

2.5 Gbps 3-TO-1 DVI/HDMI SWITCH

Check for Samples: [TMD5351](#)

FEATURES

- Compatible with HDMI 1.3a
- Supports 2.5 Gbps Signaling Rate for 480i/p, 720i/p, and 1080i/p Resolutions up to 12-Bit Color Depth
- Integrated Receiver Termination
- Selectable Receiver Equalization to Accommodate to Different Input Cable Lengths
- Intra-Pair Skew < 40 ps
- Inter-Pair Skew < 65 ps
- HBM ESD Protection Exceeds 8 kV to TMD5 Inputs

- 3.3-V Fixed Supply to TMD5 I/Os
- 5-V Fixed Supply to HPD, DDC, and Source Selection Circuits
- 64-Pin TQFP Package
- ROHS Compatible and 260°C Reflow Rated

APPLICATIONS

- Digital TV
- Digital Projector

DESCRIPTION

The TMD5351 is a 3-port digital video interface (DVI) or high-definition multimedia interface (HDMI) switch that allows up to 3 DVI or HDMI ports to be switched to a single display terminal. Four TMD5 channels, one hot plug detector, and a digital display control (DDC) interface are supported on each port. Each TMD5 channel supports signaling rates up to 2.5 Gbps to allow 1080p resolution in 12-bit color depth.

When S1 is high and S2 is low, all input terminations are disconnected, TMD5 inputs are high impedance with standard TMD5 terminations, all internal MOSFETs are turned off to disable the DDC links, and all HPD outputs are connected to the HPD_SINK. This allows the initiation of the HDMI physical address discovery process.

Termination resistors (50-Ω), pulled up to V_{CC} , are integrated at each TMD5 receiver input. External terminations are not required. A precision resistor is connected externally from the VSADJ pin to ground for setting the differential output voltage to be compliant with the TMD5 standard.

The TMD5351 provides two levels of receiver input equalization for different ranges of cable lengths. Each TMD5 receiver owns frequency responsive equalization circuits. When EQ sets low, the receiver supports the input connection in short range HDMI cables. When EQ sets high, the receiver supports the input connection in long range HDMI cables. The TMD5351 supports power saving operation. When a system is under standby mode and there is no digital audio/visual content from a connected source, the 3.3-V supply voltage, V_{CC} , can be powered off to minimize power consumption from the TMD5 inputs, outputs, and internal switching circuits. The HPD, DDC, and source selection circuits are powered up by the 5-V supply voltage, V_{DD} , to maintain the system hot plug detect response, the DDC link from the selected source to the sink under system standby operation. The device is characterized for operation from 0°C to 70°C.

Typical Application

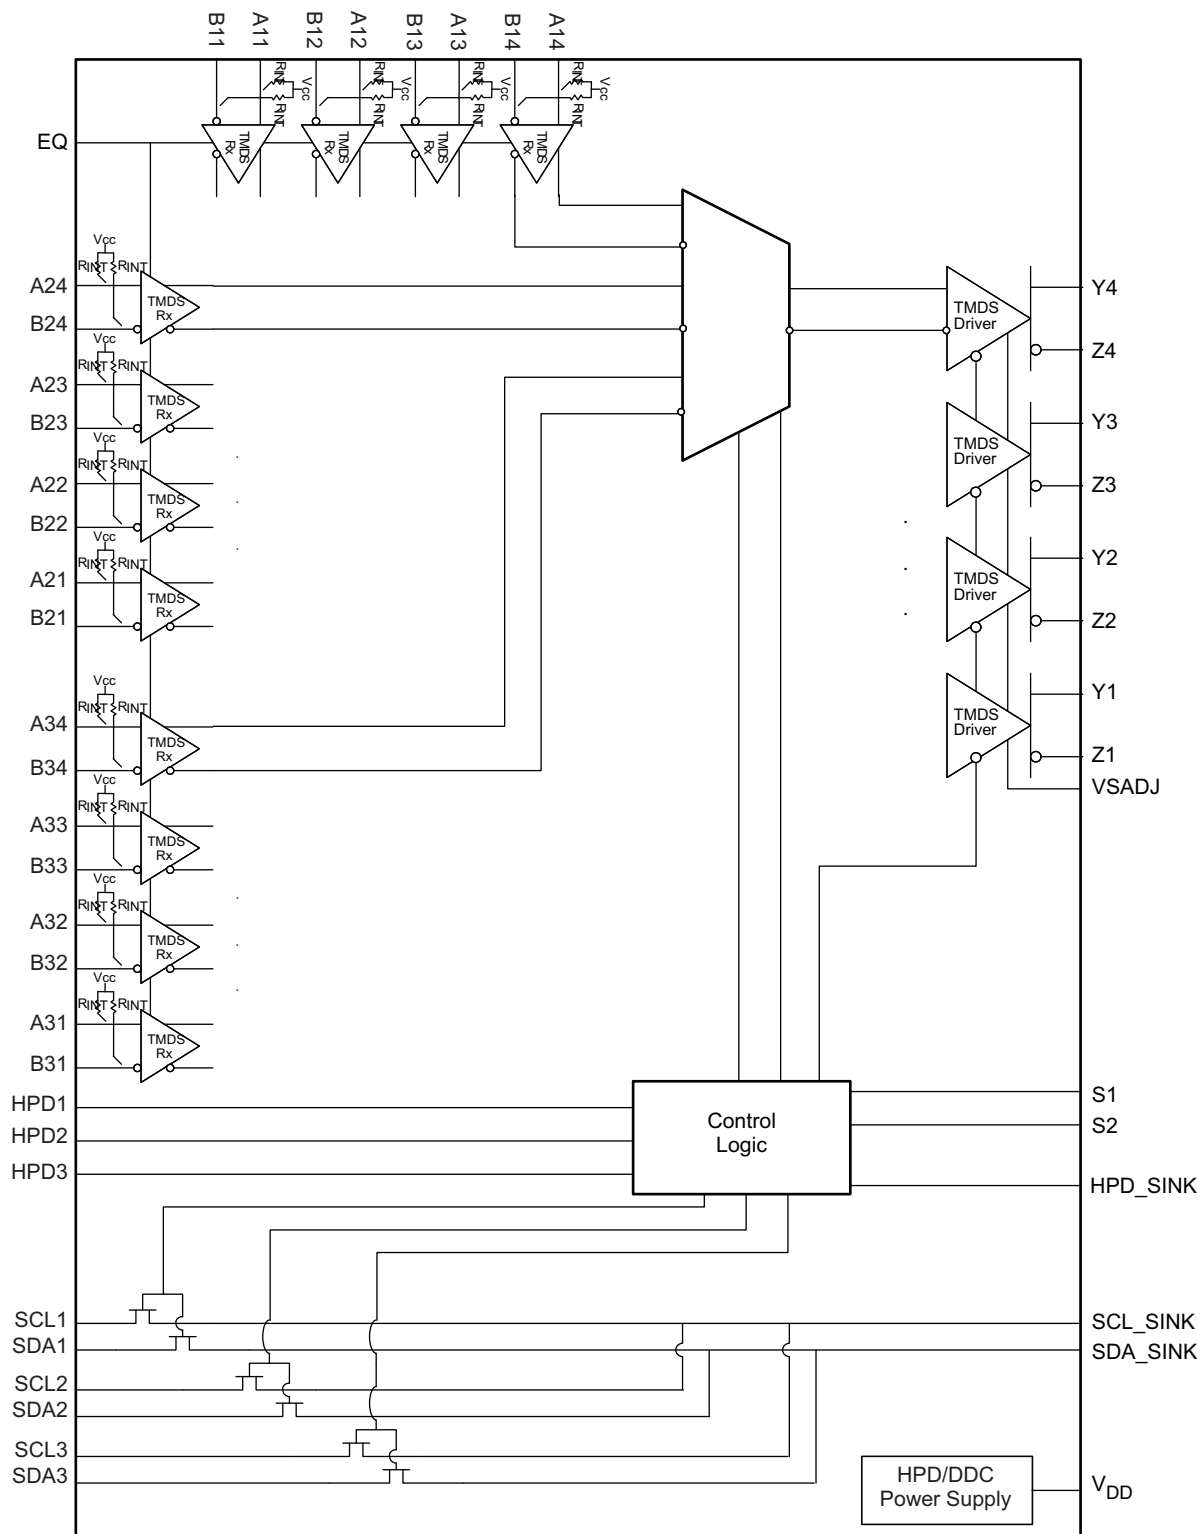

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

Figure 13.

APPLICATION INFORMATION

Supply Voltage

The TMDS351 is powered up with two different power sources. One is 3.3-V V_{CC} for the TMDS circuitry, and the other is 5-V V_{DD} for HPD, DDC, and most of the control logic. It is recommended to provide the same 3.3-V power source to the TMDS circuitry of the TMDS351 and its output termination voltage. This minimizes the leakage current from the ESD protection circuitry. When the digital television (DTV) is in standby mode operation, the same common 3.3-V power source can be turned on or off. Either way will minimize the leakage current in the device, and in the receiver connected at the output where the termination is integrated.

TMDS Inputs

Selectable frequency response equalization circuitries are provided to all twelve differential input to support short range and long range cable connections. The frequency response compensation curves and target cable losses are shown in Figure 14 and Figure 15.

Figure 14. Frequency Response Compensation Curve at EQ = L

Figure 15. Frequency Response Compensation Curve at EQ = H

Internal termination circuitry which can be switched on or off, provides 50- Ω resistance to each differential input pin when a port is selected. External terminations are not required. When the termination is switched on, current will flow to the TMDS driver. When a port is not selected, the termination is open. This stops supply current flowing from the input pins of the un-selected ports. This switchable termination provides the connected HDMI source another method of determining the sink port status, and whether it is selected or not selected, without referring to the HPD pin status.

TMDS Input Fail-Safe

The TMDS input does not incorporate a fail-safe circuit. To implement fail-safe, the input can be externally biased to prevent output oscillation. One pin can be pulled high to V_{CC} with the other grounded through a 1-k Ω resistor as shown in Figure 16.

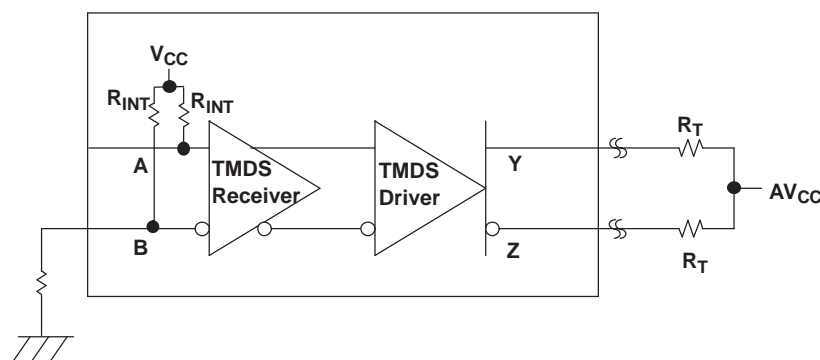

Figure 16. TMDS Input Fail-Safe Recommendation

TMDS Outputs

A 10% precision resistor, 4.02-k Ω , is recommended to control the output swing to the HDMI compliant 400 mV to 600 mV range (500 mV typical). The TMDS outputs are high impedance under standby mode operation, S1 = H and S2 = L.

HPD Pins

The HPD circuits are powered by the 5-V supply. They provide 5-V TTL output signals to the SOURCE with a typical 1-k Ω output resistance. An external 1-k Ω resistor is not needed here. The HPD output of the selected source port follows the logic level of the HPD_SINK input. Unselected HPD outputs are kept low. When the device is in standby mode, all HPD outputs follow HPD_SINK. A 1-k Ω resistor to ground keeps all HPD outputs low in standby mode if a fixed low state is preferred.

DDC Channels

The DDC circuits (SDA, SCL) are powered by a 5-V supply. The I/O pins can connect to the 5-V termination voltages directly. A 47-k Ω pull-up resistor to the 5 V is recommended on the SCL1, SCL2, and SCL3 pins. There is no pull-up resistor on the SDA pins. The pull-up resistor can be replaced with a different value.

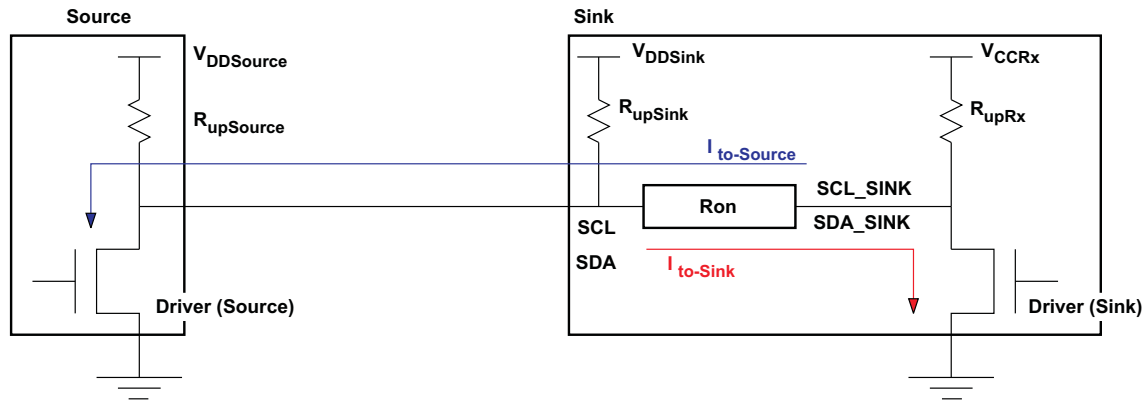

Figure 17. Simplified Electrical Circuit Model for DDC Channel

In Figure 17, when the Driver (Sink) pulls the bus low, the highest voltage level is $V_{ol(Sink)max}$. The current flow through the pass-gate resistor can be presented as:

$$I_{to-Sink} = \frac{V_{dd} - V_{ol(Sink)max}}{R_{upSource} \parallel R_{upSink}} \quad (1)$$

where the $V_{ddsource} = V_{ddsink} = V_{dd}$

To simplify the equation, $V_{ol(Sink)max}$ is set equal to 0 V to reach equation (2):

$$I_{to-Sink} = \frac{V_{dd}}{R_{upSource} \parallel R_{upSink}} \quad (2)$$

The voltage at the input of the SINK is $I_{to-Sink} \times R_{on} + V_{ol(Sink)max}$, which should be lower than the minimum input low threshold voltage of the Driver (Source), $V_{ith(Source)min}$ to keep the bus in correct interoperations.

$$V_{ith(Source)min} > I_{to-Sink} \times R_{on} + V_{ol(Sink)max} \quad (3)$$

By combining equations (2) and (3), the minimum pull-up resistor at the Sink input is:

$$R_{upSink} \geq \frac{V_{dd} \times R_{on} \times R_{upSource}}{(V_{ith(Source)min} - V_{ol(Sink)max}) \times R_{upSource} - V_{dd} \times R_{on}} \quad (4)$$

Applying the same methodology to calculate the pull-up resistor at the input of the Driver (Sink), the minimum pull-up resistor is:

$$R_{upRx} \geq \frac{V_{ccRx} \times R_{on}}{(V_{ith(Sink)min} - V_{ol(Source)max})} \quad (5)$$

The data sheet V_{PASS} specification ensures the maximum output voltage is clamped at 3.6 V to support a 3.3-V connection. Resistors pulling up to 3.3 V on SCL_SINK and SDA_SINK ensure the high level does not exceed the 3.3-V termination voltage.

Layout Considerations

The high-speed differential TMDS inputs are the most critical paths for the TMDS351. There are several considerations to minimize discontinuities on these transmission lines between the connectors and the device:

- Maintain 100-Ω differential transmission line impedance into and out of the TMDS351
- Keep an uninterrupted ground plane beneath the high-speed I/Os
- Keep the ground-path vias to the device as close as possible to allow the shortest return current path
- Keep the trace lengths of the TMDS signals between connector and device as short as possible

Using the TMDS351 in Systems with Different CEC Link Requirements

The TMDS351 supports a DTV with up to three HDMI inputs when used in conjunction with a signal-port HDMI receiver or four HDMI inputs when used in conjunction with a dual-port HDMI receiver. [Figure 18](#) and [Figure 19](#) show simplified application block diagrams for the TMDS351 in different DTVs with different consumer electronic control (CEC) requirements. The CEC is an optional feature of the HDMI interface for centralizing and simplifying user control instructions from multiple audio/video products in an inter-connected system, even when all the audio/video products are from different manufacturers. This feature minimizes the number of remote controls in a system, as well as reducing the number of times buttons need to be pressed.

A DTV Supporting a Passive CEC Link

In [Figure 18](#), the DTV does not have the capability of handling CEC signals, but allows CEC signals to pass over the CEC bus. The source selection is done by the control command of the DTV. The user cannot force the command from any audio/video product on the CEC bus. The selected source reads the E-EDID data after receiving an asserted HPD signal. The micro-controller loads different CEC physical addresses while changing the source by means of the S1 and S2 pins.

E-EDID Reading Configurations in Standby Mode

When the DTV system is in standby mode, the sources will not read the E-EDID memory because the 1-kΩ pull-down resistor keeping the HPD_SINK input at logic low forces all HPD pins to output logic low to all sources. The source will not read the E-EDID data with a low on HPD signal. However, if reading the E-EDID data in the system standby mode is preferred, then TMDS351 can still support this need.

The recommended configuration sequences are:

1. Apply the same 3.3-V power to the V_{CC} of TMDS351 and the TMDS line termination at the HDMI receiver
2. Turn off V_{CC} , and keep V_{DD} on. The TMDS circuit is off, but the HPD, the DDC and the source selection circuits are active.
3. Set S1 and S2 to select the source port which is allowed to read the E-EDID memory.

Please note if the source has a time-out limitation between the 5 V and the HPD signals, the above configuration is not applicable. Uses individual EEPROMs assigned for each input port, see [Figure 19](#). The solution uses E-EDID data to be readable during system power off or standby mode operations.

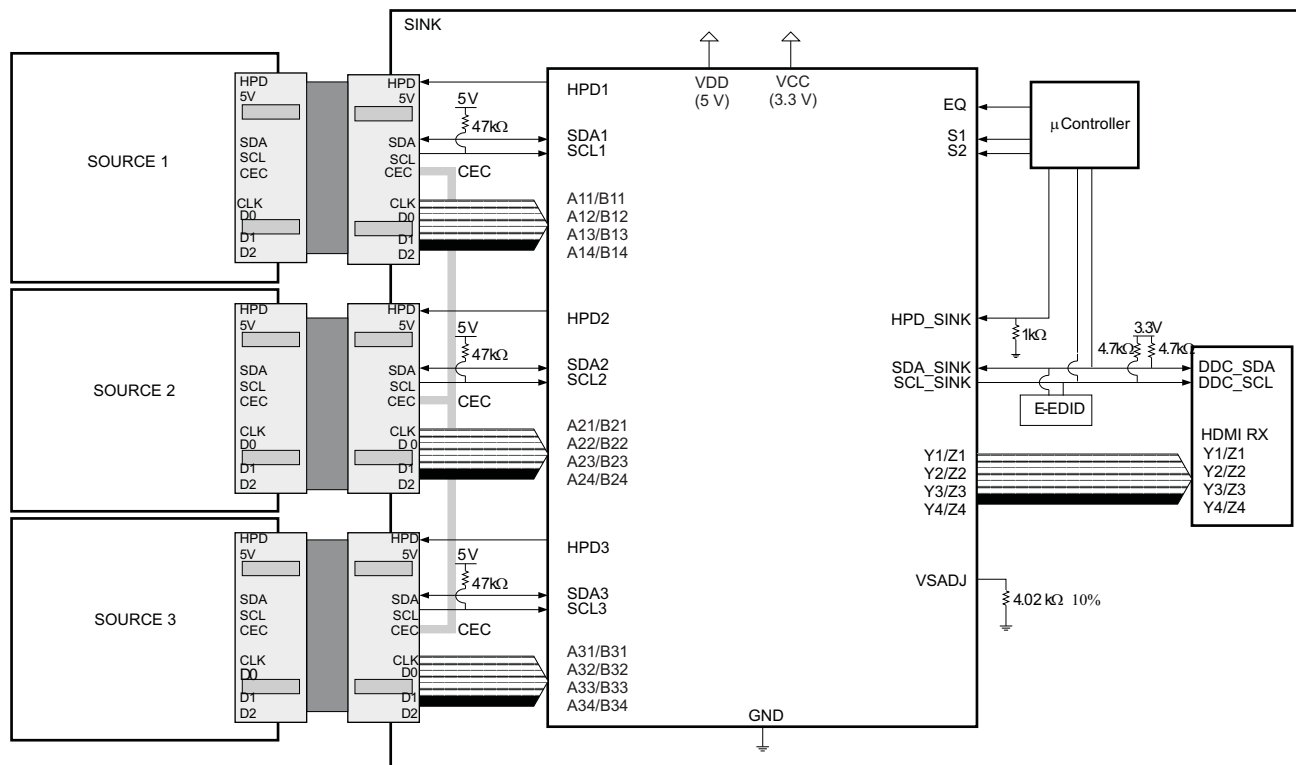

Figure 18. Three-Port HDMI Enabled DTV with TMDS351 – CEC Commands Passing Through

A DTV Supporting an Active CEC Link

In Figure 19, the CEC PHY and CEC LOGIC functions are added. The DTV can initiate and/or react to CEC signals from its remote control or other audio/video products on the same CEC bus. All sources must have their own CEC physical address to support the full functionality of the CEC link.

A source reads its CEC physical address stored its E-EDID memory after receiving a logic-high from the HPD feedback. When HPD is high, the sink-assigned CEC physical address should be maintained. Otherwise, when HPD is low the source sets CEC physical address value to (F.F.F.F).

Case 1 – AC Coupled Source (See Figure 19, Port 1)

When the source TMDS lines are AC coupled or when the source cannot detect the TMDS termination provided in the connected sink, the indication of the source selection can only come from the HPD signal. The TMDS351 HPD1 pin should be applied directly as the HPD signal back to the source.

Case 2 – DC Coupled Source (See Figure 19, Port 2)

When the source TMDS lines are DC coupled, there are two methods to inform the source that it is the active source to the sink. One is checking the HPD signal from the sink, and the other is checking the termination condition in the sink.

In a full CEC operation mode, the HPD signal is set high whether the port is selected or not. The source loads and maintains the CEC physical address when HPD is high. As soon as HPD goes low, the source loses the CEC physical address. To keep the CEC physical address to the source, the HPD signal is looping back from the source provided 5-V signal through a 1-kΩ pull-up resistor in the sink. This method is acceptable in application where the HDMI transmitter can detect the receiver termination by current sensing, and the receiver has switchable termination on the TMDS inputs. The internal termination resistors are connected to the termination voltage when the port is selected, or they are disconnected when the port is not selected. The TMDS351 features switchable termination on the TMDS inputs.

Case 3 – External Logic Control for HPD (See Figure 19, Port 3)

When the HDMI transmitter does not have the capability of detecting the receiver termination, using the HPD signal as a reference for sensing port selections is the only possible method. External control logic for switching the connections of the HPD signals between the HPD pins of the TMDS351 and the 5-V signal from the source provides a good solution.

E-EDID Reading Configurations in Standby Mode

When the TMDS351 is in standby mode operation, S1 = H and S2 = L, all sources can read their E-EDID memories simultaneously with all HPD pins following HPD_SINK in logic-high. HPD_SINK input low will prevent E-EDID reading in standby mode operation.

REVISION HISTORY

Changes from Original (May 2007) to Revision A	Page
• Changed Figure 6	12
• Changed From: Figure 19 To: Figure 18	19
• Changed From: Figure 18 To: Figure 19	20
<hr/>	
Changes from Revision A (August 2007) to Revision B	Page
• Added Junction Temperature to the THERMAL CHARACTERISTICS table	7

PACKAGING INFORMATION

Orderable part number	Status (1)	Material type (2)	Package Pins	Package qty Carrier	RoHS (3)	Lead finish/ Ball material (4)	MSL rating/ Peak reflow (5)	Op temp (°C)	Part marking (6)
TMDS351PAG	Active	Production	TQFP (PAG) 64	160 JEDEC TRAY (10+1)	Yes	NIPDAU	Level-3-260C-168 HR	0 to 70	TMDS351
TMDS351PAG.B	Active	Production	TQFP (PAG) 64	160 JEDEC TRAY (10+1)	Yes	NIPDAU	Level-3-260C-168 HR	0 to 70	TMDS351
TMDS351PAGR	Active	Production	TQFP (PAG) 64	1500 LARGE T&R	Yes	NIPDAU	Level-3-260C-168 HR	0 to 70	TMDS351

⁽¹⁾ **Status:** For more details on status, see our [product life cycle](#).

⁽²⁾ **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

⁽³⁾ **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

⁽⁴⁾ **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

⁽⁵⁾ **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

⁽⁶⁾ **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.
