRV8145SQRXZRQ1	ACTIVE	VQFN-HR	RXZ	16	3000	RoHS & Green	NIPDAU	Level-2-260C-1 YEAR	-40 to 125	DRV8145S	Samples

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".
RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.
Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.
