**FEATURES**

- Integrated All Power Components Including the Power Inductor
- Wide Input Voltage Range: 4.5V - 60V
- Constant Switching Frequency at 800kHz
- High Contrast Ratio (Minimum Dimming Current Pulse width < 16µs)
- Drives up to 16 LEDs in series at 60V input
- ±3.5% Typical LED Current Accuracy
- LED Current Adjustable from 300mA to 450mA
- Up to 95% Efficiency
- TPS92551 Modules can be Connected in Parallel for Higher Current Operation
- Input Under-Voltage Lock-Out (UVLO)
- Compatible with Ceramic and Low ESR Capacitors
- Low Electro Magnetic Interference (EMI) Complies with EN55015 Standard (1)
- LED Open and Short Circuit Protections
- Thermal Shutdown and RoHS Compliant
- -40°C to +125°C Junction Temperature Range

**APPLICATIONS**

- General Lighting, Desk Lamps
  - Cabinet Lamps
  - Decorative Lamps
  - Street Lamps
- Architecture Lighting, Recess Lights
  - Spot Lights
  - Underwater Lights

**PACKAGE HIGHLIGHTS**

- 7-Lead Easy-to-Use Package (Similar to TO-263)
- Single Exposed Die Attach Pad for Enhanced Thermal Performance
- 10.2 x 13.8 x 4.6 mm Package

---

**DESCRIPTION**

The TPS92551 Constant Current Buck LED Driver Micro-Module drives maximum 450mA LED current up to 16 LEDs in a single string (maximum 23W). It integrates all the power components including the power inductor. The TPS92551 provides a full turnkey, highly efficient solution for wide range of single string LED lighting applications with up to 95% power efficiency. It accepts an input voltage ranging from 4.5V to 60V and delivers a 350mA LED current as default. The LED current is adjustable from 300mA to 450mA by charging a single external resistor.

The module operates at constant switching frequency (800kHz) with low Electro Magnetic Interference (EMI) complying with EN55015 standard. The module has fast control loop to realize fine LED current pulse yielding 256-step PWM dimming resolution at 240Hz for general lighting. Protection features include thermal shutdown, input under-voltage lockout, LED open-circuit and short-circuit protections. The TPS92551 Micro-Module is available in 7-pin PFM power package.

ELECTRICAL CHARACTERISTICS

Limits in standard type are for $T_J = 25^\circ C$ unless otherwise stated; limits in **boldface** type apply over the operating junction temperature range $T_J$ of -40°C to 125°C. Minimum and maximum limits are specified through test, design, or statistical correlation. Typical values represent the most likely parametric norm at $T_J = 25^\circ C$, and are provided for reference purposes only. Unless otherwise stated the following conditions apply: $V_{IN} = 48V$, $I_{LED} = 350mA$. $V_{IN}$ is the voltage applied across LED+ and GND. $I_{IN}$ is the input current flowing into the LED+ node. $I_{LEDD}$ is a LED current flowing into the LED- pin. $V_{LED}$ is the voltage applied across LED+ and LED-. $V_{DIM}$ is the voltage applied across the DIM pin to ground. Resistor $R_{ADJ}$ connect from IADJ pin to ground. Resistor $R_{VREF}$ connect from VREF pin to ground.

TYPICAL PERFORMANCE CHARACTERISTICS (continued)

Unless otherwise specified, the following conditions apply: $V_{IN} = 48V$, $C_{IN}$ is a 2.2µF 100V X7R ceramic capacitor for driving 5–13 power LEDs with $I_{LED} = 350mA$. Single LED forward voltage used is 3.2V. $T_A = 25^\circ C$ for efficiency curves and waveforms.

![LED vs $R_{IADJ}$](Figure 30. $I_{LED} vs R_{IADJ}$ $R_{VREF} = \text{open}$)

![LED vs $R_{VREF}$](Figure 31. $I_{LED} vs R_{VREF}$ $R_{IADJ} = 0\Omega$)
The TPS92551 is a high power floating buck LED driver with wide input voltage range. It requires no external current sensing elements and loop compensation network. The integrated power switch enables high output power up to 23W with 450mA LED current.

High speed dimming control input allows precision and high resolution brightness control for applications which require fine brightness adjustment.
APPLICATION INFORMATION

SETTING THE LED CURRENT

The TPS92551 requires no external current sensing resistor for LED current regulation. The average LED current of the TPS92551 is adjustable from 300mA to 450mA by varying the resistance of the resistor according to the following equation and table.

For $R_{\text{VREF}} = \text{open}$ and $R_{\text{IADJ}} \leq 499\Omega$

$$I_{\text{LED}} = \frac{1050}{3k + R_{\text{IADJ}}}$$

(1)

For $R_{\text{IADJ}} = 0$ and $R_{\text{VREF}} \geq 10.5k\Omega$

$$I_{\text{LED}} = \frac{1050}{3k / R_{\text{VREF}}}$$

(2)

Table 1. Example for $I_{\text{LED}}$ Setting

Figure 32. TPS92551 Application Schematic for $I_{\text{LED}}$ Setting

Minimum Switch On-Time

The on-time of the internal switch should be no shorter than 400ns. The number of LED (typical forward voltage at 3.2V) to input voltage is constrained by that as shown in the following table.

</tr>
</tbody>
</table>
Peak Switch Current Limit

The TPS92551 features an integrated switch current limiting mechanism to prevent the LEDs from being overdriven. The switch current limiter is triggered when the switch current is three times exceeding the current level set by resistor. Once the current limiter is triggered, the internal power switch turn OFF for 3.6µs to discharge the inductor until inductor current reduces back to normal level. The current limiting feature is exceptionally important to avoid permanent damage of the TPS92551 application circuit due to short circuit of LED string.

PWM Dimming Control

The DIM pin of the TPS92551 is an input with internal pull-up that accepts logic signals for average LED current control. Applying a logic high (above 1.3V) signal to the DIM pin or leaving the DIM pin open will enable the device. Applying a logic low signal (below 0.7V) to the DIM pin will disable the switching activity of the device but maintain operation of the VCC regulator active. The TPS92551 operation of high speed dimming and very fine dimming control as shown in Figure 33.

To ensure normal operation of the TPS92551, it is recommended to set the dimming frequency not higher than 1/10 of the switching frequency. The dim pulse on time is tested down to 16µs. In applications that require high dimming contrast ratio, low dimming frequency should be used.

Parallel Operation

When a load current higher than 450mA is required by the application, TPS92551 can be used in parallel to deliver higher current. With common VINs and GNDs, the TPS92551 will operate as independent asynchronous current sinks driving the same LED load. The total DC current of the modules will be additive; however, low frequency sub-harmonic current ripple may be present and its frequency and magnitude will depend upon the phase relationship between the internal clocks as there is no provision for synchronizing driver clocks. It is suggested to have minimum 2.2µF C<sub>OUT</sub> located close the module to filter out the current ripple , and the resultant LED current will become DC. Current sharing modules should have a local C<sub>IN</sub> capacitor of minimum 2.2µF located as close to V<sub>IN</sub> and GND as possible. Refer to Figure 33 for the TPS92551 parallel operation circuit schematic. Refer to Figure 35 for the TPS92551 parallel operation results I<sub>LED</sub> vs V<sub>IN</sub>.
PC Board Layout Considerations

The overall performance of the LED driver is highly depends on the PCB layout. Poor board layout can disrupt the performance of the TPS92551 and surrounding circuitry by contributing to EMI, ground bounce and resistive voltage drop in the traces. These can send erroneous signals to the LED driver resulting in poor regulation and stability. Good layout can be implemented by following a few simple design rules.

1. Place $C_{IN}$ as close as possible to the $V_{IN}$ pin and GND exposed pad (EP).
2. Place $C_{OUT}$ (optional for reduction of LED current ripple and EMI compliance) as close as possible to the $V_{LED+}$ pin and $V_{LED-}$ pin.
3. The exposed pad (EP) must connect to the GND pin directly.

EMI Design Considerations

From an EMI reduction standpoint, it is imperative to minimize the $di/dt$ current paths (refer to Figure 36). Therefore, it is essential to connect an 2.2µF capacitor ($C_{OUT}$) across the LED+ pin and LED- pin. This will minimize the ripple current so that it can reduce radiated EMI (refer to Figure 37 and Figure 38).
Figure 36. Current Loops

(1) The marketing status values are defined as follows:
- **ACTIVE:** Product device recommended for new designs.
- **LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
- **NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
- **PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.
- **OBSOLETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) **MSL, Peak Temp.** - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) **Lead finish/Ball material** - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.
