TPS22810, 2.7-18-V, 79-mΩ On-Resistance Load Switch With Thermal Protection

1 Features

- Integrated Single Channel Load Switch
- Ambient Operating Temperature: –40°C to +105°C
  - SOT23-6 (DBV): 2-A Maximum Continuous Current
  - WSON (DRV): 3-A Maximum Continuous Current
- Input Voltage Range: 2.7 V to 18 V
- Absolute Maximum Input Voltage: 20 V
- On-Resistance ($R_{ON}$)
  - $R_{ON} = 79$ mΩ (typical) at $V_{IN} = 12$ V
- Quiescent Current
  - 62 µA (typical) at $V_{IN} = 12$ V
- Shutdown Current
  - 500 nA (typical) at $V_{IN} = 12$ V
- Thermal Shutdown
- Undervoltage Lock-Out (UVLO)
- Adjustable Quick Output Discharge (QOD)
- Configurable Rise Time With CT Pin
- SOT23-6 Package
  - 2.9-mm × 2.8-mm, 0.95-mm Pitch
- WSON Package
  - 2-mm × 2-mm, 0.65-mm Pitch
- ESD Performance Tested per JESD 22
  - ±2-kV HBM and ±1-kV CDM

2 Applications

- HD TV
- Industrial Systems
- Set Top Box
- Surveillance systems

3 Description

The TPS22810 is a single channel load switch with configurable rise time and with an integrated quick output discharge (QOD). In addition, the device features thermal shutdown to protect the device against high junction temperature. Because of this, safe operating area of the device is inherently ensured. The device contains an N-channel MOSFET that can operate over an input voltage range of 2.7 V to 18 V. SOT23-5 (DBV) package can support a maximum current of 2 A. WSON (DRV) package can support a maximum current of 3 A. The switch is controlled by an on and off input, which is capable of interfacing directly with low-voltage control signals.

The configurable rise time of the device greatly reduces inrush current caused by large bulk load capacitances, thereby reducing or eliminating power supply droop. Undervoltage lock-out is used to turn off the device if the VIN voltage drops below a threshold value, ensuring that the downstream circuitry is not damaged by being supplied by a voltage lower than intended. The configurable QOD pin controls the fall time of the device to allow design flexibility for power down.

The TPS22810 is available in a leaded, SOT-23 package (DBV) which allows to visually inspect solder joints, as well as a WSON package (DRV). The device is characterized for operation over the free-air temperature range of –40°C to +105°C.

(1) Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under Recommended Operating Conditions. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

(2) All voltage values are with respect to network ground terminal.

7.2 ESD Ratings

<td>V</td>
</tr>
</tbody>
</table>

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process. Manufacturing with less than 500-V HBM is possible with the necessary precautions.

(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process. Manufacturing with less than 250-V CDM is possible with the necessary precautions.

</table>

(1) In applications where high power dissipation and/or poor package thermal resistance is present, the maximum ambient temperature may have to be derated. Maximum ambient temperature [T A(MAX)] is dependent on the maximum operating junction temperature [Tj(MAX)], the maximum power dissipation of the device in the application [Pd(MAX)], and the junction-to-ambient thermal resistance of the part/package in the application (θJA), as given by the following equation: T A(MAX) = Tj(MAX) – (θJA × Pd(MAX)).

(2) See the Detailed Description section.

9 Detailed Description

9.1 Overview

The TPS22810 is a 6-pin, 2.7-18-V load switch with thermal protection in two separate package options. To reduce voltage drop for low voltage and high current rails, the device implements a low resistance N-channel MOSFET which reduces the drop out voltage across the device.

The device starts its operation by monitoring the VIN bus. When VIN exceeds the undervoltage-lockout threshold (VUVR), the device samples the EN/UVLO pin. A high level on this pin enables the internal MOSFET. As VIN rises, the internal MOSFET of the device starts conducting and allow current to flow from VIN to VOUT. When EN/UVLO is held low (below VENF), internal MOSFET is turned off.

A voltage V(EN/UVLO) < V(ENF) on this pin turns off the internal FET, thus disconnecting VIN from VOUT, while voltage below V(SHUTF) takes the device into shutdown mode, with IQ less than 1 μA to ensure minimal power loss.

The device has a configurable slew rate which helps reduce or eliminate power supply droop because of large inrush currents. The device also features an internal RPD resistor, which discharges VOUT once the switch is disabled.

During shutdown, the device has very low leakage currents, thereby reducing unnecessary leakages for downstream modules during standby. Integrated control logic, driver, charge pump, and output discharge FET eliminates the need for any external components which reduces solution size and bill of materials (BOM) count.

The device also features a QOD pin, which allows the configuration of the discharge rate of VOUT once the switch is disabled.

The device has a thermal protection feature. Due to this device protects itself against thermal damage due to over-temperature and over-current conditions. Safe Operating Area (SoA) requirements are thus inherently met without any special design consideration by the board designer.
9.3 Feature Description

9.3.1 On and Off Control

The EN/UVLO pin controls the state of the switch. EN/UVLO is active high and has a low threshold, making it capable of interfacing with low-voltage signals. The EN/UVLO pin is compatible with standard GPIO logic threshold. It can be used with any microcontroller with 1.2 V or higher GPIO voltage. This pin cannot be left floating and must be driven either high or low for proper functionality.

9.3.2 Quick Output Discharge (QOD)

The TPS22810 includes a QOD feature. The QOD pin can be configured in one of three ways:

- **QOD pin shorted to VOUT pin.** Using this method, the discharge rate after the switch becomes disabled is controlled with the value of the internal resistance \( R_{PD} \). The value of this resistance is listed in the Electrical Characteristics table.

- **QOD pin connected to VOUT pin using an external resistor \( R_{EXT} \).** After the switch becomes disabled, the discharge rate is controlled by the value of the total resistance of the QOD. To adjust the total QOD resistance, **Equation 1** can be used.

\[
R_{QOD} = R_{PD} + R_{EXT}
\]

where

- \( R_{QOD} \) is the total output discharge resistance
- \( R_{PD} \) is the internal pulldown resistance
- \( R_{EXT} \) is the external resistance placed between the VOUT and QOD pin.
Feature Description (continued)

• QOD pin is unused and left floating. Using this method, there is no quick output discharge functionality, and the output remains floating after the switch is disabled.

Note that during thermal shutdown, the QOD functionality is not available. The device does not discharge the load as RPD does not become engaged.

The fall times of the device depend on many factors including the total resistance of the QOD, $V_{IN}$, and the output capacitance. When QOD is connected to VOUT, the fall time changes over $V_{IN}$ as the internal RPD varies over $V_{IN}$. To calculate the approximate fall time of $V_{OUT}$ for a given $R_{QOD}$, use Equation 2 and Table 1.

$$V_{CAP} = V_{IN} \times e^{-t/\tau}$$

where

• $V_{CAP}$ is the voltage across the capacitor (V)
• $t$ is the time since power supply removal (s)
• $\tau$ is the time constant equal to $R_{QOD} \times C_L$

The fall times' dependency on $V_{IN}$ becomes minimal as the QOD value increases with additional external resistance. See Table 1 for QOD fall times.

(1) TYPICAL VALUES WITH QOD SHORTED TO VOUT

9.3.2.1 QOD when System Power is Removed

The adjustable QOD can be used to control the power down sequencing of a system even when the system power supply is removed. When the power is removed, the input capacitor, $C_{IN}$, discharges at $V_{IN}$. Past the set UVLO level, the pull-down resistance RPD becomes disabled and the output no longer becomes discharged. If there is still remaining charge on the output capacitor, this results in longer fall times. Care must be taken such that $C_{IN}$ is large enough to meet the device UVLO settings.

9.3.2.2 Internal QOD Considerations

Special considerations must be taken when using the internal RPD by shorting the QOD pin to the VOUT pin. The internal RPD is a pulldown resistance designed to quickly discharge a load after the switch has been disabled. Care must be used to ensure that excessive current does not flow through RPD during discharge so that the maximum $T_J$ of 125°C is not exceeded. When using only the internal RPD to discharge a load, the total capacitive load must not exceed 200 μF. Otherwise, an external resistor, $R_{EXT}$, must be used to ensure the amount of current flowing through RPD is properly limited and the maximum $T_J$ is not exceeded. To ensure the device is not damaged, the remaining charge from $C_L$ needs to decay naturally through the internal QOD resistance and must not be driven.

9.3.3 EN/UVLO

As an input pin, EN/UVLO controls the ON and OFF state of the internal MOSFET. In its high state, the internal MOSFET is enabled. A low on this pin turns off the internal MOSFET. High and Low levels are specified in the parametric table of the datasheet.

A voltage $V(EN/UVLO < V(ENF)$ on this pin turns off the internal FET, thus disconnecting VIN from VOUT, while voltage below V(SHUTF) takes the device into shutdown mode, with IQ less than 1 μA to ensure minimal power loss.
The EN/UVLO pin can be directly driven by a 1.8 V, 3.3 V or 5 V general purpose output pin.

The internal de-glitch delay on EN/UVLO falling edge is intentionally kept low (2.5 μs typical) for quick detection of power failure. For applications where a higher de-glitch delay on EN/UVLO is desired, or when the supply is particularly noisy, it is recommended to use an external bypass capacitor from EN/UVLO to GND.

The undervoltage lock out can be programmed by using an external resistor divider from supply VIN terminal to EN/UVLO terminal to GND as shown in Figure 18. When an undervoltage or input power fail event is detected, the internal FET is quickly turned off. If the Under-Voltage Lock-Out function is not needed, the EN/UVLO terminal must be connected to the VIN terminal. EN/UVLO terminal must not be left floating.

The device also implements internal undervoltage-lockout (UVLO) circuitry on the VIN terminal. The device disables when the VIN terminal voltage falls below internal UVLO Threshold V(UVF). The internal UVLO threshold has a hysteresis of 125 mV (5% of V(UVR)). See Figure 19 and Figure 20.

![Figure 18. Configuring UVLO with External Resistor Network](image-url)
9.3.4 Adjustable Rise Time (CT)

A capacitor to GND on the CT pin sets the slew rate. The voltage on the CT pin can be as high as 2.5 V. An approximate formula for the relationship between CT and slew rate is shown in Equation 3. This equation accounts for 10% to 90% measurement on VOUT and does NOT apply for CT < 1 nF.

Use Table 2 to determine rise times for when Ct ≥ 1 nF.

\[
SR = \frac{46.62}{Ct}
\]

where

- SR is the slew rate (in V/µs)
CT is the capacitance value on the CT pin (in pF)
The units for the constant a are µs/V. The units for the constant b are µs/(V × pF). (3)

Rise time can be calculated by dividing the input voltage by the slew rate. Table 2 contains rise time values measured on a typical device. Rise times shown below are only valid for the power-up sequence where VIN is already in steady state condition before the EN/UVLO pin is asserted high.

10 Application and Implementation

NOTE
Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

10.1 Application Information
This section highlights some of the design considerations when implementing this device in various applications. A PSPICE model for this device is also available in the product page of this device on www.ti.com (See the Device Support section for more information).

10.2 ON and OFF Control
The EN/UVLO pin controls the state of the switch. Asserting EN/UVLO high enables the switch. EN/UVLO is active high and has a low threshold, making it capable of interfacing with low-voltage signals. The EN/UVLO pin is compatible with standard GPIO logic thresholds. It can be used with any microcontroller with 1.2 V or higher GPIO voltage. This pin cannot be left floating and must be driven either high or low for proper functionality.

10.3 Input Capacitor (Optional)
To limit the voltage drop on the input supply caused by transient inrush currents when the switch turns on into a discharged load capacitor, a capacitor needs to be placed between VIN and GND. A 1-μF ceramic capacitor, C_in, placed close to the pins, is usually sufficient. Higher values of C_in can be used to further reduce the voltage drop during high current applications. When switching heavy loads, it is recommended to have an input capacitor about 10 times higher than the output capacitor to avoid excessive voltage drop.

10.4 Output Capacitor (Optional)
Due to the integrated body diode in the NMOS switch, a C_in greater than C_L is highly recommended. A C_L greater than C_in can cause VOUT to exceed VIN when the system supply is removed. This can result in current flow through the body diode from VOUT to VIN. A C_in to C_L ratio of 10 to 1 is recommended for minimizing VIN dip caused by inrush currents during startup; however, a 10 to 1 ratio for capacitance is not required for proper functionality of the device. A ratio smaller than 10 to 1 (such as 1 to 1) can cause slightly more VIN dip upon turnon due to inrush currents.

This can be mitigated by increasing the capacitance on the CT pin for a longer rise time.

10.5 Typical Application
This typical application demonstrates how the TPS22810 can be used to power downstream modules.
Typical Application (continued)

10.5.1 Design Requirements

</tr>
</tbody>
</table>

10.5.2 Detailed Design Procedure

10.5.2.1 Shutdown Sequencing During Unexpected Power Loss

Using the adjustable Quick Output Discharge function of the TPS22810, adding a load switch to each power rail can be used to manage the power down sequencing in the event of an unexpected power loss (that is battery removal). To determine the QOD values for each load switch, first confirm the power down order of the device you wish to power sequence. Be sure to check if there are voltage or timing margins that must be maintained during power down. Next, consult Table 1 to determine appropriate \(C_L\) and \(R_{QOD}\) values for each power rail's load switch so that the load switches' fall times correspond to the order in which they need to be powered down. In the above example, we must have this power rail's fall time to be 4 ms. Using Equation 2, we can determine the appropriate \(R_{QOD}\) to achieve our desired fall time.

Since fall times are measured from 90% of \(V_{OUT}\) to 10% of \(V_{OUT}\), using Equation 2, we get Equation 4 and Equation 5.

\[
1.2V = 10.8V \times e^{-(20ms)/(R_{QOD} \times (22\mu F))}
\]

\[
R_{QOD} = 413.7 \Omega
\]

Consulting Figure 6, \(R_{PD}\) at \(V_{IN} = 12\) V is approximately 250 \(\Omega\). Using Equation 1, the required external QOD resistance can be calculated as shown in Equation 6 and Equation 7.

\[
413.7 \Omega = 250 \Omega + R_{EXT}
\]

\[
R_{EXT} = 163.7 \Omega
\]

Figure 22 through Figure 25 are scope shots demonstrating an example of the QOD functionality when power is removed from the device (both ON and VIN are disconnected simultaneously). In the scope shots, the \(V_{IN} = 12\) V and correspond to when \(R_{QOD} = 1000 \Omega\), \(R_{QOD}= 500 \Omega\), and QOD = VOUT with two values of \(C_L = 10 \mu F\) and 22 \(\mu F\).
Figure 22. Fall Time $t_F$ at $V_{IN} = 12$ V, $R_{QOD} = 1000$ Ω

Figure 23. Fall Time $t_F$ at $V_{IN} = 12$ V, $R_{QOD} = 500$ Ω

Figure 24. $t_F$ at $V_{IN} = 12$ V, QOD = $V_{OUT}$

Figure 25. $t_F$ at $V_{IN} = 12$ V, $R_{QOD} = 1000$ Ω
10.5.2.2 VIN to VOUT Voltage Drop

The VIN to VOUT voltage drop in the device is determined by the $R_{ON}$ of the device and the load current. The $R_{ON}$ of the device depends upon the VIN conditions of the device. Refer to the $R_{ON}$ specification of the device in the Electrical Characteristics table of this datasheet. Once the $R_{ON}$ of the device is determined based upon the VIN conditions, use Equation 8 to calculate the VIN to VOUT voltage drop.

$$\Delta V = I_{LOAD} \times R_{ON}$$

where

- $\Delta V$ is the voltage drop from VIN to VOUT
- $I_{LOAD}$ is the load current
- $R_{ON}$ is the On-resistance of the device for a specific $V_{IN}$

An appropriate $I_{LOAD}$ must be chosen such that the $I_{MAX}$ specification of the device is not violated.

10.5.2.3 Inrush Current

To determine how much inrush current is caused by the $C_L$ capacitor, use Equation 9.

$$I_{INRUSH} = C_L \times \frac{dV_{OUT}}{dt}$$

where

- $I_{INRUSH}$ is the amount of inrush caused by $C_L$
- $C_L$ is the capacitance on VOUT
- $dt$ is the Output Voltage rise time during the ramp up of VOUT when the device is enabled
- $dV_{OUT}$ is the change in $V_{OUT}$ during the ramp up of VOUT when the device is enabled

The appropriate rise time can be calculated using the design requirements and the inrush current equation. As we calculate the rise time (measured from 10% to 90% of $V_{OUT}$), we account for this in our $dV_{OUT}$ parameter (80% of $V_{OUT} = 9.6 \text{ V}$) as shown in Equation 10 and Equation 11.

$$400 \text{ mA} = 22 \mu\text{F} \times 9.6 \text{ V/}dt$$  \hspace{1cm} (10)
$$dt = 528 \mu\text{s}$$ \hspace{1cm} (11)

To ensure an inrush current of less than 400 mA, choose a CT value that yields a rise time of more than 528 $\mu$s. Consulting Table 2 at $V_{IN} = 12 \text{ V}$, CT = 4700 $p\text{F}$ provides a typical rise time of 957 $\mu$s. Using this rise time and voltage into Equation 9, yields Equation 12 and Equation 13.

$$I_{Inrush} = 22 \mu\text{F} \times 9.6 \text{ V/} 957 \mu\text{s}$$ \hspace{1cm} (12)
$$I_{Inrush} = 220 \text{ mA}$$ \hspace{1cm} (13)
An appropriate $C_L$ value must be placed on VOUT such that the $I_{\text{MAX}}$ and $I_{\text{PLS}}$ specifications of the device are not violated.

10.5.3 Application Curves

See the oscilloscope captures below for an example of how the CT capacitor can be used to reduce inrush current for $V_{\text{IN}} = 12$ V. See the Adjustable Rise Time (CT) section for rise times for corresponding CT values.

![Figure 28. TPS22810 Inrush Current With $C_L = 22 \, \mu\text{F}, CT = 0 \, \text{pF}$](image1)

![Figure 29. TPS22810 Inrush Current With $C_L = 22 \, \mu\text{F}, CT = 4700 \, \text{pF}$](image2)

![Figure 30. TPS22810 Inrush Current With $C_L = 22 \, \mu\text{F}, CT = 27000 \, \text{pF}$](image3)

![Figure 31. TPS22810 Inrush Current With $C_L = 100 \, \mu\text{F}, CT = 0 \, \text{pF}$](image4)
11 Power Supply Recommendations

The device is designed to operate from a VIN range of 2.7 V to 18 V. This supply must be well regulated and placed as close to the device terminal as possible with the recommended 1-µF bypass capacitor. If the supply is located more than a few inches from the device terminals, additional bulk capacitance may be required in addition to the ceramic bypass capacitors. If additional bulk capacitance is required, an electrolytic, tantalum, or ceramic capacitor of 1 µF may be sufficient.

The TPS22810 operates regardless of power sequencing order. The order in which voltages are applied to VIN and ON does not damage the device as long as the voltages do not exceed the absolute maximum operating conditions.
12 Layout

12.1 Layout Guidelines
1. VIN and VOUT traces must be as short and wide as possible to accommodate for high current.
2. The VIN pin must be bypassed to ground with low ESR ceramic bypass capacitors. The typical recommended bypass capacitance is 1-μF ceramic with X5R or X7R dielectric. This capacitor must be placed as close to the device pins as possible.

12.2 Layout Example

![Recommended Board Layout](image)

**Figure 34. Recommended Board Layout**

12.3 Thermal Considerations
For best performance, all traces must be as short as possible. To be most effective, the input and output capacitors must be placed close to the device to minimize the effects that parasitic trace inductances may have on normal and short-circuit operation. Using wide traces for VIN, VOUT, and GND helps minimize the parasitic electrical effects along with minimizing the case to ambient thermal impedance.

The maximum IC junction temperature must be restricted to 150°C under normal operating conditions. To calculate the maximum allowable dissipation, \( P_{D(\text{MAX})} \) for a given output current and ambient temperature, use Equation 14.

\[
P_{D(\text{MAX})} = \frac{T_{J(\text{MAX})} - T_A}{\theta_{JA}}
\]

where
- \( P_{D(\text{MAX})} \) is the maximum allowable power dissipation
- \( T_{J(\text{MAX})} \) is the maximum allowable junction temperature (150°C for the TPS22810)
- \( T_A \) is the ambient temperature of the device
- \( \theta_{JA} \) is the junction to air thermal impedance. Refer to the Thermal Information table. This parameter is highly dependent upon board layout. (14)

13.6 Electrostatic Discharge Caution
This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

13.7 Glossary
*SLYZ022 — TI Glossary.*
This glossary lists and explains terms, acronyms, and definitions.

14 Mechanical, Packaging, and Orderable Information
The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) **MSL, Peak Temp.** - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) **Lead finish/Ball material** - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and
continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

OTHER QUALIFIED VERSIONS OF TPS22810:

- Automotive: TPS22810-Q1

NOTE: Qualified Version Definitions:

- Automotive - Q100 devices qualified for high-reliability automotive applications targeting zero defects
### TAPE AND REEL INFORMATION

**REEL DIMENSIONS**

- **Reel Diameter**
- **Reel Width (W1)**

**TAPE DIMENSIONS**

- **A0**: Dimension designed to accommodate the component width
- **B0**: Dimension designed to accommodate the component length
- **K0**: Dimension designed to accommodate the component thickness
- **W**: Overall width of the carrier tape
- **P1**: Pitch between successive cavity centers

**QUADRANT ASSIGNMENTS FOR PIN 1 ORIENTATION IN TAPE**

- **Pocket Quadrants**: Q1, Q2, Q3, Q4
- **Sprocket Holes**
- **User Direction of Feed**

*All dimensions are nominal*

Images above are just a representation of the package family, actual package may vary. Refer to the product data sheet for package details.
NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. The package thermal pad must be soldered to the printed circuit board for thermal and mechanical performance.
NOTES: (continued)

4. This package is designed to be soldered to a thermal pad on the board. For more information, see Texas Instruments literature number SLUA271 (www.ti.com/lit/slua271).

5. Vias are optional depending on application, refer to device data sheet. If some or all are implemented, recommended via locations are shown.
NOTES: (continued)

6. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. Body dimensions do not include mold flash or protrusion. Mold flash and protrusion shall not exceed 0.25 per side.
4. Leads 1,2,3 may be wider than leads 4,5,6 for package orientation.
5. Reference JEDEC MO-178.
NOTES: (continued)

6. Publication IPC-7351 may have alternate designs.
7. Solder mask tolerances between and around signal pads can vary based on board fabrication site.
NOTES: (continued)

8. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
9. Board assembly site may have different recommendations for stencil design.
IMPORTANT NOTICE AND DISCLAIMER

TI PROVIDES TECHNICAL AND RELIABILITY DATA (INCLUDING DATA SHEETS), DESIGN RESOURCES (INCLUDING REFERENCE DESIGNS), APPLICATION OR OTHER DESIGN ADVICE, WEB TOOLS, SAFETY INFORMATION, AND OTHER RESOURCES “AS IS” AND WITH ALL FAULTS, AND DISCLAIMS ALL WARRANTIES, EXPRESS AND IMPLIED, INCLUDING WITHOUT LIMITATION ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE OR NON-INFRINGEMENT OF THIRD PARTY INTELLECTUAL PROPERTY RIGHTS.

These resources are intended for skilled developers designing with TI products. You are solely responsible for (1) selecting the appropriate TI products for your application, (2) designing, validating and testing your application, and (3) ensuring your application meets applicable standards, and any other safety, security, regulatory or other requirements.

These resources are subject to change without notice. TI grants you permission to use these resources only for development of an application that uses the TI products described in the resource. Other reproduction and display of these resources is prohibited. No license is granted to any other TI intellectual property right or to any third party intellectual property right. TI disclaims responsibility for, and you will fully indemnify TI and its representatives against, any claims, damages, costs, losses, and liabilities arising out of your use of these resources.

TI’s products are provided subject to TI’s Terms of Sale or other applicable terms available either on ti.com or provided in conjunction with such TI products. TI’s provision of these resources does not expand or otherwise alter TI’s applicable warranties or warranty disclaimers for TI products.

TI objects to and rejects any additional or different terms you may have proposed.
