

- **Members of the Texas Instruments SCOPE™ Family of Testability Products**
- **Compatible With the IEEE Standard 1149.1-1990 (JTAG) Test Access Port and Boundary-Scan Architecture**
- **Control Operation of Up to Six Parallel Target Scan Paths**
- **Accommodate Pipeline Delay to Target of Up to 31 Clock Cycles**
- **Scan Data Up to 2³² Clock Cycles**
- **Execute Instructions for Up to 2³² Clock Cycles**
- **Each Device Includes Four Bidirectional Event Pins for Additional Test Capability**
- **Inputs Are TTL-Voltage Compatible**
- **EPIC™ (Enhanced-Performance Implanted CMOS) 1-μm Process**
- **Packaged in 44-Pin Plastic Leaded Chip Carrier (FN), 68-Pin Ceramic Pin Grid Array (GB), and 68-Pin Ceramic Quad Flat Packages (HV)**

description

The 'ACT8990 test-bus controllers (TBC) are members of the Texas Instruments SCOPE™ testability integrated-circuit family. This family of components supports IEEE Standard 1149.1-1990 (JTAG) boundary scan to facilitate testing of complex circuit-board assemblies. The 'ACT8990 differ from other SCOPE™ integrated circuits. Their function is to control the JTAG serial-test bus rather than being target boundary-scannable devices.

The required signals of the JTAG serial-test bus – test clock (TCK), test mode select (TMS), test data input (TDI), and test data output (TDO) can be connected from the TBC to a target device without additional logic. This is done as a chain of IEEE Standard 1149.1-1990 boundary-scannable components that share the same serial-test bus. The TBC generates TMS and TDI signals for its target(s), receives TDO signals from its target(s), and buffers its test clock input (TCKI) to a test clock output (TCKO) for distribution to its target(s). The TMS, TDI, and TDO signals can be connected to a target directly or via a pipeline, with a retiming delay of up to 31 bits. Since the TBC can be configured to generate up to six separate TMS signals [TMS (5–0)], it can be used to control up to six target scan paths that are connected in parallel (i.e., sharing common TCK, TDI, and TDO signals).

While most operations of the TBC are synchronous to TCKI, a test-off ($\overline{\text{TOFF}}$) input is provided for output control of the target interface, and a test-reset ($\overline{\text{TRST}}$) input is provided for hardware/software reset of the TBC. In addition, four event [EVENT (3–0)] I/Os are provided for asynchronous communication to target device(s). Each event has its own event generation/detection logic, and detected events can be counted by two 16-bit counters.

The TBC operates under the control of a host microprocessor/microcontroller via the 5-bit address bus [ADRS (4–0)] and the 16-bit read/write data bus [DATA (15–0)]. Read ($\overline{\text{RD}}$) and write ($\overline{\text{WR}}$) strobes are implemented such that the critical host-interface timing is independent of the TCKI period. Any one of 24 registers can be addressed for read and/or write operations. In addition to control and status registers, the TBC contains two command registers, a read buffer, and a write buffer. Status of the TBC is transmitted to the host via ready ($\overline{\text{RDY}}$) and interrupt ($\overline{\text{INT}}$) outputs.

Major commands can be issued by the host to cause the TBC to generate the TMS sequences necessary to move the target(s) from any stable test-access-port (TAP) controller state to any other stable TAP state, to execute instructions in the Run-Test/Idle TAP state, or to scan instruction or test data through the target(s). A 32-bit counter can be preset to allow a predetermined number of execution or scan operations.

Serial data that appears at the selected TDI input (TDI1 or TDI0) is transferred into the read buffer, which can be read by the host to obtain up to 16 bits of the serial-data stream. Serial data that is transmitted from the TDO output is written by the host to the write buffer.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

functional block diagram

† Inputs have internal pullup resistors.

Terminal Functions

TERMINAL NAME	I/O	DESCRIPTION
ADRS4–ADRS0	I	Address inputs. ADRS4–ADRS0 form the 5-bit address bus that interfaces the TBC to its host. These inputs specify the TBC register to be read from or written to.
DATA15–DATA0	I/O	Data inputs and outputs. DATA15–DATA0 form the 16-bit bidirectional data bus that interfaces the TBC to its host. Data is read from or written to the TBC register using this data bus.
GND		Ground
$\overline{\text{INT}}$	O	Interrupt. $\overline{\text{INT}}$ transmits an interrupt signal to the host. When the TBC requires service from the host, $\overline{\text{INT}}$ is asserted (low). $\overline{\text{INT}}$ will remain asserted (low) until the host has completed the required service.
NC		No connection
$\overline{\text{RD}}$	I	Read strobe. $\overline{\text{RD}}$ is the active low output enable for the data bus. $\overline{\text{RD}}$ is used as the strobe for reading data from the selected TBC register.
$\overline{\text{RDY}}$	O	Ready. $\overline{\text{RDY}}$ transmits a status signal to the host. When the TBC is ready to accept a read or write operation from the host, $\overline{\text{RDY}}$ is asserted (low). $\overline{\text{RDY}}$ is not asserted (high) when the TBC is in recovery from a read, write, command, or reset operation.
TCKI	I	Test clock input. TCKI is the clock input for the TBC. Most operations of the TBC are synchronous to TCKI. When enabled, all target interface outputs change on the falling edge of TCKI. Sampling of target interface inputs are configured to occur on either the rising edge or falling edge of TCKI.
TCKO	O	Test clock output. TCKO distributes TCK to the target(s). The TCKO is configured to be disabled, constant zero, constant one, or to follow TCKI. When TCKO follows TCKI, it is delayed to match the delay of generating the TDO and TMS signals.
TDI1–TDI0	I	Test data inputs. The TDI1–TDI0 serial inputs are used for shifting test data from the target(s). The TDI inputs can be directly connected to the TDO pin(s) of the target(s).
TDO	O	Test data output. TDO is used for shifting test data into the target(s). TDO can be directly connected to the TDI terminal(s) of the target(s).
TMS1–TMS0	O	Test mode select outputs. These parallel outputs transmit TMS signals to the target(s), which direct them through their TAP controller states. TMS1–TMS0 can be directly connected to the TMS terminals of the target(s).
TMS5–TMS2/ EVENT3–EVENT0	I/O	Test mode select outputs or event inputs/outputs. These I/Os can be configured for use as either TMS outputs or event inputs/outputs. As TMS outputs, they function similarly to TMS1–TMS0 above. As event I/Os, they can be used to receive/transmit interrupt signals to/from the target(s).
$\overline{\text{TOFF}}$	I	Test-off input. $\overline{\text{TOFF}}$ is the active low output disable for all outputs and I/Os of the target interface (TCKO, TDO, TMS, TMS/EVENT).
$\overline{\text{TRST}}$	I	Test-reset input. $\overline{\text{TRST}}$ is used to initiate hardware and software reset operations of the TBC. Hardware reset begins when $\overline{\text{TRST}}$ is asserted (low). Software reset begins when $\overline{\text{TRST}}$ is released (high) and proceeds synchronously to TCKI to completion in a predetermined number of cycles.
$\overline{\text{WR}}$	I	Write input. $\overline{\text{WR}}$ is the strobe for writing data to a TBC data register. Signals present at the data and address buses are captured on the rising edge of $\overline{\text{WR}}$.
V _{CC}		Supply voltage

absolute maximum ratings over operating free-air temperature range (unless otherwise noted)†

Supply voltage range, V_{CC}	-0.5 V to 7 V
Input voltage range, V_I (see Note 1)	-0.5 V to V_{CC}
Output voltage range, V_O (see Note 1)	-0.5 V to V_{CC}
Input clamp current, I_{IK} ($V_I < 0$ or $V_I > V_{CC}$)	± 20 mA
Output clamp current, I_{OK} ($V_O < 0$ or $V_O > V_{CC}$)	± 20 mA
Continuous output current, I_O ($V_O = 0$ to V_{CC})	± 25 mA
Maximum power dissipation at $T_A = 55^\circ\text{C}$ (in still air) (see Note 2): FN package	1.5W
Storage temperature range, T_{stg}	-65°C to 150°C

† Stresses beyond those listed under “absolute maximum ratings” may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under “recommended operating conditions” is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

- NOTES: 1. The input and output voltage ratings may be exceeded if the input and output clamp-current ratings are observed.
 2. The maximum package power dissipation is calculated using a junction temperature of 150°C and a board trace length of 75 mils. For more information, refer to the *Package Thermal Considerations* application note in the *ABT Advanced BiCMOS Technology Data Book*, literature number SCBD002.

PARAMETER MEASUREMENT INFORMATION

- NOTES: A. C_L includes probe and jig capacitance.
 B. Waveform 1 is for an output with internal conditions such that the output is low except when disabled by the output control. Waveform 2 is for an output with internal conditions such that the output is high except when disabled by the output control.
 C. All input pulses are supplied by generators having the following characteristics: PRR ≤ 10 MHz, Z_O = 50 Ω, t_r ≤ 3 ns, t_f ≤ 3 ns. For testing pulse duration: t_r = t_f = 1 to 3 ns. Pulse polarity can be either high-to-low-to-high or low-to-high-to-low.
 D. The outputs are measured one at a time with one transition per measurement.

Figure 1. Load Circuit and Voltage Waveforms

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "-" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer:The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

OTHER QUALIFIED VERSIONS OF SN54ACT8990, SN74ACT8990 :

- Catalog: [SN74ACT8990](#)

- Military: [SN54ACT8990](#)

NOTE: Qualified Version Definitions:

- Catalog - TI's standard catalog product

- Military - QML certified for Military and Defense Applications

GB (S-CPGA-P68)

CERAMIC PIN GRID ARRAY

- NOTES: A. All linear dimensions are in inches (millimeters).
 B. This drawing is subject to change without notice.
 C. Index mark may appear on top or bottom depending vendor.
 D. Pins are located within 0.010 (0,25) diameter of true position relative to each other at maximum material condition and within 0.030 (0,76) diameter relative to the edges of the ceramic.
 E. This package can be hermetically sealed with metal lids or with ceramic lids using glass frit.
 F. The pins can be gold plated or solder dipped.
 G. Falls within MIL STD 1835 CMGA1-PN, CMGA13-PN and JEDEC MO-067 AA, MO-066 AA respectively

GENERIC PACKAGE VIEW

FN 44

PLCC - 4.57 mm max height

PLASTIC CHIP CARRIER

Images above are just a representation of the package family, actual package may vary.
Refer to the product data sheet for package details.

4040005-4/C

PACKAGE OUTLINE

FN0044A

PLCC - 4.57 mm max height

PLASTIC CHIP CARRIER

4215154/A 04/2017

NOTES:

1. All linear dimensions are in inches. Any dimensions in brackets are in millimeters. Any dimensions in parenthesis are for reference only. Controlling dimensions are in inches. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. Dimension does not include mold protrusion. Maximum allowable mold protrusion .01 in [0.25 mm] per side.
4. Reference JEDEC registration MS-018.

EXAMPLE BOARD LAYOUT

FN0044A

PLCC - 4.57 mm max height

PLASTIC CHIP CARRIER

LAND PATTERN EXAMPLE
EXPOSED METAL SHOWN
SCALE:4X

SOLDER MASK DETAILS

4215154/A 04/2017

NOTES: (continued)

- 5. Publication IPC-7351 may have alternate designs.
- 6. Solder mask tolerances between and around signal pads can vary based on board fabrication site.

EXAMPLE STENCIL DESIGN

FN0044A

PLCC - 4.57 mm max height

PLASTIC CHIP CARRIER

SOLDER PASTE EXAMPLE
BASED ON 0.125 mm THICK STENCIL
SCALE:4X

4215154/A 04/2017

NOTES: (continued)

7. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
8. Board assembly site may have different recommendations for stencil design.

HV (S-QQFP-F68)

CERAMIC QUAD FLATPACK

- NOTES:
- A. All linear dimensions are in inches (millimeters).
 - B. This drawing is subject to change without notice.
 - C. This package can be hermetically sealed with a ceramic lid using glass frit.
 - D. This dimension allows for package edge anomalies caused by material protrusion, such as rough ceramic, misaligned ceramic layers and lids, meniscus, and glass overrun.
