1 Features

- Input Voltage Range from 1.8 V to 5.5 V
- 2.3-µA Operating Quiescent Current
- Up to 4 MHz Switching Frequency
- Output Current 0.6 A / 1 A
- 1% Output Voltage Accuracy
- Selectable Power Save / Forced PWM Mode
- R2D converter for flexible \( V_{\text{OUT}} \) setting
- 16 Selectable + 1 Fixed Output Voltages
  - TPS62800 (4 MHz): 0.4 V to 0.775 V
  - TPS62801 (4 MHz): 0.8 V to 1.55 V
  - TPS62802 (4 MHz): 1.8 V to 3.3 V
  - TPS62806 (1.5 MHz): 0.4 V to 0.775 V
  - TPS62807 (1.5 MHz): 0.8 V to 1.55 V
  - TPS62808 (1.5 MHz): 1.8 V to 3.3 V
- Smart Enable Pin
- Optimized Pinout to Support 0201 Components
- DCS-Control™ Topology
- Output Discharge
- 100% Duty Cycle Operation
- Tiny 6-pin, 0.35 mm Pitch WCSP package
- Supports < 0.6 mm Solution Height
- Supports < 5 mm² Solution Size

2 Applications

- Wearable Electronics, IoT Applications
- 2xAA Battery Powered Applications
- Smart Phones

3 Description

The TPS6280x device family is a step down converter with 2.3-µA typical quiescent current featuring highest efficiency and smallest solution size. TI's DCS-Control™ topology enables the device to operate with tiny inductors and capacitors with a switching frequency up to 4 MHz. At light load conditions, it seamlessly enters Power Save Mode to reduce switching cycles and maintain high efficiency.

Connecting the VSEL/MODE pin to GND selects a fixed output voltage. With only one external resistor connected to VSEL/MODE pin, 16 internally set output voltages can be selected. An integrated R2D (resistor to digital) converter reads out the external resistor and sets the output voltage. The same device part number can be used for different applications and voltage rails just by changing a single resistor. Furthermore, the internally set output voltage provides better accuracy compared to a traditional external resistor divider network. Once the device has started up, the DC/DC converter enters Forced PWM Mode by applying a high level at the VSEL/MODE pin. In this operating mode, the device runs at a typical 4-MHz or 1.5-MHz switching frequency, enabling lowest output voltage ripple and highest efficiency. The TPS6280x device series comes in a tiny 6-pin WCSP package with 0.35-mm pitch.

---

Typical Application

Efficiency vs. \( I_{\text{OUT}} \) at 1.2\( V_{\text{OUT}} \)

## 7 Specifications

### 7.1 Absolute Maximum Ratings\(^{(1)}\)

<table>
<thead>
<tr>
<th>Pin voltage(^{(2)})</th>
<th>MIN</th>
<th>MAX</th>
<th>UNIT</th>
</tr>
</thead>
<tbody>
<tr>
<td>VIN</td>
<td>–0.3</td>
<td>6</td>
<td>V</td>
</tr>
<tr>
<td>SW</td>
<td>–0.3</td>
<td>VIN +0.3V</td>
<td>V</td>
</tr>
<tr>
<td>SW (AC), less than 10ns, while switching</td>
<td>–2.5</td>
<td>9</td>
<td>V</td>
</tr>
<tr>
<td>EN, VSEL/MODE</td>
<td>–0.3</td>
<td>6</td>
<td>V</td>
</tr>
<tr>
<td>VOS</td>
<td>–0.3</td>
<td>5</td>
<td>V</td>
</tr>
<tr>
<td>Operating junction temperature, T(_J)</td>
<td>–40</td>
<td>150</td>
<td>°C</td>
</tr>
<tr>
<td>Storage temperature, T(_{stg})</td>
<td>–65</td>
<td>150</td>
<td>°C</td>
</tr>
</tbody>
</table>

\(^{(1)}\) Stresses beyond those listed under **absolute maximum ratings** may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions beyond those indicated under **recommended operating conditions** is not implied. Exposure to absolute–maximum–rated conditions for extended periods may affect device reliability.

\(^{(2)}\) All voltage values are with respect to network ground terminal GND.

### 7.2 ESD Ratings

<table>
<thead>
<tr>
<th>V(_{(ESD)})</th>
<th>Electrostatic discharge</th>
<th>VALUE</th>
<th>UNIT</th>
</tr>
</thead>
<tbody>
<tr>
<td>Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins(^{(1)})</td>
<td>±2000</td>
<td>V</td>
<td></td>
</tr>
<tr>
<td>Charged device model (CDM), per JEDEC specification JESD22-C101, all pins(^{(2)})</td>
<td>±500</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

\(^{(1)}\) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process. The human body model is a 100-pF capacitor discharged through a 1.5-kΩ resistor into each pin.

\(^{(2)}\) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

8 Detailed Description

8.1 Overview
The TPS6280x is a high frequency synchronous step down converter with ultra low quiescent current consumption. Using TI's DCS-Control™ topology, the device extends the high efficiency operation area down to microamperes of load current during Power Save Mode Operation. TI's DCS-Control™ (Direct Control with Seamless Transition into Power Save Mode) is an advanced regulation topology, which combines the advantages of hysteretic and voltage mode control. Characteristics of DCS-Control™ are excellent AC load regulation and transient response, low output ripple voltage and a seamless transition between PFM and PWM mode operation. DCS-Control™ includes an AC loop which senses the output voltage (VOS pin) and directly feeds the information to a fast comparator stage. This comparator sets the switching frequency, which is constant for steady state operating conditions, and provides immediate response to dynamic load changes. In order to achieve accurate DC load regulation, a voltage feedback loop is used. The internally compensated regulation network achieves fast and stable operation with small external components and low ESR capacitors.

8.2 Functional Block Diagram

8.3 Feature Description

8.3.1 Smart Enable and Shutdown (EN)
An internal 500kΩ resistor pulls the EN pin to GND and avoids the pin to be floating. This prevents an uncontrolled startup of the device in case the EN pin cannot be driven to low level safely. With EN low, the device is in shutdown mode. The device is turned on with EN set to a high level. The pulldown control circuit disconnects the pulldown resistor on the EN pin once the internal control logic and the reference have been powered up. With EN set to a low level, the device enters shutdown mode and the pulldown resistor is activated again.
Feature Description (continued)

8.3.2 Softstart

Once the device has been enabled with EN high, it initializes and powers up its internal circuits. This occurs during the regulator startup delay time $t_{\text{Startup delay}}$. Once $t_{\text{Startup delay}}$ expires, the internal soft start circuitry ramps up the output voltage within the Soft start time $t_{ss}$, see Figure 9.

The startup delay time $t_{\text{Startup delay}}$ varies depending on the selected VSEL value. It is shortest with VSEL = 0 and longest with VSEL = 16. See Figure 52 to Figure 56.

![Device Startup](image)

Figure 9. Device Startup

8.3.3 VSEL/MODE Pin

This pin has two functions, output voltage selection during startup of the converter and operating mode selection. See also Device Comparison Table.

8.3.3.1 Output Voltage Selection (R2D Converter)

The output voltage is set with a single external resistor connected between the VSEL/MODE pin and GND. Once the device has been enabled and the control logic as well as the internal reference have been powered up, a R2D (resistor to digital) conversion is started to detect the external resistor $R_{VSEL}$ within the regulator startup delay time $t_{\text{Startup delay}}$. An internal current source applies current through the external resistor and an internal ADC reads back the resulting voltage level. Depending on the level, an internal feedback divider network is selected to set the correct output voltage. Once this R2D conversion is finished, the current source is turned off to avoid current flow through the external resistor.

After power up, the pin is configured as an input for Mode Selection. Therefore, the output voltage is set only once. If the Mode selection function is used in combination with the VSEL function, ensure that there is no additional current path or capacitance greater than 30pF total to GND, during R2D conversion. Otherwise a false output voltage will be set.

Connecting VSEL/MODE to GND selects a pre-defined output voltage (TPS62800 = 0.7 V, TPS62801 = 1.2 V, TPS62802 = 1.8 V, TPS62806 = 0.7 V, TPS62807 = 1.2 V, TPS62808 = 1.8 V). In this case, no external resistor is needed which enables a smaller solution size.

8.3.3.2 Mode Selection: Power Save Mode / Forced PWM Operation

A low level at this pin selects Power Save Mode operation, and a high level selects forced PWM operation. The Mode can be changed during operation after the device has been powered up. The Mode selection function is only available after the R2D converter has read out the external resistor.
Feature Description (continued)

8.3.4 Undervoltage Lockout (UVLO)
To avoid misoperation of the device at low input voltages, an undervoltage lockout (UVLO) comparator monitors the supply voltage. The UVLO comparator shuts down the device at an input voltage of 1.7V (max) with falling $V_{IN}$. The device starts at an input voltage of 1.8V (max) rising $V_{IN}$. Once the device re-enters operation out of an undervoltage lockout condition, it behaves like being enabled. The internal control logic is powered up and the external resistor at the VSEL/MODE pin is read out.

8.3.5 Switch Current Limit / Short Circuit Protection
The TPS6280x integrates a current limit on the high side, as well on the low side MOSFETs to protect the device against overload or short circuit conditions. The current in the switches is monitored cycle by cycle. If the high side MOSFET current limit $I_{LIMF}$ trips, the high side MOSFET is turned off and the low side MOSFET is turned on to ramp down the inductor current. Once the inductor current through the low side switch decreases below the low side MOSFET current limit $I_{LIMF}$, the low side MOSFET is turned off and the high side MOSFET turns on again.

8.3.6 Thermal Shutdown
The junction temperature ($T_J$) of the device is monitored by an internal temperature sensor. If $T_J$ exceeds the thermal shutdown temperature $T_{SD}$ of 160°C (typ), the device enters thermal shutdown. Both the high side and low side power FETs are turned off. When $T_J$ decreases below the hysteresis amount of typically 20°C, the converter resumes operation, beginning with a soft start to the originally set $V_{OUT}$ (there is no R2D conversion of $R_{VSEL}$). The thermal shutdown is not active in Power Save Mode.

8.3.7 Output Voltage Discharge
The purpose of the output discharge function is to ensure a defined down-ramp of the output voltage when the device is disabled and to keep the output voltage close to 0 V. The output discharge feature is only active once the device has been enabled at least once since the supply voltage was applied. The output discharge function is not active if the device is disabled and the supply voltage is applied the first time.

The internal discharge resistor is connected to the VOS pin. The discharge function is enabled as soon as the device is disabled. The minimum supply voltage required to keep the discharge function active is $V_{IN} > V_{TH_UVLO}$.
8.4 Device Functional Modes

8.4.1 Power Save Mode Operation

The DCS-Control™ topology supports Power Save Mode operation. At light loads the device operates in PFM (Pulse Frequency Modulation) mode that generates a single switching pulse to ramp up the inductor current and recharge the output capacitor, followed by a sleep period where most of the internal circuits are shutdown to achieve lowest operating quiescent current. During this time, the load current is supported by the output capacitor. The duration of the sleep period depends on the load current and the inductor peak current. During the sleep periods, the current consumption is reduced to typically 2.3 µA. This low quiescent current consumption is achieved by an ultra low power voltage reference, an integrated high impedance feedback divider network and an optimized Power Save Mode operation.

In PFM Mode, the switching frequency varies linearly with the load current. At medium and high load conditions, the device enters automatically PWM (Pulse Width Modulation) mode and operates in continuous conduction mode with a nominal switch frequency $f_{sw}$ of typically 4MHz or 1.5MHz. The switching frequency in PWM mode is controlled and depends on $V_{IN}$ and $V_{OUT}$. The boundary between PWM and PFM mode is when the inductor current becomes discontinuous.

If the load current decreases, the converter seamlessly enters PFM mode to maintain high efficiency down to very light loads. Since DCS-Control™ supports both operation modes within one single building block, the transition from PWM to PFM Mode is seamless with minimum output voltage ripple.

8.4.2 Forced PWM Mode Operation

After the device has powered up and ramped up $V_{OUT}$, the VSEL/MODE pin acts as an input. With a high level on VSEL/MODE pin, the device enters forced PWM Mode and operates with a constant switching frequency over the entire load range, even at very light loads. This reduces or eliminates interference with RF and noise sensitive circuits, but lowers efficiency at light loads.

8.4.3 100% Mode Operation

The duty cycle of the buck converter operating in PWM mode is given as $D = V_{OUT}/V_{IN}$. The duty cycle increases as the input voltage comes close to the output voltage. In 100% duty cycle mode, it keeps the high side switch on continuously. The high side switch stays turned on as long as the output voltage is below the internal set point. This allows the conversion of small input to output voltage differences.

8.4.4 Optimized Transient Performance from PWM to PFM Mode Operation

For most converters, the load transient response in PWM mode is improved compared to PFM mode, since the converter reacts faster on the load step and actively sinks energy on the load release. Compare figure Figure 43 and Figure 42. As an additional feature, the TPS6280x automatically enters PWM mode for 16 cycles after a heavy load release in order to bring the output voltage back to the regulation level faster. After 16 cycles of PWM mode, it automatically returns to PFM mode (if VSEL/MODE is driven low). See Figure 10. Without this optimization, the output voltage overshoot would be higher and would look like the $V_{OUT}$ trace. This feature is only active once the load is high enough and the converter operates in PWM mode.

9 Application and Implementation

NOTE
Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI’s customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

9.1 Application Information
The following section discusses the design of the external components to complete the power supply design for several input and output voltage options by using typical applications as a reference.

9.2 Typical Application

Click here to create a custom design using the TPS62802 device with the WEBENCH® Power Designer.
Click here to create a custom design using the TPS62806 device with the WEBENCH® Power Designer.
Click here to create a custom design using the TPS62807 device with the WEBENCH® Power Designer.
Click here to create a custom design using the TPS62808 device with the WEBENCH® Power Designer.

1. Start by entering the input voltage (V\text{IN}), output voltage (V\text{OUT}), and output current (I\text{OUT}) requirements.
2. Optimize the design for key parameters such as efficiency, footprint, and cost using the optimizer dial.
3. Compare the generated design with other possible solutions from Texas Instruments.

The WEBENCH Power Designer provides a customized schematic along with a list of materials with real-time pricing and component availability.

In most cases, these actions are available:
• Run electrical simulations to see important waveforms and circuit performance
• Run thermal simulations to understand board thermal performance
• Export customized schematic and layout into popular CAD formats
• Print PDF reports for the design, and share the design with colleagues

Get more information about WEBENCH tools at www.ti.com/WEBENCH.

9.2.2.2 Inductor Selection

The inductor value affects the peak-to-peak ripple current, the PWM-to-PFM transition point, the output voltage ripple and the efficiency. The selected inductor has to be rated for its DC resistance and saturation current. The inductor ripple current (\Delta I_L) decreases with higher inductance and increases with higher V\text{IN} or V\text{OUT} and can be estimated according to Equation 1.

Equation 2 calculates the maximum inductor current under static load conditions. The saturation current of the inductor should be rated higher than the maximum inductor current, as calculated with Equation 2. This is recommended because during a heavy load transient the inductor current rises above the calculated value. A more conservative way is to select the inductor saturation current according to the high side MOSFET switch current limit, I_L\text{IMF}.

\begin{align*}
\Delta I_L &= V_{\text{out}} \times \frac{1 - V_{\text{out}}}{L \times f} \\
I_{\text{Lmax}} &= I_{\text{outmax}} + \frac{\Delta I_L}{2}
\end{align*}

where
• f = Switching Frequency
• L = Inductor Value
• \Delta I_L = Peak to Peak inductor ripple current
• I_{\text{Lmax}} = Maximum Inductor current
Table 3 shows a list of possible inductors.

9.2.2.3 Output Capacitor Selection

The DCS-Control™ scheme of the TPS6280x allows the use of tiny ceramic capacitors. Ceramic capacitors with low ESR values have the lowest output voltage ripple and are recommended. The output capacitor requires either an X7R or X5R dielectric. At light load currents, the converter operates in Power Save Mode and the output voltage ripple is dependent on the output capacitor value. A larger output capacitors can be used reducing the output voltage ripple.

The inductor and output capacitor together provide a low-pass filter. To simplify this process, Table 4 outlines possible inductor and capacitor value combinations.

(1) An effective inductance range of 0.33 µH to 0.82 µH is recommended. An effective capacitance range of 2 µF to 26µF is recommended.
(2) Typical application configuration. Other check marks indicate alternative filter combinations.
(3) An effective inductance range of 0.7 µH to 1.2 µH is recommended. An effective capacitance range of 3 µF to 26 µF is recommended.

9.2.2.4 Input Capacitor Selection

Because the buck converter has a pulsating input current, a low ESR ceramic input capacitor is required for best input voltage filtering to minimize input voltage spikes. For most applications a 4.7-µF input capacitor is sufficient. When operating from a high impedance source, like a coin cell, a larger input buffer capacitor ≥10µF is recommended to avoid voltage drops during startup and load transients. The input capacitor can be increased without any limit for better input voltage filtering. The leakage current of the input capacitor adds to the overall current consumption.

Table 5 shows a selection of input and output capacitors.

10 Power Supply Recommendations

The power supply must provide a current rating according to the supply voltage, output voltage and output current of the TPS6280x.

11 Layout

11.1 Layout Guidelines

The pinout of TPS6280x has been optimized to enable a single top layer PCB routing of the IC and its critical passive components such as \( C_{\text{IN}} \), \( C_{\text{OUT}} \) and \( L \). Furthermore, this pin out allows to connect tiny components such as 0201 (0603) size capacitors and 0402 (1005) size inductor. A solution size smaller than 5mm\(^2\) can be achieved with a fixed output voltage.

- As for all switching power supplies, the layout is an important step in the design. Care must be taken in board layout to get the specified performance.
- It is critical to provide a low inductance, low impedance ground path. Therefore, use wide and short traces for the main current paths.
- The input capacitor should be placed as close as possible to the IC’s VIN and GND pins. This is the most critical component placement.
- The VOS line is a sensitive, high impedance line and should be connected to the output capacitor and routed away from noisy components and traces (e.g. SW line) or other noise sources.

11.2 Layout Example

12 Device and Documentation Support

12.1 Device Support

12.1.1 Third-Party Products Disclaimer

TI’s publication of information regarding third-party products or services does not constitute an endorsement regarding the suitability of such products or services or a warranty, representation or endorsement of such products or services, either alone or in combination with any TI product or service.

12.2 Custom Design With WEBENCH® Tools

Click here to create a custom design using the TPS62800 device with the WEBENCH® Power Designer.
Click here to create a custom design using the TPS62801 device with the WEBENCH® Power Designer.
Click here to create a custom design using the TPS62802 device with the WEBENCH® Power Designer.
Click here to create a custom design using the TPS62806 device with the WEBENCH® Power Designer.

1. Start by entering the input voltage (V_in), output voltage (V_out), and output current (I_out) requirements.
2. Optimize the design for key parameters such as efficiency, footprint, and cost using the optimizer dial.
3. Compare the generated design with other possible solutions from Texas Instruments.

The WEBENCH Power Designer provides a customized schematic along with a list of materials with real-time pricing and component availability.

In most cases, these actions are available:
• Run electrical simulations to see important waveforms and circuit performance
• Run thermal simulations to understand board thermal performance
• Export customized schematic and layout into popular CAD formats
• Print PDF reports for the design, and share the design with colleagues

Get more information about WEBENCH tools at www.ti.com/WEBENCH.

12.4 Community Resources

The following links connect to TI community resources. Linked contents are provided “AS IS” by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI’s views; see TI’s Terms of Use.

**TI E2E™ Online Community**  *TI's Engineer-to-Engineer (E2E) Community.* Created to foster collaboration among engineers. At e2e.ti.com, you can ask questions, share knowledge, explore ideas and help solve problems with fellow engineers.

**Design Support**  *TI's Design Support* Quickly find helpful E2E forums along with design support tools and
Community Resources (continued)

contact information for technical support.

12.5 Trademarks
DCS-Control, E2E are trademarks of Texas Instruments.
Topology is a trademark of others.
All other trademarks are the property of their respective owners.

12.6 Electrostatic Discharge Caution

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

12.7 Glossary

SLYZ022 — Ti Glossary.
This glossary lists and explains terms, acronyms, and definitions.

13 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

</tbody>
</table>

(1) The marketing status values are defined as follows:
- **ACTIVE**: Product device recommended for new designs.
- **LIFEBUY**: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
- **NRND**: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
- **PREVIEW**: Device has been announced but is not in production. Samples may or may not be available.
- **OBSOLETE**: TI has discontinued the production of the device.

(2) **RoHS**: TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".
- **RoHS Exempt**: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.
- **Green**: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) **MSL, Peak Temp.** - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.
There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.
## TAPE AND REEL INFORMATION

### REEL DIMENSIONS

- **Reel Diameter**

### TAPE DIMENSIONS

- **A0** Dimension designed to accommodate the component width
- **B0** Dimension designed to accommodate the component length
- **K0** Dimension designed to accommodate the component thickness
- **W** Overall width of the carrier tape
- **P1** Pitch between successive cavity centers
