SBOS278B - SEPTEMBER 2003 - REVISED JANUARY 2004

# Very Low Noise, High-Speed, 12V CMOS Operational Amplifier

# **FEATURES**

BANDWIDTH: 20MHz
 SLEW RATE: 30V/us

• FAST 16-BIT SETTLING TIME

LOW NOISE: 6nV/√Hz (typ) at 100kHz
 EXCELLENT CMRR, PSRR, and AOI

RAIL-TO-RAIL OUTPUTCM RANGE INCLUDES GND

• THD+N: 0.0003% (typ) at 1kHz

QUIESCENT CURRENT: 5.5mA/ch (max)

SUPPLY VOLTAGE: 4V to 12V

• SHUTDOWN MODE (OPAx726): 6μA/ch

# **APPLICATIONS**

- OPTICAL NETWORKING
- TRANSIMPEDANCE AMPLIFIERS
- INTEGRATORS
- ACTIVE FILTERS
- A/D CONVERTER BUFFERS
- I/V CONVERTER FOR DACs
- PORTABLE AUDIO
- PROCESS CONTROL
- TEST EQUIPMENT

# DESCRIPTION

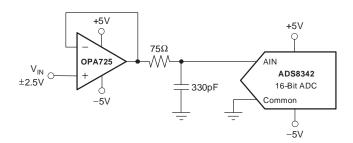

The OPA725 and OPA726 series op amps use a state-of-the-art 12V analog CMOS process, and combine outstanding ac performance with low bias current and excellent CMRR, PSRR, and A<sub>OL</sub>. The 20MHz Gain-Bandwidth (GBW) Product is achieved by using a proprietary and patent-pending output stage design. These characteristics allow excellent 16-bit settling times for driving 16-bit Analog-to-Digital converters (ADCs).

Excellent ac characteristics, such as 20MHz GBW,  $30V/\mu s$  slew rate and 0.0003% THD+N make the OPA725 and OPA726 well-suited for communication, high-end audio, and active filter applications. With a bias current of less than 200pA, they are well-suited for use as transimpedance (I/V-conversion) amplifiers for monitoring optical power in ONET applications.

The OPA725 and OPA726 op amps can be used in single-supply applications from 4V up to 12V, or dual-supply from  $\pm 2V$  to  $\pm 6V$ . The output swings to within 150mV of the rails, maximizing dynamic range. The shutdown versions (OPAx726) reduce the quiescent current to less than  $6\mu A$  and feature a reference pin for easy shutdown operation with standard CMOS logic in dual-supply applications.

The OPA725 (single) is available in SOT23-5 and SO-8 packages, and the OPA2725 (dual) is available in MSOP-8 and SO-8 packages. The OPA726 (single with shutdown) is available in MSOP-8 and SO-8. The OPA2726 (dual with shutdown) is available in MSOP-10. All versions are specified for operation from -40°C to +125°C.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

<sup>(1)</sup> For the most current package and ordering information, see the Package Option Addendum located at the end of this datasheet.

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe

proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

# APPLICATIONS INFORMATION

OPA725 and OPA726 series 20MHz CMOS op amps have a fast slew rate, low noise, and excellent PSRR, CMRR, and  $A_{OL}$ . These op amps can operate on typically 4.3mA quiescent current from a single (or split) supply in the range of 4V to 12V ( $\pm$ 2V to  $\pm$ 6V), making them highly versatile and easy to use. They are stable in a unity-gain configuration.

Power-supply pins should be bypassed with 1nF ceramic capacitors in parallel with 1μF tantalum capacitors.

#### **OPERATING VOLTAGE**

OPA725 series op amps are specified from 4V to 12V supplies over a temperature range of  $-40^{\circ}\text{C}$  to  $+125^{\circ}\text{C}$ . They will operate well in  $\pm5\text{V}$  or +5V to +12V power-supply systems. Parameters that vary significantly with operating voltage or temperature are shown in the Typical Characteristics.

#### **ENABLE/SHUTDOWN**

OPA725 series op amps require approximately 4.3mA quiescent current. The enable/shutdown feature of the OPA726 allows the op amp to be shut off to reduce this current to approximately  $6\mu$ A.

The enable/shutdown input is referenced to the Enable Reference Pin, DGND (see Pin Configurations). This pin can be connected to logic ground in dual-supply op amp configurations to avoid level-shifting the enable logic signal, as shown in Figure 1.

The Enable Reference Pin voltage,  $V_{DGND}$ , must not exceed (V+) – 2V. It may be set as low as V–. The amplifier is enabled when the Enable Pin voltage is greater than  $V_{DGND}$  + 2V. The amplifier is disabled (shutdown) if the Enable Pin voltage is less than  $V_{DGND}$  + 0.8V. The Enable Pin is connected to internal pull-up circuitry and will enable the device if left unconnected.

#### **COMMON-MODE VOLTAGE RANGE**

The input common-mode voltage range of the OPA725 and OPA726 series extends from V- to (V+)-2V.

Common-mode rejection is excellent throughout the input voltage range from V- to (V+) – 3V. CMRR decreases somewhat as the common-mode voltage extends to (V+) – 2V, but remains very good and is tested throughout this range. See the Electrical Characteristics table for details.

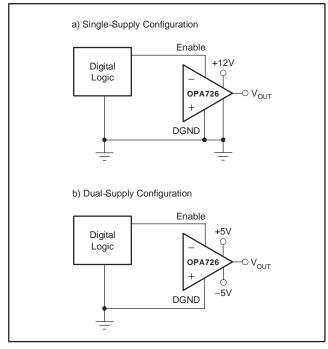

Figure 1. Enable Reference Pin Connection for Single- and Dual-Supply Configurations

#### INPUT OVER-VOLTAGE PROTECTION

Device inputs are protected by ESD diodes that will conduct if the input voltages exceed the power supplies by more than approximately 300mV. Momentary voltages greater than 300mV beyond the power supply can be tolerated if the current is limited to 10mA. This is easily accomplished with an input resistor in series with the op amp, as shown in Figure 2. The OPA725 series features no phase inversion when the inputs extend beyond supplies, if the input is current limited.

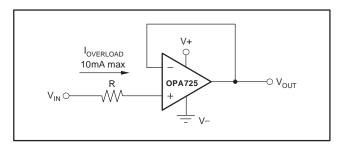

Figure 2. Input Current Protection for Voltages
Exceeding the Supply Voltage

#### **RAIL-TO-RAIL OUTPUT**

A class AB output stage with common-source transistors is used to achieve rail-to-rail output. This output stage is capable of driving heavy loads connected to any point between V+ and V–. For light resistive loads ( >  $100k\Omega$  ), the output voltage can swing to 150mV (175mV for dual) from the supply rail, while still maintaining excellent linearity (A $_{OL}$  > 110dB). With  $1k\Omega$  (2k $\Omega$  for dual) resistive loads, the output is specified to swing to within 250mV from the supply rails with excellent linearity (see the Typical Characteristics curve  $Output\ Voltage\ Swing\ vs\ Output\ Current)$ .

#### CAPACITIVE LOAD AND STABILITY

Capacitive load drive is dependent upon gain and the overshoot requirements of the application. Increasing the gain enhances the ability of the amplifier to drive greater capacitive loads (see the Typical Characteristics curve Small-Signal Overshoot vs Capacitive Load).

One method of improving capacitive load drive in the unity-gain configuration is to insert a  $10\Omega$  to  $20\Omega$  resistor inside the feedback loop, as shown in Figure 3. This reduces ringing with large capacitive loads while maintaining DC accuracy.

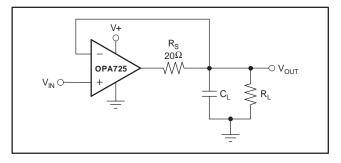

Figure 3. Series Resistor in Unity-Gain Buffer Configuration Improves Capacitive Load Drive

#### **DRIVING FAST 16-BIT ADCs**

The OPA725 series is optimized for driving fast 16-bit ADCs such as the ADS8342. The OPA725 op amps buffer the converter input capacitance and resulting charge injection, while providing signal gain. Figure 4 shows the OPA725 in a single-ended method of interfacing to the ADS8342 16-bit, 250kSPS, 4-channel ADC with an input range of ±2.5V. The OPA725 has demonstrated excellent settling time to the 16-bit level within the 600ns acquisition time of the ADS8342. The RC filter, shown in Figure 4, has been carefully tuned for best noise and settling performance. It may need to be adjusted for different op amp configurations. Please refer to the ADS8342 data sheet (available for download at www.ti.com) for additional information on this product.

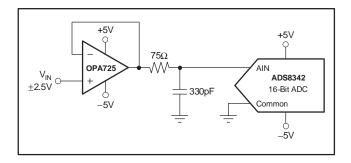

Figure 4. OPA725 Driving an ADC

#### TRANSIMPEDANCE AMPLIFIER

Wide bandwidth, low input bias current, and low input voltage and current noise make the OPA725 an ideal wideband photodiode transimpedance amplifier. Low-voltage noise is important because photodiode capacitance causes the effective noise gain of the circuit to increase at high frequency.

The key elements to a transimpedance design, as shown in Figure 5, are the expected diode capacitance ( $C_D$ ), which should include the parasitic input common-mode and differential-mode input capacitance (4pF + 5pF for the OPA725); the desired transimpedance gain ( $R_F$ ); and the GBW for the OPA725 (20MHz). With these three variables set, the feedback capacitor value ( $C_F$ ) can be set to control the frequency response.  $C_F$  includes the stray capacitance of  $R_F$ , which is 0.2pF for a typical surface-mount resistor.

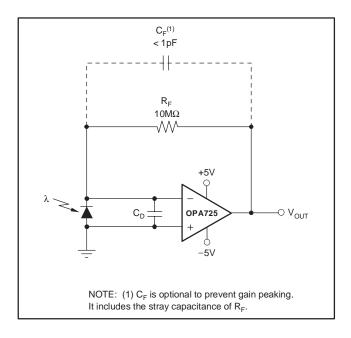

Figure 5. Dual-Supply Transimpedance Amplifier

To achieve a maximally-flat, 2nd-order Butterworth frequency response, the feedback pole should be set to:

$$\frac{1}{2\pi R_F C_F} = \sqrt{\frac{GBW}{4\pi R_F C_D}}$$
 (1)

Bandwidth is calculated by:

$$f_{-3dB} = \sqrt{\frac{GBW}{2\pi R_F C_D}} Hz$$
 (2)

For even higher transimpedance bandwidth, the high-speed CMOS OPA354 (100MHz GBW), OPA300 (180 MHz GBW), OPA355 (200MHz GBW), or OPA656, OPA657 (400MHz GBW) may be used.

For single-supply applications, the +IN input can be biased with a positive dc voltage to allow the output to reach true zero when the photodiode is not exposed to any light, and respond without the added delay that results from coming out of the negative rail. (Refer to Figure 6.) This bias voltage also appears across the photodiode, providing a reverse bias for faster operation.

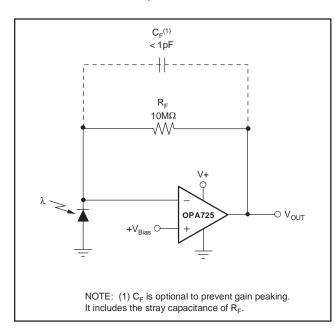

Figure 6. Single-Supply Transimpedance Amplifier

For additional information, refer to Application Bulletin SBOA055, *Compensate Transimpedance Amplifiers Intuitively*, available for download at www.ti.com.

# OPTIMIZING THE TRANSIMPEDANCE CIRCUIT

To achieve the best performance, components should be selected according to the following guidelines:

- For lowest noise, select R<sub>F</sub> to create the total required gain. Using a lower value for R<sub>F</sub> and adding gain after the transimpedance amplifier generally produces poorer noise performance. The noise produced by R<sub>F</sub> increases with the square-root of R<sub>F</sub>, whereas the signal increases linearly. Therefore, signal-to-noise ratio is improved when all the required gain is placed in the transimpedance stage.
- 2. Minimize photodiode capacitance and stray capacitance at the summing junction (inverting input). This capacitance causes the voltage noise of the op amp to be amplified (increasing amplification at high frequency). Using a low-noise voltage source to reverse-bias a photodiode can significantly reduce its capacitance. Smaller photodiodes have lower capacitance. Use optics to concentrate light on a small photodiode.
- Noise increases with increased bandwidth. Limit the circuit bandwidth to only that required. Use a capacitor across the R<sub>F</sub> to limit bandwidth, even if not required for stability.
- 4. Circuit board leakage can degrade the performance of an otherwise well-designed amplifier. Clean the circuit board carefully. A circuit board guard trace that encircles the summing junction and is driven at the same voltage can help control leakage.

For additional information, refer to the Application Bulletins *Noise Analysis of FET Transimpedance Amplifiers* (SBOA060), and *Noise Analysis for High-Speed Op Amps* (SBOA066), available for download at the TI web site.

<sup>(1)</sup> The marketing status values are defined as follows: **ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available. **OBSOLETE:** TI has discontinued the production of the device.

# PACKAGE OPTION ADDENDUM

(2) RoHS: TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (CI) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

- (3) MSL, Peak Temp. The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.
- (4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.
- (5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.
- (6) Lead finish/Ball material Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

SMALL OUTLINE PACKAGE

#### NOTES:

- 1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.

  2. This drawing is subject to change without notice.

  3. This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not
- exceed 0.15 mm per side.
- 4. This dimension does not include interlead flash. Interlead flash shall not exceed 0.25 mm per side.
- 5. Reference JEDEC registration MO-187, variation BA.

SMALL OUTLINE PACKAGE

NOTES: (continued)

6. Publication IPC-7351 may have alternate designs.

7. Solder mask tolerances between and around signal pads can vary based on board fabrication site.

SMALL OUTLINE PACKAGE

NOTES: (continued)

- 8. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
- 9. Board assembly site may have different recommendations for stencil design.

SMALL OUTLINE TRANSISTOR

#### NOTES:

- 1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
  2. This drawing is subject to change without notice.
  3. Reference JEDEC MO-178.

- 4. Body dimensions do not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.25 mm per side.
- 5. Support pin may differ or may not be present.

SMALL OUTLINE TRANSISTOR

NOTES: (continued)

6. Publication IPC-7351 may have alternate designs.

7. Solder mask tolerances between and around signal pads can vary based on board fabrication site.

SMALL OUTLINE TRANSISTOR

NOTES: (continued)

- 8. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
- 9. Board assembly site may have different recommendations for stencil design.

SMALL OUTLINE INTEGRATED CIRCUIT

## NOTES:

- 1. Linear dimensions are in inches [millimeters]. Dimensions in parenthesis are for reference only. Controlling dimensions are in inches. Dimensioning and tolerancing per ASME Y14.5M.
- 2. This drawing is subject to change without notice.
- 3. This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed .006 [0.15] per side.
- 4. This dimension does not include interlead flash.
- 5. Reference JEDEC registration MS-012, variation AA.

SMALL OUTLINE INTEGRATED CIRCUIT

NOTES: (continued)

6. Publication IPC-7351 may have alternate designs.

7. Solder mask tolerances between and around signal pads can vary based on board fabrication site.

SMALL OUTLINE INTEGRATED CIRCUIT

#### NOTES: (continued)

- 8. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
- 9. Board assembly site may have different recommendations for stencil design.

# DGK (S-PDSO-G8)

# PLASTIC SMALL-OUTLINE PACKAGE

NOTES:

- A. All linear dimensions are in millimeters.
- B. This drawing is subject to change without notice.
- Body length does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.15 per end.
- Body width does not include interlead flash. Interlead flash shall not exceed 0.50 per side.
- E. Falls within JEDEC MO-187 variation AA, except interlead flash.

# DGK (S-PDSO-G8)

# PLASTIC SMALL OUTLINE PACKAGE

#### NOTES:

- A. All linear dimensions are in millimeters.
- B. This drawing is subject to change without notice.
- C. Publication IPC-7351 is recommended for alternate designs.
- D. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC-7525 for other stencil recommendations.
- E. Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.
