

## ISO724x High-Speed, Quad-Channel Digital Isolators

### 1 Features

- 25 and 150-Mbps Signaling Rate Options
  - Low Channel-to-Channel Output Skew; 1 ns Maximum
  - Low Pulse-Width Distortion (PWD); 2 ns Maximum
  - Low Jitter Content; 1 ns Typ at 150 Mbps
- Selectable Default Output (ISO7240CF)
- > 25-Year Life at Rated Working Voltage (see [High-Voltage Lifetime of the ISO72x Family of Digital Isolators](#) and [Isolation Capacitor Lifetime Projection](#))
- 4-kV ESD Protection
- Operates With 3.3-V or 5-V Supplies
- High Electromagnetic Immunity (see [ISO72x Digital Isolator Magnetic-Field Immunity](#))
- –40°C to +125°C Operating Temperature Range
- Safety-Related Certifications:
  - VDE 4000 V<sub>PK</sub> Basic Insulation per DIN V VDE V 0884-10 (VDE V 0884-10):2006-12
  - 2.5 kV<sub>RMS</sub> Insulation for 1 minute per UL 1577
  - CSA Component Acceptance Notice #5A and IEC 60950-1 End Equipment Standard

### 2 Applications

- Industrial Fieldbus
- Computer Peripheral Interface
- Servo Control Interface
- Data Acquisition

### 3 Description

The ISO7240x, ISO7241x, and ISO7242x devices are quad-channel digital isolators with multiple channel configurations and output-enable functions. These devices have logic-input and logic-output buffers separated by Texas Instrument's silicon-dioxide (SiO<sub>2</sub>) isolation barrier. Used in conjunction with isolated power supplies, these devices help block high voltage, isolate grounds, and prevent noise currents from entering the local ground and interfering with or damaging sensitive circuitry.

The ISO7240x family of devices has all four channels in the same direction. The ISO7241x family of devices has three channels in the same direction and one channel in the opposition direction. The ISO7242x family of devices has two channels in each direction.

## 4 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

Changes from Revision S (April 2016) to Revision T	Page
• Added isolation resistance for $100^{\circ}\text{C} \leq T_A \leq 125^{\circ}\text{C}$ in the <i>Insulation Specifications</i> table.....	11
• Deleted the maximum transient overvoltage from VDE in the <i>Safety-Related Certifications</i> table.....	11
• Added the <i>Receiving Notification of Documentation Updates</i> and the <i>Community Resources</i> section.....	33

Changes from Revision R (September 2015) to Revision S	Page
• Changed the HBM value from $\pm 4$ V to $\pm 4000$ V and the CDM value from $\pm 1$ V to $\pm 1000$ V in the <i>ESD Ratings</i> table.....	9
• Moved the device power dissipation parameter from the <i>Thermal Information</i> table to the <i>Power Dissipation Characteristics</i> table .....	10

Changes from Revision Q (January 2015) to Revision R	Page
• Changed <i>Features</i> From: "Basic Isolation per DIN EN 60747-5-5 (VDE 0884-5) & DIN EN 61010-1" To:"Basic Insulation per DIN V VDE V 0884-10 (VDE V 0884-10):2006-12" .....	1
• Changed $V_{CC1}$ To $V_{CC1}$ , $V_{CC2}$ To $V_{CCO}$ , GND1 To GNDI, and GND2 To GNDO, and added Notes 1 and 2 to the	

<i>Simplified Schematic</i> .....	1
• Changed the CTI Test Conditions From: IEC 60112/VDE 0303 Part 1 To: DIN EN 60112 (VDE 0303-11); IEC 60112 in the <i>Package Characteristics</i> table .....	11
• Changed section title From: <i>DIN EN 60747-5-5 Insulation Characteristics</i> To: <i>DIN V VDE V 0884-10 (VDE V 0884-10):2006-1 Insulation Characteristics</i> (.....	11
• Deleted C <sub>1</sub> - Input capacitance to ground from the <i>Package Characteristics</i> table .....	11
• Changed R <sub>S</sub> Test Conditions From: V <sub>IO</sub> = 500 V at T <sub>S</sub> To: V <sub>IO</sub> = 500 V at T <sub>S</sub> = 150°C in the <i>DIN V VDE V 0884-10 (VDE V 0884-10):2006-1 Insulation Characteristics</i> table .....	11
• Changed "DIN EN 60747-5-5 & DIN EN 61010-1" To: DIN V VDE V 0884-10 (VDE V 0884-10):2006-12 and DIN EN 61010-1 (VDE 0411-1): 2011-07 in the <i>Regulatory Information</i> table.....	11
• Changed title From: <i>IEC Safety Limiting Values</i> To: <i>Safety Limiting Values</i> .....	12
• Changed V <sub>OH</sub> MIN values From: V <sub>CC</sub> - 0.8 To: V <sub>CCO</sub> - 0.8 and V <sub>CC</sub> - 0.1 To: V <sub>CCO</sub> - 0.1 in the <i>Electrical Characteristics: V<sub>CC1</sub> and V<sub>CC2</sub> at 5-V Operation</i> .....	12
• Changed V <sub>OH</sub> Test Condition ISO7240 To: 3.3-V side and the MIN value From: V <sub>CC</sub> - 0.4 To V <sub>CCO</sub> -0.4 in the <i>Electrical Characteristics: V<sub>CC1</sub> at 5-V, V<sub>CC2</sub> at 3.3-V Operation</i> .....	13
• Changed V <sub>OH</sub> Test Condition ISO724x (5-V side) To: 5-V side and the MIN value From: V <sub>CC</sub> - 0.8 To: V <sub>CCO</sub> - 0.8 in the <i>Electrical Characteristics: V<sub>CC1</sub> at 5-V, V<sub>CC2</sub> at 3.3-V Operation</i> .....	13
• Changed V <sub>OH</sub> , Test Condition I <sub>OH</sub> = -20 µA MIN value From: V <sub>CC</sub> - 0.1 To V <sub>CCO</sub> - 0.1 in the <i>lectrical Characteristics: V<sub>CC1</sub> at 5-V, V<sub>CC2</sub> at 3.3-V Operation</i> .....	13
• Changed V <sub>OH</sub> Test Condition ISO7240 To: 3.3-V side and the MIN value From: V <sub>CC</sub> - 0.4 To V <sub>CCO</sub> -0.4 in the <i>Electrical Characteristics: V<sub>CC1</sub> at 3.3-V, V<sub>CC2</sub> at 5-V Operation</i> .....	14
• Changed V <sub>OH</sub> Test Condition ISO724x (5-V side) To: 5-V side and the MIN value From: V <sub>CC</sub> - 0.8 To: V <sub>CCO</sub> - 0.8 in the <i>Electrical Characteristics: V<sub>CC1</sub> at 3.3-V, V<sub>CC2</sub> at 5-V Operation</i> .....	14
• Changed V <sub>OH</sub> , Test Condition I <sub>OH</sub> = -20 µA MIN value From: V <sub>CC</sub> - 0.1 To V <sub>CCO</sub> - 0.1 in the <i>Electrical Characteristics: V<sub>CC1</sub> at 3.3-V, V<sub>CC2</sub> at 5-V Operation</i> .....	14
• Changed V <sub>OH</sub> MIN values From: V <sub>CC</sub> - 0.4 To: V <sub>CCO</sub> - 0.4 and V <sub>CC</sub> - 0.1 To: V <sub>CCO</sub> - 0.1 in the <i>Electrical Characteristics: V<sub>CC1</sub> and V<sub>CC2</sub> at 3.3 V Operation</i> .....	15
• Changed <a href="#">Figure 2</a> title From: <i>Thermal Derating Curve per DIN EN 60747-5-5</i> To: <i>Thermal Derating Curve per VDE</i> .....	18
• Changed V <sub>CC1</sub> To: V <sub>CC1</sub> and V <sub>CC2</sub> To: V <sub>CCO</sub> in Common-Mode Transient Immunity Test Circuit and Voltage Waveform ...	23

**Changes from Revision P (August 2014) to Revision Q**

• Changed the V <sub>I</sub> MAX value in the <i>Absolute Maximum Ratings</i> table From: 6 V To: V <sub>CC</sub> + 0.5 V .....	9
• Added Note 3 to the <i>Absolute Maximum Ratings</i> table.....	9
• Moved T <sub>STG</sub> - Storage From the <i>ESD Ratings</i> table to the <i>Absolute Maximum Ratings</i> table .....	9
• Changed the <i>Handling Rating</i> table to the <i>ESD Ratings</i> table. ....	9
• Added one row to the <i>ISO7240CF Functions Table</i> table. Values: X, PD, X, X, X, Undetermined .....	25
• Added one row to the <i>Device Function Table ISO724x</i> table. Values: X, PD, X, X, Undetermined .....	25
• Changed the <i>Device I/O Schematics</i> labels From: "ISO7240CF Input" To: "ISO7240CF Input, Disable" and From: "Enable" To: "Enable, Control" .....	26

**Changes from Revision O (November 2012) to Revision P**
**Page**

• Added <i>Pin Configuration and Functions</i> section, <i>Handling Rating</i> table, <i>Feature Description</i> section, <i>Device Functional Modes</i> , <i>Application and Implementation</i> section, <i>Power Supply Recommendations</i> section, <i>Layout</i> section, <i>Device and Documentation Support</i> section, and <i>Mechanical, Packaging, and Orderable Information</i> section .....	1
• Changed ISO7241C minimum supply from 2.8 V to 3.15 V .....	9

**Changes from Revision N (January 2012) to Revision O** **Page**

- Added the *Safety Limiting Values* section ..... 12

**Changes from Revision M (January 2011) to Revision N** **Page**

- Changed Feature From: Operates 3.3-V or 5-V Supplies To: Operates With 2.8-V (ISO7241C), 3.3-V or 5-V Supplies ..... 1
- Added device options to  $V_{CC}$  in the RECOMMENDED OPERATING CONDITIONS table ..... 9
- Changed Table Note (1) ..... 9
- Changed the CTI MIN value From:  $\geq 175$  V To:  $\geq 400$  V ..... 11
- Changed the *Regulatory Information* table ..... 11
- Changed Table Note (1) ..... 12
- Changed  $I_{CC1}$  and  $I_{CC2}$  test conditions in the  $V_{CC1}$  and  $V_{CC2}$  at 5-V *Electrical Characteristics:  $V_{CC1}$  and  $V_{CC2}$  at 5-V Operation* table ..... 12
- Changed Table Note (1) ..... 13
- Changed  $I_{CC1}$  and  $I_{CC2}$  test conditions in the  $V_{CC1}$  at 5-V,  $V_{CC2}$  at 3.3-V *Electrical Characteristics:  $V_{CC1}$  at 5-V,  $V_{CC2}$  at 3.3-V Operation* table ..... 13
- Changed Table Note (1) ..... 14
- Changed  $I_{CC1}$  and  $I_{CC2}$  test conditions in the  $V_{CC1}$  at 3.3-V,  $V_{CC2}$  at 5-V *Electrical Characteristics:  $V_{CC1}$  at 3.3-V,  $V_{CC2}$  at 5-V Operation* table ..... 14
- Changed Table Note (1) ..... 15
- Added ELECTRICAL and Switching CHARACTERISTICS tables for  $V_{CC1}$  and  $V_{CC2}$  at 2.8V (ISO722xC-only) ..... 15
- Changed  $I_{CC1}$  and  $I_{CC2}$  test conditions in the  $V_{CC1}$  and  $V_{CC2}$  at 3.3 V table ..... 15
- Changed  $V_{CC}$  *Undervoltage Threshold vs Free-Air Temperature* From  $V_{CC1}$  Failsafe Threshold To:  $V_{CC}$  Undervoltage Threshold ..... 19

**Changes from Revision L (January 2010) to Revision M** **Page**

- Changed the CSA File Number From: 1698195 To: 220991 ..... 11
- Changed Switching Characteristic Test Circuit and Voltage Waveforms, Failsafe Delay Time Test Circuit and Voltage Waveforms, and Wake Time From Input Disable Test Circuit and Voltage Waveforms ..... 21

**Changes from Revision K (December 2009) to Revision L** **Page**

## 5 Description (Continued)

The devices with the C suffix (C option) have TTL input thresholds and a noise-filter at the input that prevents transient pulses from being passed to the output of the device. The devices with the M suffix (M option) have CMOS  $V_{CC}/2$  input thresholds and do not have the input noise filter or the additional propagation delay.

The ISO7240CF device has an input disable function on pin 7, and a selectable high or low failsafe-output function with the CTRL pin (pin 10). The failsafe output is a logic high when a logic high is placed on the CTRL pin or it is left unconnected. If a logic low signal is applied to the CTRL pin, the failsafe output becomes a logic-low output state. The input disable function of the ISO7240CF device prevents data from being passed across the isolation barrier to the output. When the inputs are disabled or  $V_{CC1}$  is powered down, the outputs are set by the CTRL pin.

These devices can be powered from 3.3-V or 5-V supplies on either side, in any combination. The signal input pins are 5-V tolerant regardless of the voltage supply level that is used.

These devices are characterized for operation over the ambient temperature range of  $-40^{\circ}\text{C}$  to  $+125^{\circ}\text{C}$ .

## 7 Specifications

### 7.1 Absolute Maximum Ratings

 See <sup>(1)</sup>

		MIN	MAX	UNIT
$V_{CC}$	Supply voltage <sup>(2)</sup> , $V_{CC1}$ , $V_{CC2}$	-0.5	6	V
$V_I$	Voltage at IN, OUT, EN, DISABLE, CTRL	-0.5	$V_{CC} + 0.5$ <sup>(3)</sup>	V
$I_O$	Output current	-15	15	mA
$T_J$	Maximum junction temperature		170	°C
$T_{stg}$	Storage temperature	-65	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) All voltage values are with respect to network ground terminal and are peak voltage values.
- (3) Maximum voltage must not exceed 6 V.

### 7.2 ESD Ratings

		VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001 <sup>(1)</sup>	±4000
		Charged device model (CDM), per JEDEC specification JESD22-C101 <sup>(2)</sup>	±1000
		Machine model (MM), per ANSI/ESDS5.2-1996	±200

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

- (1) Creepage and clearance requirements should be applied according to the specific equipment isolation standards of an application. Care should be taken to maintain the creepage and clearance distance of a board design to ensure that the mounting pads of the isolator on the printed-circuit board do not reduce this distance. Creepage and clearance on a printed-circuit board become equal in certain cases. Techniques such as inserting grooves and/or ribs on a printed circuit board are used to help increase these specifications.
- (2) This coupler is suitable for *basic electrical insulation* only within the maximum operating ratings. Compliance with the safety ratings shall be ensured by means of suitable protective circuits.
- (3) Apparent charge is electrical discharge caused by a partial discharge (pd).
- (4) All pins on each side of the barrier tied together creating a two-terminal device

## 7.8 Safety Limiting Values

Safety limiting<sup>(1)</sup> intends to minimize potential damage to the isolation barrier upon failure of input or output circuitry. A failure of the I/O can allow low resistance to ground or the supply and, without current limiting, dissipate sufficient power to overheat the die and damage the isolation barrier, potentially leading to secondary system failures.

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
I <sub>S</sub> Safety input, output, or supply current	R <sub>θJA</sub> = 168°C/W, V <sub>I</sub> = 5.5 V, T <sub>J</sub> = 170°C, T <sub>A</sub> = 25°C, see <a href="#">Figure 2</a>			156	mA
	R <sub>θJA</sub> = 168°C/W, V <sub>I</sub> = 3.6 V, T <sub>J</sub> = 170°C, T <sub>A</sub> = 25°C, see <a href="#">Figure 2</a>			239	
T <sub>S</sub> Safety temperature				150	°C

- (1) The safety-limiting constraint is the maximum junction temperature specified in the data sheet. The power dissipation and junction-to-air thermal impedance of the device installed in the application hardware determines the junction temperature. The assumed junction-to-air thermal resistance in the [Thermal Information](#) table is that of a device installed on a high-K test board for leaded surface-mount packages. The power is the recommended maximum input voltage times the current. The junction temperature is then the ambient temperature plus the power times the junction-to-air thermal resistance.

## 9 Detailed Description

### 9.1 Overview

The isolator in Figure 17 is based on a capacitive isolation-barrier technique. The I/O channel of the device consists of two internal data channels, a high-frequency channel (HF) with a bandwidth from 100 kbps up to 150 Mbps, and a low-frequency channel (LF) covering the range from 100 kbps down to DC. In principle, a single-ended input signal entering the HF-channel is split into a differential signal through the inverter gate at the input. The following capacitor-resistor networks differentiate the signal into transients, which then are converted into differential pulses by two comparators. The comparator outputs drive a NOR-gate flip-flop the output of which feeds an output multiplexer. A decision logic (DCL) at the driving output of the flip-flop measures the durations between signal transients. If the duration between two consecutive transients exceeds a certain time limit, as in the case of a low-frequency signal, the DCL forces the output-multiplexer to switch from the high- to the low-frequency channel.

Because low-frequency input signals require the internal capacitors to assume prohibitively large values, these signals are pulse-width modulated (PWM) with the carrier frequency of an internal oscillator, thus creating a sufficiently high frequency signal, capable of passing the capacitive barrier. As the input is modulated, a low-pass filter (LPF) is required to remove the high-frequency carrier from the actual data before passing it on to the output multiplexer.

## 10 Application and Implementation

### NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### 10.1 Application Information

The ISO724xx family of devices uses a single-ended TTL or CMOS-logic switching technology. The supply voltage range is from 3.15 V to 5.5 V for both supplies,  $V_{CC1}$  and  $V_{CC2}$ . When designing with digital isolators, keep in mind that because of the single-ended design structure, digital isolators do not conform to any specific interface standard and are only intended for isolating single-ended CMOS or TTL digital signal lines. The isolator is typically placed between the data controller (that is,  $\mu C$  or UART), and a data converter or a line transceiver, regardless of the interface type or standard.

### 10.2 Typical Application

#### 10.2.1 Isolated Data Acquisition System for Process Control

The ISO724xx family of devices can be used with Texas Instruments' precision analog-to-digital converter and mixed signal microcontroller to create an advanced isolated data acquisition system as shown in Figure 19.

#### 10.2.1.1 Design Requirements

Unlike optocouplers, which require external components to improve performance, provide bias, or limit current, the ISO724x family of devices only require two external bypass capacitors to operate.

## 11 Power Supply Recommendations

To help ensure reliable operation at data rates and supply voltages, a 0.1- $\mu$ F bypass capacitor is recommended at input and output supply pins (VCC1 and VCC2). The capacitors should be placed as close to the supply pins as possible. If only a single primary-side power supply is available in an application, isolated power can be generated for the secondary-side with the help of a transformer driver such as Texas Instruments' [SN6501](#) device. For such applications, detailed power supply design and transformer selection recommendations are available in [SN6501 Transformer Driver for Isolated Power Supplies](#).

## 12 Layout

### 12.1 Layout Guidelines

A minimum of four layers is required to accomplish a low EMI PCB design (see [Figure 28](#)). Layer stacking should be in the following order (top-to-bottom): high-speed signal layer, ground plane, power plane and low-frequency signal layer.

- Routing the high-speed traces on the top layer avoids the use of vias (and the introduction of their inductances) and allows for clean interconnects between the isolator and the transmitter and receiver circuits of the data link.
- Placing a solid ground plane next to the high-speed signal layer establishes controlled impedance for transmission line interconnects and provides an excellent low-inductance path for the return current flow.
- Placing the power plane next to the ground plane creates additional high-frequency bypass capacitance of approximately 100 pF/in<sup>2</sup>.
- Routing the slower speed control signals on the bottom layer allows for greater flexibility as these signal links usually have margin to tolerate discontinuities such as vias.

If an additional supply voltage plane or signal layer is needed, add a second power or ground plane system to the stack to keep it symmetrical. This makes the stack mechanically stable and prevents it from warping. Also the power and ground plane of each power system can be placed closer together, thus increasing the high-frequency bypass capacitance significantly.

For detailed layout recommendations, refer to [Digital Isolator Design Guide](#).

#### 12.1.1 PCB Material

For digital circuit boards operating at less than 150 Mbps, (or rise and fall times greater than 1 ns), and trace lengths of up to 10 inches, use standard FR-4 UL94V-0 printed circuit board. This PCB is preferred over cheaper alternatives because of lower dielectric losses at high frequencies, less moisture absorption, greater strength and stiffness, and the self-extinguishing flammability-characteristics.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
