

LV14540 SIMPLE SWITCHER® Power Converter 40V, 5A, 2MHz Step-Down Converter

1 Features

- 4V to 40V input range
- 5A continuous output current
- 100mΩ high-side MOSFET
- Minimum on time: 100ns
- Current mode control
- Adjustable switching frequency from 200kHz to 2MHz
- Frequency synchronization to external clock
- Internal compensation for ease of use
- High duty cycle operation supported
- Precision enable input
- 1µA shutdown current
- Thermal, overvoltage and short protection
- 8-pin HSOIC with PowerPAD™ integrated circuit package

2 Applications

- Automotive battery regulation
- Industrial power supplies
- Telecom and datacom systems
- Battery powered systems

Simplified Schematic

3 Description

The LV14540 is a 40V, 5A, step-down regulator with an integrated high-side MOSFET. With a wide input range from 4V to 40V, the device is designed for various applications from industrial to automotive for power conditioning from unregulated sources. A wide adjustable switching frequency range allows either efficiency or external component size to be optimized. Internal loop compensation means that the user is free from the tedious task of loop compensation design. Internal loop compensation also minimizes the external components of the device. A precision enable input allows simplification of regulator control and system power sequencing. The device also has built-in protection features such as cycle-by-cycle current limit, thermal sensing and shutdown due to excessive power dissipation, and output overvoltage protection.

Package Information

4 Pin Configuration and Functions

Figure 4-1. 8-Pin HSOIC DDA Package (Top View)

Table 4-1. Pin Functions

PIN		TYPE ⁽¹⁾	DESCRIPTION
NAME	NO.		
BOOT	1	P	Bootstrap capacitor connection for high-side MOSFET driver. Connect a high quality 0.1 μ F capacitor from BOOT to SW.
VIN	2	P	Connect to power supply and bypass capacitors C _{IN} . Path from VIN pin to high frequency bypass C _{IN} and GND must be as short as possible.
EN	3	A	Enable pin, with internal pullup current source. Pull below 1.2V to disable. Float or connect to VIN to enable. Adjust the input undervoltage lockout with two resistors. See the Enable and Adjustable Undervoltage Lockout section.
RT/SYNC	4	A	Resistor Timing or External Clock input. An internal amplifier holds this pin at a fixed voltage when using an external resistor to ground to set the switching frequency. If the pin is pulled above the PLL upper threshold, a mode change occurs and the pin becomes a synchronization input. The internal amplifier is disabled and the pin is a high impedance clock input to the internal PLL. If clocking edges stop, the internal amplifier is re-enabled and the operating mode returns to frequency programming by resistor.
FB	5	A	Feedback input pin, connect to the feedback divider to set V _{OUT} . Do not short this pin to ground during operation.
SS	6	A	Soft-start control pin. Connect to a capacitor to set soft-start time.
GND	7	G	System ground pin
SW	8	P	Switching output of the regulator. Internally connected to high-side power MOSFET. Connect to power inductor.
Thermal Pad	9	G	Major heat dissipation path of the die. Must be connected to ground plane on PCB.

(1) A = Analog, P= Power, G = Ground

5 Specifications

5.1 Absolute Maximum Ratings

Over junction temperature range of -40°C to $+150^{\circ}\text{C}$ (unless otherwise noted) ⁽¹⁾

		MIN	MAX	UNIT
Input voltages	VIN, EN to GND	-0.3	45	V
	BOOT to GND	-0.3	50	
	SS to GND	-0.3	5	
	FB to GND	-0.3	5.5	
	RT/SYNC to GND	-0.3	3.6	
Output voltages	BOOT to SW		5.5	V
	SW to GND	-3	45	
T _J	Junction temperature	-40	150	$^{\circ}\text{C}$
T _{stg}	Storage temperature	-65	150	$^{\circ}\text{C}$

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

5.2 ESD Ratings

			VALUE	UNIT
V _(ESD)	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	± 2000	V
		Charged device model (CDM), per JEDEC specification JESD22-C101 ⁽²⁾	± 500	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
 (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

5.3 Recommended Operating Conditions

Over the recommended operating junction temperature range of -40°C to 125°C (unless otherwise noted)

		MIN	MAX	UNIT
Buck regulator	VIN	4	40	V
	VOUT	0.8	32	
	BOOT		45	
	SW	-1	40	
	FB	0	5	
Control	EN	0	40	V
	RT/SYNC	0	3.3	
	SS	0	3	
Frequency	Switching frequency range at RT mode	200	2000	kHz
	Switching frequency range at SYNC mode	250	2000	
Temperature	Operating junction temperature, T _J	-40	125	$^{\circ}\text{C}$

5.4 Thermal Information

THERMAL METRIC ⁽¹⁾		LV14540	UNIT
		DDA (HSOIC)	
		8 PINS	
R _{θJA}	Junction-to-ambient thermal resistance	43.2	°C/W
Ψ _{JT}	Junction-to-top characterization parameter	5.2	
Ψ _{JB}	Junction-to-board characterization parameter	16.4	
R _{θJC(top)}	Junction-to-case (top) thermal resistance	52.1	
R _{θJC(bot)}	Junction-to-case (bottom) thermal resistance	7.8	
R _{θJB}	Junction-to-board thermal resistance	16.4	

(1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.

5.5 Electrical Characteristics

Limits apply over the recommended operating junction temperature (T_J) range of –40°C to +125°C, unless otherwise stated. Minimum and Maximum limits are specified through test, design or statistical correlation. Typical values represent the most likely parametric norm at T_J = 25°C, and are provided for reference purposes only. Unless otherwise specified, the following conditions apply: V_{IN} = 4 V to 40 V.

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
POWER SUPPLY (VIN PIN)						
V _{IN}	Operation input voltage		4		40	V
UVLO	Undervoltage lockout thresholds	Rising threshold	3.5	3.7	3.9	V
		Hysteresis		285		mV
I _{SHDN}	Shutdown supply current	V _{EN} = 0 V, T _J = 25°C, 4.0 V ≤ V _{IN} ≤ 40 V		1	3.0	μA
I _Q	Operating quiescent current (non-switching)	V _{FB} = 1.0 V, T _J = 25°C		300		μA
ENABLE (EN PIN)						
V _{EN_TH}	EN threshold voltage		1.05	1.20	1.38	V
I _{EN_PIN}	EN PIN current	Enable threshold +50 mV		–4.6		μA
		Enable threshold –5 mV		–1.0		
I _{EN_HYS}	EN hysteresis current			–3.6		μA
EXTERNAL SOFT-START						
I _{SS}	SS pin current	T _A = 25°C		3		μA
VOLTAGE REFERENCE (FB PIN)						
V _{FB}	Feedback voltage	T _J = 25°C	0.744	0.750	0.756	V
		T _J = –40°C to 125°C	0.735	0.750	0.765	V
HIGH-SIDE MOSFET						
R _{DS_ON}	On-resistance	V _{IN} = 12 V		100	180	mΩ
High-side MOSFET CURRENT LIMIT						
I _{LIMIT}	Current limit	V _{IN} = 12 V, T _A = 25°C, Open Loop	6.2	7.9	9.7	A
THERMAL PERFORMANCE						
T _{SHDN}	Thermal shutdown threshold			170		°C
T _{HYS}	Hysteresis			12		

5.6 Switching Characteristics

Over the recommended operating junction temperature range of -40°C to 125°C (unless otherwise noted)

PARAMETER		TEST CONDITION	MIN	TYP	MAX	UNIT
f_{SW}	Switching frequency	$R_{\text{T}} = 49.9 \text{ k}\Omega$, 1% accuracy	400	500	600	kHz
$V_{\text{SYNC_HI}}$	SYNC clock high level threshold		1.7			V
$V_{\text{SYNC_LO}}$	SYNC clock low level threshold		0.5			
$T_{\text{SYNC_MIN}}$	Minimum SYNC input pulse width	Measured at 500 kHz, $V_{\text{SYNC_HI}} > 3 \text{ V}$, $V_{\text{SYNC_LO}} < 0.3 \text{ V}$	30			ns
$T_{\text{LOCK_IN}}$	PLL lock in time	Measured at 500 kHz	100			μs
$T_{\text{ON_MIN}}$	Minimum controllable on time	$V_{\text{IN}} = 12 \text{ V}$, $I_{\text{Load}} = 1 \text{ A}$	100			ns
D_{MAX}	Maximum duty cycle	$f_{\text{SW}} = 200 \text{ kHz}$	97%			%

5.7 Typical Characteristics

Unless otherwise specified the following conditions apply: $V_{IN} = 12\text{ V}$, $f_{SW} = 300\text{ kHz}$, $L = 6.5\ \mu\text{H}$, $C_{OUT} = 47\ \mu\text{F} \times 4$, $T_A = 25^\circ\text{C}$

6 Detailed Description

6.1 Overview

The LV14540 SIMPLE SWITCHER® power converter regulator is an easy-to-use step-down DC/DC converter that operates from 4.0 V to 40 V supply voltage. The device integrates a 100 mΩ (typical) high-side MOSFET and is capable of delivering up to 5 A DC load current with exceptional efficiency and thermal performance in a very small design size. The operating current is typically 120 μA under no-load condition (not switching). When the device is disabled, the supply current is typically 1 μA. An extended family is available in 2 A and 3.5 A load options in pin-to-pin compatible packages.

The LV14540 implements constant frequency peak current mode control with pulse skipping mode at light load to achieve high efficiency. The device is internally compensated, which reduces design time, and requires fewer external components. The switching frequency is programmable from 200 kHz to 2 MHz by an external resistor, R_T . The LV14540 is also capable of synchronization to an external clock within the 250 kHz to 2 MHz frequency range, which allows the device to be designed to fit small board space at higher frequency, or high efficient power conversion at lower frequency.

Other optional features are included for more comprehensive system requirements, including precision enable, adjustable soft-start time, and approximately 97% duty cycle by a BOOT capacitor recharge circuit. These features provide a flexible and easy to use platform for a wide range of applications. Protection features include over temperature shutdown, V_{OUT} overvoltage protection (OVP), V_{IN} undervoltage lockout (UVLO), cycle-by-cycle current limit, and short-circuit protection with frequency fold-back.

6.2 Functional Block Diagram

6.3 Feature Description

6.3.1 Fixed Frequency Peak Current Mode Control

The following operation description of the LV14540 refers to the [Section 6.2](#) and the waveforms in [Figure 6-1](#). LV14540 output voltage is regulated by turning on the high-side N-MOSFET with controlled ON time. During high-side switch ON time, the SW pin voltage swings up to approximately V_{IN} , and the inductor current, i_L , increases with linear slope $(V_{IN} - V_{OUT}) / L$. When high-side switch is off, inductor current discharges through freewheel diode with a slope of $-V_{OUT} / L$. The control parameter of a buck converter is defined as Duty Cycle $D = t_{ON} / T_{SW}$, where t_{ON} is the high-side switch ON time and T_{SW} is the switching period. The regulator control loop maintains a constant output voltage by adjusting the duty cycle D . In an ideal buck converter where losses are ignored, D is proportional to the output voltage and inversely proportional to the input voltage: $D = V_{OUT} / V_{IN}$.

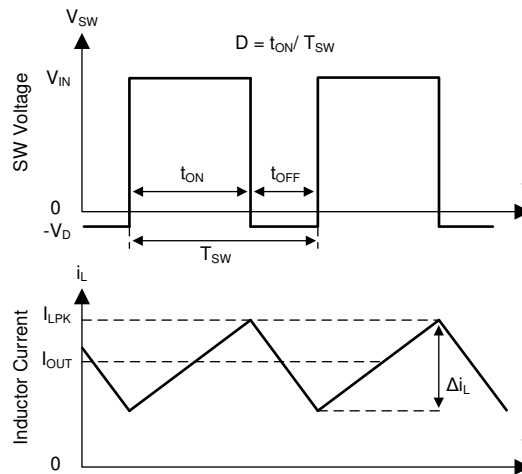

Figure 6-1. SW Node and Inductor Current Waveforms in Continuous Conduction Mode (CCM)

The LV14540 employs fixed frequency peak current mode control. A voltage feedback loop is used to get accurate DC voltage regulation by adjusting the peak current command based on voltage offset. The peak inductor current is sensed from the high-side switch and compared to the peak current to control the ON time of the high-side switch. The voltage feedback loop is internally compensated, which allows for fewer external components, makes design easy, and provides stable operation with almost any combination of output capacitors. The regulator operates with fixed switching frequency at normal load condition. At very light load, the LV14540 operates in pulse skipping mode to maintain high efficiency and the switching frequency decrease with reduced load current.

6.3.2 Slope Compensation

The LV14540 adds a compensating ramp to the MOSFET switch current sense signal. This slope compensation prevents sub-harmonic oscillations at duty cycle greater than 50%. The peak current limit of the high-side switch is not affected by the slope compensation and remains constant over the full duty cycle range.

6.3.3 Pulse Skipping Mode

The LV14540 operates in pulse skipping mode (PSM) at light load current to improve efficiency by reducing switching and gate drive losses. If the output voltage is within regulation and the peak switching current at the end of any switching cycle is below the current threshold of 300 mA, the device enters PSM. The PSM current threshold is the peak switch current level corresponding to a nominal internal COMP voltage of 400 mV.

When in PSM, the internal COMP voltage is clamped at 400 mV, the high-side MOSFET is inhibited, and the device draws about 120 μ A input quiescent current. Because the device is not switching, the output voltage begins to decay. The voltage control loop responds to the falling output voltage by increasing the internal COMP voltage. The high-side MOSFET is enabled and switching resumes when the error amplifier lifts internal COMP voltage above 400 mV. The output voltage recovers to the regulated value, and internal COMP voltage eventually falls below the PSM threshold at which time the device again enters PSM.

6.3.4 Low Dropout Operation and Bootstrap Voltage (BOOT)

The LV14540 provides an integrated bootstrap voltage regulator. A small capacitor between the BOOT and SW pins provides the gate drive voltage for the high-side MOSFET. The BOOT capacitor is refreshed when the high-side MOSFET is off and the external low-side diode conducts. The recommended value of the BOOT capacitor is 0.1 μ F. TI recommends a ceramic capacitor with an X7R or X5R grade dielectric with a voltage rating of 16 V or higher for stable performance overtemperature and voltage.

When operating with a low voltage difference from input to output, the high-side MOSFET of the LV14540 operates at approximately 97% duty cycle. When the high-side MOSFET is continuously on for 5 or 6 switching cycles (5 or 6 switching cycles for frequency lower than 1 MHz, and 10 or 11 switching cycles for frequency

higher than 1 MHz) and the voltage from BOOT to SW drops below 3.2 V, the high-side MOSFET is turned off and an integrated low side MOSFET pulls SW low to recharge the BOOT capacitor.

Since the gate drive current sourced from the BOOT capacitor is small, the high-side MOSFET can remain on for many switching cycles before the MOSFET is turned off to refresh the capacitor. Thus the effective duty cycle of the switching regulator can be high, approaching 97%. The effective duty cycle of the converter during dropout is mainly influenced by the voltage drops across the power MOSFET, the inductor resistance, the low-side diode voltage and the printed circuit board resistance.

6.3.5 Adjustable Output Voltage

The internal voltage reference produces a precise 0.75 V (typical) voltage reference over the operating temperature. The output voltage is set by a resistor divider from output voltage to the FB pin. TI recommends to use 1% tolerance or better and temperature coefficient of 100 ppm or lower divider resistors. Select the low-side resistor R_{FBB} for the desired divider current and use Equation 1 to calculate high-side R_{FBT} . Larger value divider resistors are good for efficiency at light load. However, if the values are too high, the regulator is more susceptible to noise and voltage errors from the FB input current can become noticeable. TI recommends R_{FBB} in the range from 10 k Ω to 100 k Ω for most applications.

Figure 6-2. Output Voltage Setting

$$R_{FBT} = \frac{V_{OUT} - 0.75}{0.75} R_{FBB} \quad (1)$$

6.3.6 Enable and Adjustable Undervoltage Lockout

The LV14540 is enabled when the VIN pin voltage rises above 3.7 V (typical) and the EN pin voltage exceeds the enable threshold of 1.2 V (typical). The LV14540 is disabled when the VIN pin voltage falls below 3.42 V (typical) or when the EN pin voltage is below 1.2 V. The EN pin has an internal pullup current source (typically $I_{EN} = 1 \mu\text{A}$) that enables operation of the LV14540 when the EN pin is floating.

Many applications benefit from the employment of an enable divider R_{ENT} and R_{ENB} in Figure 6-3 to establish a precision system UVLO level for the stage. System UVLO can be used for supplies operating from utility power as well as battery power. System UVLO can be used for sequencing, making sure of reliable operation, or supply protection, such as a battery. An external logic signal can also be used to drive EN input for system sequencing and protection.

When EN terminal voltage exceeds 1.2 V, an additional hysteresis current (typically $I_{HYS} = 3.6 \mu\text{A}$) is sourced out of the EN terminal. When the EN terminal is pulled below 1.2 V, I_{HYS} current is removed. This additional current facilitates adjustable input voltage UVLO hysteresis. Use Equation 2 and Equation 3 to calculate R_{ENT} and R_{ENB} for desired UVLO hysteresis voltage.

Figure 6-3. System UVLO by Enable Dividers

$$R_{ENT} = \frac{V_{START} - V_{STOP}}{I_{HYS}} \quad (2)$$

$$R_{ENB} = \frac{V_{EN}}{\frac{V_{START} - V_{EN}}{R_{ENT}} + I_{EN}} \quad (3)$$

where V_{START} is the desired voltage threshold to enable LV14540, V_{STOP} is the desired voltage threshold to disable device.

6.3.7 External Soft Start

The LV14540 has soft-start pin for programmable output ramp-up time. The soft-start feature is used to prevent inrush current impacting the LV14540 and the load when power is first applied. The soft-start time can be programmed by connecting an external capacitor C_{SS} from SS pin to GND. An internal current source (typically $I_{SS} = 3 \mu\text{A}$) charges C_{SS} and generates a ramp from 0V to V_{REF} . The soft-start time can be calculated by [Equation 4](#):

$$t_{SS}(\text{ms}) = \frac{C_{SS}(\text{nF}) \times V_{REF}(\text{V})}{I_{SS}(\mu\text{A})} \quad (4)$$

The internal soft start resets while the device is disabled or in thermal shutdown.

6.3.8 Switching Frequency and Synchronization (RT/SYNC)

The switching frequency of the LV14540 can be programmed by the resistor R_T from the RT/SYNC pin and GND pin. The RT/SYNC pin cannot be left floating or shorted to ground. To determine the timing resistance for a given switching frequency, use [Equation 5](#) or the curve in [Figure 6-4](#). [Table 6-1](#) gives typical R_T values for a given f_{SW} .

$$R_T(\text{k}\Omega) = 42904 \times f_{SW}(\text{kHz})^{-1.088} \quad (5)$$

Figure 6-4. R_T versus Frequency Curve

Table 6-1. Typical Frequency Setting R_T Resistance

f _{SW} (kHz)	R _T (kΩ)
200	133
350	73.2
500	49.9
750	32.4
1000	23.2
1500	15.0
1912	11.5
2000	11.0

The LV14540 switching action can also be synchronized to an external clock from 250 kHz to 2 MHz. Connect a square wave to the RT/SYNC pin through either circuit network shown in Figure 6-5. The internal oscillator is synchronized by the falling edge of the external clock. The recommendations for the external clock include a high level no lower than 1.7 V, a low level no higher than 0.5 V, and a pulse width greater than 30 ns. When using a low impedance signal source, the frequency setting resistor R_T is connected in parallel with an AC coupling capacitor C_{COUP} to termination resistor R_{TERM} (for example, 50 Ω). The two resistors in series provide the default frequency setting resistance when the signal source is turned off. A 470 pF ceramic capacitor can be used for C_{COUP}. Figure 6-6, Figure 6-7, and Figure 6-8 show the device synchronized to an external system clock.

Figure 6-5. Synchronizing to an External Clock

Figure 6-6. Synchronizing in CCM

Figure 6-7. Synchronizing in DCM

Figure 6-8. Synchronizing in PSM

Equation 6 calculates the maximum switching frequency limitation set by the minimum controllable on time and the input to output step-down ratio. Setting the switching frequency above this value causes the regulator to skip switching pulses to achieve the low duty cycle required at maximum input voltage.

$$f_{SW(max)} = \frac{1}{t_{ON}} \times \left(\frac{I_{OUT} \times R_{IND} + V_{OUT} + V_D}{V_{IN_MAX} - I_{OUT} \times R_{DS_ON} + V_D} \right) \quad (6)$$

where

- I_{OUT} = Output current
- R_{IND} = Inductor series resistance
- V_{IN_MAX} = Maximum input voltage
- V_{OUT} = Output voltage
- V_D = Diode voltage drop
- R_{DS_ON} = High-side MOSFET switch on resistance
- t_{ON} = Minimum on-time

6.3.9 Overcurrent and Short-Circuit Protection

The LV14540 is protected from overcurrent condition by cycle-by-cycle current limiting on the peak current of the high-side MOSFET. High-side MOSFET overcurrent protection is implemented by the nature of the Peak Current Mode control. The high-side switch current is compared to the output of the Error Amplifier (EA) minus slope compensation every switching cycle. Refer to the [Section 6.2](#) for more details. The peak current of high-side switch is limited by a clamped maximum peak current threshold which is constant. So the peak current limit of

the high-side switch is not affected by the slope compensation and remains constant over the full duty cycle range.

The LV14540 also implements a frequency foldback to protect the converter in severe overcurrent or short conditions. The oscillator frequency is divided by 2, 4, and 8 as the FB pin voltage decrease to 75%, 50%, and 25% of V_{REF} . The frequency foldback increases the off-time by increasing the period of the switching cycle so that it provides more time for the inductor current to ramp down and leads to a lower average inductor current. Lower frequency also means lower switching loss. Frequency foldback reduces power dissipation and prevents overheating and potential damage to the device.

6.3.10 Overvoltage Protection

The LV14540 employs an output overvoltage protection (OVP) circuit to minimize voltage overshoot when recovering from output fault conditions or strong unload transients in designs with low output capacitance. The OVP feature minimizes output overshoot by turning off high-side switch immediately when FB voltage reaches to the rising OVP threshold which is nominally 109% of the internal voltage reference V_{REF} . When the FB voltage drops below the falling OVP threshold which is nominally 107% of V_{REF} , the high-side MOSFET resumes normal operation.

6.3.11 Thermal Shutdown

The LV14540 provides an internal thermal shutdown to protect the device when the junction temperature exceeds 170°C (typical). The high-side MOSFET stops switching when the thermal shutdown activates. After the die temperature falls below 158°C (typical), the device reinitiates the power up sequence controlled by the internal soft-start circuitry.

6.4 Device Functional Modes

6.4.1 Shutdown Mode

The EN pin provides electrical ON and OFF control for the LV14540. When V_{EN} is below 1.0 V, the device is in shutdown mode. The switching regulator is turned off and the quiescent current drops to 1.0 μ A typically. The LV14540 also employs undervoltage lockout protection. If V_{IN} voltage is below the UVLO level, the regulator turns off.

6.4.2 Active Mode

The LV14540 is in active mode when V_{EN} is above the precision enable threshold and V_{IN} is above the UVLO level. The simplest way to enable the LV14540 is to connect the EN pin to VIN pin. This connection allows self start-up when the input voltage is in the operation range: 4.0 V to 40 V. Please refer to [Section 6.3.6](#) for details on setting these operating levels.

In active mode, depending on the load current, the LV14540 is in one of three modes:

1. Continuous conduction mode (CCM) with fixed switching frequency when load current is above half of the peak-to-peak inductor current ripple.
2. Discontinuous conduction mode (DCM) with fixed switching frequency when load current is lower than half of the peak-to-peak inductor current ripple in CCM operation.
3. Sleep-mode when the internal COMP voltage drops to 400 mV at very light load.

6.4.3 CCM Mode

CCM operation is employed in the LV14540 when the load current is higher than half of the peak-to-peak inductor current. In CCM operation, the frequency of operation is fixed, output voltage ripple is at a minimum in this mode and the maximum output current of 5 A can be supplied by the LV14540.

6.4.4 Light Load Operation

When the load current is lower than half of the peak-to-peak inductor current in CCM, the LV14540 operates in DCM. At even lighter current loads, sleep-mode is activated to maintain high efficiency operation by reducing switching and gate drive losses.

7 Application and Implementation

Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

7.1 Application Information

The LV14540 is a step-down DC-to-DC regulator. The device is typically used to convert a higher DC voltage to a lower DC voltage with a maximum output current of 5A. The following design procedure can be used to select components for the LV14540. This section presents a simplified discussion of the design process.

7.2 Typical Application

The LV14540 only requires a few external components to convert from a wide voltage range supply to a fixed output voltage. A schematic of 5 V/5 A application circuit is shown in Figure 7-1. The external components must fulfill the needs of the application, but also the stability criteria of the control loop of the device.

Figure 7-1. Application Circuit, 5V Output

7.2.1 Design Requirements

This example details the design of a high frequency switching regulator using ceramic output capacitors. A few parameters must be known to start the design process. These parameters are typically determined at the system level:

Input voltage, V_{IN}	7 V to 36 V, typical 12 V
Output voltage, V_{OUT}	5.0 V
Maximum output current I_{O_MAX}	5 A
Transient response 0.5 A to 5 A	5%
Output voltage ripple	50 mV
Input voltage ripple	400 mV
Switching frequency f_{SW}	300 kHz
Soft-start time	5 ms

7.2.2 Detailed Design Procedure

7.2.2.1 Output Voltage Set-Point

The output voltage of the LV14540 is externally adjustable using a resistor divider network. The divider network is comprised of top feedback resistor R_{FBT} and bottom feedback resistor R_{FBB} . Equation 7 is used to determine the output voltage:

$$R_{FBT} = \frac{V_{OUT} - 0.75}{0.75} R_{FBB} \quad (7)$$

Choose the value of R_{FBT} to be 100 k Ω . With the desired output voltage set to 5 V and the $V_{FB} = 0.75$ V, the R_{FBB} value can then be calculated using Equation 7. The formula yields to a value 17.65 k Ω . Choose the closest available value of 17.8 k Ω for R_{FBB} .

7.2.2.2 Switching Frequency

For desired frequency, use Equation 8 to calculate the required value for R_T .

$$R_T (\text{k}\Omega) = 42904 \times f_{SW} (\text{kHz})^{-1.088} \quad (8)$$

For 300kHz, the calculated R_T is 86.57 k Ω and standard value 86.6 k Ω can be used to set the switching frequency at 300 kHz.

7.2.2.3 Output Inductor Selection

The most critical parameters for the inductor are the inductance, saturation current, and the RMS current. The inductance is based on the desired peak-to-peak ripple current Δi_L . Because the ripple current increases with the input voltage, the maximum input voltage is always used to calculate the minimum inductance L_{MIN} . Use Equation 10 to calculate the minimum value of the output inductor. K_{IND} is a coefficient that represents the amount of inductor ripple current relative to the maximum output current. A reasonable value of K_{IND} must be 20% – 40%. During an instantaneous short or over current operation event, the RMS and peak inductor current can be high. The inductor current rating must be higher than current limit.

$$\Delta i_L = \frac{V_{OUT} \times (V_{IN_MAX} - V_{OUT})}{V_{IN_MAX} \times L \times f_{SW}} \quad (9)$$

$$L_{MIN} = \frac{V_{IN_MAX} - V_{OUT}}{I_{OUT} \times K_{IND}} \times \frac{V_{OUT}}{V_{IN_MAX} \times f_{SW}} \quad (10)$$

In general, choosing lower inductance in switching power supplies is preferable because lower inductance usually corresponds to faster transient response, smaller DCR, and reduced size for more compact designs. But too low of an inductance can generate too large of an inductor current ripple such that over current protection at the full load can be falsely triggered. Too low of an inductance also generates more conduction loss because the RMS current is slightly higher. Larger inductor current ripple also implies larger output voltage ripple with the same output capacitors. With peak current mode control, it is not recommend to have too small of an inductor current ripple. A larger peak current ripple improves the comparator signal to noise ratio.

For this design example, choose $K_{IND} = 0.4$. The minimum inductor value is calculated to be 7.17 μH , and a nearest standard value is chosen: 8.2 μH . A standard 8.2 μH ferrite inductor with a capability of 7 A RMS current and 10 A saturation current can be used.

7.2.2.4 Output Capacitor Selection

The output capacitors, C_{OUT} , must be chosen with care because the output capacitors directly affects the steady state output voltage ripple, loop stability, and the voltage over/undershoot during load current transients.

The output ripple is essentially composed of two parts. One is caused by the inductor current ripple going through the Equivalent Series Resistance (ESR) of the output capacitors:

$$\Delta V_{\text{OUT_ESR}} = \Delta i_L \times \text{ESR} = K_{\text{IND}} \times I_{\text{OUT}} \times \text{ESR} \quad (11)$$

The other is caused by the inductor current ripple charging and discharging the output capacitors:

$$\Delta V_{\text{OUT_C}} = \frac{\Delta i_L}{8 \times f_{\text{SW}} \times C_{\text{OUT}}} = \frac{K_{\text{IND}} \times I_{\text{OUT}}}{8 \times f_{\text{SW}} \times C_{\text{OUT}}} \quad (12)$$

The two components in the voltage ripple are not in phase, so the actual peak-to-peak ripple is smaller than the sum of two peaks.

Output capacitance is usually limited by transient performance specifications if the system requires tight voltage regulation with presence of large current steps and fast slew rate. When a fast large load increase happens, output capacitors provide the required charge before the inductor current can slew up to the appropriate level. The control loop of the regulator usually needs three or more clock cycles to respond to the output voltage droop. The output capacitance must be large enough to supply the current difference for three clock cycles to maintain the output voltage within the specified range. Equation 13 shows the minimum output capacitance needed for specified output undershoot. When a sudden large load decrease happens, the output capacitors absorb energy stored in the inductor. The catch diode cannot sink current so the energy stored in the inductor results in an output voltage overshoot. Equation 14 calculates the minimum capacitance required to keep the voltage overshoot within a specified range.

$$C_{\text{OUT}} > \frac{3 \times (I_{\text{OH}} - I_{\text{OL}})}{f_{\text{SW}} \times V_{\text{US}}} \quad (13)$$

$$C_{\text{OUT}} > \frac{I_{\text{OH}}^2 - I_{\text{OL}}^2}{(V_{\text{OUT}} + V_{\text{OS}})^2 - V_{\text{OUT}}^2} \times L \quad (14)$$

where

- K_{IND} = Ripple ratio of the inductor ripple current ($\Delta i_L / I_{\text{OUT}}$)
- I_{OL} = Low level output current during load transient
- I_{OH} = High level output current during load transient
- V_{US} = Target output voltage undershoot
- V_{OS} = Target output voltage overshoot

For this design example, the target output ripple is 50 mV. Assume $\Delta V_{\text{OUT_ESR}} = \Delta V_{\text{OUT_C}} = 50$ mV, and choose $K_{\text{IND}} = 0.4$. Equation 11 yields ESR no larger than 25 m Ω and Equation 12 yields C_{OUT} no smaller than 16.7 μF . For the target overshoot and undershoot range of this design, $V_{\text{US}} = V_{\text{OS}} = 5\% \times V_{\text{OUT}} = 250$ mV. The C_{OUT} can be calculated to be no smaller than 180 μF and 79.2 μF by Equation 13 and Equation 14, respectively. In summary, the most stringent criteria for the output capacitor is 180 μF . Four 47 μF , 16 V, X7R ceramic capacitors with 5 m Ω ESR are used in parallel.

7.2.2.5 Schottky Diode Selection

The breakdown voltage rating of the diode is preferred to be 25% higher than the maximum input voltage. The current rating for the diode must be equal to the maximum output current for best reliability in most applications. In cases where the input voltage is much greater than the output voltage, the average diode current is lower. In this case, using a diode with a lower average current rating, approximately $(1-D) \times I_{\text{OUT}}$, is possible, however, the peak current rating must be higher than the maximum load current. A 6 A to 7 A rated diode is a good starting point.

7.2.2.6 Input Capacitor Selection

The LV14540 device requires high frequency input decoupling capacitor or capacitors and a bulk input capacitor, depending on the application. The typical recommended value for the high frequency decoupling capacitor is 4.7 μF to 10 μF . A high-quality ceramic capacitor type X5R or X7R with sufficiency voltage rating is recommended. To compensate the derating of ceramic capacitors, a voltage rating of twice the maximum input voltage is recommended. Additionally, some bulk capacitance can be required, especially if the LV14540 circuit is not located within approximately 5 cm from the input voltage source. This capacitor is used to provide damping to the voltage spike due to the lead inductance of the cable or the trace. For this design, two 2.2 μF , X7R ceramic capacitors rated for 100 V are used. Use a 0.1 μF for high-frequency filtering and place as close as possible to the device pins.

7.2.2.7 Bootstrap Capacitor Selection

Every LV14540 design requires a bootstrap capacitor (C_{BOOT}). The recommended capacitor is 0.1 μF and rated 16 V or higher. The bootstrap capacitor is located between the SW pin and the BOOT pin. The bootstrap capacitor must be a high-quality ceramic type with an X7R or X5R grade dielectric for temperature stability.

7.2.2.8 Soft-start Capacitor Selection

Use [Equation 15](#) to calculate the soft-start capacitor value:

$$C_{\text{SS}}(\text{nF}) = \frac{t_{\text{SS}}(\text{ms}) \times I_{\text{SS}}(\mu\text{A})}{V_{\text{REF}}(\text{V})} \quad (15)$$

where

- C_{SS} = Soft-start capacitor value
- I_{SS} = Soft-start charging current (3 μA)
- t_{SS} = Desired soft-start time

For the desired soft-start time of 5 ms and soft-start charging current of 3 μA , [Equation 15](#) yields a soft-start capacitor value of 20 nF, a standard 22 nF ceramic capacitor is used.

7.2.3 Application Curves

Unless otherwise specified, the following conditions apply: $V_{IN} = 12\text{ V}$, $f_{SW} = 300\text{ kHz}$, $L = 6.5\text{ }\mu\text{H}$, $C_{OUT} = 47\text{ }\mu\text{F} \times 4$, $T_A = 25^\circ\text{C}$

$V_{IN} = 12\text{ V}$ $V_{OUT} = 5\text{ V}$ $I_{OUT} = 2\text{ A}$

Figure 7-2. Start-Up by EN

$V_{IN} = 12\text{ V}$ $V_{OUT} = 5\text{ V}$ $I_{OUT} = 2\text{ A}$

Figure 7-3. Start-Up by V_{IN}

7.3 Best Design Practices

- Do not exceed the [Absolute Maximum Ratings](#)
- Do not exceed the [Recommended Operating Conditions](#).
- Do not exceed the [ESD Ratings](#).
- Do not allow the EN input to float.
- Do not allow the output voltage to exceed the input voltage, nor go below ground.
- Follow all the guidelines and suggestions found in this data sheet before committing the design to production. TI application engineers are ready to help critique design and PCB layout to help make the project a success.

7.4 Power Supply Recommendations

The LV14540 is designed to operate from an input voltage supply range between 4 V and 40 V. This input supply must be able to withstand the maximum input current and maintain a stable voltage. The resistance of the input supply rail must be low enough that an input current transient does not cause a high enough drop at the LV14540 supply voltage that can cause a false UVLO fault triggering and system reset. If the input supply is located more than a few inches from the LV14540, additional bulk capacitance can be required in addition to the ceramic input capacitors. The amount of bulk capacitance is not critical, but a 47 μ F or 100 μ F electrolytic capacitor is a typical choice .

7.5 Layout

7.5.1 Layout Guidelines

Layout is a critical portion of good power supply design. The following guidelines help users design a PCB with the best power conversion performance, thermal performance, and minimized generation of unwanted EMI.

1. Close the feedback network, resistor R_{FBT} and R_{FBB} , to the FB pin. V_{OUT} sense path away from noisy nodes and preferably through a layer on the other side of a shielding layer.
2. Place the input bypass capacitor C_{IN} as close as possible to the VIN pin and ground. Grounding for both the input and output capacitors must consist of localized top side planes that connect to the GND pin and PAD.
3. Place the inductor L close to the SW pin to reduce magnetic and electrostatic noise.
4. Place the output capacitor, C_{OUT} close to the junction of L and the diode D. The L, D, and C_{OUT} trace must be as short as possible to reduce conducted and radiated noise and increase overall efficiency.
5. Make the ground connection for the diode C_{IN} and C_{OUT} as small as possible and tied to the system ground plane in only one spot (preferably at the C_{OUT} ground point) to minimize conducted noise in the system ground plane.
6. For more detail on switching power supply layout considerations see [AN-1149 Layout Guidelines for Switching Power Supplies application report](#)

8.3 Support Resources

[TI E2E™ support forums](#) are an engineer's go-to source for fast, verified answers and design help — straight from the experts. Search existing answers or ask your own question to get the quick design help you need.

Linked content is provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

8.4 Trademarks

PowerPAD™ and TI E2E™ are trademarks of Texas Instruments.

SIMPLE SWITCHER® is a registered trademark of Texas Instruments.

All trademarks are the property of their respective owners.

8.5 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

[TI Glossary](#) This glossary lists and explains terms, acronyms, and definitions.

9 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

Changes from Revision A (February 2024) to Revision B (December 2024)	Page
• Added approved nouns after the SIMPLE SWITCHER trademark throughout the document.....	1
• Changed the MAX voltage rating for BOOT to SW from 6.5V to 5.5V, and FB to GND from 7V to 5.5V.....	4
• Changed thermal metrics of DDA package, R _{θJA} from 42.5 to 43.2, ψ _{JT} from 9.9 to 5.2, ψ _{JB} 25.4 to 16.4, R _{θJC(top)} from 56.1 to 52.1, R _{θJC(bot)} from 3.8 to 7.8, R _{θJB} from 25.5 to 16.4.....	5
• Deleted the test condition of " BOOT to SW = 5.8 V " on parameter R _{DS_ON}	5
• Deleted the test condition of " BOOT to SW = 5.8 V " on parameter T _{ON_MIN}	6

Changes from Revision * (June 2015) to Revision A (February 2024)	Page
• Updated the numbering format for tables, figures, and cross-references throughout the document.....	1
• First public release.....	1
• Changed SOIC to HSOIC throughout the document.....	1
• Deleted S from the device name.....	1
• Updated the format of the <i>Package Information</i> table.....	1
• Updated the TYPE column.....	3
• Changed VIN, EN to GND MAX from 44 to 45.....	4
• Changed BOOT to GND MAX from 49 to 50.....	4
• Updated <i>ESD Ratings</i> table to current TI standards.....	4
• Updated Equation 5	13
• Updated Table 6-1	13
• Added the <i>Device Functional Modes</i> section.....	17
• Updated Equation 8	19
• Added the <i>Best Design Practices</i> section.....	23

10 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
LV14540DDAR	ACTIVE	SO PowerPAD	DDA	8	2500	RoHS & Green	NIPDAU NIPDAUAG	Level-2-260C-1 YEAR	-40 to 125	14540	Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSELETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "-" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

PACKAGE OUTLINE

PowerPAD™ SOIC - 1.7 mm max height

PLASTIC SMALL OUTLINE

4214849/A 08/2016

PowerPAD is a trademark of Texas Instruments.

NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.15 mm per side.
4. This dimension does not include interlead flash. Interlead flash shall not exceed 0.25 mm per side.
5. Reference JEDEC registration MS-012.

EXAMPLE BOARD LAYOUT

- NOTES:
- All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5-1994.
 - This drawing is subject to change without notice.
 - Body dimensions do not include mold flash or protrusion not to exceed 0,15.
 - This package is designed to be soldered to a thermal pad on the board. Refer to Technical Brief, PowerPad Thermally Enhanced Package, Texas Instruments Literature No. SLMA002 for information regarding recommended board layout. This document is available at www.ti.com <<http://www.ti.com>>.
 - See the additional figure in the Product Data Sheet for details regarding the exposed thermal pad features and dimensions.
 - This package complies to JEDEC MS-012 variation BA

PowerPAD is a trademark of Texas Instruments.

DDA (R-PDSO-G8)

PowerPAD™ PLASTIC SMALL OUTLINE

THERMAL INFORMATION

This PowerPAD™ package incorporates an exposed thermal pad that is designed to be attached to a printed circuit board (PCB). The thermal pad must be soldered directly to the PCB. After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For additional information on the PowerPAD package and how to take advantage of its heat dissipating abilities, refer to Technical Brief, PowerPAD Thermally Enhanced Package, Texas Instruments Literature No. SLMA002 and Application Brief, PowerPAD Made Easy, Texas Instruments Literature No. SLMA004. Both documents are available at www.ti.com.

The exposed thermal pad dimensions for this package are shown in the following illustration.

Exposed Thermal Pad Dimensions

4206322-6/L 05/12

NOTE: A. All linear dimensions are in millimeters

PowerPAD is a trademark of Texas Instruments

- NOTES:
- A. All linear dimensions are in millimeters.
 - B. This drawing is subject to change without notice.
 - C. Publication IPC-7351 is recommended for alternate designs.
 - D. This package is designed to be soldered to a thermal pad on the board. Refer to Technical Brief, PowerPad Thermally Enhanced Package, Texas Instruments Literature No. SLMA002, SLMA004, and also the Product Data Sheets for specific thermal information, via requirements, and recommended board layout. These documents are available at www.ti.com <<http://www.ti.com>>. Publication IPC-7351 is recommended for alternate designs.
 - E. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Example stencil design based on a 50% volumetric metal load solder paste. Refer to IPC-7525 for other stencil recommendations.
 - F. Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.

PowerPAD is a trademark of Texas Instruments.
