TPS92633-Q1 Three-Channel Automotive High-Side LED Driver with Thermal Sharing and Off-Board Binning

1 Features

- AEC-Q100 qualified for automotive applications:
  - Temperature grade 1: –40°C to 125°C, $T_A$
- Wide input voltage range: 4.5 V to 40 V
- Thermal sharing by external shunt resistor
- Low supply current in fault mode
- Three high-precision current regulation:
  - Up to 150-mA current output for each channel
  - ±5% accuracy over full temperature range
  - Independent current setting by resistor
  - Independent PWM pin for brightness control
  - Support off-board brightness binning resistor
  - Support external NTC for current derating
- Low dropout voltage:
  - Maximum dropout: 600 mV at 150 mA
- Diagnostics and protection
  - LED open-circuit with auto-recovery
  - LED short-to-GND with auto-recovery
  - Single LED short-circuit detection with auto-recovery
  - Diagnostic enable with adjustable threshold
  - Fault bus configurable as either one-fails–all-fail or only-failed-channel off (N-1)
  - Thermal shutdown
- Operation junction temperature range: –40°C to 150°C

2 Applications

- **Automotive exterior rear light**: rear lamp, center high mounted stop lamp, side marker
- **Automotive exterior small light**: door handle, blind spot detection indicator, charging inlet
- **Automotive interior light**: overhead console, reading lamp
- **General-purpose LED driver applications**

3 Description

The TPS92633-Q1 three-channel LED driver includes an unique thermal management design to reduce temperature rising on the device. The TPS92633-Q1 is a linear driver directly powered by automotive batteries with large voltage variations to output full current loads up to 150 mA per channel. External shunt resistors are leveraged to share output current and dissipate power out of the driver. The TPS92633-Q1 also drives LED units and off-board brightness binning resistors to simplify the manufacturing process and lower whole system cost. Its full-diagnostic capabilities include LED open, LED short-to-GND circuit and single LED short circuit detection.

The one-fails-all-fail feature of TPS92633-Q1 is able to work together with other LED drivers, such as the TPS9261x-Q1, TPS92630/8-Q1, and TPS92830-Q1 devices, to address different requirements.

\(^{(1)}\) Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under Recommended Operating Conditions. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

6.2 ESD Ratings

7 Detailed Description

7.1 Overview

The TPS92633-Q1 three-channel LED driver includes an unique thermal management design to reduce temperature rising on the device. The TPS92633-Q1 is a linear driver directly powered by automotive batteries with large voltage variations to output full current loads up to 150 mA per channel. The current output at each channel can be independently set by external R(SNS) resistors. Current flows from the supply through the R(SNSx) resistor into the integrated current regulation circuit and to the LEDs through OUTx pin and RESx pin. All three-channel current is configurable by an external resistor connected to the ICTRL pin. Either a NTC resistor for LED temperature monitor or a LED brightness binning resistor can be connected to ICTRL pin in same board or off-board. The TPS92633-Q1 device supports both supply control and EN/PWM control to turn LED ON/OFF. The LED brightness is also adjustable by voltage dutycycle applied on either SUPPLY or EN/PWM with frequency above 100 Hz. The TPS92633 provides full diagnostics to keep the system operating reliably including LED open/short circuit detection, single LED short circuit detection, supply POR and thermal shutdown protection. The TPS92633-Q1 device is in a HTSSOP package with total 20 leads. The TPS92633-Q1 can be used with other TPS9261x-Q1, TPS92630-Q1 and TPS92830-Q1 family devices together to achieve one-fails-all-fail protection by tying all FAULT pins together as a fault bus.

7.2 Functional Block Diagram

7.3 Feature Description

7.3.1 Power Supply (SUPPLY)

7.3.1.1 Power-On Reset

The TPS92633-Q1 device has an internal power-on-reset (POR) function. When power is applied to the SUPPLY pin, the internal POR circuit holds the device in reset state until V(SUPPLY) is above V(POR_rising).

7.3.1.2 Supply Current in Fault Mode

The TPS92633-Q1 device consumes minimal quiescent current, I(Fault), into SUPPLY when the FAULT pin is externally pulled LOW. At the same time, the device shuts down all three output drivers, IREF and ICTRL.
If device detects a fault, it pulls down the FAULT pin by an internal constant current, $I_{\text{FAULT_pulldown}}$ as a fault indication to the fault bus.

### 7.3.2 Enable and Shutdown (EN)

The TPS92633-Q1 device has an enable input. When EN is low, the device is in sleep mode with ultra low quiescent current $I_{\text{SD}}$. This low current helps to save system-level current consumption in applications where battery voltage directly connects to the device without high-side switches.

### 7.3.3 Reference Current (IREF)

The TPS92633-Q1 device has IREF pin to generate a high accuracy and low temperature shift current reference. The calculated result for $I_{\text{IREF}}$ is 100 µA when $R_{\text{IREF}}$ is 12.3 kΩ. The $I_{\text{IREF}}$ can be programmed by external resistor, $R_{\text{IREF}}$ in the range from 25 µA to 250 µA. The voltage on the IREF pin is regulated to the 1.235 V typically, and the current output on IREF pin can be calculated by using Equation 1.

$$I_{\text{IREF}} = \frac{V_{\text{IREF}}}{R_{\text{IREF}}}$$

where

- $V_{\text{IREF}} = 1.235$ V (typical)
- $R_{\text{IREF}} = 12.3$ kΩ recommended

The $R_{\text{IREF}}$ resistor needs to be placed as close as possible to the IREF pin with a 1-nF ceramic capacitor in parallel to achieve the noise immunity. The off-board $R_{\text{IREF}}$ setup is not allowed due to the concern of reference current instability.

### 7.3.4 Constant-Current Output and Setting (INx)

The TPS92633-Q1 device is a high-side current driver for driving LEDs. The device controls each output current through regulating the voltage drop on an external high-side current-sense resistor, $R_{\text{SNSx}}$ between SUPPLY and INx independently for each channel. An integrated error amplifier drives an internal power transistor to maintain the voltage drop on the current-sense resistor $R_{\text{SNSx}}$ to $V_{\text{CS_REG}}$, therefore regulates the current output to target value. When the output current is in regulation, the current value for each channel can be calculated by using Equation 2.

$$I_{\text{OUTx_Tot}} = \frac{V_{\text{CS_REG}}}{R_{\text{SNSx}}}$$

where

- $V_{\text{CS_REG}}$ is variable according to Equation 3
- $x = 1, 2$ or $3$ for output channel 1, 2 or 3

When the supply voltage drops below total LED string forward voltage plus required headroom voltage, the sum of $V_{\text{DROPOUT}}$ and $V_{\text{CS_REG}}$, the TPS92633-Q1 is not able to deliver enough current output as set by the value of $R_{\text{SNSx}}$, and the voltage across the current-sense resistor $R_{\text{SNSx}}$ is less than $V_{\text{CS_REG}}$.

### 7.3.5 Analog Current Control (ICTRL)

The TPS92633-Q1 supports analog constant current control for all three output channels together through adjusting the $V_{\text{CS_REG}}$ voltage. As described in Constant-Current Output and Setting (INx), the TPS92633-Q1 regulates each channel output current by maintaining the voltage drop on each $R_{\text{SNSx}}$ same to $V_{\text{CS_REG}}$. The $V_{\text{CS_REG}}$ voltage is adjustable by an external resistor on ICTRL pin. The TPS92633-Q1 outputs a constant current, $I_{\text{ICTRL}}$, on the ICTRL pin and measures the voltage on the ICTRL pin, $V_{\text{ICTRL}}$, to determine the $V_{\text{CS_REG}}$. The $I_{\text{ICTRL}}$ current is 10 times of the $I_{\text{IREF}}$, and the $V_{\text{ICTRL}}$ is multiplied result of $I_{\text{ICTRL}}$ and $R_{\text{ICTRL}}$. The TPS92633-Q1 internally clamps the $V_{\text{ICTRL}}$ to maximum 2.75 V. The $V_{\text{CS_REG}}$ voltage can be calculated by using Equation 3.
\[ V_{(\text{CS\_REG})} = \frac{l_{(\text{IREF})} \times R_{(\text{ICTRL})} \times 25}{17} \]  

where

- \( l_{(\text{IREF})} \) is in A unit
- \( R_{(\text{ICTRL})} \) is in Ω unit
- \( V_{(\text{CS\_REG})} \) is in V unit

The minimum voltage of \( V_{(\text{CS\_REF})} \) is 50 mV typically to maintain the high accurate current output.

The final total output current for each channel can be calculated by using Equation 4 which is combination of Equation 1, Equation 2 and Equation 3.

\[ I_{(\text{OUT\_Tot})} = \frac{V_{(\text{IREF})} \times R_{(\text{ICTRL})} \times 25}{R_{(\text{IREF})} \times R_{(\text{SNSx})} \times 17} \]  

where

- \( V_{(\text{IREF})} = 1.235 \) V
- \( R_{(\text{IREF})} \) is in kΩ unit
- \( R_{(\text{ICTRL})} \) is in Ω unit
- \( R_{(\text{SNSx})} \) is in Ω unit
- \( I_{(\text{OUT\_Tot})} \) is in mA unit

The calculated result for \( I_{(\text{OUT\_Tot})} \) is 147.7 mA when \( R_{(\text{IREF})} \) is 12.3 kΩ, \( R_{(\text{ICTRL})} \) is 1000 Ω and \( R_{(\text{SNSx})} \) is 1Ω.

### 7.3.5.1 Off-Board Brightness Binning Resistor

With analog current control feature, a LED brightness binning resistor can be connected to ICTRL pin to set the output current according to LED brightness bin. The binning resistor can be placed in off-board with LED units. In order to achieve the best performance for the noise rejection, two resistors in serial can be adopted. One resistor is placed as close as possible to the ICTRL pin in the same PCB board with device, and another one real binning resistor is placed in the other PCB board with LED units together.

As Figure 7-1 illustrated, the \( R_{(\text{ICTRL1})} \) resistor and \( C_{(\text{ICTRL})} \) ceramic capacitor need to be placed as close as possible to the ICTRL pin for noise decoupling. The off-board \( R_{(\text{ICTRL2})} \) resistor can be placed in LED board as real binning resistor. TI recommends a 10-nF ceramic capacitor for \( C_{(\text{ICTRL})} \).
The $V_{CS,\text{REG}}$ is 50 mV typically when the ICTRL pin is short to GND.

### 7.3.2.5 NTC Resistor

The analog current control feature also allows to connect a NTC thermistor on ICTRL pin to achieve the LED current derating based on measured PCB board temperature or LED unit temperature. The resistance of NTC thermistor depends on the environment temperature. The resistance of NTC thermistor is decreasing with the temperature rising. It leads to the decreasing of the equivalent resistance of $R_{\text{ICTRL}}$ on ICTRL pin and the output current reduction from the calculation based on Equation 2 and Equation 3.

TI recommends to connect a resistor network including NTC thermistor (e.g. NCU18XH103F6SRB) to ICTRL pin as illustrated in below Figure 7-2. The resistor value of $R_1$ and $R_2$ work with NTC thermistor to adjust the equivalent resistance curve depending on the temperature to achieve the system required current derating.

---

**Figure 7-1. Application Schematic For Off-Board Brightness Binning Resistor**

**Figure 7-2. Application Schematic For External NTC Thermistor**
7.3.6 Thermal Sharing Resistor (OUTx and RESx)

The TPS92633-Q1 device provides two current output paths for each channel. Current flows from the supply through the R(SNSx) resistor into the integrated current regulation circuit and to the LEDs through OUTx pin and RESx pin. The current output on both OUTx pin and RESx pin is independently regulated to achieve total required current output. The summed current of OUTx and RESx is equal to the current through the R(SNSx) resistor in the channel. The OUTx connects to anode of LEDs load in serial directly, however RESx connects to the LEDs through an external resistor to share part of the power dissipation and reduce the thermal accumulation in TPS92633-Q1.

The integrated independent current regulation in TPS92633-Q1 dynamically adjusts the output current on both OUTx and RESx output to maintain the stable summed current for LED. The TPS92633-Q1 always regulates the current output to the RESx pin as much as possible until the RESx current path is saturated, and the rest of required current is regulated from the OUTx. As a result, the most of the current to LED outputs through the RESx pin when the voltage dropout is relatively high between SUPPLY and LED required total forward voltage. In the opposite case, the most of the current to LED outputs through the OUTx pin when the voltage headroom is relatively low between SUPPLY and LED required forward voltage. Figure 7-3 and Figure 7-4 shows the curve of current and power dissipation distributor depending on supply voltage when R(RESx) is 68.5 Ω.

7.3.7 PWM Control (PWMx)

The pulse width modulation (PWM) input of the TPS92633-Q1 functions as enable for the output current. When the voltage applied on the PWM pin is higher than V_{IH(PWM)}, the relevant output current is enabled. When the voltage applied on PWM pin is lower than V_{IL(PWM)}, the output current is disabled as well as the diagnostic features. Besides output current enable and disable function, the PWM input of TPS92633-Q1 also supports adjustment of the average current output for brightness control when the frequency of applied PWM signal is higher than 100 Hz, which is out of visible frequency range of human eyes. TI recommends a 200-Hz PWM signal with 1% to 100% duty cycle input for brightness control. Please refer to Figure 7-5 for typical timing information and Figure 8-4 for typical PWM dimming application.
The detailed information and value of each time period in Figure 7-5 is described in Timing Requirements.

The TPS92633-Q1 device has three total PWM input pins, PWM1, PWM2 and PWM3, to control each of current output channel independently. PWM1 input controls the output channel1 for both OUT1 and RES1, PWM2 input controls the output channel2 for both OUT2 and RES2, and PWM3 input controls the output channel3 for both OUT3 and RES3.

7.3.8 Supply Control

The TPS92633-Q1 can support supply control to turn ON and OFF output current. When the voltage applied on the SUPPLY pin is higher than the LED string forward voltage plus needed headroom voltage at required current, and the PWM pin voltage is high, the output current is turned ON and well regulated. However, when the voltage applied on the SUPPLY pin is lower than \(V_{(POR\_falling)}\), the output current is turned OFF. With this feature, the power supply voltage in designed pattern can control the output current ON/OFF. The brightness is adjustable if the ON/OFF frequency is fast enough. Because of the high accuracy design of PWM threshold in TPS92633-Q1, it enables a resistor divider on the PWM pin to set the SUPPLY threshold higher than LED forward voltage plus required headroom voltage as shown in Figure 7-6. The headroom voltage is basically the summation of \(V_{(DROPOUT)}\) and \(V_{(CS\_REG)}\). When the voltage on the PWM pin is higher than \(V_{(IH\_PWM)}\), the output current is turned ON. However, when the voltage on the PWM is lower than \(V_{(IL\_PWM)}\), the output current is turned OFF. The SUPPLY threshold voltage can be calculated by using Equation 5.
Figure 7-6. Application Schematic For Supply Control LED Brightness

\[
V_{(SUPPLY\_PWM\_th\_rising)} = V_{IH(PWM)} \times \left(1 + \frac{R_{(UPPER)}}{R_{(LOWER)}}\right)
\]

where
- \(V_{IH(PWM)} = 1.26\) V (maximum)

7.3.9 Diagnostics

The device is able to detect and protect fault from LED-string short-to-GND, LED-string open-circuit, single LED short-circuit and junction over-temperature scenarios. It also supports one-fails–all-fail fault bus design that can flexibly fit different regulatory requirements.

7.3.9.1 IREF Short-to-GND Detection

The TPS92633-Q1 device has IREF short-to-GND detection through monitoring the voltage on the IREF pin. The IREF pin short-to-GND fault is reported by constantly pulling down the FAULT pin, if the IREF pin voltage, \(V_{(IREF)}\) is lower than \(V_{(IREF\_SHORT\_th)}\) for longer than the deglitch time of \(t_{(IREF\_deg)}\). The current for all output channels and ICTRL pin are turned off and the current out of IREF pin is clamped to \(I_{(IREF\_ST\_Clamp)}\) when IREF pin short-to-GND fault is detected.

The TPS92633-Q1 recovers to normal operating if the \(V_{(IREF)}\) voltage rises up over \(V_{(IREF\_SHORT\_th)}\).

7.3.9.2 IREF Open Detection

The TPS92633-Q1 device has IREF open detection through monitoring the current through the IREF pin. The IREF pin open fault is reported by constantly pulling down the FAULT pin, when the current through IREF pin, \(I_{(IREF)}\) is lower than \(I_{(IREF\_OPEN\_th)}\) for longer than the deglitch time of \(t_{(IREF\_deg)}\). The current for all output channels and ICTRL pin are turned off when IREF pin open fault is detected.

The TPS92633-Q1 recovers to normal operating if the \(I_{(IREF)}\) current rises up over \(I_{(IREF\_OPEN\_th)}\).

7.3.9.3 LED Short-to-GND Detection

The TPS92633-Q1 device has LED short-to-GND detection. The LED short-to-GND detection monitors the output voltage when the output current is enabled. Once a short-to-GND LED failure is detected, the device turns off the faulty channel and retries automatically, regardless of the state of the PWM input. When the retry mechanism detects the removal of the LED short-to-GND fault, the device resumes to normal operation.
The TPS92633-Q1 monitors the \( V_{\text{OUTx}} \) voltage and \( V_{\text{RESx}} \) voltage of each channel and compares it with the internal reference voltage to detect a short-to-GND failure. When \( V_{\text{OUTx}} \) or \( V_{\text{RESx}} \) voltage falls below \( V_{\text{SG\_th\_falling}} \) longer than the deglitch time of \( t_{\text{SG\_deg}} \), the device asserts the short-to-GND fault and pulls low the FAULT pin. During the deglitch time period, if \( V_{\text{OUTx}} \) and \( V_{\text{RESx}} \) rises above \( V_{\text{SG\_th\_rising}} \), the timer is reset.

Once the TPS92633-Q1 has asserted a short-to-GND fault, the device turns off the faulty output channel and retries automatically with a small current. During retrying the device sources a small current \( I_{\text{Retry}} \) from SUPPLY to OUT to pull up the LED loads continuously. Once auto-retry detects output voltage rising above \( V_{\text{SG\_th\_rising}} \), it clears the short-to-GND fault and resumes to normal operation. Figure 7-7 illustrates the timing for LED short-circuit detection, protection, retry and recovery.

**Figure 7-7. LED Short-to-GND Detection and Recovery Timing Diagram**

The detailed information and value of each time period in Figure 7-7 is described in Timing Requirements.

### 7.3.9.4 LED Open-Circuit Detection

The TPS92633-Q1 device has LED open-circuit detection. The LED open-circuit detection monitors the output voltage when the current output is enabled. The LED open-circuit detection is only enabled when DIAGEN is HIGH. A short-to-battery fault is also detected and recognized as an LED open-circuit fault.

The TPS92633-Q1 monitors dropout-voltage differences between the IN and OUT pins for each LED channel when PWM is HIGH. The voltage difference \( V_{\text{INx}} - V_{\text{OUTx}} \) is compared with the internal reference voltage \( V_{\text{OPEN\_th\_rising}} \) to detect LED open-circuit incident. When \( V_{\text{OUTx}} \) rises causing \( V_{\text{INx}} - V_{\text{OUTx}} \) less than the \( V_{\text{OPEN\_th\_rising}} \) voltage and lasts longer the deglitch time of \( t_{\text{OPEN\_deg}} \), the device asserts an open-circuit fault. Once a LED open-circuit failure is detected, the internal constant-current sink pulls down the FAULT pin voltage. During the deglitch time period, when \( V_{\text{OUTx}} \) falls and makes \( V_{\text{INx}} - V_{\text{OUTx}} \) larger than \( V_{\text{OPEN\_th\_falling}} \), the deglitch timer is reset.

The TPS92633-Q1 shuts down the output current regulation for the faulty channel after LED open-circuit fault is detected. The device sources a small current \( I_{\text{Retry}} \) from SUPPLY to OUT when DIAGEN input is logic High. Once the fault condition is removed, the device resumes normal operation and releases the FAULT pin. Figure 7-8 illustrates the timing for LED open-circuit detection, protection, retry and recovery.
The detailed information and value of each time period in Figure 7-8 is described in Timing Requirements.

7.3.9.5 Single LED Short-Circuit Detection (SLS_REF)

The TPS92633-Q1 device has single LED short-circuit detection. The single LED short-circuit detection monitors the output voltage when the output current is enabled. Once a single LED short-circuit failure is detected, the device turns off the faulty channel and retries automatically, regardless of the state of the PWM input. If the retry mechanism detects the removal of the single LED short-circuit fault, the device resumes to normal operation.

The TPS92633-Q1 monitors the $V_{(OUTx)}$ voltage of each channel and internally compares the scale down voltage of $V_{(OUTx)}$ with an external resistor programmable reference voltage on SLS_REF to detect a single LED short-circuit failure. When the voltage of $V_{(OUTx)}$ falls below $V_{(SLS_{th_falling})}$ longer than the deglitch time of $t_{(SLS_{deg})}$, the device asserts the single LED short-circuit fault and pulls low the FAULT pin. During the deglitch time period, if the scale down voltage of $V_{(OUTx)}$ rises above $V_{(SLS_{th_rising})}$, the timer is reset.

Once the TPS92633-Q1 has asserted a single LED short-circuit fault, the device turns off the faulty output channel and retries automatically. During retrying the device sources full current from IN to OUT to pull up the LED loads every 10 ms for 300-µs period when the PWM input is logic high for the faulty channel. Once auto-retry detects the voltage of $V_{(OUTx)}$ rising above $V_{(SLS_{th_rising})}$, it clears the single LED short-circuit fault and resumes to normal operation. The $V_{(SLS_{th_rising})}$ is 2.5% higher the $V_{(SLS_{th_falling})}$. The scale down ratio for $V_{(OUTx)}$ is $N_{(OUTx)}$. Figure 7-9 describes internal diagram for single LED short-circuit detection circuit. And the $V_{(SLS_{th_falling})}$ threshold voltage for single LED short-circuit is calculated by using Equation 6.
Figure 7-9. Single LED Short-Circuit Detection Block Diagram

\[ V_{(SLS\_th\_falling)} = \frac{N_{(OUT)} \times R_{(SLS\_REF)} \times V_{(REF)} \times N_{(SLS\_REF)}}{R_{(IREF)}} \]  

(6)

where

- \( V_{(IREF)} = 1.235 \text{ V (typical)} \)
- \( R_{(IREF)} = 12.3 \text{ kΩ recommended} \)
- \( R_{(SLS\_REF)} \) is in kΩ unit
- \( N_{(OUT)} = 4 \) (typical)
- \( N_{(SLS\_REF)} = 1 \) (typical)

The calculated result for \( V_{(SLS\_th\_falling)} \) is 5.34 V when \( R_{(IREF)} \) is 12.3 kΩ and \( R_{(SLS\_REF)} \) is 13.3 kΩ.

Figure 7-10 illustrates the timing for single-LED short-circuit detection, protection, retry and recovery.
The detail information and value of each time period in Figure 7-10 is described in Timing Requirements.

**7.3.9.6 LED Open-Circuit and Single LED Short-Circuit Detection Enable (DIAGEN)**

The TPS92633-Q1 device supports the DIAGEN pin with an accurate threshold to disable the LED open-circuit and single LED short-circuit diagnostic functions. The DIAGEN pin can be used to enable or disable LED open-circuit detection and single LED short-circuit detection based on SUPPLY pin voltage sensed by an external resistor divider as illustrated in Figure 7-11. When the voltage applied on DIAGEN pin is higher than the threshold $V_{\text{IH(DIAGEN)}}$, the device enables LED open-circuit and single LED short-circuit diagnosis. When $V_{\text{DIAGEN}}$ is lower than the threshold $V_{\text{IL(DIAGEN)}}$, the device disables LED open-circuit and single LED short-circuit detection.

Only LED open-circuit detection and single LED short-circuit detection can be disabled by pulling down the DIAGEN pin. The LED short-to-GND detection and over-temperature protection cannot be turned off by pulling down the DIAGEN pin. The SUPPLY threshold voltage can be calculated by using Equation 7.

**Figure 7-11. Application Schematic For DIAGEN**

\[
V_{\text{(SUPPLY\_DIAGEN\_th\_falling)}} = V_{\text{IL(DIAGEN)}} \times \left(1 + \frac{R_{\text{(UPPER)}}}{R_{\text{(LOWER)}}}\right)
\]

(7)

where

- $V_{\text{IL(DIAGEN)}} = 1.045$ V (minimum)

**7.3.9.7 Low Dropout Operation**

When the supply voltage drops below LED string total forward voltage plus headroom voltage at required current, the TPS92633-Q1 device operates in low-dropout conditions to deliver current output as close as possible to target value. The actual current output is less than preset value due to insufficient headroom voltage for power transistor. As a result, the voltage across the sense resistor fails to reach the regulation target. The headroom voltage is the summation of $V_{\text{DROPOUT}}$ and $V_{\text{CS\_REG}}$.

If the TPS92633-Q1 is designed to operate in low-dropout condition, the open-circuit diagnostics and single LED short-circuit detection must be disabled by pulling the DIAGEN pin voltage lower than $V_{\text{IL(DIAGEN)}}$. Otherwise, the TPS92633-Q1 detects an open-circuit fault or single LED short-circuit fault and reports a fault on the FAULT pin. The DIAGEN pin is used to avoid false diagnostics due to low supply voltage.
7.3.9.8 Over-Temperature Protection

The TPS92633-Q1 device monitors device junction temperature. When the junction temperature reaches thermal shutdown threshold $T_{(TSD)}$, the output shuts down. Once the junction temperature falls below $T_{(TSD)} - T_{(TSD,HYS)}$, the device recovers to normal operation. During over-temperature protection, the FAULT pin is pulled low.

7.3.10 FAULT Bus Output With One-Fails–All-Fail

During normal operation, the FAULT pin of TPS92633-Q1 is weakly pulled up by an internal pullup current source, $I_{(FAULT\_pullup)}$. If any fault scenario occurs, the FAULT pin is strongly pulled low by the internal pulldown current sink, $I_{(FAULT\_pulldown)}$ to report out the fault alarm.

Meanwhile, the TPS92633-Q1 also monitors the FAULT pin voltage internally. If the FAULT pin of the TPS92633-Q1 is pulled low by external current sink below $V_{IL(FAULT)}$, the current output is turned off even though there is no fault detected on owned outputs. The device does not resume to normal operation until the FAULT pin voltage rises above $V_{IH(FAULT)}$.

Based on this feature, the TPS92633-Q1 device is able to construct a FAULT bus by tying FAULT pins from multiple TPS92633-Q1 devices to achieve one-fails-all-fail function as Figure 7-12 showing. The lower side TPS92633-Q1 (B) detects any kind of LED fault and pulls low the FAULT pin. The low voltage on FAULT pin is detected by upper side TPS926133-Q1 (A) because the FAULT pins are connected of two devices. The upper side TPS92633-Q1 (A) turns off all output current for each channel as a result. If the FAULT pins of each TPS92633-Q1 are all connected to drive the base of an external PNP transistor as illustrated in Figure 7-13, the one-fails–all-fail function is disabled and only the faulty channel is turned off.

7.4 Device Functional Modes

7.4.1 Undervoltage Lockout, $V_{\text{SUPPLY}} < V_{\text{POR\_rising}}$

When the device is in undervoltage lockout status, the TPS92633-Q1 device disables all functions until the supply rises above the $V_{\text{POR\_rising}}$ threshold.

7.4.2 Normal Operation $V_{\text{SUPPLY}} \geq 4.5 \text{ V}$

The device drives an LED string in normal operation. With enough voltage drop across SUPPLY and OUT, the device is able to drive the output in constant-current mode.

7.4.3 Low-Voltage Dropout Operation

When the device drives an LED string in low-dropout operation, if the $V_{\text{DROPOUT}}$ is less than the open-circuit detection threshold, the device may report a false open-circuit fault or single LED short-circuit fault. TI recommends only enabling the open-circuit detection and single LED short-circuit detection when SUPPLY voltage is enough higher than LED string voltage to avoid a false open-circuit detection.

7.4.4 Fault Mode

When the device detects any fault, the device tries to pull down the FAULT pin with a constant current. If the FAULT bus is pulled down, the device switches to fault mode and consumes a fault current of $I_{\text{Fault}}$. 
8 Application and Implementation

Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI’s customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

8.1 Application Information

In automotive lighting applications, thermal performance and LED diagnostics are always design challenges for linear LED drivers.

The TPS92633-Q1 device is capable of detecting LED open-circuit, LED short-circuits and single-LED short-circuit. To increase current driving capability, the TPS92633-Q1 device supports using an external shunt resistor to help dissipate heat as following section Thermal Sharing Resistor describes. This method provides a low-cost solution of using external resistors to minimize thermal accumulation on the device itself due to large voltage difference between input voltage and LED string forward voltage, while still keeping high accuracy of the total current output.

8.2 Typical Applications

8.2.1 BCM Controlled Rear Lamp with One-Fails-All-Fail Setup

The multiple TPS92633-Q1 devices are capable to drive different functions for automotive rear lamp including stop, turn indicator, tail, fog, reverse and center-high-mounted-stop-lamp. The One-Fails-all-Fail single lamp mode can be easily achieved by FAULT bus by shorting the FAULT pins.

![Figure 8-1. Typical Application Schematic](image)

8.2.1.1 Design Requirements

Input voltage range is from 9 V to 16 V, and a total 9 LEDs, with 3 LEDs in each string required to achieve stop function. The LED maximum forward voltage, $V_{F_{\text{MAX}}}$ is 2.5 V for each LED, however the minimum forward voltage, $V_{F_{\text{MIN}}}$ is 1.9 V. The current requirement for each LED, $I_{\text{LED}}$ is 140 mA. The LED brightness and ON/OFF control is manipulated by body control module, BCM, directly by connecting and disconnecting the power supply to the LED load. Single-LED short-circuit detection is also required.
8.2.1.2 Detailed Design Procedure

**STEP 1**: Determine the reference current setting resistor, \( R_{\text{REF}} \), by using Equation 8.

\[
R_{\text{REF}} = \frac{V_{\text{REF}}}{I_{\text{REF}}}
\]  

(8)

where

- \( V_{\text{REF}} = 1.235 \text{ V} \) (typical)
- \( I_{\text{REF}} = 100 \mu\text{A} \) (recommended)

TI recommends 100 µA current for reference current, \( I_{\text{REF}} \) if the ICTRL resistor is placed in the same board with TPS92633-Q1. The calculated result for \( R_{\text{REF}} \) is 12.3 kΩ when \( I_{\text{REF}} = 100 \mu\text{A} \).

**STEP 2**: Design the ICTRL resistor, \( R_{\text{CTRL}} \), for setting the regulation voltage, \( V_{\text{CS_REG}} \) by using Equation 9.

\[
R_{\text{CTRL}} = \frac{V_{\text{CS_REG}} \times 17}{I_{\text{REF}} \times 25}
\]  

(9)

where

- \( V_{\text{CS_REG}} = 100 \text{ mV} \) (recommended)
- \( I_{\text{REF}} = 100 \mu\text{A} \) (recommended)

TI recommends 100 mV for reference voltage across current sensing resistor, \( R_{\text{SNSx}} \) if the ICTRL pin is not used for driving off-board binning resistor or NTC resistor. The calculated result for \( R_{\text{CTRL}} \) is 680 Ω when \( V_{\text{CS_REG}} = 100 \text{ mV} \).

**STEP 3**: Determine the current sensing resistor, \( R_{\text{SNSx}} \), by using Equation 10.

\[
R_{\text{SNSx}} = \frac{V_{\text{REF}} \times R_{\text{CTRL}} \times 25}{R_{\text{REF}} \times I_{\text{OUTX}_\text{Tot}} \times 17}
\]  

(10)

where

- \( V_{\text{REF}} = 1.235 \text{ V} \) (typical)
- \( R_{\text{CTRL}} = 680 \text{ Ω} \)
- \( R_{\text{REF}} = 12.3 \text{ kΩ} \)
- \( I_{\text{OUTX}_\text{Tot}} = 140 \text{ mA} \)

According to design requirements, output current for each channel is same so that the \( R_{\text{SNS1}} = R_{\text{SNS2}} = R_{\text{SNS3}} = 0.717 \text{ Ω} \). Two resistors in parallel are required to achieve equivalent 0.717-Ω resistance because 0.717 Ω is not a standard decade resistance value.

**STEP 4**: Design the current distribution between \( I_{\text{OUTX}} \) and \( I_{\text{RESX}} \), and calculate the current sharing resistor, \( R_{\text{RESX}} \) by using Equation 11. The \( R_{\text{RESx}} \) value actually decides the current distribution for \( I_{\text{OUTx}} \) path and \( I_{\text{RESx}} \) path, basic principle is to design the \( R_{\text{RESx}} \) to consume appropriate 50% total power dissipation at typical supply operating voltage.

\[
R_{\text{RESx}} = \frac{V_{\text{SUPPLY}} - V_{\text{OUTX}}}{I_{\text{OUTX}_\text{Tot}} \times 0.5}
\]  

(11)

where

- \( V_{\text{SUPPLY}} = 12 \text{ V} \) (typical)
• \( I_{(\text{OUTx Tot})} = 140 \, \text{mA} \)

The calculated result for \( R_{(\text{RESx})} \) resistor value including \( R_{(\text{RES1})} \), \( R_{(\text{RES2})} \) and \( R_{(\text{RES3})} \) is 75 \( \Omega \) when \( V_{(\text{OUTx})} \) is typical \( 3 \times 2.2 \, V = 6.6 \, V \).

**STEP 5**: Design the single-LED short-circuit threshold voltage and calculate the value of \( R_{(\text{SLS REF})} \) resistor for setting single-LED short-circuit threshold by using Equation 12.

The total forward voltage for three LEDs in serial is \( 3 \times 2.5 \, V = 7.5 \)-V maximum and \( 3 \times 1.9 \, V = 5.7 \)-V minimum. Once anyone of three LEDs is defective with short-circuit behavior, the total forward voltage for remaining two LEDs in serial is \( 2 \times 2.5 \, V = 5 \)-V maximum and \( 2 \times 1.9 \, V = 3.8 \)-V minimum. So the 5.3 \( V \) is selected to be threshold for single-LED short-circuit, \( V_{(\text{SLS th falling})} \).

\[
R_{(\text{SLS REF})} = \frac{V_{(\text{SLS th falling})} \times R_{(\text{REF})}}{N_{(\text{OUT})} \times V_{(\text{REF})} \times N_{(\text{SLS REF})}}
\]

(12)

where

- \( V_{(\text{REF})} = 1.235 \, V \) (typical)
- \( R_{(\text{REF})} = 12.3 \, k\Omega \)
- \( N_{(\text{OUT})} = 4 \)
- \( N_{(\text{SLS REF})} = 1 \)

The calculated result for \( R_{(\text{SLS REF})} \) is 13.3 \( k\Omega \) for \( V_{(\text{SLS th falling})} \) is 5.34 \( V \).

**STEP 6**: Design the threshold voltage of SUPPLY to enable the LED open-circuit and single-LED short-circuit diagnostics, and calculate voltage divider resistor value for \( R_{1} \) and \( R_{2} \) on DIAGEN pin.

The maximum forward voltage of LED-string is \( 3 \times 2.5 \, V = 7.5 \, V \). To avoid the open-circuit fault or single-LED short-circuit reported in low-dropout operation conditions, additional headroom between SUPPLY and OUTx needs to be considered. The TPS92633-Q1 device must disable open-circuit detection and single-LED short-circuit detection when the supply voltage is below LED-string maximum forward voltage plus \( V_{(\text{OPEN th rising})} \) and \( V_{(\text{CS REG})} \). The voltage divider resistor, \( R_{1} \) and \( R_{2} \) value can be calculated by Equation 13.

\[
R_{1} = \left( \frac{V_{(\text{OPEN th rising})} + V_{(\text{CS REG})} + V_{(\text{OUTx})}}{V_{(\text{IL(DIAGEN)})}} - 1 \right) \times R_{2}
\]

(13)

where

- \( V_{(\text{OPEN th rising})} = 210 \, mV \) (maximum)
- \( V_{(\text{CS REG})} = 100 \, mV \)
- \( V_{(\text{IL(DIAGEN)})} = 1.045 \, V \) (minimum)
- \( R_{2} = 10 \, k\Omega \) (recommended)

The calculated result for \( R_{1} \) is 64.9 \( k\Omega \) when \( V_{(\text{OUTx})} \) maximum voltage is 7.5 \( V \) and \( V_{(\text{CS REG})} \) is 100 \( mV \).

**STEP 7**: Design the threshold voltage of SUPPLY to turn on and off each channel of LED, and calculate voltage divider resistor value for \( R_{3} \) and \( R_{4} \) on PWM input pin.

The minimum forward voltage of LED-string is \( 3 \times 1.9 \, V = 5.7 \, V \). To make sure the current output on each of LED-string is normal, each LED-string needs to be turned off when SUPPLY voltage is lower than LED minimum required forward voltage plus dropout voltage between INx to OUTx and \( V_{(\text{CS REG})} \). The voltage divider resistor, \( R_{3} \) and \( R_{4} \) value can be calculated by Equation 14.

\[
R_{3} = \left( \frac{V_{(\text{DROPOUT})} + V_{(\text{CS REG})} + V_{(\text{OUTx})}}{V_{(\text{Ih(PWM)})}} - 1 \right) \times R_{4}
\]

(14)
where

- \( V_{\text{DROP OUT}} \) = 300 mV (typical)
- \( V_{\text{CS REG}} \) = 100 mV
- \( V_{\text{IH(PWM)}} \) = 1.26 V (maximum)
- \( R_4 \) = 10 k\( \Omega \) (recommended)

The calculated result for \( R_3 \) is 38.3 k\( \Omega \) when \( V_{\text{(OUTx)}} \) minimum voltage is 5.7 V and \( V_{\text{(CS REG)}} \) is 100 mV.

8.2.1.3 Application Curves

![Figure 8-2. Supply Dimming 80% Brightness](image1)

![Figure 8-3. Supply Dimming 20% Brightness](image2)
8.2.2 Independent PWM Controlled Rear Lamp with Off Board LED and Binning Resistor

The TPS92633-Q1 device is able to drive each current output channel independently by PWM input at PWM1, PWM2 and PWM3 pins. The LED and LED binning resistor can be placed in different PCB to the TPS92633-Q1 device. The LED binning resistor is connected to the ICTRL pin to set the LED current accordingly.

![Typical Application Schematic](image)

**Figure 8-4. Typical Application Schematic**

### 8.2.2.1 Design Requirements

Input voltage range is from 9 V to 16 V, and a total 6 LEDs, with 2 LEDs in each string required to achieve turn indicator function. The LED maximum forward voltage, $V_{F_{\text{MAX}}}$ is 2.5 V for each LED, however the minimum forward voltage, $V_{F_{\text{MIN}}}$ is 1.9 V. The binning resistor for LED is placed with LED units together in another PCB out of LED driver board. The LED current is 50 mA, 75 mA and 100 mA depending on the brightness bin. Each current output channel is independently controlled by MCU through individual GPIO. Single-LED short-circuit detection is not required.

### 8.2.2.2 Detailed Design Procedure

TI recommends to short the SLS_REF pin to GND when single-LED short-circuit is not required.

**STEP 1:** Determine the reference current setting resistor, $R_{(\text{IREF})}$, by using Equation 15.

$$R_{(\text{IREF})} = \frac{V_{(\text{IREF})}}{I_{(\text{IREF})}}$$  \hspace{1cm} (15)

where

- $V_{(\text{IREF})} = 1.235$ V (typical)
- $I_{(\text{IREF})} = 200 \mu$A (recommended for off-board binning resistor)

TI recommends 200-µA current for reference current, $I_{(\text{IREF})}$ if the ICTRL resistor is placed in the other board with TPS92633-Q1. The calculated result for $R_{(\text{IREF})}$ is 6.19 kΩ when $I_{(\text{IREF})} = 200 \mu$A.

**STEP 2:** Design the ICTRL resistor, $R_{(\text{ICTRL1})}$ and $R_{(\text{ICTRL2})}$, for setting the regulation voltage, $V_{(\text{CS_REG})}$, by using Equation 16.

$$R_{(\text{ICTRL1})} + R_{(\text{ICTRL2})} = \frac{V_{(\text{CS_REG})} \times 17}{I_{(\text{IREF})} \times 25}$$  \hspace{1cm} (16)

where
• $I_{\text{REF}} = 200 \mu A$ (recommended for off-board binning resistor)

TI recommends 80 mV, 120 mV and 160 mV or reference voltage across current sensing resistor, $R_{\text{SNSx}}$, for three different brightness binning LED. The calculated result for $R_{\text{ICTRL1}}$ and $R_{\text{ICTRL2}}$ for different brightness bin LED is listed in Table 8-1. It is recommended to choose as large as possible $R_{\text{ICTRL1}}$ to achieve the highest noise immunity.

**STEP 3:** Determine the current sensing resistor, $R_{\text{SNSx}}$, by using Equation 17.

$$R_{\text{SNSx}} = \frac{V_{\text{REF}} \times R_{\text{ICTRL}} \times 25}{R_{\text{REF}} \times I_{\text{OUTX,Tot}} \times 17}$$  

(17)

where

• $V_{\text{REF}} = 1.235 \text{ V} \text{ (typical)}$
• $R_{\text{REF}} = 6.19 \text{ k}\Omega$

According to design requirements, output current for each channel is same so that the $R_{\text{SNS1}} = R_{\text{SNS2}} = R_{\text{SNS3}}$. The calculated result for $R_{\text{SNSx}}$ is listed in Table 8-1.

**Table 8-1. Calculated Resistor Table**

<table>

<td>274 $\Omega$</td>
</tr>
<tr>
<td>$R_{\text{SNSx}}$</td>
<td>1.6 $\Omega$</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**STEP 4:** Design the current distribution between $I_{\text{OUTX}}$ and $I_{\text{RESx}}$ and calculate the current sharing resistor, $R_{\text{RESx}}$, by using Equation 18. The $R_{\text{RESx}}$ value actually decides the current distribution for $I_{\text{OUTX}}$ path and $I_{\text{RESx}}$ path, basic principle is to design the $R_{\text{RESx}}$ to consume appropriate 50% total power dissipation at typical supply operating voltage.

$$R_{\text{RESx}} = \frac{V_{\text{SUPPLY}} - V_{\text{OUTX}}}{I_{\text{OUTX,Tot}} \times 0.5}$$  

(18)

where

• $V_{\text{SUPPLY}} = 12 \text{ V} \text{ (typical)}$
• $I_{\text{OUTX,Tot}} = 100 \text{ mA} \text{ (maximum)}$

The calculated result for $R_{\text{RESx}}$ resistor value including $R_{\text{RES1}}$, $R_{\text{RES2}}$ and $R_{\text{RES3}}$ is 152 $\Omega$ when $V_{\text{OUTX}}$ is typical $2 \times 2.2 \text{ V} = 4.4 \text{ V}$.

**STEP 5:** Design the threshold voltage of SUPPLY to enable the LED open-circuit and single-LED short-circuit diagnostics, and calculate voltage divider resistor value for $R1$ and $R2$ on DIAGEN pin.

The maximum forward voltage of LED-string is $2 \times 2.5 \text{ V} = 5 \text{ V}$. To avoid the open-circuit fault reported in low-dropout operation conditions, additional headroom between SUPPLY and OUTX needs to be considered. The TPS92633-Q1 device must disable open-circuit detection when the supply voltage is below LED-string maximum forward voltage plus $V_{\text{OPEN_th_rising}}$ and $V_{\text{CS_REG}}$. The voltage divider resistor, $R1$ and $R2$ value can be calculated by Equation 19.
\[
R_1 = \left( \frac{V_{\text{OPEN\_th\_rising}} + V_{\text{CS\_REG}} + V_{\text{OUTx}}}{V_{\text{IL\_DIAGEN}}} - 1 \right) \times R_2
\]

(19)

where

- \( V_{\text{OPEN\_th\_rising}} = 210 \text{ mV (maximum)} \)
- \( V_{\text{CS\_REG}} = 160 \text{ mV (maximum)} \)
- \( V_{\text{IL\_DIAGEN}} = 1.045 \text{ V (minimum)} \)
- \( R_2 = 10 \text{ k} \Omega \text{ (recommended)} \)

The calculated result for \( R_1 \) is 41.2 k\( \Omega \) when \( V_{\text{OUTx}} \) maximum voltage is 5 V and \( V_{\text{CS\_REG}} \) is 160 mV maximum.

Ch4 = V(DIAGEN)  
Ch5 = V(OUT1)  
Ch6 = I(OUT_Tot)
9 Power Supply Recommendations

The TPS92633-Q1 is designed to operate from an automobile electrical power system within the range specified in Power Supply. The $V_{\text{SUPPLY}}$ input must be protected from reverse voltage and load dump condition over 40 V. The impedance of the input supply rail must be low enough that the input current transient does not cause drop below LED string required forward voltage. If the input supply is connected with long wires, additional bulk capacitance may be required in addition to normal input capacitor.
10 Layout

10.1 Layout Guidelines

Thermal dissipation is the primary consideration for TPS92633-Q1 layout.

- TI recommends large thermal dissipation area in both top and bottom layers of PCB. The copper pouring area in same layer with TPS92633-Q1 footprint should directly cover the thermal pad land of the device with wide connection as much as possible. The copper pouring in opposite PCB layer or inner layers should be connected to thermal pad directly through multiple thermal vias.

- TI recommends to place $R_{(\text{RES}x)}$ resistors away from the TPS92633-Q1 device with more than 20-mm distance because $R_{(\text{RES}x)}$ resistors are dissipating some amount of the power as well as the TPS92633-Q1. It is better to place two heat source components apart to reduce the thermal accumulation concentrated at small PCB area. The large copper pouring area is also required surrounding the $R_{(\text{RES}x)}$ resistors for helping thermal dissipating.

The noise immunity is the secondary consideration for TPS92633-Q1 layout.

- TI recommends to place the noise decoupling capacitors for SUPPLY, ICTRL and IREF pins as close as possible to the pins.

- TI recommends to place the $R_{(\text{SNS}x)}$ resistor as close as possible to the INx pins with the shortest PCB track to SUPPLY pin.

11 Device and Documentation Support

11.1 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on ti.com. Click on Subscribe to updates to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

11.2 Support Resources

TI E2E™ support forums are an engineer's go-to source for fast, verified answers and design help — straight from the experts. Search existing answers or ask your own question to get the quick design help you need.

Linked content is provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's Terms of Use.

11.3 Trademarks

PowerPAD™ is a trademark of TI.
TI E2E™ is a trademark of Texas Instruments.
All trademarks are the property of their respective owners.

11.4 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

11.5 Glossary

TI Glossary This glossary lists and explains terms, acronyms, and definitions.
12 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

(1) The marketing status values are defined as follows:
- **ACTIVE**: Product device recommended for new designs.
- **LIFEBUY**: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
- **NRND**: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
- **PREVIEW**: Device has been announced but is not in production. Samples may or may not be available.
- **OBSOLETE**: TI has discontinued the production of the device.

(2) RoHS: TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt**: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green**: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

NOTES:

A. All linear dimensions are in millimeters.
B. This drawing is subject to change without notice.
C. Body dimensions do not include mold flash or protrusions. Mold flash and protrusion shall not exceed 0.15 per side.
D. This package is designed to be soldered to a thermal pad on the board. Refer to Technical Brief, PowerPAD Thermally Enhanced Package, Texas Instruments Literature No. SLMA002 for information regarding recommended board layout. This document is available at www.ti.com <http://www.ti.com>.
E. See the additional figure in the Product Data Sheet for details regarding the exposed thermal pad features and dimensions.
F. Falls within JEDEC MO-153

PowerPAD is a trademark of Texas Instruments.
THERMAL INFORMATION

This PowerPAD™ package incorporates an exposed thermal pad that is designed to be attached to a printed circuit board (PCB). The thermal pad must be soldered directly to the PCB. After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For additional information on the PowerPAD package and how to take advantage of its heat dissipating abilities, refer to Technical Brief, PowerPAD Thermally Enhanced Package, Texas Instruments Literature No. SLMA002 and Application Brief, PowerPAD Made Easy, Texas Instruments Literature No. SLMA004. Both documents are available at www.ti.com.

The exposed thermal pad dimensions for this package are shown in the following illustration.

![Exposed Thermal Pad Dimensions](image)

Exposed Thermal Pad Dimensions

**NOTE:**

A. All linear dimensions are in millimeters

⚠️ Exposed tie strap features may not be present.
NOTES:
A. All linear dimensions are in millimeters.
B. This drawing is subject to change without notice.
C. Customers should place a note on the circuit board fabrication drawing not to alter the center solder mask defined pad.
D. This package is designed to be soldered to a thermal pad on the board. Refer to Technical Brief, PowerPad Thermally Enhanced Package, Texas Instruments Literature No. SLMA002, SLMA004, and also the Product Data Sheets for specific thermal information, via requirements, and recommended board layout. These documents are available at www.ti.com. Publication IPC-7351 is recommended for alternate designs.
E. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Example stencil design based on a 50% volumetric metal load solder paste. Refer to IPC-7525 for other stencil recommendations.
F. Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.
