

# TPS75715, TPS75718, TPS75725, TPS75733 WITH POWER GOOD AND TPS75701 FAST-TRANSIENT RESPONSE 3-A LOW-DROPOUT VOLTAGE REGULATORS

SLVS306E – NOVEMBER 2000 – REVISED FEBRUARY 2009

- 3-A Low-Dropout Voltage Regulator
- Available in 1.5-V, 1.8-V, 2.5-V, and 3.3-V Fixed-Output and Adjustable Versions
- Open Drain Power-Good ( $\overline{\text{PG}}$ ) Status Output (Fixed Options Only)
- Dropout Voltage Typically 150 mV at 3 A (TPS75733)
- Low 125  $\mu\text{A}$  Typical Quiescent Current
- Fast Transient Response
- 3% Tolerance Over Specified Conditions for Fixed-Output Versions
- Available in 5-Pin TO-220 and TO-263 Surface-Mount Packages
- Thermal Shutdown Protection

## description

The TPS757xx family of 3-A low dropout (LDO) regulators contains four fixed voltage option regulators with integrated power-good ( $\overline{\text{PG}}$ ) and an adjustable voltage option regulator. These devices are capable of supplying 3 A of output current with a dropout of 150 mV (TPS75733). Therefore, the device is capable of performing a 3.3-V to 2.5-V conversion. Quiescent current is 125  $\mu\text{A}$  at full load and drops down to less than 1  $\mu\text{A}$  when the device is disabled. The TPS757xx is designed to have fast transient response for large load current changes.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

PRODUCTION DATA information is current as of publication date. Products conform to specifications per the terms of Texas Instruments standard warranty. Production processing does not necessarily include testing of all parameters.

# TPS75715, TPS75718, TPS75725, TPS75733 WITH POWER GOOD AND TPS75701 FAST-TRANSIENT RESPONSE 3-A LOW-DROPOUT VOLTAGE REGULATORS

SLVS306E – NOVEMBER 2000 – REVISED FEBRUARY 2009

## description (continued)

Because the PMOS device behaves as a low-value resistor, the dropout voltage is low (typically 150 mV at an output current of 3 A for the TPS75733) and is directly proportional to the output current. Additionally, since the PMOS pass element is a voltage-driven device, the quiescent current is low and independent of output loading (typically 125  $\mu$ A over the full range of output current). These two key specifications yield a significant improvement in operating life for battery-powered systems.

The device is enabled when  $\overline{\text{EN}}$  is connected to a low-level voltage. This LDO family also features a sleep mode; applying a TTL high signal to  $\overline{\text{EN}}$  (enable) shuts down the regulator, reducing the quiescent current to less than 1  $\mu$ A at  $T_J = 25^\circ\text{C}$ . The power-good terminal ( $\overline{\text{PG}}$ ) is an active low, open drain output, which can be used to implement a power-on reset or a low-battery indicator.

The TPS757xx is offered in 1.5-V, 1.8-V, 2.5-V, and 3.3-V fixed-voltage versions and in an adjustable version (programmable over the range of 1.22 V to 5 V). Output voltage tolerance is specified as a maximum of 3% over line, load, and temperature ranges. The TPS757xx family is available in a 5-pin TO-220 (KC) and TO-263 (KTT) packages.

### AVAILABLE OPTIONS

| $T_J$          | OUTPUT VOLTAGE (TYP)     | TO-220 (KC) | TO-263(KTT) |
|----------------|--------------------------|-------------|-------------|
| -40°C to 125°C | 3.3 V                    | TPS75733KC  | TPS75733KTT |
|                | 2.5 V                    | TPS75725KC  | TPS75725KTT |
|                | 1.8 V                    | TPS75718KC  | TPS75718KTT |
|                | 1.5 V                    | TPS75715KC  | TPS75715KTT |
|                | Adjustable 1.22 V to 5 V | TPS75701KC  | TPS75701KTT |

NOTE: The TPS75701 is programmable using an external resistor divider (see application information). The KTT package is available taped and reeled. Add an R suffix to the device type (e.g., TPS75701KTTR) to indicate tape and reel.

† See application information section for capacitor selection details.

Figure 1. Typical Application Configuration (For Fixed Output Options)

## SLVS306E – NOVEMBER 2000 – REVISED FEBRUARY 2009

The schematic diagram illustrates a voltage regulator circuit with current limit and shutdown features. The input voltage  $V_{IN}$  is connected to the UVLO (Under-Voltage Lockout) block and the Bandgap Reference block. The  $\overline{EN}$  (Enable) signal is inverted and connected to the UVLO block. The UVLO block outputs  $\overline{UVLO}$  to an AND gate. The Bandgap Reference block provides a  $V_{ref} = 1.22\text{ V}$  reference voltage to the inverting input of the error amplifier and to another AND gate. The Current Sense block monitors the output current and outputs  $ILIM$  to the non-inverting input of the error amplifier. The error amplifier's output drives the base of the pass transistor (NPN BJT) and is also connected to the SHUTDOWN pin of the PMOS transistor. The PMOS transistor's gate is connected to  $V_{IN}$  and its source to  $V_{OUT}$ . The output voltage  $V_{OUT}$  is divided by resistors  $R1$  and  $R2$  to provide feedback to the error amplifier. The Thermal Shutdown block provides a shutdown signal to the AND gate. The output of the AND gate (combining  $\overline{UVLO}$ ,  $V_{ref}$ , and Thermal Shutdown signals) drives the base of the PMOS transistor. The Falling Edge Delay block provides a delay to the PMOS transistor's gate. The PMOS transistor's drain is connected to  $V_{OUT}$  and its source to ground, with the  $\overline{PG}$  (Power Good) signal taken from its source.

# TPS75715, TPS75718, TPS75725, TPS75733 WITH POWER GOOD AND TPS75701 FAST-TRANSIENT RESPONSE 3-A LOW-DROPOUT VOLTAGE REGULATORS

SLVS306E – NOVEMBER 2000 – REVISED FEBRUARY 2009

## TPS757xx $\overline{\text{PG}}$ timing diagram

NOTE:  $V_{IT-}$  Trip voltage is typically 9% lower than the output voltage ( $91\%V_O$ ).  $V_{IT-}$  to  $V_{IT+}$  is the hysteresis voltage.

## detailed description

The TPS757xx family includes four fixed-output voltage regulators (1.5 V, 1.8 V, 2.5 V, and 3.3 V), and an adjustable regulator, the TPS75701 (adjustable from 1.22 V to 5 V). The bandgap voltage is typically 1.22 V.

## pin functions

### enable ( $\overline{\text{EN}}$ )

The  $\overline{\text{EN}}$  terminal is an input which enables or shuts down the device. If  $\overline{\text{EN}}$  is a logic high, the device will be in shutdown mode. When  $\overline{\text{EN}}$  goes to logic low, the device will be enabled.

### power-good ( $\overline{\text{PG}}$ )

The  $\overline{\text{PG}}$  terminal for the fixed voltage option devices is an open drain, active low output that indicates the status of  $V_O$  (output of the LDO). When  $V_O$  reaches approximately 91% of the regulated voltage,  $\overline{\text{PG}}$  will go to a low impedance state. It will go to a high-impedance state when  $V_O$  falls below approximately 89% (i.e. over load condition) of the regulated voltage. The open drain output of the  $\overline{\text{PG}}$  terminal requires a pullup resistor.

### feedback (FB)

FB is an input terminal used for the adjustable-output option and must be connected to the output terminal either directly, in order to generate the minimum output voltage of 1.22 V, or through an external feedback resistor divider for other output voltages. The FB connection should be as short as possible. It is essential to route it in such a way to minimize/avoid noise pickup. Adding RC networks between FB terminal and  $V_O$  to filter noise is not recommended because it may cause the regulator to oscillate.

# TPS75715, TPS75718, TPS75725, TPS75733 WITH POWER GOOD AND TPS75701 FAST-TRANSIENT RESPONSE 3-A LOW-DROPOUT VOLTAGE REGULATORS

SLVS306E – NOVEMBER 2000 – REVISED FEBRUARY 2009

## detailed description (continued)

### input voltage (IN)

The  $V_{IN}$  terminal is an input to the regulator.

### output voltage (OUTPUT)

The  $V_{OUTPUT}$  terminal is an output to the regulator.

## THERMAL INFORMATION

The amount of heat that an LDO linear regulator generates is directly proportional to the amount of power it dissipates during operation. All integrated circuits have a maximum allowable junction temperature ( $T_{Jmax}$ ) above which normal operation is not assured. A system designer must design the operating environment so that the operating junction temperature ( $T_J$ ) does not exceed the maximum junction temperature ( $T_{Jmax}$ ). The two main environmental variables that a designer can use to improve thermal performance are air flow and external heatsinks. The purpose of this information is to aid the designer in determining the proper operating environment for a linear regulator that is operating at a specific power level.

In general, the maximum expected power ( $P_{D(max)}$ ) consumed by a linear regulator is computed as:

$$P_{Dmax} = (V_{I(avg)} - V_{O(avg)}) \times I_{O(avg)} + V_{I(avg)} \times I_{(Q)} \quad (1)$$

Where:

$V_{I(avg)}$  is the average input voltage.

$V_{O(avg)}$  is the average output voltage.

$I_{O(avg)}$  is the average output current.

$I_{(Q)}$  is the quiescent current.

For most TI LDO regulators, the quiescent current is insignificant compared to the average output current; therefore, the term  $V_{I(avg)} \times I_{(Q)}$  can be neglected. The operating junction temperature is computed by adding the ambient temperature ( $T_A$ ) and the increase in temperature due to the regulator's power dissipation. The temperature rise is computed by multiplying the maximum expected power dissipation by the sum of the thermal resistances between the junction and the case ( $R_{\theta JC}$ ), the case to heatsink ( $R_{\theta CS}$ ), and the heatsink to ambient ( $R_{\theta SA}$ ). Thermal resistances are measures of how effectively an object dissipates heat. Typically, the larger the device, the more surface area available for power dissipation and the lower the object's thermal resistance.

Figure 21 illustrates these thermal resistances for (a) a TO-220 package attached to a heatsink, and (b) a TO-263 package mounted on a JEDEC High-K board.

Figure 21. Thermal Resistances

## THERMAL INFORMATION

Equation 2 summarizes the computation:

$$T_J = T_A + P_{D\max} \times (R_{\theta JC} + R_{\theta CS} + R_{\theta SA}) \quad (2)$$

The  $R_{\theta JC}$  is specific to each regulator as determined by its package, lead frame, and die size provided in the regulator's datasheet. The  $R_{\theta SA}$  is a function of the type and size of heatsink. For example, *black body radiator* type heatsinks, like the one attached to the TO-220 package in Figure 21(a), can have  $R_{\theta CS}$  values ranging from 5°C/W for very large heatsinks to 50°C/W for very small heatsinks. The  $R_{\theta CS}$  is a function of how the package is attached to the heatsink. For example, if a thermal compound is used to attach a heatsink to a TO-220 package,  $R_{\theta CS}$  of 1°C/W is reasonable.

Even if no external *black body radiator* type heatsink is attached to the package, the board on which the regulator is mounted will provide some heatsinking through the pin solder connections. Some packages, like the TO-263 and TI's TSSOP PowerPAD™ packages, use a copper plane underneath the package or the circuit board's ground plane for additional heatsinking to improve their thermal performance. Computer aided thermal modeling can be used to compute very accurate approximations of an integrated circuit's thermal performance in different operating environments (e.g., different types of circuit boards, different types and sizes of heatsinks, and different air flows, etc.). Using these models, the three thermal resistances can be combined into one thermal resistance between junction and ambient ( $R_{\theta JA}$ ). This  $R_{\theta JA}$  is valid only for the specific operating environment used in the computer model.

Equation 2 simplifies into equation 3:

$$T_J = T_A + P_{D\max} \times R_{\theta JA} \quad (3)$$

Rearranging equation 3 gives equation 4:

$$R_{\theta JA} = \frac{T_J - T_A}{P_{D\max}} \quad (4)$$

Using equation 3 and the computer model generated curves shown in Figures 22 and 25, a designer can quickly compute the required heatsink thermal resistance/board area for a given ambient temperature, power dissipation, and operating environment.

## THERMAL INFORMATION

### TO-220 power dissipation

The TO-220 package provides an effective means of managing power dissipation in through-hole applications. The TO-220 package dimensions are provided in the *Mechanical Data* section at the end of the data sheet. A heatsink can be used with the TO-220 package to effectively lower the junction-to-ambient thermal resistance.

To illustrate, the TPS75725 in a TO-220 package was chosen. For this example, the average input voltage is 3.3 V, the output voltage is 2.5 V, the average output current is 3 A, the ambient temperature 55°C, the air flow is 150 LFM, and the operating environment is the same as documented below. Neglecting the quiescent current, the maximum average power is:

$$P_{D\max} = (3.3 - 2.5) \text{ V} \times 3 \text{ A} = 2.4 \text{ W} \quad (5)$$

Substituting  $T_{J\max}$  for  $T_J$  into equation 4 gives equation 6:

$$R_{\theta JA\max} = (125 - 55)^\circ\text{C} / 2.4 \text{ W} = 29^\circ\text{C/W} \quad (6)$$

From Figure 22,  $R_{\theta JA}$  vs Heatsink Thermal Resistance, a heatsink with  $R_{\theta SA} = 22^\circ\text{C/W}$  is required to dissipate 2.4 W. The model operating environment used in the computer model to construct Figure 22 consisted of a standard JEDEC High-K board (2S2P) with a 1 oz. internal copper plane and ground plane. Since the package pins were soldered to the board, 450 mm<sup>2</sup> of the board was modeled as a heatsink. Figure 23 shows the side view of the operating environment used in the computer model.

## THERMAL INFORMATION

### TO-220 power dissipation (continued)

Figure 23

From the data in Figure 22 and rearranging equation 4, the maximum power dissipation for a different heatsink  $R_{\theta SA}$  and a specific ambient temperature can be computed (see Figure 24).

Figure 24

## THERMAL INFORMATION

### TO-263 power dissipation

The TO-263 package provides an effective means of managing power dissipation in surface mount applications. The TO-263 package dimensions are provided in the *Mechanical Data* section at the end of the data sheet. The addition of a copper plane directly underneath the TO-263 package enhances the thermal performance of the package.

To illustrate, the TPS75725 in a TO-263 package was chosen. For this example, the average input voltage is 3.3 V, the output voltage is 2.5 V, the average output current is 3 A, the ambient temperature 55°C, the air flow is 150 LFM, and the operating environment is the same as documented below. Neglecting the quiescent current, the maximum average power is:

$$P_{Dmax} = (3.3 - 2.5) V \times 3 A = 2.4 W \quad (7)$$

Substituting  $T_{Jmax}$  for  $T_J$  into equation 4 gives equation 8:

$$R_{\theta JAmax} = (125 - 55)^{\circ}C / 2.4 W = 29^{\circ}C/W \quad (8)$$

From Figure 25,  $R_{\theta JA}$  vs Copper Heatsink Area, the ground plane needs to be 2 cm<sup>2</sup> for the part to dissipate 2.4 W. The model operating environment used in the computer model to construct Figure 25 consisted of a standard JEDEC High-K board (2S2P) with a 1 oz. internal copper plane and ground plane. The package is soldered to a 2 oz. copper pad. The pad is tied through thermal vias to the 1 oz. ground plane. Figure 26 shows the side view of the operating environment used in the computer model.

## THERMAL INFORMATION

### TO-263 power dissipation (continued)

Figure 26

From the data in Figure 25 and rearranging equation 4, the maximum power dissipation for a different ground plane area and a specific ambient temperature can be computed (see Figure 27).

Figure 27

## APPLICATION INFORMATION

### programming the TPS75701 adjustable LDO regulator

The output voltage of the TPS75701 adjustable regulator is programmed using an external resistor divider as shown in Figure 28. The output voltage is calculated using:

$$V_O = V_{ref} \times \left(1 + \frac{R1}{R2}\right) \quad (9)$$

Where:

$$V_{ref} = 1.224 \text{ V typ (the internal reference voltage)}$$

Resistors R1 and R2 should be chosen for approximately 40-μA divider current. Lower value resistors can be used but offer no inherent advantage and waste more power. Higher values should be avoided as leakage currents at FB increase the output voltage error. The recommended design procedure is to choose R2 = 30.1 kΩ to set the divider current at 40 μA and then calculate R1 using:

$$R1 = \left(\frac{V_O}{V_{ref}} - 1\right) \times R2 \quad (10)$$

OUTPUT VOLTAGE  
PROGRAMMING GUIDE

| OUTPUT VOLTAGE | R1   | R2   | UNIT |
|----------------|------|------|------|
| 2.5 V          | 31.4 | 30.1 | kΩ   |
| 3.3 V          | 51   | 30.1 | kΩ   |
| 3.6 V          | 58.3 | 30.1 | kΩ   |

Figure 28. TPS75701 Adjustable LDO Regulator Programming

### regulator protection

The TPS757xx PMOS-pass transistor has a built-in back diode that conducts reverse currents when the input voltage drops below the output voltage (e.g., during power down). Current is conducted from the output to the input and is not internally limited. When extended reverse voltage is anticipated, external limiting may be appropriate.

The TPS757xx also features internal current limiting and thermal protection. During normal operation, the TPS757xx limits output current to approximately 10 A. When current limiting engages, the output voltage scales back linearly until the overcurrent condition ends. While current limiting is designed to prevent gross device failure, care should be taken not to exceed the power dissipation ratings of the package. If the temperature of the device exceeds 150°C(typ), thermal-protection circuitry shuts it down. Once the device has cooled below 130°C(typ), regulator operation resumes.

## APPLICATION INFORMATION

### input capacitor

For a typical application, a ceramic input bypass capacitor ( $0.22\ \mu\text{F}$  –  $1\ \mu\text{F}$ ) is recommended to ensure device stability. This capacitor should be as close as possible to the input pin. Due to the impedance of the input supply, large transient currents will cause the input voltage to droop. If this droop causes the input voltage to drop below the UVLO threshold, the device will turn off. Therefore, it is recommended that a larger capacitor be placed in parallel with the ceramic bypass capacitor at the regulator's input. The size of this capacitor depends on the output current, response time of the main power supply, and the main power supply's distance to the regulator. At a minimum, the capacitor should be sized to ensure that the input voltage does not drop below the minimum UVLO threshold voltage during normal operating conditions.

### output capacitor

As with most LDO regulators, the TPS757xx requires an output capacitor connected between OUT and GND to stabilize the internal control loop. The minimum recommended capacitance value is  $47\ \mu\text{F}$  with an ESR (equivalent series resistance) of at least  $200\ \text{m}\Omega$ . As shown in Figure 29, most capacitor and ESR combinations with a product of  $47\text{e-}6 \times 0.2 = 9.4\text{e-}6$  or larger will be stable, provided the capacitor value is at least  $47\ \mu\text{F}$ . Solid tantalum electrolytic and aluminum electrolytic capacitors are all suitable, provided they meet the requirements described in this section. Larger capacitors provide a wider range of stability and better load transient response.

This information along with the ESR graphs, Figures 19, 20, and 29, is included to assist in selection of suitable capacitance for the user's application. When necessary to achieve low height requirements along with high output current and/or high load capacitance, several higher ESR capacitors can be used in parallel to meet these guidelines.

- (1) Status:** For more details on status, see our [product life cycle](#).
- (2) Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.
- (3) RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.
- (4) Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
- (5) MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.
- (6) Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "-" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

**Important Information and Disclaimer:**The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

## TAPE AND REEL INFORMATION

PLASTIC FLANGE-MOUNT PACKAGE

4200577-4/G 01/13

- NOTES:
- A. All linear dimensions are in millimeters.
  - B. This drawing is subject to change without notice.
  - C. Body dimensions do not include mold flash or protrusion. Mold flash or protrusion not to exceed 0.005 (0,13) per side.
- Falls within JEDEC TO-263 variation BA, except minimum lead thickness, maximum seating height, and minimum body length.

KTT (R-PSFM-G5)

PLASTIC FLANGE-MOUNT PACKAGE

- NOTES:
- All linear dimensions are in millimeters.
  - This drawing is subject to change without notice.
  - Publication IPC-SM-782 is recommended for alternate designs.
  - Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC-7525.
  - Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.
  - This package is designed to be soldered to a thermal pad on the board. Refer to the Product Datasheet for specific thermal information, via requirements, and recommended thermal pad size. For thermal pad sizes larger than shown a solder mask defined pad is recommended in order to maintain the solderable pad geometry while increasing copper area.

## IMPORTANT NOTICE AND DISCLAIMER

TI PROVIDES TECHNICAL AND RELIABILITY DATA (INCLUDING DATASHEETS), DESIGN RESOURCES (INCLUDING REFERENCE DESIGNS), APPLICATION OR OTHER DESIGN ADVICE, WEB TOOLS, SAFETY INFORMATION, AND OTHER RESOURCES "AS IS" AND WITH ALL FAULTS, AND DISCLAIMS ALL WARRANTIES, EXPRESS AND IMPLIED, INCLUDING WITHOUT LIMITATION ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE OR NON-INFRINGEMENT OF THIRD PARTY INTELLECTUAL PROPERTY RIGHTS.
