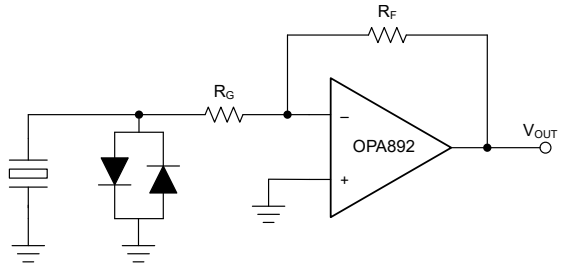
OPA892 2-GHz, 10-V/V Stable, 0.95-nV/√Hz, Ultra-Low THD Operational Amplifier

1 Features

- Ultra-low 0.95-nV/√Hz voltage noise
- High speed:
  - 2-GHz gain-bandwidth product
  - 700-V/µs slew rate
  - 30-ns settling time (0.1%)
- Stable at gains ≥10 V/V
- Output drive, I_O = 200 mA (typical)
- Very low distortion:
  - THD = –78 dBc (f = 1 MHz, R_L = 150 Ω)
  - THD+N = –114 dBc (f = 1 kHz, BW = 80 kHz)
- Wide range of power supplies:
  - V_{CC} = ±4.5 V to ±18 V
- Offset nulling pins on the OPA892

2 Applications

- Ultrasound scanner
- Source measurement unit (SMU)
- Power quality meter
- Ultrasound Scanners
- Vector signal transceiver (VST)
- Professional audio mixer or control surface
- Professional microphones and wireless systems
- Professional speaker systems
- Professional audio amplifier
- Soundbar
- Turntable
- Professional video camera
- Guitar and other instrument amplifier
- Data acquisition (DAQ)



Low Distortion Piezoelectric Sensor Amplifier

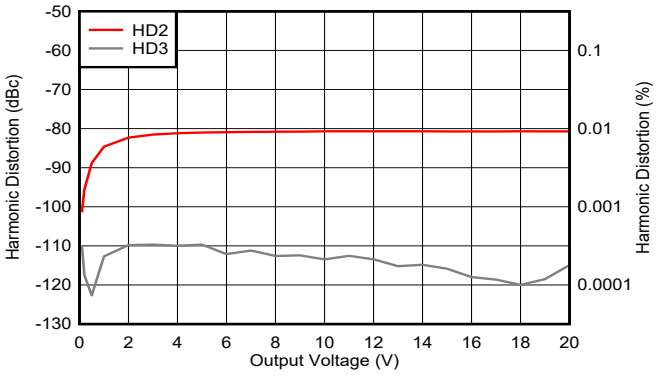
3 Description

The OPA892 and OPA2892 (OPAx892) are ultra-low voltage noise, high-speed voltage-feedback amplifiers that are an excellent choice for applications requiring low voltage noise, including communication and imaging. The single-amplifier OPA892 and the dual-amplifier OPA2892 offer very good ac performance with a 290-MHz bandwidth, a 700-V/µs slew rate, and a 30-ns settling time (0.1%) for a gain of 10 V/V. The OPAx892 are stable at gains of 10 or greater and –9 or less. These amplifiers have a high drive capability of 200 mA and draw only 7.5 mA of supply current per amplifier. With a total harmonic distortion (THD) of –68 dBc at f = 1 MHz, the OPAx892 are designed for applications requiring low distortion. Because the distortion remains low over a wide range of output voltages, the OPAx892 is useful in large dynamic-range applications such as imaging, sonar, and audio.

Device Information

PART NUMBER	AMPLIFIERS	PACKAGE(1)	PACKAGE SIZE(2)
OPA892	One	D (SOIC, 8)	4.9 mm × 6 mm
OPA2892 (3)	Two	DGN (HVSSOP, 8)	3 mm × 4.9 mm

(1) For more information, see Section 10.
(2) The package size (length × width) is a nominal value and includes pins, where applicable.
(3) Preview information (not Advanced Information).



V_{CC} = ±15 V, R_L = 150 Ω, f = 1 MHz

Table 4-2. Pin Functions: OPA2892

PIN		TYPE	DESCRIPTION
NAME	NO.		
1IN–	2	Input	Channel 1 inverting input
1IN+	3	Input	Channel 1 noninverting input
1OUT	1	Output	Channel 1 output
2IN–	6	Input	Channel 2 inverting input
2IN+	5	Input	Channel 2 noninverting input
2OUT	7	Output	Channel 2 output
VCC–	4	—	Negative power supply
VCC+	8	—	Positive power supply

5 Specifications

5.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)(1)

			MIN	MAX	UNIT
V_{CC}	Supply voltage, $V_{CC+} – V_{CC–}$			37	V
V_I	Input voltage			$\pm V_{CC}$	V
I_O	Output current(2)			240	mA
V_{IO}	Differential input voltage			±1.5	V
I_{IN}	Continuous input current			10	mA
T_J	Junction temperature	Any condition		150	°C
		Continuous operation, long-term reliability(3)		125	
T_{stg}	Storage temperature		–65	150	°C

(1) Operation outside the *Absolute Maximum Ratings* may cause permanent device damage. *Absolute Maximum Ratings* do not imply functional operation of the device at these or any other conditions beyond those listed under *Recommended Operating Conditions*. If used outside the *Recommended Operating Conditions* but within the *Absolute Maximum Ratings*, the device may not be fully functional, and this may affect device reliability, functionality, performance, and shorten the device lifetime.
(2) When continuously operating at any output current, do not exceed the maximum junction temperature. Keep the output current less than the absolute maximum rating regardless of time interval.
(3) The maximum junction temperature for continuous operation is limited by package constraints. Operation greater than this temperature can result in reduced reliability, lifetime of the device, or both.

5.2 ESD Ratings

			VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins(1)	±4000	V
		Charged device model (CDM), per ANSI/ESDA/JEDEC JS-002, all pins(2)	±1500	

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

5.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

			MIN	NOM	MAX	UNIT
V_{CC}	Supply voltage	Dual-supply	±4.5	±15	±18	V
		Single-supply	9	30	36	
T_A	Operating free-air temperature		–40	25	85	°C

5.4 Thermal Information

THERMAL METRIC(1)		OPA892 D (SOIC) 8 PINS	OPAS2892 DGN (HVSSOP) 8 PINS	UNIT
$R_{\theta JA}$	Junction-to-ambient thermal resistance	124.5	52	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	65.0	75.2	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	72.2	24.5	°C/W
Ψ_{JT}	Junction-to-top characterization parameter	13.6	4	°C/W
Ψ_{JB}	Junction-to-board characterization parameter	71.4	24.5	°C/W
$R_{\theta JC(bot)}$	Junction-to-case (bottom) thermal resistance	N/A	9.1	°C/W

(1) For information about traditional and new thermal metrics, see the Semiconductor and IC Package Thermal Metrics application report.

6 Detailed Description

6.1 Overview

The OPAx892 are high-speed operational amplifiers configured in a decompensated voltage-feedback architecture. The OPAx892 are stable with gain configurations of 10 V/V or greater. These amplifiers are built using a greater than 30-V, complementary, bipolar process with NPN and PNP transistors possessing an f_T of several GHz. This configuration results in exceptionally high-performance amplifiers with wide bandwidth, high slew rate, fast settling time, and low distortion.

6.2 Functional Block Diagram

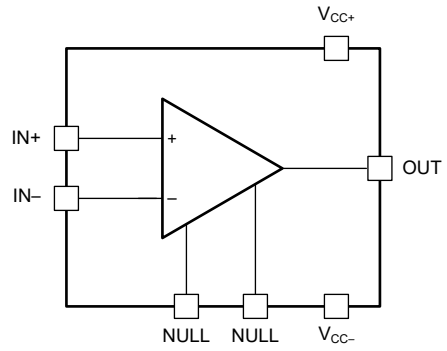

Figure 6-1. OPA892: Single Channel

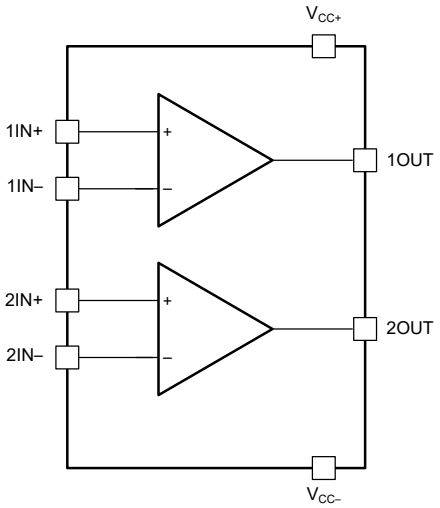

Figure 6-2. OPA2892: Dual Channel

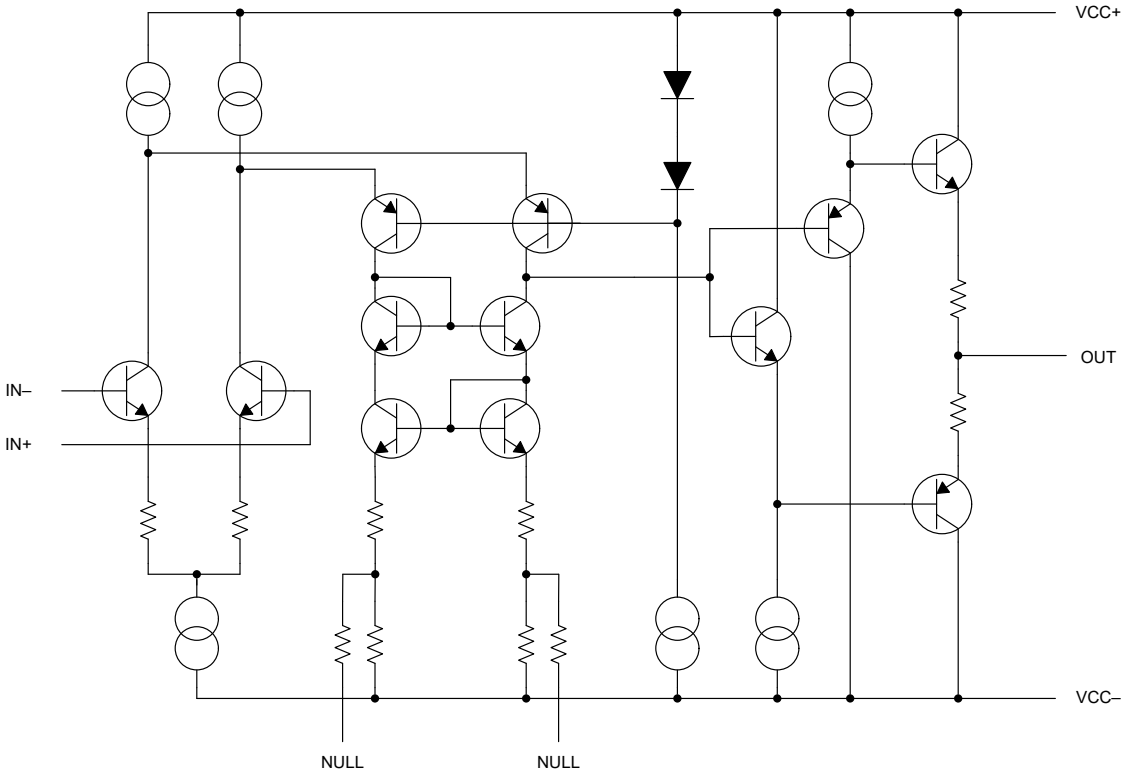

Figure 6-3. OPA892 Simplified Schematic

6.3 Feature Description

6.3.1 Offset Nulling

The OPAx892 have a very low input offset voltage for high-speed amplifiers. However, if additional correction is required, an offset nulling function is provided on the OPA892. To adjust the input offset voltage, place a potentiometer between pin 1 and pin 8 of the device, and tie the wiper to the negative supply. Figure 6-4 shows this feature.

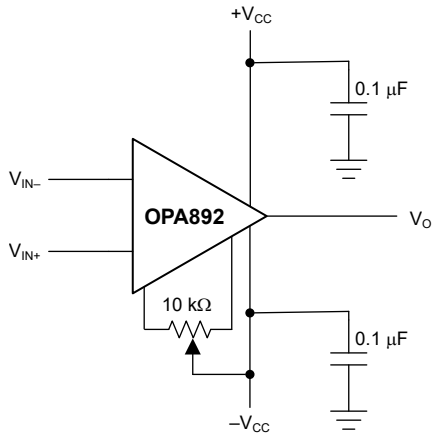

Figure 6-4. Offset Nulling Schematic

6.4 Device Functional Modes

The OPAx892 family has a single functional mode and can be used with both single-supply or split power-supply configurations. The power-supply voltage must be greater than 9 V (±4.5 V) and less than 36 V (±18 V).

7 Application and Implementation

Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

7.1 Application Information

7.1.1 Driving a Capacitive Load

The OPAx892 are internally compensated to maximize bandwidth and slew-rate performance. To maintain stability, take additional precautions when driving capacitive loads with a high-performance amplifier. As a result of the internal compensation, significant capacitive loading directly on the output node decreases the device phase margin, and potentially lead to high-frequency ringing or oscillations. Therefore, for capacitive loads greater than 10 pF, place an isolation resistor in series with the output of the amplifier. Figure 7-1 shows this configuration. For most applications, a minimum resistance of 20 Ω is recommended. In 75-Ω transmission systems, setting the series resistor value to 75 Ω is a beneficial choice because this value isolates any capacitance loading and provides source impedance matching.

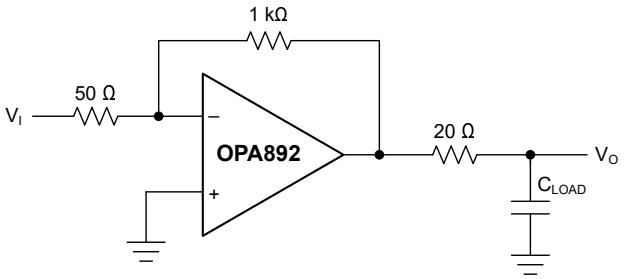

Figure 7-1. Driving a Capacitive Load

7.1.2 General Configuration

When receiving low-level signals, limiting the bandwidth of the incoming signals into the system is often required. Figure 7-2 shows how the simplest way to accomplish this limiting is to place an RC filter at the noninverting pin of the amplifier.

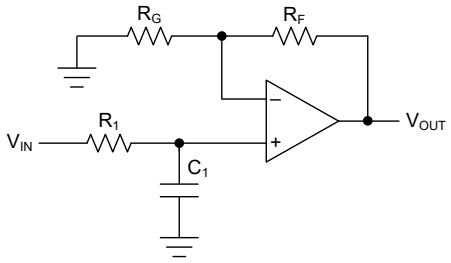

Figure 7-2. Single-Pole Low-Pass Filter

$$\frac{V_{OUT}}{V_{IN}} = \left(1 + \frac{R_F}{R_G}\right) \times \left(\frac{1}{1 + sR_1C_1}\right) \quad (1)$$

7.2 Typical Application

One important characteristic of the OPAx892 amplifier is the decompensated architecture. By pushing out the dominate pole to a higher frequency using this common technique, the amplifier is no longer stable in lower gain configurations. The minimum stable gain for the OPAx892 is specified to be 10 V/V. When a lower gain is needed in a preamp or buffer application, a related product to be considered is the OPA891. Because the OPA891 is not decompensated, the gain-bandwidth product is approximately an order of magnitude lower than the OPAx892. Both of these amplifiers have similar noise performance, but the best bandwidth and distortion performance comes from using the correct amplifier depending on the gain needs of the application.

When applications require gain of 10 V/V or larger, choose the OPAx892 to obtain a low value of harmonic distortion and THD+N. Figure 7-3 shows a where in the analog signal chain this type of amplification can be required. Often found in applications such as ultrasound, audio, and sonar, a preamp is used near the input sensor to boost the signal to a more practical level with an emphasis on keeping noise and distortion as small as possible. Later in the signal chain, significantly more gain can be required to provide for other required functions such analog filtering, mixing, splitting, or just the need to match the signal level to a following device. An amplifier such as the OPAx892 maintains the fidelity of the signal by providing the needed gain with significantly impacting distortion over a wide bandwidth and output swing. Figure 7-4 shows the amplifier design example. The amplification stage provides an additional 10 V/V of gain to the analog signal chain.

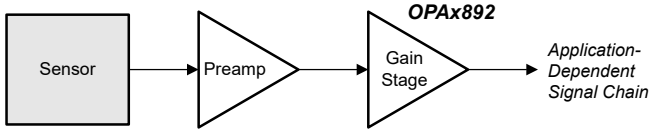

Figure 7-3. Gain Stage in an Analog-Front-End Block Diagram

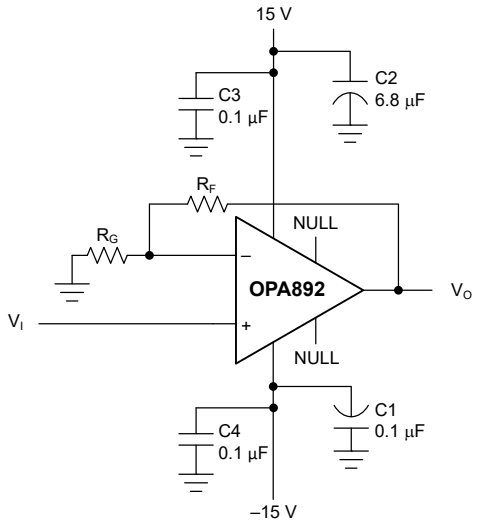

Figure 7-4. Noninverting Gain Configuration

7.2.1 Design Requirements

The objective is to design a 10 V/V amplifier to be for a mid-stage amplifier that minimizes the THD of the signal over the output range shown in Table 7-1.

Table 7-1. Design Parameters

PARAMETER	VALUE
Supply voltage	±15 V
Voltage gain	+10 V/V
Small-signal peaking	< 2 dB
Load resistance	1 kΩ

7.2.2 Detailed Design Procedure

As detailed by Figure 7-4, the example design is a common non-inverting op-amp configuration. In this design example, the spit ±15 V supplies are bypassed by a pair of capacitors as discussed in Section 7.4.1. Although not explicitly shown, a optional resistor equal to R_F || R_G can be added from the noninverting input to ground to keep the inputs balanced to help mitigate input bias current impact.

Set the gain to 10 V/V by the proper selection of the two resistors using equation Equation 2. In this example, set the ratio of the resistance to 9 to obtain the design goal of a gain of 10. There exists a second degree of freedom that allows the absolute value to be somewhat arbitrary while maintaining the specified ratio of resistor values. Increasing feedback resistance leads to an increase in the amount of overshoot in the small-signal frequency response (see Figure 5-1). In the time domain, the impact shows up as and increase in ringing and settling time for step-function input signals. If the resistances are very small, power dissipation effects increase.

$$\text{gain} = \frac{V_O}{V_I} = 1 + \frac{R_F}{R_G} \tag{2}$$

The best practice is to chose the resistors to be in of moderate values to avoid the detrimental effects at both extremes. Choosing R_F = 220 Ω is a good compromise in between these two extremes. Using Equation 2, the corresponding gain resistor is found to be 24 Ω. The amount of small-signal peaking is a modest 1.5 dB (see Figure 5-1), which meets the design goal.

A unique feature of this amplifier family is the output stage has been designed to drive a substantial amount of output current. This choice allows for the OPAx892 to maintain significant bandwidth even with very large input signals. Figure 7-5 shows the modest reduction of bandwidth, even for output signals as large as 20 V_{PP}. The time domain impact of this feature is a more precise amplification (that is, lower distortion) even for large dynamic range input signals.

Using the amplifier designed in this section, Figure 7-6 shows the measured components of THD down to the 5th harmonic. The figure shows that the 2nd harmonic dictates the THD performance, with the 4th harmonic being the next highest component. Other amplifiers can produce low distortion at lower input levels but distortion rapidly rises as the output amplitude rises. Figure 5-17 shows the harmonic distortion stays approximately constant, even at large values of output amplitude, making the OPAx892 a solid choice for large amplitude applications where distortion and noise are critical considerations.

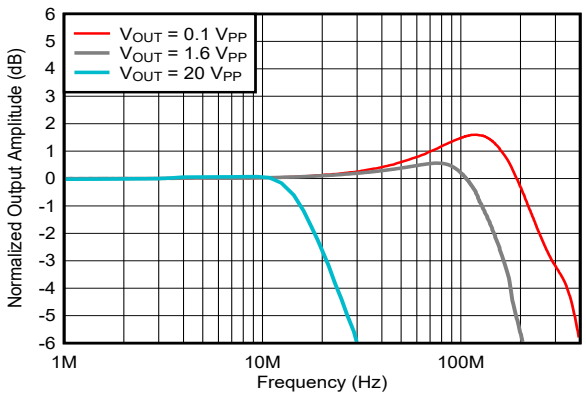

Figure 7-5. Very Large-Signal Frequency Response

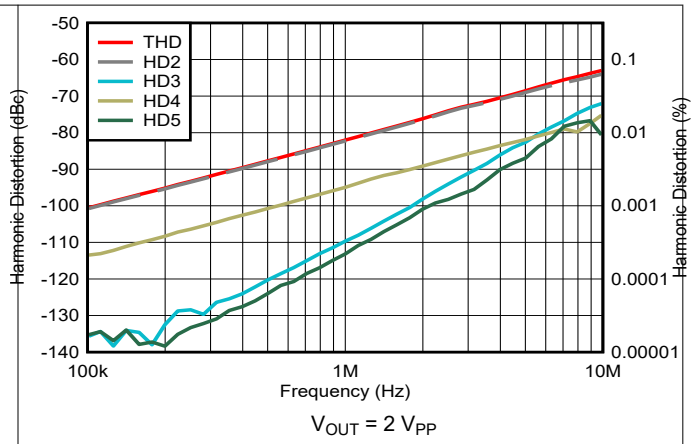

Figure 7-6. Harmonic Distortion Components vs Frequency

7.3 Power Supply Recommendations

The OPAx892 devices are designed to operate on power supplies ranging from ±4.5 V to ±16 V (single-ended supplies of 9 V to 32 V). Use a power-supply accuracy of 5% or better. When operated on a board with high-speed digital signals, make sure to provide isolation between digital signal noise and the analog input pins. The OPAx892 are connected to the positive power supply (V_{CC+}) through pin 7 and pin 8, respectively. Both devices use pin 4 for the negative power supply ($V_{CC–}$). Decouple each supply pin to GND as close to the device as possible.

7.4 Layout

7.4.1 Layout Guidelines

To achieve the levels of high-frequency performance of the OPAx892, follow proper printed-circuit board (PCB), high-frequency design techniques. The following is a general set of guidelines. In addition, a OPAx892 evaluation board is available to use as a guide for layout or for evaluating the device performance.

- **Ground planes**—make sure that the ground plane used on the board provides all components with a low-inductive ground connection. However, in the areas of the amplifier inputs and output, the ground plane can be removed to minimize stray capacitance.
- **Proper power-supply decoupling**—use a 6.8-µF tantalum capacitor in parallel with a 0.1-µF ceramic capacitor on each supply pin. Sharing the tantalum capacitor among several amplifiers is possible depending on the application, but always use a 0.1-µF ceramic capacitor on the supply pin of every amplifier. In addition, place the 0.1-µF capacitor as close as possible to the supply pin. As this distance increases, the inductance in the connecting trace makes the capacitor less effective. Strive for distances of less than 0.1 inch (2.54 mm) between the device power pins and the ceramic capacitors.
- **Short trace runs or compact part placements**—optimized high-frequency performance is achieved when stray series inductance has been minimized. To realize this, make the circuit layout as compact as possible, thereby minimizing the length of all trace runs. Pay particular attention to the inputs of the amplifier, keeping the trace lengths as short as possible. This layout helps to minimize stray capacitance at the input of the amplifier.

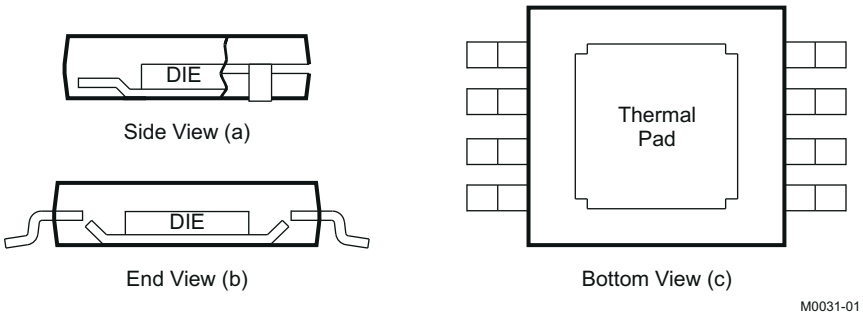
7.4.1.1 General PowerPAD™ Integrated Circuit Package Design Considerations

The OPAx892 is available in a thermally-enhanced DGN package, which is a member of the PowerPAD™ integrated circuit package family. Figure 7-7 **a** and Figure 7-7 **b** show that this package is constructed using a downset leadframe upon which the die is mounted. Figure 7-7 **c** that this arrangement results in the leadframe being exposed as a thermal pad on the underside of the package. Because this thermal pad has direct thermal contact with the die, excellent thermal performance can be achieved by providing a good thermal path away from the thermal pad.

The PowerPAD integrated circuit package allows for both assembly and thermal management in one manufacturing operation. During the surface-mount solder operation (when the leads are being soldered), the thermal pad can also be soldered to a copper area underneath the package. Through the use of thermal paths within this copper area, heat can be conducted away from the package into either a ground plane or other heat dissipating device.

The PowerPAD integrated circuit package represents a breakthrough in combining the small area and ease of assembly of the surface mount with the previously awkward mechanical methods of heat sinking.

More complete details of the PowerPAD integrated circuit package installation process and thermal management techniques are found in *PowerPAD Thermally-Enhanced Package*. This document is found on the TI website (www.ti.com) by searching on the keyword PowerPAD. The document can also be ordered through your local TI sales office; refer to SLMA002 when ordering.



NOTE: The thermal pad (PowerPAD integrated circuit package) is electrically isolated from all other pins and can be connected to any potential from V_{CC-} to V_{CC+}. Typically, the thermal pad is connected to the ground plane because this plane tends to physically be the largest and is able to dissipate the most amount of heat.

8 Device and Documentation Support

TI offers an extensive line of development tools. Tools and software to evaluate the performance of the device, generate code, and develop solutions are listed below.

8.1 Documentation Support

8.1.1 Related Documentation

For related documentation, see the following:

- Texas Instruments, *Noise Analysis in Operational Amplifier Circuits* application report
- Texas Instruments, *PowerPAD Thermally Enhanced Package* application report
- Texas Instruments, *Single op-amp evaluation module for SO-8 package*users guide
- Texas Instruments, *Dual op-amp evaluation module for SO-8 package* users guide
- Texas Instruments, *Dual op amp evaluation module for MSOP-8 package* users guide

8.2 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on ti.com. Click on *Notifications* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

8.3 Support Resources

TI E2E™ support forums are an engineer's go-to source for fast, verified answers and design help — straight from the experts. Search existing answers or ask your own question to get the quick design help you need.

Linked content is provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's Terms of Use.

8.4 Trademarks

PowerPAD™ and TI E2E™ are trademarks of Texas Instruments.
All trademarks are the property of their respective owners.

8.5 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

8.6 Glossary

TI Glossary — This glossary lists and explains terms, acronyms, and definitions.

9 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

DATE	REVISION	NOTES
November 2023	*	Initial Release

10 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
OPA892DR	ACTIVE	SOIC	D	8	3000	RoHS & Green	NIPDAU	Level-1-260C-UNLIM	-40 to 85	O892	Samples

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".
RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.
Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

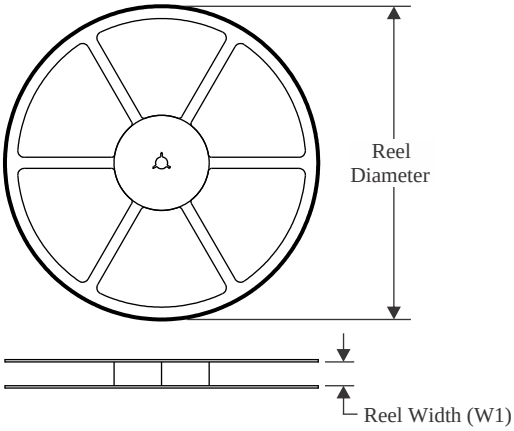
(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

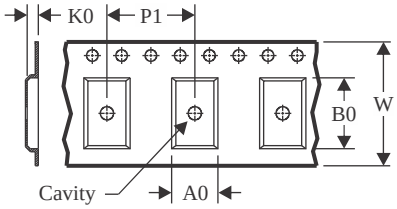
(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

TAPE AND REEL INFORMATION

REEL DIMENSIONS

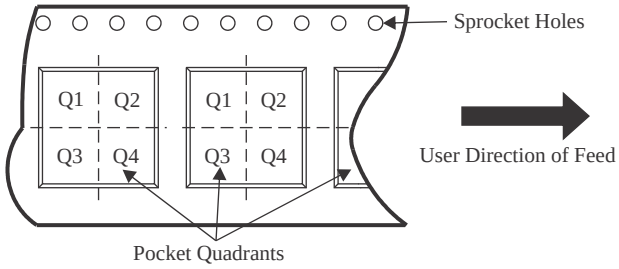


TAPE DIMENSIONS



A0	Dimension designed to accommodate the component width
B0	Dimension designed to accommodate the component length
K0	Dimension designed to accommodate the component thickness
W	Overall width of the carrier tape
P1	Pitch between successive cavity centers

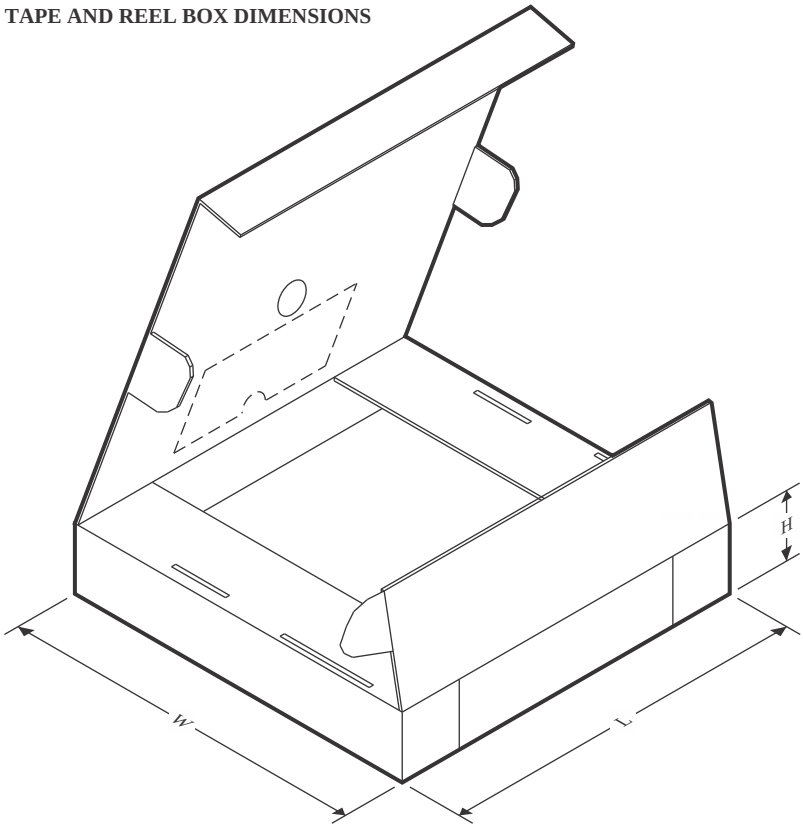
QUADRANT ASSIGNMENTS FOR PIN 1 ORIENTATION IN TAPE



*All dimensions are nominal

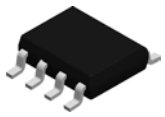
Device	Package Type	Package Drawing	Pins	SPQ	Reel Diameter (mm)	Reel Width W1 (mm)	A0 (mm)	B0 (mm)	K0 (mm)	P1 (mm)	W (mm)	Pin1 Quadrant
OPA892DR	SOIC	D	8	3000	330.0	12.4	6.4	5.2	2.1	8.0	12.0	Q1

TAPE AND REEL BOX DIMENSIONS



*All dimensions are nominal

Device	Package Type	Package Drawing	Pins	SPQ	Length (mm)	Width (mm)	Height (mm)
OPA892DR	SOIC	D	8	3000	356.0	356.0	35.0

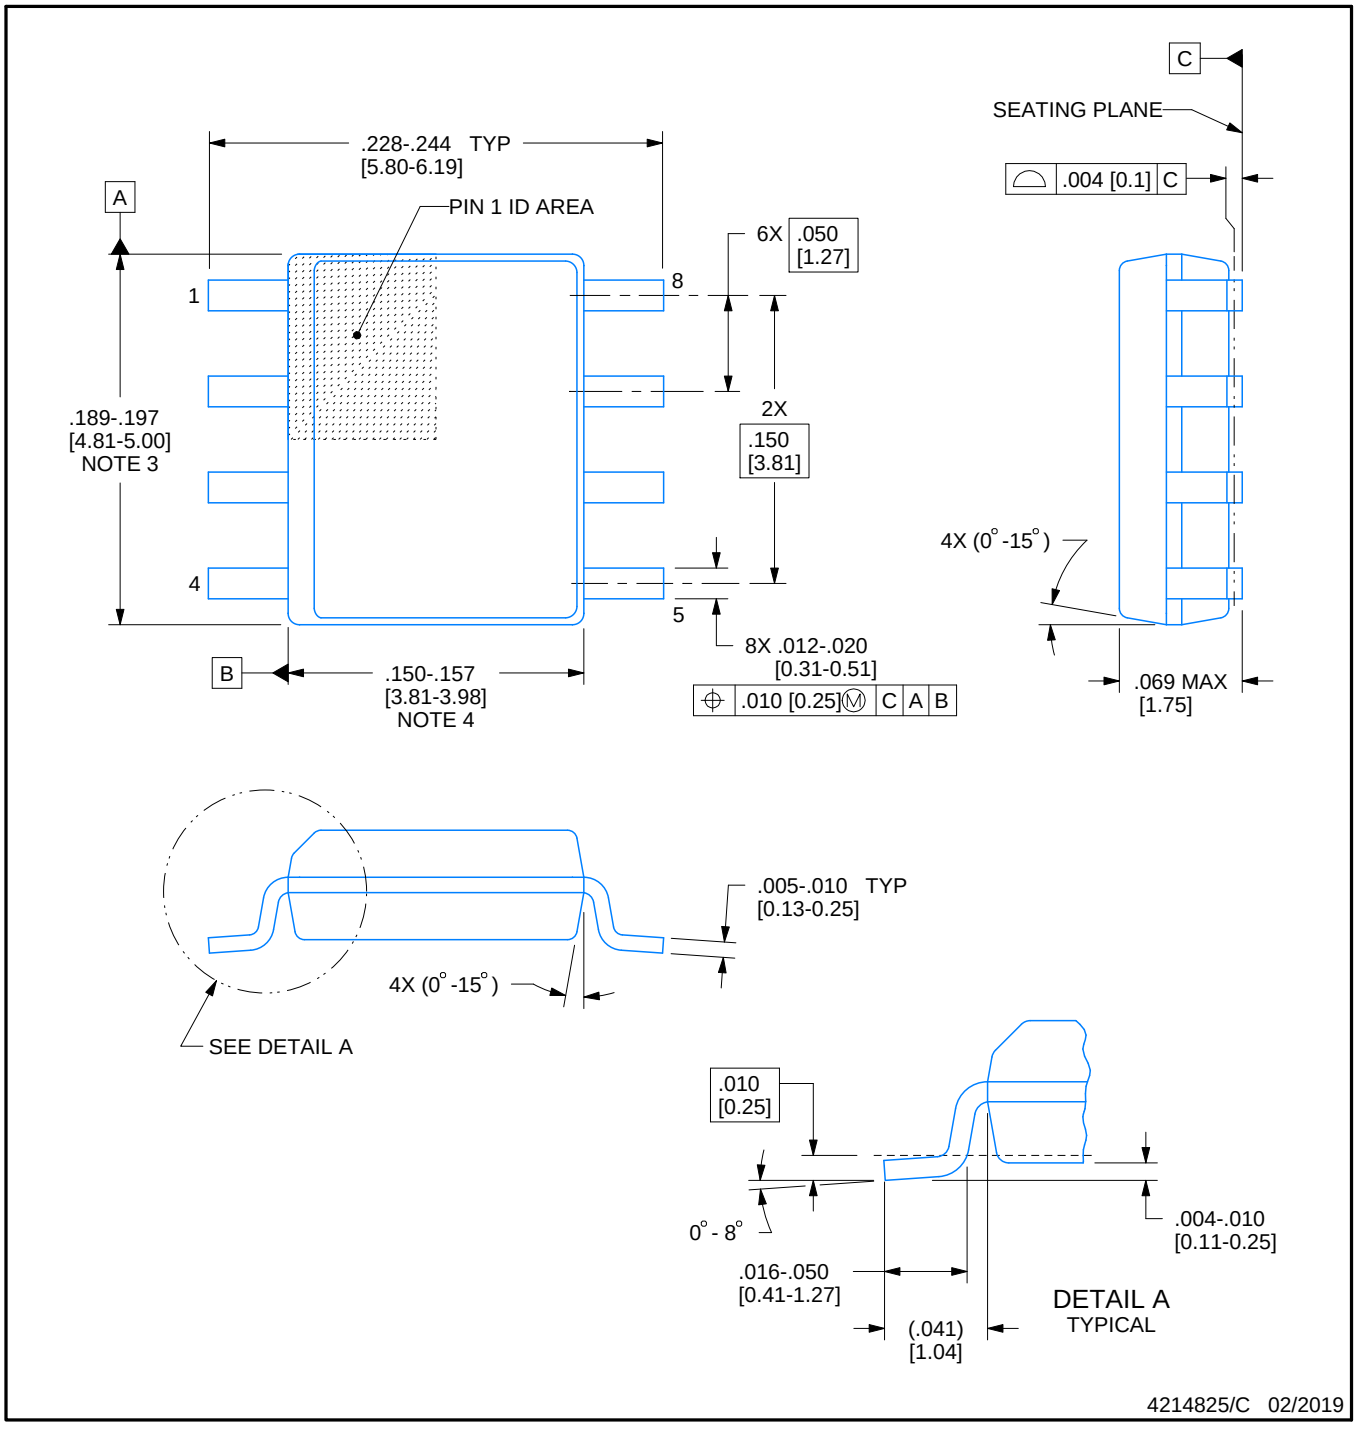


PACKAGE OUTLINE

D0008A

SOIC - 1.75 mm max height

SMALL OUTLINE INTEGRATED CIRCUIT



NOTES:

1. Linear dimensions are in inches [millimeters]. Dimensions in parenthesis are for reference only. Controlling dimensions are in inches. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed .006 [0.15] per side.
4. This dimension does not include interlead flash.
5. Reference JEDEC registration MS-012, variation AA.
