

## TPS7A6650H-Q1 40-V, Ultralow- $I_{(q)}$ , 150°C-Ambient-Temperature Regulator

### 1 Features

- Qualified for Automotive Applications
- AEC-Q100 Qualified With the Following Results:
  - Device Temperature:  $-40^{\circ}\text{C}$  to  $150^{\circ}\text{C}$  Ambient Operating Temperature Range
  - Device HBM ESD Classification Level H2
  - Device CDM ESD Classification Level C4
- 4-V to 40-V Wide  $V_{in}$  Input Voltage Range With up to 45-V Transient
- Output Current: 50 mA
- Low Quiescent Current,  $I_{(q)}$ :
  - 2  $\mu\text{A}$  when EN = Low (Shutdown Mode)
  - 12  $\mu\text{A}$  Typical at Light Loads
- Low ESR Ceramic Output Stability Capacitor (2.2  $\mu\text{F}$ –100  $\mu\text{F}$ )
- 130-mV Dropout Voltage at 50 mA (Typical,  $V_{(Vin)} = 4\text{ V}$ )
- Fixed 5-V Output Voltage
- Low Input Voltage Tracking
- Integrated Power-On Reset
  - Programmable Reset-Pulse Delay
  - Open-Drain Reset Output
- Integrated Fault Protection
  - Thermal Shutdown
  - Short-Circuit Protection
- 8-Pin MSOP-DGN Package

### 2 Applications

- Powertrain Sensor Module
- Infotainment Systems With Sleep Mode
- Body Control Modules
- Always-On Battery Applications
  - Gateway Applications
  - Remote Keyless Entry Systems
  - Immobilizers

### 3 Description

The TPS7A6650H-Q1 is a low-dropout linear regulator designed for up to 40-V  $V_{in}$  operations. With only 12- $\mu\text{A}$  quiescent current at no load, it is quite suitable for standby microprocessor control-unit systems, especially in automotive applications.

The device features integrated short-circuit and overcurrent protection. The device implements reset delay on power up to indicate the output voltage is stable and in regulation. One can program the delay with an external capacitor. A low-voltage tracking feature allows for a smaller input capacitor and can possibly eliminate the need of using a boost converter during cold-crank conditions.

The device operates in the  $-40^{\circ}\text{C}$  to  $150^{\circ}\text{C}$  temperature range, which makes it well suited for power supplies in various automotive applications.

## 5 Pin Configuration and Functions

NC – No internal connection

NU – Make no external connection

### Pin Functions

PIN NAME	PIN NO.	TYPE	DESCRIPTION
CT	4	O	Reset-pulse delay adjustment. Connect this pin via a capacitor to GND
EN	2	I	Enable pin. The device enters the standby state when the enable pin becomes lower than the threshold.
NU	7	I	Not-used pin; make no external connection
GND	5	G	Ground reference
NC	3	—	Not-connected pin
PG	6	O	Output ready. This open-drain pin must connect to Vout via an external resistor. The output voltage going below threshold pulls it down.
Vin	1	P	Input power-supply voltage
Vout	8	O	Output voltage
—	—	—	Thermal pad

## 6 Specifications

### 6.1 Absolute Maximum Ratings

over operating ambient temperature range (unless otherwise noted) <sup>(1)</sup>

		MIN	MAX	UNIT
Vin, EN	Unregulated input <sup>(2)</sup> <sup>(3)</sup>	–0.3	45	V
Vout	Regulated output	–0.3	7	V
CT		–0.3	25	V
PG		–0.3	Vout	V
T <sub>J</sub>	Operating junction temperature range	–40	160	°C
T <sub>stg</sub>	Storage temperature range	–65	160	°C

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, and do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

(2) All voltage values are with respect to GND

(3) Absolute maximum voltage, withstand 45 V for 200 ms

## 6.2 ESD Ratings

			VALUE	UNIT	
V <sub>(ESD)</sub>	Electrostatic discharge	Human body model (HBM), per AEC Q100-002 <sup>(1)</sup>	±4000	V	
		Charged device model (CDM), per AEC Q100-011	All pins		±1000
			Corner pins (1, 4, 5, and 8)		±1000

(1) AEC Q100-002 indicates HBM stressing is done in accordance with the ANSI/ESDA/JEDEC JS-001 specification.

## 6.3 Recommended Operating Conditions

over operating ambient temperature range (unless otherwise noted)

			MIN	MAX	UNIT
V <sub>in</sub>	Unregulated input		4	40	V
EN			0	40	V
CT			0	20	V
V <sub>out</sub>			1.5	5.5	V
PG	Low voltage (I/O)		0	5.5	V
T <sub>A</sub>	Operating ambient temperature		–40	150	°C

## 6.4 Thermal Information

THERMAL METRIC <sup>(1)</sup>		TPS7A6650H-Q1	UNIT
		DGN (HVSSOP)	
		8 PINS	
R <sub>θJA</sub>	Junction-to-ambient thermal resistance	63.4	°C/W
R <sub>θJC(top)</sub>	Junction-to-case (top) thermal resistance	53	°C/W
R <sub>θJB</sub>	Junction-to-board thermal resistance <sup>(2)</sup>	37.4	°C/W
ψ <sub>JT</sub>	Junction-to-top characterization parameter	3.7	°C/W
ψ <sub>JB</sub>	Junction-to-board characterization parameter	37.1	°C/W
R <sub>θJC(bot)</sub>	Junction-to-case (bottom) thermal resistance	13.5	°C/W

(1) For more information about traditional and new thermal metrics, see the *Semiconductor and IC Package Thermal Metrics* application report (SPRA953).

(2) The junction-to-board thermal resistance is obtained by simulating in an environment with a ring cold plate fixture to control the PCB temperature, as described in JESD51-8.

## 6.5 Electrical Characteristics

V<sub>(Vin)</sub> = 14 V, 1 mΩ < ESR < 2 Ω, T<sub>J</sub> = –40°C to 160°C (unless otherwise noted)

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
<b>SUPPLY VOLTAGE AND CURRENT (V<sub>in</sub>)</b>					
V <sub>(Vin)</sub>	Input voltage	I <sub>O</sub> = 1 mA	5.5	40	V
I <sub>(q)</sub>	Quiescent current	V <sub>(Vin)</sub> = 5.5 V to 40 V, EN = ON, I <sub>O</sub> = 0.2 mA	12	22	μA
I <sub>(Sleep)</sub>	Input sleep current	No load current and EN = OFF		4	μA
I <sub>(EN)</sub>	EN pin current	V <sub>(EN)</sub> = 40 V		1	μA
V <sub>(VinUVLO)</sub>	Undervoltage detection	Ramp V <sub>(Vin)</sub> down until output turns OFF		2.6	V
V <sub>(UVLOhys)</sub>	Undervoltage hysteresis		1		V
<b>ENABLE INPUT (EN)</b>					
V <sub>IL</sub>	Logic input low level		0	0.4	V
V <sub>IH</sub>	Logic input high level		1.7		V

## Electrical Characteristics (continued)

$V_{(Vin)} = 14\text{ V}$ ,  $1\text{ m}\Omega < \text{ESR} < 2\ \Omega$ ,  $T_J = -40^\circ\text{C}$  to  $160^\circ\text{C}$  (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
<b>REGULATED OUTPUT (Vout)</b>

(1) Design information – Not tested

## 6.6 Switching Characteristics

over operating free-air temperature range (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
<b>TIMING FOR RESET (PG)</b>						
$t_{(\text{POR})}$	Power-on-reset delay	Where C = delay capacitor value; capacitance C = $100\text{ nF}$ <sup>(1)</sup>	50	100	180	ms
$t_{(\text{POR-fixed})}$		No capacitor on pin	100	290	650	$\mu\text{s}$
$t_{(\text{Deglitch})}$	Reset deglitch time		20	250		$\mu\text{s}$

(1) This information only is not tested in production and equation basis is  $(C \times 1) / 1 \times 10^{-6} = t_d$  (delay time).  
Where C = Delay capacitor value. Capacitance C range =  $100\text{ pF}$  to  $100\text{ nF}$ .

## 6.7 Qualification Summary

The TPS7A6650H-Q1 device has passed all the Grade 0 level qualification items required in AEC-Q100 with one exception: High temperature storage lifetime (HTSL). For the HTSL item, the Grade 0 level requirement is passing  $175^\circ\text{C}$  for 1000 hours of stress. For this device, it passed at  $160^\circ\text{C}$  for 1000 hours stress.

## Typical Characteristics (continued)

All oscilloscope waveforms were taken at room temperature.

## 7 Detailed Description

### 7.1 Overview

This product is a combination of a low-dropout linear regulator with reset function. The power-on reset initializes once the  $V_{out}$  output exceeds 91.6% of the target value. The power-on-reset delay is a function of the value set by an external capacitor on the CT pin before releasing the PG pin high.

### 7.2 Functional Block Diagram

Figure 13. TPS7A6650H-Q1 Functional Block Diagram

### 7.3 Feature Description

#### 7.3.1 Enable (EN)

This is a high-voltage-tolerant pin; high input activates the device and turns the regulator ON. One can connect this input to the  $V_{in}$  pin for self-bias applications.

#### 7.3.2 Regulated Output ( $V_{out}$ )

This is the regulated output based on the required voltage. The output has current limitation. During initial power up, the regulator has a soft start incorporated to control initial current through the pass element and the output capacitor.

## Feature Description (continued)

In the event the regulator drops out of regulation, the output tracks the input minus a drop based on the load current. When the input voltage drops below the UVLO threshold, the regulator shuts down until the input voltage recovers above the minimum start-up level.

### 7.3.3 Power-On Reset (PG)

This is an output with an external pullup resistor to the regulated supply. The output remains low until the regulated  $V_{out}$  has exceeded approximately 90% of the set value and the power-on-reset delay has expired. The on-chip oscillator presets the delay. The regulated output falling below the 90% level asserts this output low after a short de-glitch time of approximately 250  $\mu$ s (typical).

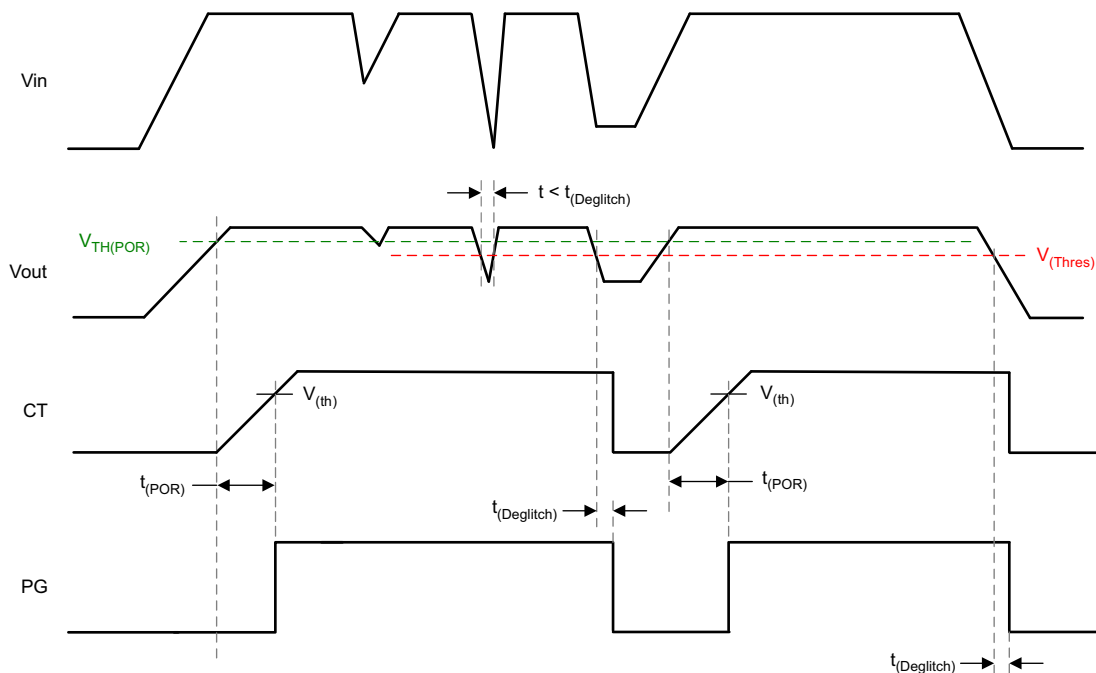

### 7.3.4 Reset Delay Timer (CT)

An external capacitor on this pin sets the timer delay before the reset pin is asserted high. The constant output current charges an external capacitor until the voltage exceeds a threshold to trip an internal comparator. If this pin is open, the default delay time is 290  $\mu$ s (typ). After releasing the PG pin high, the capacitor on this pin discharges, thus allowing the capacitor to charge from approximately 0.2 V for the next power-on-reset delay-timer function.

An external capacitor, CT, defines the reset-pulse delay time,  $t_{(POR)}$ , with the charge time of:

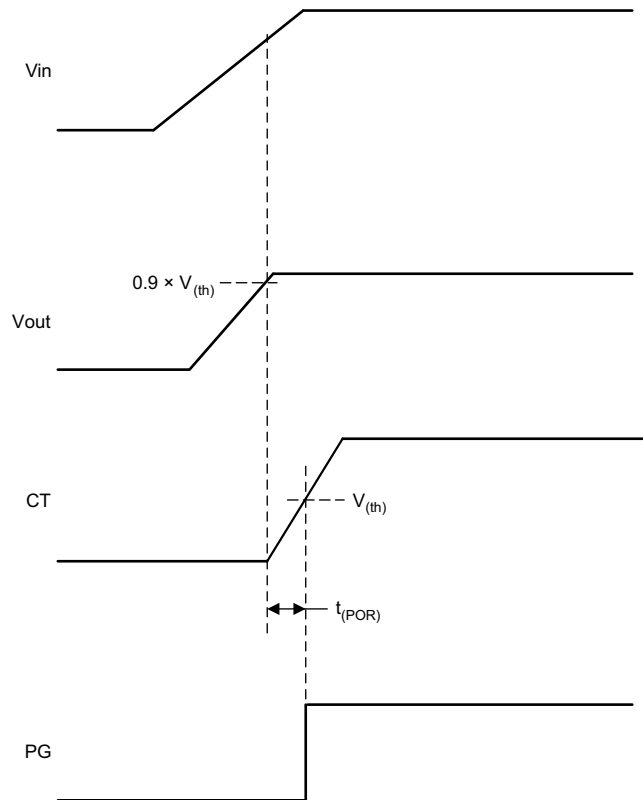

$$t_{(POR)} = \frac{C_{(CT)} \times 1V}{1\mu A} \quad (1)$$

The power-on reset initializes once the output  $V_{(Vout)}$  exceeds 91.6% of the programmed value. The power-on-reset delay is a function of the value set by an external capacitor on the CT pin before the releasing of the PG pin high.

**Figure 14. Conditions for Activation of Reset**

## Feature Description (continued)

**Figure 15. External Programmable Reset Delay**

### 7.3.5 Undervoltage Shutdown

There is an internally fixed undervoltage shutdown threshold. Undervoltage shutdown activates when the input voltage on  $V_{in}$  drops below  $V_{(inUVLO)}$ . This ensures the regulator is not latched into an unknown state during low input supply voltage. If the input voltage has a negative transient which drops below the UVLO threshold and recovers, the regulator shuts down and powers up with a normal power-up sequence once the input voltage is above the required levels.

### 7.3.6 Low-Voltage Tracking

At low input voltages, the regulator drops out of regulation and the output voltage tracks input minus a voltage based on the load current ( $I_O$ ) and switch resistance ( $R_{(SW)}$ ). This allows for a smaller input capacitor and can possibly eliminate the need of using a boost convertor during cold-crank conditions.

### 7.3.7 Thermal Shutdown

These devices incorporate a thermal shutdown (TSD) circuit as a protection from overheating. For continuous normal operation, the junction temperature should not exceed the TSD trip point. If the junction temperature exceeds the TSD trip point, the output turns off. When the junction temperature falls below the TSD trip point, the output turns on again.

Thermal protection disables the output when the junction temperature rises to approximately 175°C, allowing the device to cool. Cooling of the junction temperature to approximately 155°C enables the output circuitry. Depending on power dissipation, thermal resistance, and ambient temperature, the thermal protection circuit may cycle on and off. This cycling limits the dissipation of the regulator, protecting it from damage as a result of overheating.

## Feature Description (continued)

The purpose of the design of the internal protection circuitry of the TPS7A6650H-Q1 is for protection against overload conditions, not as a replacement for proper heat-sinking. Continuously running the TPS7A6650H-Q1 device into thermal shutdown degrades device reliability.

### 7.4 Device Functional Modes

#### 7.4.1 Operation With $V_{(VIN)} < 4\text{ V}$

The devices operate with input voltages above 4 V. The maximum UVLO voltage is 2.6 V, and the devices operate at an input voltage above 4 V. The devices can also operate at lower input voltages; no minimum UVLO voltage is specified. At input voltages below the actual UVLO voltage, the devices do not operate.

#### 7.4.2 Operation With EN Control

The enable rising edge threshold voltage is 1.7 V (maximum). With the EN pin held above that voltage and the input voltage above 4 V, the device becomes active. The enable falling edge is 0.4 V (minimum). Holding the EN pin below that voltage disables the device, thus reducing the IC quiescent current.

## 8 Application and Implementation

### NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### 8.1 Application Information

The TPS7A6650H-Q1 device is a 150-mA low-dropout linear regulator designed for up to 40-V  $V_{in}$  operation with only 12- $\mu$ A quiescent current at no load.

### 8.2 Typical Application

Figure 16 shows a typical application circuits for the TPS7A6650H-Q1. One may use different values of external components, depending on the end application. An application may require a larger output capacitor during fast load steps in order to prevent reset from occurring. TI recommends a low-ESR ceramic capacitor with dielectric of type X7R or X8R.

#### 8.2.1 TPS7A6650H-Q1 Typical Application

Figure 16. Typical Application Schematic for TPS7A6650H-Q1

#### 8.2.1.1 Design Requirements

For this design example, use the parameters listed in Table 1 as the design parameters.

Table 1. Design Parameters

DESIGN PARAMETER	EXAMPLE VALUE
Input voltage range	4 V to 40 V
Output voltage	5 V
Output current rating	50 mA
Output capacitor range	2.2 $\mu$ F to 100 $\mu$ F
Output capacitor ESR range	1 m $\Omega$ to 2 $\Omega$
CT capacitor range	100 pF to 100 nF

### 8.2.1.2 Detailed Design Procedure

To begin the design process, determine the following:

- Input voltage range
- Output voltage
- Output current rating
- Input capacitor
- Output capacitor
- Power-up-reset delay time

#### 8.2.1.2.1 Input Capacitor

The device requires an input decoupling capacitor, the value of which depends on the application. The typical recommended value for the decoupling capacitor is 10  $\mu\text{F}$ . The voltage rating must be greater than the maximum input voltage.

#### 8.2.1.2.2 Output Capacitor

The device requires an output capacitor to stabilize the output voltage. The capacitor value should be between 2.2  $\mu\text{F}$  and 100  $\mu\text{F}$ . The ESR range should be between 1 m $\Omega$  and 2  $\Omega$ . TI recommends to selecting a ceramic capacitor with low ESR to improve the load transient response.

### 8.2.1.3 Application Performance Plot

Figure 17. Power Up (5 V), 20 ms/div,  $I_L = 20 \text{ mA}$

## 9 Power Supply Recommendations

Design of the device is for operation from an input voltage supply with a range between 4 V and 28 V. This input supply must be well regulated. If the input supply is located more than a few inches from the TPS7A6650H-Q1 device, TI recommends adding an electrolytic capacitor with a value of 22  $\mu\text{F}$  and a ceramic bypass capacitor at the input.

## 10 Layout

### 10.1 Layout Guidelines

#### 10.1.1 Package Mounting

Solder pad footprint recommendations for the TPS7A6650H-Q1 are available at the end of this product data sheet and at [www.ti.com](http://www.ti.com).

#### 10.1.2 Board Layout Recommendations to Improve PSRR and Noise Performance

For the layout of TPS7A6650H-Q1, place the input and output capacitors close to the devices as shown in [Figure 18](#). In order to enhance the thermal performance, TI recommends surrounding the device with some vias.

To improve ac performance such as PSRR, output noise, and transient response, TI recommends a board design with separate ground planes for  $V_{in}$  and  $V_{out}$ , with each ground plane connected only at the GND pin of the device. In addition, the ground connection for the output capacitor should connect directly to the GND pin of the device.

Minimize equivalent series inductance (ESL) and ESR in order to maximize performance and ensure stability. Place every capacitor as close as possible to the device and on the same side of the PCB as the regulator itself.

Do not place any of the capacitors on the opposite side of the PCB from where the regulator is installed. TI strongly discourages the use of vias and long traces because they may impact system performance negatively and even cause instability.

If possible, and to ensure the maximum performance specified in this product data sheet, use the same layout pattern used for the TPS7A6650H-Q1 evaluation board, available at [www.ti.com](http://www.ti.com).

### 10.2 Layout Example

Figure 18. TPS7A6650H-Q1 Board Layout Diagram

### 10.3 Power Dissipation and Thermal Considerations

Calculate power dissipated in the device using [Equation 2](#).

$$P_D = I_O \times (V_{(Vin)} - V_{(Vout)}) + I_{(q)} \times V_{(Vin)} \quad (2)$$

where:

- $P_D$  = continuous power dissipation
- $I_O$  = output current
- $V_{(Vin)}$  = input voltage
- $V_{(Vout)}$  = output voltage

As  $I_{(q)} \ll I_O$ , therefore ignore the term  $I_{(q)} \times V_{(Vin)}$  in [Equation 2](#).

For a device under operation at a given ambient air temperature ( $T_A$ ), calculate the junction temperature ( $T_J$ ) using [Equation 3](#).

## Power Dissipation and Thermal Considerations (continued)

$$T_J = T_A + (R_{\theta JA} \times P_D) \quad (3)$$

where:

$R_{\theta JA}$  = junction-to-ambient air thermal impedance

$$\Delta T = T_J - T_A = (R_{\theta JA} \times P_D) \quad (4)$$

## 11 Device and Documentation Support

E2E is a trademark of Texas Instruments.  
All other trademarks are the property of their respective owners.

### 11.2 Electrostatic Discharge Caution

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

### 11.3 Glossary

**SLYZ022** — *TI Glossary*.

This glossary lists and explains terms, acronyms, and definitions.

## 12 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most-current data available for the designated devices. This data is subject to change without notice and without revision of this document. For browser-based versions of this data sheet, see the left-hand navigation pane.

**PACKAGING INFORMATION**

Orderable part number	Status (1)	Material type (2)	Package   Pins	Package qty   Carrier	RoHS (3)	Lead finish/ Ball material (4)	MSL rating/ Peak reflow (5)	Op temp (°C)	Part marking (6)
<a href="#">TPS7A6650HQDGNRQ1</a>	Active	Production	HVSSOP (DGN)   8	2500   LARGE T&R	Yes	NIPDAUAG	Level-2-260C-1 YEAR	-40 to 150	13LV

<sup>(1)</sup> **Status:** For more details on status, see our [product life cycle](#).

<sup>(2)</sup> **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

<sup>(3)</sup> **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

<sup>(4)</sup> **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

<sup>(5)</sup> **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

<sup>(6)</sup> **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

## TAPE AND REEL INFORMATION

### QUADRANT ASSIGNMENTS FOR PIN 1 ORIENTATION IN TAPE

## GENERIC PACKAGE VIEW

**DGN 8**

**PowerPAD™ HVSSOP - 1.1 mm max height**

3 x 3, 0.65 mm pitch

SMALL OUTLINE PACKAGE

This image is a representation of the package family, actual package may vary.  
Refer to the product data sheet for package details.

4225482/B

4225480/C 11/2024

PowerPAD is a trademark of Texas Instruments.

NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.15 mm per side.
4. This dimension does not include interlead flash. Interlead flash shall not exceed 0.25 mm per side.
5. Reference JEDEC registration MO-187.

# EXAMPLE BOARD LAYOUT

DGN0008G

PowerPAD™ HVSSOP - 1.1 mm max height

SMALL OUTLINE PACKAGE

LAND PATTERN EXAMPLE  
EXPOSED METAL SHOWN  
SCALE: 15X

4225480/C 11/2024

NOTES: (continued)

6. Publication IPC-7351 may have alternate designs.
7. Solder mask tolerances between and around signal pads can vary based on board fabrication site.
8. Vias are optional depending on application, refer to device data sheet. If any vias are implemented, refer to their locations shown on this view. It is recommended that vias under paste be filled, plugged or tented.
9. Size of metal pad may vary due to creepage requirement.

# EXAMPLE STENCIL DESIGN

DGN0008G

PowerPAD™ HVSSOP - 1.1 mm max height

SMALL OUTLINE PACKAGE

**SOLDER PASTE EXAMPLE**  
EXPOSED PAD 9:  
100% PRINTED SOLDER COVERAGE BY AREA  
SCALE: 15X

STENCIL THICKNESS	SOLDER STENCIL OPENING
0.1	1.76 X 2.11
0.125	1.57 X 1.89 (SHOWN)
0.15	1.43 X 1.73
0.175	1.33 X 1.60

4225480/C 11/2024

NOTES: (continued)

10. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
11. Board assembly site may have different recommendations for stencil design.
