

# REF50xx

## Low-Noise, Very Low Drift, Wide $V_{IN}$ Precision Voltage Reference

### 1 Features

- Low temperature drift (maximum):
  - Enhanced-grade (New): 2.5ppm/°C
  - High-grade: 3ppm/°C
  - Standard-grade: 8ppm/°C
- High accuracy (maximum):
  - Enhanced-grade: 0.025%
  - High-grade: 0.05%
  - Standard-grade: 0.1%
- Low noise:
  - Enhanced-grade: 0.5 $\mu$ V<sub>PP</sub>/V
  - High/Standard-grade: 3 $\mu$ V<sub>PP</sub>/V
- Excellent long-term stability:
  - 22ppm after first 1000 hours (SOIC-8)
  - 50ppm after first 1000 hours (VSSOP-8)
- Wide input voltage support:
  - Enhanced-grade: 42V
  - High/Standard-grade: 18V
- High-output current:  $\pm$ 10mA
- Temperature range: -40°C to 125°C

### 2 Applications

- Precision data acquisition systems
- Semiconductor test equipment
- Industrial process controls
- Medical instrumentation
- Pressure and temperature transmitters
- Lab and field instrumentation

### 3 Description

The REF50xx is a family of low-noise, low-drift, very high precision voltage references. These references are capable of both sinking and sourcing current, and have excellent line and load regulation.

Excellent temperature drift (2.5ppm/°C) and high accuracy (0.025%) are achieved using proprietary design techniques. These features, combined with very low flicker noise (0.5 $\mu$ V<sub>PP</sub>/V), make the REF50xx family an excellent choice for use in high-precision data acquisition systems. REF50 family is available in enhanced grade (REF50xxEI), high grade (REF50xxI) and standard grade (REF50xxAI). The reference voltages are offered in 8-pin SOIC and VSSOP packages and are specified from -40°C to 125°C.

The REF50xxEI supports wide supply voltage rating of 42V with ultra-low IQ of 340 $\mu$ A. The wide supply range allows for direct connection to the battery or field supply. This also protects the device in case of power supply IC failure.

#### Device Information

PART NUMBER	PACKAGE (1)	BODY SIZE (NOM) (2)
REF50xxI , REF50xxAI	SOIC (8)	4.90mm × 3.91mm
	VSSOP (8)	3.00mm × 3.00mm
REF50xxEI	SOIC (8)	4.90mm × 3.91mm

- (1) For all available packages, see the orderable addendum at the end of the data sheet.
- (2) The package size (length × width) is a nominal value and includes pins, where applicable.

**Table 5-1. Pin Functions**

NAME	PIN		DESCRIPTION
	REF50xxI, REF50xxA	REF50xxE	
DNC	1, 8	8	Do not connect
EN	-	1	Device enable control. Low level input disables the reference output and device enters shutdown mode. Device can be enabled by driving voltage > 1.6V or leaving the EN pin floating.
VIN	2	2	Input supply voltage
TEMP	3	3	Temperature monitoring pin. Provides a temperature-dependent output voltage
GND	4	4	Ground
TRIM/NR	5	-	Output adjustment or noise reduction pin
NR	-	5	Noise reduction pin
VOUT	6	6	Reference voltage output
NC	7		No internal connection
NC		7	Leave it floating or connect it to GND

## 6 Specifications

### 6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)<sup>(1)</sup>

		MIN	MAX	UNIT
Input voltage	$V_{IN}$ <sup>(2)</sup>	-0.3	18	V
	$V_{IN}$ <sup>(3)</sup>	-0.3	48	
Output Voltage	$V_{OUT}$ <sup>(2)</sup>	-0.3	5.5	V
Operating temperature	( $T_A$ )	-55	125	°C
Junction temperature	( $T_J$ max)		150	
Storage temperature range	( $T_{stg}$ )	-65	150	

- (1) Stresses above these ratings can cause permanent damage. Exposure to absolute maximum conditions for extended periods can degrade device reliability. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those specified is not implied. These are stress ratings only and functional operation of the device at these or any other conditions beyond those specified in the Electrical Characteristics Table is not implied.
- (2) Specification for REF5xxI and REF50xxAI.
- (3) Specification for REF50xxEI.

### 6.2 ESD Ratings

			VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge <sup>(3)</sup>	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins <sup>(1)</sup>	± 3000	V
		Charged device model (CDM), per JEDEC specification JESD22-C101, all pins <sup>(2)</sup>	± 1000	
	Electrostatic discharge <sup>(4)</sup>	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins <sup>(1)</sup>	± 2000	
		Charged device model (CDM), per JEDEC specification JESD22-C101, all pins <sup>(2)</sup>	± 500	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.
- (3) Specification for REF50xxI and REF50xxAI.
- (4) Specification for REF50xxEI.

### 6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
$V_{IN}$	Input voltage <sup>(2)</sup>	$V_{OUT} + 0.2$ <sup>(1)</sup>		18	V
	Input voltage <sup>(3)</sup>	$V_{OUT} + 0.2$		42	V
NR	Noise reduction <sup>(3)</sup>	0		6	V
$I_{OUT}$	Output current	-10		10	mA
$T_A$	Operating ambient temperature	-40	25	125	°C

- (1) Except for the REF5020, where  $V_{IN}$  (minimum) = 2.7V.
- (2) Specification for REF50xxI and REF50xxAI.
- (3) Specification for REF50xxEI.

## 6.4 Thermal Information

THERMAL METRIC <sup>(1)</sup>		REF50xxEI	REF50xxI , REF50xxAI		UNIT
		D (SOIC)	D (SOIC)	DGK (VSSOP)	
		8 PINS	8 PINS	8 PINS	
$R_{\theta JA}$	Junction-to-ambient thermal resistance	120	115	160.9	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	52	63.4	53.9	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	66	57.1	82.9	°C/W
$\Psi_{JT}$	Junction-to-top characterization parameter	9.8	15.4	5.1	°C/W
$\Psi_{JB}$	Junction-to-board characterization parameter	64.7	56.2	80.7	°C/W
$R_{\theta JC(bot)}$	Junction-to-case (bottom) thermal resistance	N/A	N/A	N/A	°C/W

- (1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.

## 6.5 Electrical Characteristics REF50

At  $T_A = 25^\circ\text{C}$ ,  $I_{\text{LOAD}} = 0$ ,  $C_L = 1\mu\text{F}$  and  $V_{\text{IN}} = (V_{\text{OUT}} + 0.2\text{V})$  to 18V, unless otherwise noted

PARAMETER		TEST CONDITION	MIN	TYP	MAX	UNIT

## 7 Parameter Measurement Information

### 7.1 Solder Heat Shift

The materials used in the manufacture of the REF50xx have differing coefficients of thermal expansion, resulting in stress on the device die when the part is heated. Mechanical and thermal stress on the device can cause the output voltages to shift, degrading the initial accuracy and drift specifications of the product. Reflow soldering is a common cause of this error.

To illustrate this effect, a total of 36 devices were soldered on printed-circuit-boards using lead-free solder paste and the paste manufacturer suggested reflow profile. The reflow profile is as shown in [Figure 7-1](#). The printed-circuit-board is comprised of FR4 material. The board thickness is 0.8mm and the area is 13mm × 13mm.

The reference voltage is measured before and after the reflow process across temperature; the typical shift of accuracy and drift is displayed in [Figure 7-2](#) for REF50xxEI and [Figure 7-3](#) through [Figure 7-10](#) for REF50xx. Although all tested units exhibit very low shifts, higher shifts are also possible depending on the size, thickness, and material of the printed-circuit-board. An important note is that the histograms display the typical shift for exposure to a single reflow profile. Exposure to multiple reflows, as is common on printed circuit boards (PCBs) with surface-mount components on both sides, causes additional shifts in the output bias voltage. If the PCB is exposed to multiple reflows, then solder the device in the last pass to minimize device exposure to thermal stress.

## 8 Detailed Description

### 8.1 Overview

The REF50xx is family of low-noise, precision band-gap voltage references that are specifically designed for excellent initial voltage accuracy and drift. See [Section 8.2](#) for a simplified block diagram of the REF50xx.

### 8.2 Functional Block Diagram

**Figure 8-1. REF50xxI, REF50xxAI Block Diagram**

**Figure 8-2. REF50xxEI Block Diagram**

## 8.3 Feature Description

### 8.3.1 Temperature Monitoring

The temperature output terminal (TEMP, pin 3) provides a temperature-dependent voltage output with approximately 60kΩ source impedance. As illustrated in Figure 6-8, the output voltage follows the nominal relationship:

$$\text{REF50xxI, REF50xxAI: } V_{\text{TEMP PIN}} = 509\text{mV} + 2.64 \times T(^{\circ}\text{C}) \quad (1)$$

$$\text{REF50xxEI: } V_{\text{TEMP PIN}} = 625\text{mV} + 2.64 \times T(^{\circ}\text{C}) \quad (2)$$

This pin indicates general chip temperature, accurate to approximately  $\pm 15^{\circ}\text{C}$ . Although not generally suitable for accurate temperature measurements, this pin can be used to indicate temperature changes or for temperature compensation of analog circuitry. A temperature change of  $30^{\circ}\text{C}$  corresponds to an approximate 79mV change in voltage at the TEMP pin.

The TEMP pin has high-output impedance (see Section 8.2). Loading this pin with a low-impedance circuit induces a measurement error; however, this pin does not have any effect on  $V_{\text{OUT}}$  accuracy.

To avoid errors caused by low-impedance loading, buffer the TEMP pin output with a suitable low-temperature drift op amp, such as the OPA333, OPA335, or OPA376, as shown in Figure 8-3.

NOTE: (1) Low drift op amp, such as the OPA333, OPA335, or OPA376.

**Figure 8-3. Buffering the TEMP Pin Output**

### 8.3.2 Temperature Drift

The REF50xx is designed for minimal drift error, which is defined as the change in output voltage over temperature. The drift is calculated using the box method, as described in Equation 3.

$$\text{Drift} = \left( \frac{V_{\text{OUTMAX}} - V_{\text{OUTMIN}}}{V_{\text{OUT}} \times \text{Temp Range}} \right) \times 10^6 (\text{ppm}) \quad (3)$$

The REF50xx features a maximum drift coefficient of 2.5ppm/ $^{\circ}\text{C}$  for the enhanced-grade version, 3ppm/ $^{\circ}\text{C}$  for the high-grade version, and 8ppm/ $^{\circ}\text{C}$  for the standard-grade.

### 8.3.3 Thermal Hysteresis

Thermal hysteresis for the REF50xx is defined as the change in output voltage after operating the device at 25°C, cycling the device through the specified temperature range, and returning to 25°C. Thermal hysteresis can be expressed as [Equation 4](#):

$$V_{\text{HYST}} = \left( \frac{|V_{\text{PRE}} - V_{\text{POST}}|}{V_{\text{NOM}}} \right) \cdot 10^6 \text{ (ppm)} \quad (4)$$

where

- $V_{\text{HYST}}$  = thermal hysteresis (in units of ppm)
- $V_{\text{NOM}}$  = the specified output voltage
- $V_{\text{PRE}}$  = output voltage measured at 25°C pre-temperature cycling
- $V_{\text{POST}}$  = output voltage measured after the device has been cycled from 25°C through the specified temperature range of –40°C to 125°C and returned to 25°C

### 8.3.4 Noise Performance

Typical 0.1Hz to 10Hz voltage noise for each member of the REF50xx family is specified in the Electrical Characteristics table. The noise voltage increases with output voltage and operating temperature. Additional filtering can be used to improve output noise levels, although take care to make sure the output impedance does not degrade performance.

For additional information about how to minimize noise and maximize performance in mixed-signal applications such as data converters, refer to the [How a Voltage Reference Affects ADC Performance Part 1](#), [How a Voltage Reference Affects ADC Performance Part 2](#), and [How a Voltage Reference Affects ADC Performance Part 3](#) analog design journals.

**Figure 8-4. Noise Reduction Using the TRIM/NR Pin**

### 8.3.5 Long-Term Stability

Due to aging and environmental effects, all semiconductor devices experience physical changes of the semiconductor die and the packaging material over time. These changes and the associated package stress on the die cause the output voltage in precision voltage references to deviate over time. The value of such change is specified in the data sheet by a parameter called the long-term stability (also known as the long-term drift (LTD)). [Equation 5](#) shows how LTD is calculated. Note that the LTD value is positive if the output voltage drifts higher over time and negative if the voltage drifts lower over time. [Figure 6-23](#) through [Figure 6-30](#) show the drift of the output voltage for REF50xx over the first 4000 operating hours.

$$\text{LTD(ppm)}\Big|_{t=n} = \frac{(V_{\text{OUT}}\Big|_{t=0} - V_{\text{OUT}}\Big|_{t=n})}{V_{\text{OUT}}\Big|_{t=0}} \times 10^6 \quad (5)$$

where

- $\text{LTD(ppm)}\Big|_{t=n}$  = long-term stability (in units of ppm)
- $V_{\text{OUT}}\Big|_{t=0}$  = output voltage at time = 0 hr

- $V_{OUT}|_{t=n}$  = output voltage at time = n hr

### 8.3.6 Output Adjustment Using the TRIM/NR Pin

The REF50xxI, REF50xxAI provides a very accurate, factory-trimmed voltage output. However,  $V_{OUT}$  can be adjusted using the trim and noise reduction pin (TRIM/NR, pin 5). Figure 8-5 shows a typical circuit that allows an output adjustment of  $\pm 15$  mV.

**Figure 8-5.  $V_{OUT}$  Adjustment Using the TRIM/NR Pin**

The REF50xx allows access to the band-gap through the TRIM/NR pin. Placing a capacitor from the TRIM/NR pin to GND (Figure 8-4) in combination with the internal  $R_3$  and  $R_4$  resistors creates a low-pass filter. A capacitance of  $1\mu\text{F}$  creates a low-pass filter with the corner frequency from 10Hz to 20Hz. Such a filter decreases the overall noise measured on the  $V_{OUT}$  pin by half. Higher capacitance results in a lower filter cutoff frequency, further reducing output noise. Using this capacitor increases start-up time.

## 8.4 Device Functional Modes

### 8.4.1 Basic Connections

Figure 8-6 shows the typical connections for the REF50xx. TI recommends a supply bypass capacitor ranging from  $1\mu\text{F}$  to  $10\mu\text{F}$ . A  $1\mu\text{F}$  to  $50\mu\text{F}$  output capacitor ( $C_L$ ) must be connected from  $V_{\text{OUT}}$  to GND. The equivalent series resistance (ESR) value of  $C_L$  must be less than or equal to  $1.5\Omega$  to make sure output stability. To minimize noise, the recommended ESR of  $C_L$  is from  $1\Omega$  and  $1.5\Omega$ .

**Figure 8-6. Basic Connections**

### 8.4.2 Supply Voltage

The REF50xx family of voltage references features extremely low dropout voltage. With the exception of the REF5020, which has a minimum supply requirement of 2.7V, these references can be operated with a supply of 200mV more than the output voltage in an unloaded condition. For loaded conditions, a typical dropout voltage versus load plot is provided in Figure 6-6.

### 8.4.3 Negative Reference Voltage

For applications requiring a negative and positive reference voltage, the REF50xx and OPA735 can be used to provide a dual-supply reference from a 5V supply. Figure 8-7 shows the REF5025 used to provide a 2.5V supply reference voltage. The low-drift performance of the REF50xx complements the low offset voltage and zero drift of the OPA735 to provide an accurate solution for split-supply applications. Take care to match the temperature coefficients of  $R_1$  and  $R_2$ .

NOTE: Bypass capacitors not shown.

**Figure 8-7. The REF5025 and OPA735 Create Positive and Negative Reference Voltages**

## 9 Applications and Implementation

### Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

### 9.1 Application Information

Data acquisition systems often require stable voltage references to maintain accuracy. The REF50xx family features low noise, very low drift, and high initial accuracy for high-performance data converters. [Figure 9-1](#) shows the REF5040 in a basic data acquisition system.

### 9.2 Typical Applications

#### 9.2.1 16-Bit, 250-KSPS Data Acquisition System

Figure 9-1. Complete Data Acquisition System Using the REF50xx

#### 9.2.1.1 Design Requirements

When using the REF50xx in the design, select a proper output capacitor that does not create gain peaking, thereby increasing total system noise. At the same time, the capacitor must be selected to provide required filtering performance for the system. In addition, input bypass capacitor and noise reduction capacitors must be added for optimum performances. During the design of the data acquisition system, equal consideration must be given to the buffering analog input signal as well as the reference voltage. Having a properly designed input buffer with an associated RC filter is a necessary requirement for good performance of the data acquisition system.

#### 9.2.1.2 Detailed Design Procedure

The OPA365 is used to drive the 16-bit analog-to-digital converter (ADS8326). The RC filter at the output of the OPA365 is used to reduce the charge kick-back created by the opening and closing of the sampling switch inside the ADC. Design the RC filter such that the voltage at the sampling capacitor settles to 16-bit accuracy within the acquisition time of the ADC. The bandwidth of the driving amplifier must at least be four times the bandwidth of the RC filter.

The REF5040 is used to drive the REF pin of the ADS8326. Proper selection of voltage reference output capacitor is very important for this design. Very low equivalent series resistance (ESR) creates gain-peaking, which degrades SNR of the total system. If the ESR of the capacitor is not enough, then an additional resistor must be added in series with the output capacitor. A capacitance of 1µF can be connected to the NR pin to reduce band-gap noise of the REF50xx.

SNR measurements using different RC filters at the output of the OPA365, different values of output capacitor for the REF50xx and different values of capacitors at the TRIM/NR pin are shown in [Table 9-1](#).

**Table 9-1. Data Acquisition Measurement Results for Different Conditions**

	TEST CONDITION 1	TEST CONDITION 2
OPA365 RC filter	124Ω, 1nF	124Ω, 1nF
REF5040 output capacitor	10µF	10µF + 47µF
TRIM/NR pin capacitor	0µF	1µF
SNR	86.7dB	92.8dB

### 9.2.1.3 Application Curve

**Figure 9-2. FFT Plot-Noise Floor of Data Acquisition System**

## 10 Power Supply Recommendations

The REF50xx family of voltage references features extremely low dropout voltage. With the exception of the REF5020, which has a minimum supply requirement of 2.7V, these references can be operated with a supply of 200mV more than the output voltage in an unloaded condition. For loaded conditions, a typical dropout voltage versus load plot is provided in [Figure 6-6](#). TI recommends a supply bypass capacitor ranging from 1µF to 50µF for REF50xxI and REF50xxAI. TI recommends a supply bypass capacitor ranging from 1µF to 100µF for REF50xxEI.

## 11 Layout

### 11.1 Layout Guidelines

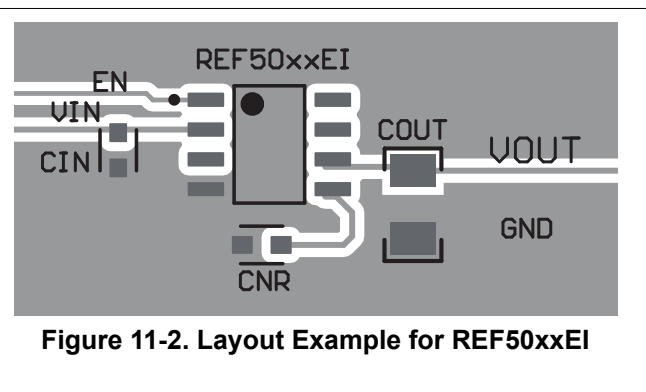

#### REF50xxI, REF50xxAI

- Place the power-supply bypass capacitor as closely as possible to the supply and ground pins. The recommended value of this bypass capacitor is from 1µF to 10µF. If necessary, additional decoupling capacitance can be added to compensate for noisy or high-impedance power supplies.
- Place a 1µF noise filtering capacitor between the NR pin and ground.
- The output must be decoupled with a 1µF to 50µF capacitor. A resistor in series with the output capacitor is optional. For better noise performance, the recommended ESR on the output capacitor is from 1Ω to 1.5Ω.
- A high-frequency, 1µF capacitor can be added in parallel between the output and ground to filter noise and help with switching loads as data converters.

#### REF50xxEI

- Place the power-supply bypass capacitor as close as possible to the supply and ground pins. The recommended value of this bypass capacitor is from 0.1µF to 10µF. If necessary, additional decoupling capacitance can be added to compensate for noisy or high-impedance power supplies. The smallest capacitor must be placed closest to the device.
- Place a 0.1µF to 1µF class 1 noise filtering capacitor between the NR pin and ground.
- The output must be decoupled with a 1µF to 100µF low ESR (maximum 1 Ω) capacitor.

### 11.2 Layout Example

### 11.3 Power Dissipation

The REF50xx family is specified to deliver current loads of ±10mA over the specified input voltage range. The temperature of the device increases according to [Equation 6](#):

$$T_J = T_A + P_D \times \theta_{JA} \quad (6)$$

where

- $T_J$  = junction temperature (°C)
- $T_A$  = ambient temperature (°C)
- $P_D$  = power dissipated (W)
- $\theta_{JA}$  = junction-to-ambient thermal resistance (°C/W)

The REF50xx junction temperature must not exceed the absolute maximum rating of 150°C.

(1) **Status:** For more details on status, see our [product life cycle](#).

(2) **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

(3) **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

(4) **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

(5) **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

**Important Information and Disclaimer:**The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

# DGK0008A

# PACKAGE OUTLINE

VSSOP - 1.1 mm max height

SMALL OUTLINE PACKAGE

4214862/A 04/2023

**NOTES:**

PowerPAD is a trademark of Texas Instruments.

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.15 mm per side.
4. This dimension does not include interlead flash. Interlead flash shall not exceed 0.25 mm per side.
5. Reference JEDEC registration MO-187.

# EXAMPLE BOARD LAYOUT

DGK0008A

™ VSSOP - 1.1 mm max height

SMALL OUTLINE PACKAGE

LAND PATTERN EXAMPLE  
EXPOSED METAL SHOWN  
SCALE: 15X

SOLDER MASK DETAILS

4214862/A 04/2023

NOTES: (continued)

6. Publication IPC-7351 may have alternate designs.
7. Solder mask tolerances between and around signal pads can vary based on board fabrication site.
8. Vias are optional depending on application, refer to device data sheet. If any vias are implemented, refer to their locations shown on this view. It is recommended that vias under paste be filled, plugged or tented.
9. Size of metal pad may vary due to creepage requirement.

# EXAMPLE STENCIL DESIGN

DGK0008A

<sup>TM</sup> VSSOP - 1.1 mm max height

SMALL OUTLINE PACKAGE

SOLDER PASTE EXAMPLE  
SCALE: 15X

4214862/A 04/2023

NOTES: (continued)

11. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
12. Board assembly site may have different recommendations for stencil design.

D0008A

# PACKAGE OUTLINE

SOIC - 1.75 mm max height

SMALL OUTLINE INTEGRATED CIRCUIT

4214825/C 02/2019

## NOTES:

- Linear dimensions are in inches [millimeters]. Dimensions in parenthesis are for reference only. Controlling dimensions are in inches. Dimensioning and tolerancing per ASME Y14.5M.
- This drawing is subject to change without notice.
- This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed  $.006$  [0.15] per side.
- This dimension does not include interlead flash.
- Reference JEDEC registration MS-012, variation AA.
