

SN75LVPE5412 SNLS693B - DECEMBER 2021 - REVISED DECEMBER 2023

SN75LVPE5412 PCle® 5.0 32Gbps 4-Channel Linear Redriver with 1:2 Demux

1 Features

- Quad channel PCIe 5.0 linear redriver or repeater with integrated 1:2 demultiplexer
- Protocol agnostic linear redriver compatible to PCIe, UPI, CCIX, NVLink, DisplayPort, SAS, SATA, and XFI
- Single 3.3V supply PCIe power rail can be used
- Low 720mW active power for 4-channel operation
- No heat sink required
- Provides equalization up to 24dB at 16GHz
- Excellent RX/TX differential RL of -10dB for 8-16GHz
- Low additive RJ of 55 fs RMS with PRBS data
- Low latency of 90ps
- Automatic receiver detection and seamless support for PCIe link training
- Device configuration by pin control or SMBus / I²C.
- Demux selection through pin
- Internal voltage regulator provides immunity to supply noise
- High speed production testing for reliable manufacturing
- Support for x4, x8, and x16 bus width with one or multiple device
- Available companion multiplexer product **SN75LVPE5421**
- -40°C to 85°C temperature range
- 3.5 × 9mm 42 Pin 0.5mm pitch WQFN package

2 Applications

- Desktop PC and motherboard
- Display panel, gaming console
- Rack server, microserver, and tower server
- · High performance computing, hardware accelerator
- Data storage, network attached storage
- Storage area network (SAN) and host bus adapter (HBA) card
- Network interface card (NIC)

3 Description

The SN75LVPE5412 is a four channel linear redriver with integrated demultiplexer (demux). The low-power high-performance linear redriver is designed to support PCIe 5.0 and other interfaces up to 32Gbps.

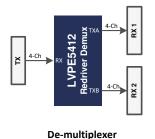

The SN75LVPE5412 receivers deploy continuous time linear equalizers (CTLE) to provide a highfrequency boost. The equalizer can open an input eye that is completely closed due to inter-symbol interference (ISI) induced by an interconnect medium, such as PCB traces and cables. During PCle link training the linear redriver along with the passive channel in between a Root Complex (RC) and Endpoint (EP) as a whole get trained for best transmit and receive equalization settings resulting in the best electrical link. Low channel to channel cross-talk, low additive jitter and excellent return loss allows the device to become almost a passive element in the link. The devices has internal linear voltage regulator to provide clean power supply for high speed data paths that provides high immunity to any supply noise on the board.

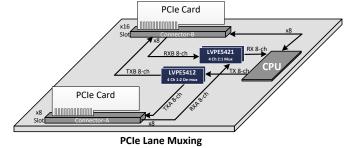

SN75LVPE5412 implements high testing during production for reliable high volume manufacturing. The device also has low AC and DC gain variation providing consistent equalization in high volume platform deployment.

Package Information

PART NUMBER	PACKAGE ⁽¹⁾	PACKAGE SIZE ⁽²⁾
SN75LVPE5412	RUA (WQFN, 42)	9mm × 3.5mm

- For more information, see Section 10.
- The package size (length × width) is a nominal value andincludes pins, where applicable.

4 Pin Configuration and Functions

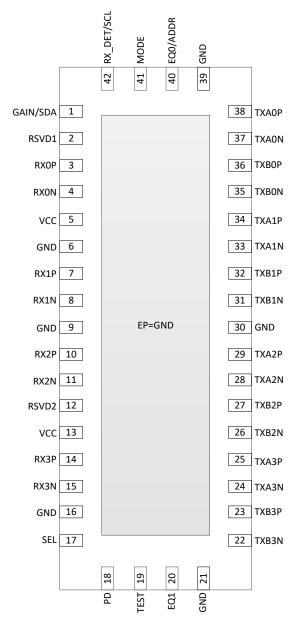

Figure 4-1. RUA Package, 42-Pin WQFN (Top View)

Table 4-1. Pin Functions

PIN	PIN		D=0001071011			
NAME	NO.	TYPE ⁽¹⁾	DESCRIPTION			
MODE	41	I, 5-level	Sets device control configuration modes. The 5-level IO pin is defined in Table 6-1. The pin can be exercised at device power up or in normal operation mode. L0: Pin Mode – device control configuration is done solely by strap pins. L1 or L2: SMBus/l ² C Mode – device control configuration is done by an external controller with SMBus/l ² C primary. This pin along with ADDR pin sets devices secondary address. L3 and L4 (Float): RESERVED – TI internal test modes.			
EQ0 /ADDR	40	I, 5-level	In Pin Mode:			
EQ1	20	I, 5-level	The EQ0 and EQ1 pins sets receiver linear equalization CTLE (AC gain) for all channels according to Table 6-2. These pins are sampled at device power-up only. In SMBus/I ² C Mode: The ADDR pin in conjunction with MODE pin sets SMBus / I ² C secondary address according to Table 6-5. The pin is sampled at device power-up only.			
GAIN /SDA	1	I, 5-level / IO	In Pin Mode: Flat gain (broadband gain – DC and AC) from the input to the output of the device for all channels. Note: the device also provides AC (high frequency) gain in the form of equalization controlled by EQ pins or SMBus/I²C registers. The pin is sampled at device power-up only. In SMBus/I²C Mode: 3.3V SMBus/I²C data. External pullup resistor such as 4.7 kΩ required for operation.			
GND	EP, 6, 9, 16, 21, 30, 39	Р	Ground reference for the device. EP: the Exposed Pad at the bottom of the QFN package. It is used as the GND return for the device. The EP should be connected to one or more ground planes through the low resistance path. A via array provides a low impedance path to GND. The EP also improves thermal dissipation.			
PD	18	I, 3.3V LVCMOS	2-level logic controlling the operating state of the redriver. Active in both <i>Pin Mode</i> and <i>SMBus/l</i> ² <i>C Mode</i> . The pin is used part of PCIe RX_DET state machine as outlined in Table 6-4. High: power down for all channels Low: power up, normal operation for all channels			
RSVD1, 2	2, 12	_	Reserved pins – for best signal integrity performance connect the pins to GND. Alternate option would be 0 Ω resistors from pins to GND.			
RX_DET /SCL	42	I, 5-level / IO	In <i>Pin Mode:</i> Sets receiver detect state machine options according to Table 6-4. The pin is sampled at device power-up only. In <i>SMBus/l</i> ² <i>C Mode:</i> 3.3V SMBus/l ² C clock. External pullup resistor such as 4.7 kΩ required for operation.			
RX0N	4	I	Inverting differential RX inputs. Channel 0.			
RX0P	3	I	Noninverting differential RX inputs. Channel 0.			
RX1N	8	I	Inverting differential RX inputs. Channel 1.			
RX1P	7	1	Noninverting differential RX inputs. Channel 0.			
RX2N	11	I	Inverting differential RX inputs. Channel 2.			
RX2P	10	I	Noninverting differential RX inputs. Channel 2.			
RX3N	15	I	Inverting differential RX inputs. Channel 3.			
RX3P	14	I	Noninverting differential RX inputs. Channel 3.			
SEL	17	I, 3.3V LVCMOS	Selects the mux path. Active in both <i>Pin Mode</i> and <i>SMBus/l</i> ² <i>C Mode</i> . The pin has a weak internal pull-down resistor. Note: the SEL pin must be exercised in system implementations for mux selection between Port A vs Port B. The pin is used for PCIe RX_DET state machine as outlined in Table 6-4. L: Port A selected. H: Port B selected.			
TXA0N	37	0	Inverting differential TX output – Port A, Channel 0.			
TXA0P	38	0	Non-inverting differential TX output – Port A, Channel 0.			
TXA1N	33	0	Inverting differential TX output – Port A, Channel 1.			

Table 4-1. Pin Functions (continued)

PIN		TYPE ⁽¹⁾	DESCRIPTION			
NAME NO.		I TPE(")	DESCRIPTION			
TXA1P	34	0	Non-inverting differential TX output – Port A, Channel 1.			
TXA2N	28	0	Inverting differential TX output – Port A, Channel 2.			
TXA2P	29	0	Non-inverting differential TX output – Port A, Channel 2.			
TXA3N	24	0	Inverting differential TX output – Port A, Channel 3.			
TXA3P	25	0	Non-inverting differential TX output – Port A, Channel 3.			
TXB0N	35	0	Inverting differential TX output – Port B, Channel 0.			
TXB0P	36	0	Non-inverting differential TX output – Port B, Channel 0.			
TXB1N	31	0	Inverting differential TX output – Port B, Channel 1.			
TXB1P	32	0	Non-inverting differential TX output – Port B, Channel 1.			
TXB2N	26	0	Inverting differential TX output – Port B, Channel 2.			
TXB2P	27	0	Non-inverting differential TX output – Port B, Channel 2.			
TXB3N	22	0	Inverting differential TX output – Port B, Channel 3.			
TXB3P	23	0	Non-inverting differential TX output – Port B, Channel 3.			
TEST	19	O TI internal test pin. Keep no connect.				
VCC 5, 13 P		Р	Power supply, VCC = 3.3V ± 10%. The VCC pins on this device should be connected through a low-resistance path to the board VCC plane.			

⁽¹⁾ I = input, O = output, P = power, GND = ground

5 Specifications

5.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)(1)

		MIN	MAX	UNIT
VCC _{ABSMAX}	Supply voltage (VCC)	-0.5	4.0	V
VIO _{CMOS,ABSMAX}	3.3V LVCMOS and open drain I/O voltage	-0.5	4.0	V
VIO _{5LVL,ABSMAX}	5-level input I/O voltage	-0.5	2.75	V
VIO _{HS-RX,ABSMAX}	High-speed I/O voltage (RXnP, RXnN)	-0.5	3.2	V
VIO _{HS-TX,ABSMAX}	High-speed I/O voltage (TXnP, TXnN)	-0.5	2.75	V
$T_{J,ABSMAX}$	Junction temperature		150	°C
T _{stg}	Storage temperature range	-65	150	°C

⁽¹⁾ Operation outside the *Absolute Maximum Rating* may cause permanent device damage. *Absolute Maximum Rating* do not imply functional operation of the device at these or any other conditions beyond those listed under *Recommended Operating Condition*. If used outside the *Recommended Operating Condition* but within the *Absolute Maximum Rating*, the device may not be fully functional, and this may affect device reliability, functionality, performance, and shorten the device lifetime.

5.2 ESD Ratings

			VALUE	UNIT
V _(ESD) Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	±2000	V	
V _(ESD)		Charged device model (CDM), per ANSI/ESDA/JEDEC JS-002 ⁽²⁾	±500	

⁽¹⁾ JEDEC document JEP155 states that 500V HBM allows safe manufacturing with a standard ESD control process. Pins listed as ±2 kV may actually have higher performance.

5.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

5.8 Typical Characteristics

Figure 5-1 shows typical EQ gain curves versus frequency for different EQ settings. Figure 5-2 shows EQ gain variation over temperature for maximum EQ setting of 19. Figure 5-3 shows typical differential return loss for Rx and Tx pins.

5.9 Typical Jitter Characteristics

Figure 5-4, Figure 5-5, and Figure 5-6 illustrate eye diagrams at source, through calibration traces, and through SN75LVPE5412 respectively.

6 Detailed Description

6.1 Overview

The SN75LVPE5412 is a four channel linear redriver with integrated demultiplexer (demux). The low-power high-performance linear repeater or redriver is designed to support PCIe 1.0, 2.0, 3.0, 4.0, and 5.0. The device is a protocol agnostic linear redriver that can operate for other AC-coupled interface up to 32Gbps.

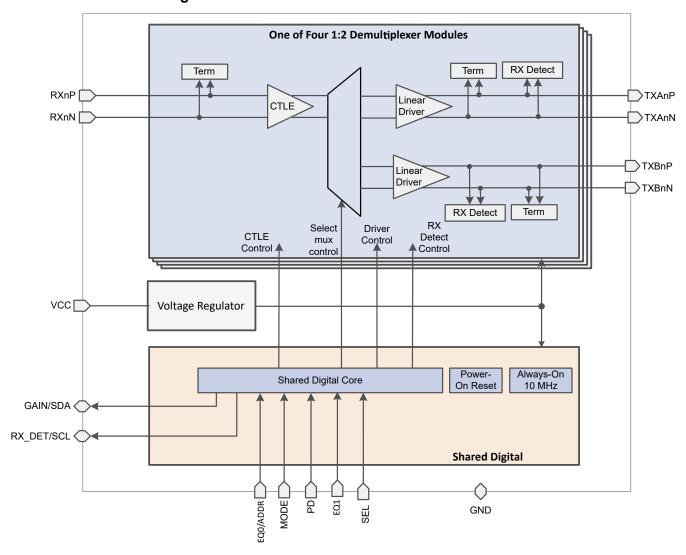

The signal channels of the SN75LVPE5412 operate independently from one another. Each channel includes a continuous-time linear equalizer (CTLE) and a linear output driver, which together compensate for a lossy transmission channel between the source transmitter and the final receiver. The linearity of the data path is specifically designed to preserve any transmit equalization while keeping PCle receiver's (either from Root Complex or Endpoint) equalization effective.

The SN75LVPE5412 can be configured in two different ways:

Pin Mode – device control configuration is done solely by strap pins. Pin mode is expected to be good enough for many system implementation needs.

SMBus/I²C Secondary Mode – provides most flexibility. Requires an external SMBus/I²C primary device to configure SN75LVPE5412 though writing to its secondary address.

6.3 Feature Description

6.3.1 Five-Level Control Inputs

The SN75LVPE5412 has five 5-level inputs pins (EQ1, EQ0, GAIN, MODE, and RX_DET) that are used to control the configuration of the device. These 5-level inputs use a resistor divider to help set the 5 valid levels and provide a wider range of control settings. External resistors must be of 10% tolerance or better. The EQ0, EQ1, GAIN, and RX_DET pins are sampled at power-up only. The MODE pin can be exercised at device power up or in normal operation mode.

Table 6-1. 5-Level Control Pin Settings

LEVEL	SETTING
LO	1 kΩ to GND
L1	8.25 kΩ to GND
L2	24.9 kΩ to GND
L3	75 kΩ to GND
L4	F (Float)

6.3.2 Linear Equalization

The SN75LVPE5412 receivers feature a continuous-time linear equalizer (CTLE) that applies high-frequency boost and low-frequency attenuation to help equalize the frequency-dependent insertion loss effects of a passive channel. The receivers implement two stage linear equalizer for wide range of equalization capability. The equalizer stages also provide flexibility to make subtle modifications of mid-frequency boost for best EQ gain profile match with wide range of channel media characteristics. The EQ profile control feature is only available in SMBus/I²C Mode. In Pin Mode the settings are optimized for FR4 traces.

Table 6-2 shows available equalization boost through EQ control pins or SMBus/I²C registers. In Pin Control mode EQ1 and EQ0 pins set equalization boost for all channels. In I²C Mode individual channels can be independently programmed for EQ boost.

Table 6-2. Equalization Control Settings

		EQUA	TYPICAL EQ	BOOST (dB)				
	Pin N	Mode		SMBus/I	² C Mode			
EQ INDEX	EQ1	EQ0	eq_stage1_3:0	eq_stage2_2:0	eq_profile_3:0	eq_stage1_bypass	At 8 GHz	At 16 GHz
0	L0	L0	0	0	0	1	2.0	4.0

6.3.3 Flat Gain

The GAIN pin can be used to set the overall datapath flat gain (broadband gain including high frequency) of the SN75LVPE5412 when the device is in Pin Mode. The pin GAIN sets the Flat-Gain for all channels. In I²C Mode each channel can be independently set. Table 6-3 shows flat gain control configuration settings. The default recommendation for most systems will be GAIN = L4 (float) that provides flat gain of 0dB.

The flat gain and equalization of the SN75LVPE5412 must be set such that the output signal swing at DC and high frequency does not exceed the DC and AC linearity ranges of the devices, respectively.

Table 6-3. Flat Gain Configuration Settings

Pin Mode GAIN	l ² C Mode flat_gain_2:0	Flat Gain
L0	0	-5.6dB
L1	1	-3.8dB
L2	3	-1.2dB
L3	7	+2.6dB
L4 (float)	5	+0.6dB (default recommendation)

6.3.4 Receiver Detect State Machine

The SN75LVPE5412 deploys an RX detect state machine that governs the RX detection cycle as defined in the PCI express specifications. At device power up or through manually triggered event using PD or SEL pin or writing to the relevant I²C/SMBus register, the redriver determines whether or not a valid PCI express termination is present at the far end of the link. The RX_DET pin of SN75LVPE5412 provides additional flexibility for system designers to appropriately set the device in desired mode according to Table 6-4. For the PCIe application the RX_DET pin can be left floating for default settings.

Note: power up ramp or PD/SEL event triggers RX detect for all four channels. In applications where SN75LVPE5412 channels are used for multiple PCle links, the RX detect function can be performed for individual channels through writing in appropriate I²C/SMBus registers.

Table 6-4. Receiver Detect State Machine Settings

PD	RX_DET	RX Common-mode Impedance	COMMENTS
L	LO	Always 50 Ω	PCI Express RX detection state machine is disabled. Recommended for non PCIe interface use case where the SN75LVPE5412 is used as buffer with equalization.
L	L1	Pre Detect: Hi-Z Post Detect: 50 Ω .	Outputs polls until 3 consecutive valid detections

Product Folder Links: SN75LVPE5412

Table 6-4. Receiver Detect State Machine Settings (continued)

Table of Transcript Detect State Indonting Committee and								
PD	RX_DET	RX Common-mode Impedance	COMMENTS					
L	L2	Pre Detect: Hi-Z Post Detect: 50 Ω.	Outputs polls until 2 consecutive valid detections					
L	L3	Pre Detect: Hi-Z Post Detect: 50 Ω.	Reserved					
L	L4 (Float)	Pre Detect: Hi-Z Post Detect: 50 Ω.	TX polls every ≅150 µs until valid termination is detected. RX CM impedance held at Hi-Z until detection Reset by asserting PD high for 200 µs then low. Recommended default setting for PCIe.					
Н	X	Hi-Z	Reset Channels and set their RX impedance to Hi-Z					

6.4 Device Functional Modes

6.4.1 Active PCIe Mode

The device is in normal operation with PCle state machine enabled by RX_DET = L4 (float). This mode is recommended for PCle use cases. In this mode, the PD pin is driven low in a system (for example, by PCle connector *PRSNT* signal). In this mode, the device redrives and equalizes PCle RX or TX signals to provide better signal integrity.

6.4.2 Active Buffer Mode

The device is in normal operation with PCIe state machine disabled by RX_DET = L0. This mode is recommended for non-PCIe use cases. In this mode, the device is working as a buffer to provide linear equalization to improve signal integrity.

6.4.3 Standby Mode

The device is in standby mode invoked by PD = H. In this mode, the device is in standby mode conserving power.

6.5 Programming

6.5.1 Pin Mode

The SN75LVPE5412 can be fully configured through pin-strap pins. In this mode the device uses 2-level and 5-level pins for device control and signal integrity optimum settings.

6.5.2 SMBUS/I²C Register Control Interface

If MODE = L2 (SMBus / I^2C secondary control mode), the SN75LVPE5412 is configured for best signal integrity through a standard I^2C or SMBus interface that may operate up to 400 kHz. The secondary address of the SN75LVPE5412 is determined by the pin strap settings on the ADDR and MODE pins. Table 6-5 provides the eight possible secondary addresses (7-bit) for each channel banks of the device. In SMBus/ I^2C modes the SCL, SDA pins must be pulled up to a 3.3V supply with a pull-up resistor. The value of the resistor depends on total bus capacitance. 4.7k Ω is a good first approximation for a bus capacitance of 10pF.

Table 6-5. SMBUS/I2C Secondary Address Settings

MODE	ADDR	7-bit Secondary Address Channels 0-1	7-bit Secondary Address Channels 2-3
L1	L0	0x18	0x19

Submit Document Feedback

The SN75LVPE5412 has two types of registers:

- Shared Registers: These registers can be accessed at any time and are used for device-level configuration, status read back, control, or to read back the device ID information.
- Channel Registers: These registers are used to control and configure specific features for each individual channel. All channels have the same register set and can be configured independent of each other or configured as a group through broadcast writes to Bank 0 or Bank 1.

The SN75LVPE5412 features two banks of channels, Bank 0 (Channels 0-1) and Bank 1 (Channels 2-), each featuring a separate register set and requiring a unique SMBus secondary address.

Channel Registers Base Address	Channel Bank 0 Access	Channel Bank 1 Access
0x00	Channel 0 registers	Channel 2 registers
0x20	Channel 0 registers	Channel 2 registers
0x40	Channel 1 registers	Channel 3 registers
0x60	Channel 1 registers	Channel 3 registers
0x80	Broadcast write channel Bank 0 registers, read channel 0 registers	Broadcast write channel Bank 1 registers, read channel 2 registers
0xE0	Bank 0 Share registers	Bank 1 Share registers

7 Application and Implementation

Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

7.1 Application Information

The SN75LVPE5412 is a high-speed linear repeater with integrated demux. The device extends the reach of differential channels impaired by loss from transmission media like PCBs and cables. It can be deployed in a variety of different systems. The following sections outline typical applications and their associated design considerations.

7.2 Typical Applications

The SN75LVPE5412 is a PCI Express linear redriver that can also be configured as interface agnostic redriver by disabling its RX detect feature. The device can be used in a wide range of interfaces including:

- PCI Express
- Ultra Path Interconnect (UPI)
- SATA
- SAS
- DisplayPort

Submit Document Feedback

7.2.1 PCIe x8 Lane Switching

The SN75LVPE5412 and SN75LVPE5421 can be used to switch PCIe lanes from a CPU into one of the two PCIe CEM connectors. Figure 7-1 shows a simplified schematic for the following configuration:

- Two SN75LVPE5412 demultiplex eight TX channels from the CPU into one of the two PCIe slots.
- Two SN75LVPE5421 multiplex eight RX channels from one of the two PCIe slots to CPU.

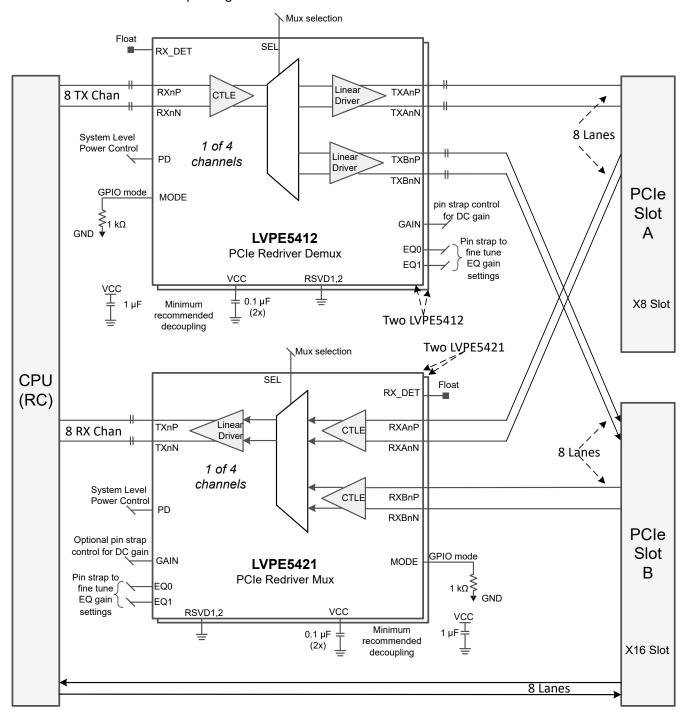

Figure 7-1. Simplified Schematic for PCIe Lane Switching

7.2.1.1 Design Requirements

As with any high-speed design, there are many factors which influence the overall performance. The following list indicates critical areas for consideration during design:

- Use 85 Ω impedance traces when interfacing with PCIe CEM connectors. Length matching on the P and N traces should be done on the single-ended segments of the differential pair.
- Use a uniform trace width and trace spacing for differential pairs.
- Place AC-coupling capacitors near to the receiver end of each channel segment to minimize reflections.
- For Gen 3.0, 4.0, and 5.0, AC-coupling capacitors of 220 nF are recommended, set the maximum body size to 0402, and add a cutout void on the GND plane below the landing pad of the capacitor to reduce parasitic capacitance to GND.
- Back-drill connector vias and signal vias to minimize stub length.
- Use reference plane vias to ensure a low inductance path for the return current.

7.2.1.2 Detailed Design Procedure

In PCIe Gen 3.0, 4.0, and 5.0 applications, the specification requires RX-TX link training to establish and optimize signal conditioning settings at 8.0, 16.0, and 32.0Gbps, respectively. In link training, the RX partner requests a series of FIR – pre-shoot and de-emphasis coefficients (10 presets) from the TX partner. The RX partner includes CTLE and DFE. The link training would pre-condition the signal, with an equalized link between the Root Complex and Endpoint.

Note: there is no link training in PCle Gen 1.0 (2.5Gbps) or PCle Gen 2.0 (5.0Gbps) applications. The SN75LVPE5412 is placed in between the TX and RX. It helps extend the PCB trace reach distance by boosting the attenuated signals with its equalization, which allows the user to recover the signal by the downstream RX more easily.

For operation in Gen 5.0, 4.0, and 3.0 links, the SN75LVPE5412 transmit outputs are designed to pass the TX Preset signaling onto the RX for the PCIe Gen 5.0, 4.0, and 3.0 link to train and optimize the equalization settings. The suggested setting for the device is GAIN = L4 (default). Adjustments to the EQ setting should be performed based on the channel loss to optimize the eye opening in the RX partner. The TX equalization presets or CTLE and DFE coefficients in the RX can also be adjusted to further improve the eye opening.

Copyright © 2023 Texas Instruments Incorporated

7.2.2 Protocol Agnostic Linear Redriver for High Speed Interfaces

The SN75LVPE5412 can be used as a four channel protocol agnostic linear redriver demultiplexer (demux) for data rates up to 32Gbps. To use the device in a non-PCle application, the RX DET pin must be pin-strapped to GND with $1k\Omega$ resistor (L0).

This section explains how the SN75LVPE5412 can be used in DisplayPort (DP) application. The device is a linear redriver which is agnostic to DP link training. The DP link training negotiation between a display source and sink stays effective through the device. The redriver becomes part of the electrical channel along with passive traces, cables, and so forth, resulting in optimum source and sink parameters for best electrical link.

Figure 7-2 shows a simplified schematic for DisplayPort demultiplexing application using SN75LVPE5412. Auxiliary and Hot plug detect (HPD) are demuxed outside of the device. If system use case requires implementing DP power states, then the device must be controlled by the I²C.

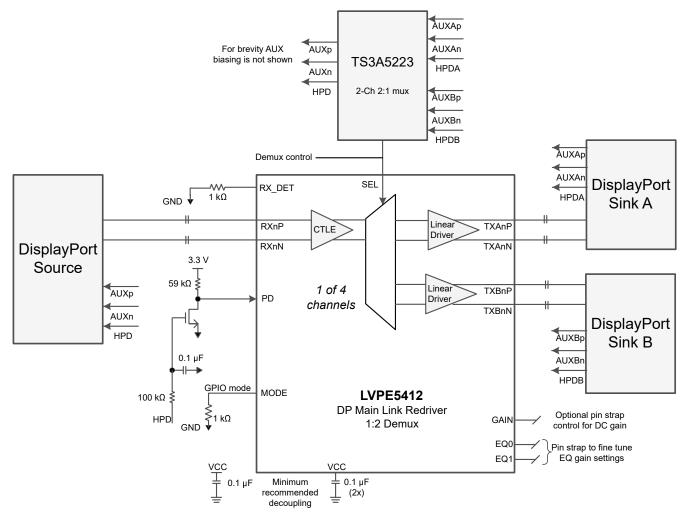

Figure 7-2. Simplified Schematic for DisplayPort Demultiplexer Application

The inverted DisplayPort HPD signal can be used to put the device into standby mode by using its PD pin. Note: in a DisplayPort link a sink can use HPD line to create an interrupt for its link partner source. If HPD signal is used for power management, then an RC filter must be installed to filter out HPD interrupt signals.

The SN75LVPE5412 can similarly be used for other AC-coupled high speed interfaces. Care must be taken to understand the specifications of the interface to ensure feasibility.

Product Folder Links: SN75LVPE5412

7.3 Power Supply Recommendations

Follow these general guidelines when designing the power supply:

- 1. The power supply should be designed to provide the operating conditions outlined in the recommended operating conditions section in terms of DC voltage, AC noise, and start-up ramp time.
- 2. The SN75LVPE5412 does not require any special power supply filtering, such as ferrite beads, provided that the recommended operating conditions are met. Only standard supply decoupling is required. Typical supply decoupling consists of a 0.1 μF capacitor per VCC pin, one 1.0 μF bulk capacitor per device, and one 10 μF bulk capacitor per power bus that delivers power to one or more devices. The local decoupling (0.1 μF) capacitors must be connected as close to the VCC pins as possible and with minimal path to the device ground pad.

7.4 Layout

7.4.1 Layout Guidelines

The following guidelines should be followed when designing the layout:

- 1. Decoupling capacitors should be placed as close to the VCC pins as possible. Placing the decoupling capacitors directly underneath the device is recommended if the board design permits.
- 2. High-speed differential signals TXnP/TXnN and RXnP/RXnN should be tightly coupled, skew matched, and impedance controlled.
- 3. Vias should be avoided when possible on the high-speed differential signals. When vias must be used, take care to minimize the via stub, either by transitioning through most or all layers or by back drilling.
- 4. GND relief can be used (but is not required) beneath the high-speed differential signal pads to improve signal integrity by counteracting the pad capacitance.
- 5. GND vias should be placed directly beneath the device connecting the GND plane attached to the device to the GND planes on other layers. This has the added benefit of improving thermal conductivity from the device to the board.

7.4.2 Layout Example

Figure 7-3 shows SN75LVPE5412 layout example.

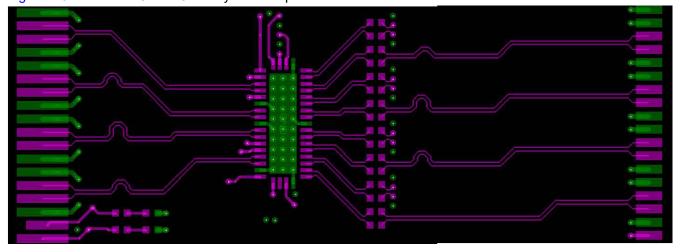

Figure 7-3. SN75LVPE5412 Layout Example

Figure 7-4 shows a layout illustration where two SN75LVPE5412 and two SN75LVPE5421 are used to switch 8 lanes between the two PCIe slots.

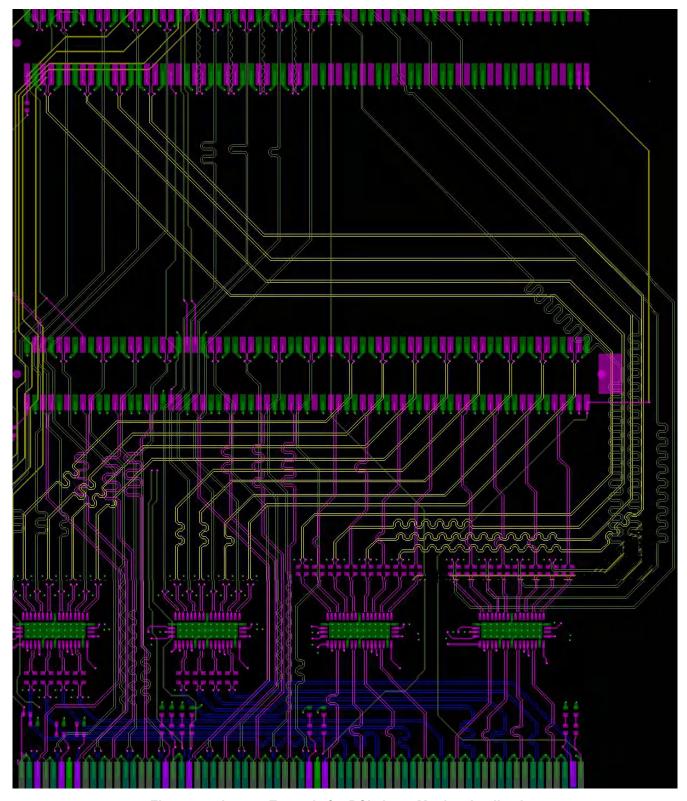

Figure 7-4. Layout Example for PCle Lane Muxing Application

8 Device and Documentation Support

8.1 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on ti.com. Click on *Notifications* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

8.2 Support Resources

TI E2E[™] support forums are an engineer's go-to source for fast, verified answers and design help — straight from the experts. Search existing answers or ask your own question to get the quick design help you need.

Linked content is provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's Terms of Use.

8.3 Trademarks

TI E2E™ is a trademark of Texas Instruments.

PCle® is a registered trademark of PCI-SIG.

All trademarks are the property of their respective owners.

8.4 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

10 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

www.ti.com 21-Dec-2023

PACKAGING INFORMATION

Orderable Device	Status	Package Type	Package Drawing	Pins	Package Qty	Eco Plan	Lead finish/ Ball material	MSL Peak Temp	Op Temp (°C)	Device Marking (4/5)	Samples
SN75LVPE5412RUAR	ACTIVE	WQFN	RUA	42	3000	RoHS & Green	NIPDAU	Level-2-260C-1 YEAR	0 to 85	5PR412	Samples
SN75LVPE5412RUAT	ACTIVE	WQFN	RUA	42	250	RoHS & Green	NIPDAU	Level-2-260C-1 YEAR	0 to 85	5PR412	Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) RoHS: TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

- (3) MSL, Peak Temp. The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.
- (4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.
- (5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.
- (6) Lead finish/Ball material Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

PLASTIC QUAD FLATPACK - NO LEAD

This image is a representation of the package family, actual package may vary. Refer to the product data sheet for package details.

PLASTIC QUAD FLATPACK - NO LEAD

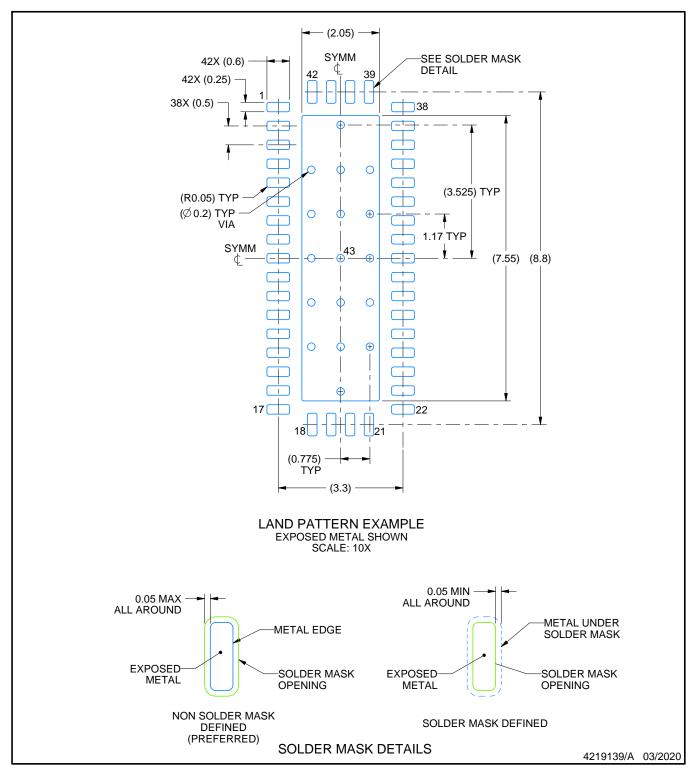

NOTES:

- 1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
 2. This drawing is subject to change without notice.
- 3. The package thermal pad must be soldered to the printed circuit board for thermal and mechanical performance.

PLASTIC QUAD FLATPACK - NO LEAD

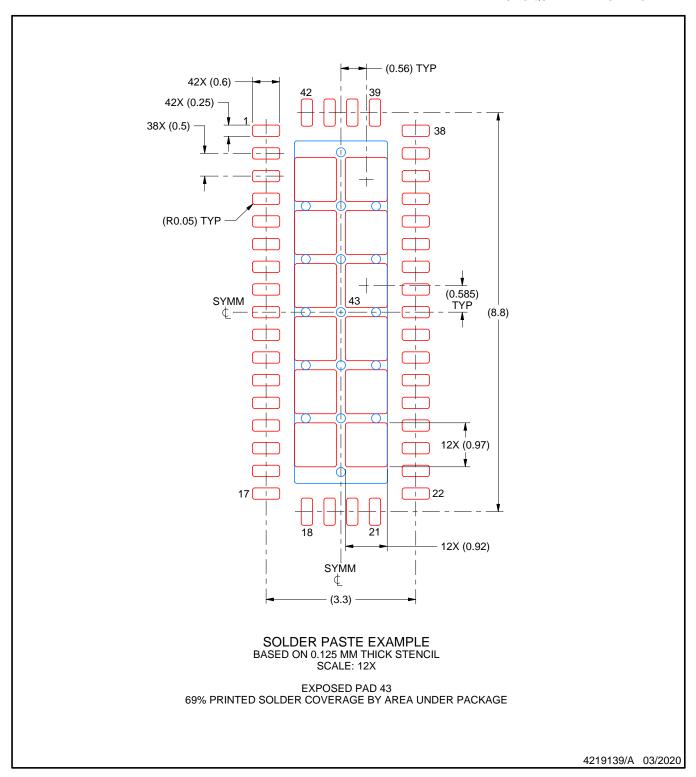

NOTES: (continued)

- 4. This package is designed to be soldered to a thermal pad on the board. For more information, see Texas Instruments literature number SLUA271 (www.ti.com/lit/slua271).
- 5. Vias are optional depending on application, refer to device data sheet. If any vias are implemented, refer to their locations shown on this view. It is recommended that vias under paste be filled, plugged or tented.

PLASTIC QUAD FLATPACK - NO LEAD

NOTES: (continued)

6. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.

IMPORTANT NOTICE AND DISCLAIMER

TI PROVIDES TECHNICAL AND RELIABILITY DATA (INCLUDING DATA SHEETS), DESIGN RESOURCES (INCLUDING REFERENCE DESIGNS), APPLICATION OR OTHER DESIGN ADVICE, WEB TOOLS, SAFETY INFORMATION, AND OTHER RESOURCES "AS IS" AND WITH ALL FAULTS, AND DISCLAIMS ALL WARRANTIES, EXPRESS AND IMPLIED, INCLUDING WITHOUT LIMITATION ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE OR NON-INFRINGEMENT OF THIRD PARTY INTELLECTUAL PROPERTY RIGHTS.

These resources are intended for skilled developers designing with TI products. You are solely responsible for (1) selecting the appropriate TI products for your application, (2) designing, validating and testing your application, and (3) ensuring your application meets applicable standards, and any other safety, security, regulatory or other requirements.

These resources are subject to change without notice. TI grants you permission to use these resources only for development of an application that uses the TI products described in the resource. Other reproduction and display of these resources is prohibited. No license is granted to any other TI intellectual property right or to any third party intellectual property right. TI disclaims responsibility for, and you will fully indemnify TI and its representatives against, any claims, damages, costs, losses, and liabilities arising out of your use of these resources.

TI's products are provided subject to TI's Terms of Sale or other applicable terms available either on ti.com or provided in conjunction with such TI products. TI's provision of these resources does not expand or otherwise alter TI's applicable warranties or warranty disclaimers for TI products.

TI objects to and rejects any additional or different terms you may have proposed.
