TPSM53603 36-V Input, 3-A Power Module in Enhanced HotRod™ QFN Package

1 Features

- 5-mm x 5.5-mm x 4-mm Enhanced HotRod™ QFN package
  - Industry’s smallest 36-V, 3-A footprint: 85-mm² solution size (single-sided)
  - Low EMI: Meets CISPR11 radiated emissions
  - Excellent thermal performance:
    Up to 18 W output power at 85°C, no airflow
  - Standard footprint: single large thermal pad and all pins accessible from perimeter
- Input voltage range: 3.8 V to 36 V
- Output voltage range: 1 V to 7 V
- Efficiency up to 95%
- Power-good flag
- Precision enable
- Built-in hiccup-mode short-circuit protection, overtemperature protection, start-up into pre-bias output, soft start, and UVLO
- Operating IC junction range: –40°C to +125°C
- Operating ambient range: –40°C to +105°C
- Shock and vibration tested to Mil-STD-883D
- Pin compatible with: 4-A TPSM53604 and 2-A TPSM53602
- Create a custom design using the TPSM53603 with the WEBENCH® Power Designer
- Download the EVM Design Files for fast board design

2 Applications

- General purpose wide VIN power supplies
- Factory automation and control
- Test and measurement
- Aerospace and defense
- Negative output voltage applications

3 Description

The TPSM53603 power module is a highly integrated 3-A power solution that combines a 36-V input, step-down, DC/DC converter with power MOSFETs, a shielded inductor, and passives in a thermally-enhanced QFN package. The 5-mm x 5.5-mm x 4-mm, 15-pin package uses Enhanced HotRod QFN technology for improved thermal performance, small footprint, and low EMI. The package footprint has all pins accessible from the perimeter and a single large thermal pad for simple layout and easy handling in manufacturing.

The total solution requires as few as four external components and eliminates the loop compensation and magnetics part selection from the design process. The full feature set includes power good, programmable UVLO, prebias start-up, overcurrent, and overtemperature protections, making the TPSM53603 an excellent device for powering a wide range of applications.

#### Changes from Revision * (December 2019) to Revision A (July 2020)

- Updated package information to the correct package type .............................................. 1
- Updated the numbering format for tables, figures and cross-references throughout the document 1
5 Pin Configuration and Functions

![Figure 5-1. 15-Pin QFN RDA Package (Top View)](image)

<table>
<thead>
<tr>
<th>PIN</th>
<th>TYPE</th>
<th>DESCRIPTION</th>
</tr>
</thead>
<tbody>
<tr>
<td>NO.</td>
<td>NAME</td>
<td>DESCRIPTION</td>
</tr>
<tr>
<td>12</td>
<td>AGND</td>
<td>Analog ground. Zero voltage reference for input references and logic. All electrical parameters are measured with respect to this pin. This pin must be connected to PGND at a single point. See <strong>Section 10</strong> for a recommended layout.</td>
</tr>
<tr>
<td>4, 5</td>
<td>DNC</td>
<td>Do not connect. Do not connect these pins to ground, to another DNC pin, or to any other voltage. These pins are connected to internal circuitry. Each pin must be soldered to an isolated pad.</td>
</tr>
<tr>
<td>2</td>
<td>EN</td>
<td>Enable pin. This pin turns the converter on when pulled high and turns off the converter when pulled low. This pin can be connected directly to VIN. Do not float. This pin can be used to set the input under voltage lockout with two resistors. See <strong>Section 7.3.6</strong>.</td>
</tr>
<tr>
<td>9</td>
<td>FB</td>
<td>Feedback input. Connect the mid-point of the feedback resistor divider to this pin. Connect the upper resistor (R_{FBT}) of the feedback divider to (V_{OUT}) at the desired point of regulation. Connect the lower resistor (R_{FBB}) of the feedback divider to AGND.</td>
</tr>
<tr>
<td>3, 10, 11</td>
<td>NC</td>
<td>Not connected. These pins are not connected to any circuitry within the module. It is recommended that these pins be connected to the PGND plane on the application board to enhance shielding and thermal performance.</td>
</tr>
<tr>
<td>15</td>
<td>PGND</td>
<td>Power ground. This is the return current path for the power stage of the device. Connect this pad to the input supply return, the load return, and the capacitors associated with the VIN and VOUT pins. See <strong>Section 10</strong> for a recommended layout.</td>
</tr>
<tr>
<td>6</td>
<td>PGOOD</td>
<td>Power-good pin. Open-drain output that asserts low if feedback voltage is not within the specified window thresholds. A 10-kΩ to 100-kΩ pullup resistor is required and can be tied to the V5V pin or other DC voltage less than 22 V. If not used, this pin can be left open or connected to PGND.</td>
</tr>
<tr>
<td>1, 14</td>
<td>VIN</td>
<td>Input supply voltage. Connect the input supply to these pins. Connect input capacitors between these pins and PGND in close proximity to the device.</td>
</tr>
<tr>
<td>7, 8</td>
<td>VOUT</td>
<td>Output voltage. These pins are connected to the internal output inductor. Connect these pins to the output load and connect external output capacitors between these pins and PGND.</td>
</tr>
<tr>
<td>13</td>
<td>V5V</td>
<td>Internal 5-V LDO output. Supplies internal control circuits. Do not connect to external loads. This pin can be used as logic supply for PGOOD pin.</td>
</tr>
</tbody>
</table>

</tbody>
</table>

(1) Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under Recommended Operating Conditions. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

(2) The voltage on this pin must not exceed the voltage on the VIN pin by more than 0.3 V.

(3) The ambient temperature is the air temperature of the surrounding environment. The junction temperature is the temperature of the internal power IC when the device is powered. Operating below the maximum ambient temperature, as shown in the safe operating area (SOA) curves in the typical characteristics sections, ensures that the maximum junction temperature of any component inside the module is never exceeded.

6.2 ESD Ratings

<table>
<thead>
<tr>
<th>V_(ESD)</th>

<td>V</td>
</tr>
<tr>
<td></td>
<td>Charged-device model (CDM) (2)</td>
<td>±1000</td>
<td>V</td>
</tr>
</tbody>
</table>

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

Over operating ambient temperature range (unless otherwise noted) (1)

<td>µF</td>
</tr>
<tr>
<td>Output capacitance, C_OUT</td>
<td>min (6)</td>
<td>1000</td>
<td>µF</td>
</tr>
</tbody>
</table>

(1) Recommended operating conditions indicate conditions for which the device is intended to be functional, but do not ensure specific performance limits. For ensured specifications, see Section 6.5.

(2) The voltage on this pin must not exceed the voltage on the VIN pin by more than 0.3 V.

(3) The recommended minimum V\_IN is 3.8 V or (V\_OUT + 1 V), whichever is greater. See the Section 7.3.9 section for more information.

(4) The recommended maximum output voltage varies depending input voltage. See the Section 7.3.9 section for more information.

(5) Minimum C\_IN of 20 µF must be ceramic type.
The minimum amount of required output capacitance varies depending on the output voltage. See Table 7-1.

### 6.4 Thermal Information

<table>
<thead>

</tr>
<tr>
<td>$T_{SHDN}$</td>
<td>Thermal shutdown temperature</td>
<td>165</td>
</tr>
<tr>
<td></td>
<td>Recovery temperature</td>
<td>148</td>
</tr>
</tbody>
</table>

(1) For more information about traditional and new thermal metrics, see the Semiconductor and IC Package Thermal Metrics application report.

(2) The junction-to-ambient thermal resistance, $R_{JA}$, applies to devices soldered directly to a 75-mm x 75-mm four-layer PCB with 2 oz. copper and natural convection cooling. Additional airflow and PCB copper area reduces $R_{JA}$. For more information see the Section 10.3 section.

(3) The junction-to-top board characterization parameter, $\psi_{JT}$, estimates the junction temperature, $T_J$, of a device in a real system, using a procedure described in JESD51-2A (sections 6 and 7). $T_J = \psi_{JT} \times P_{dis} + T_T$; where $P_{dis}$ is the power dissipated in the device and $T_T$ is the temperature of the top of the device.

(4) The junction-to-board characterization parameter, $\psi_{JB}$, estimates the junction temperature, $T_J$, of a device in a real system, using a procedure described in JESD51-2A (sections 6 and 7). $T_J = \psi_{JB} \times P_{dis} + T_B$; where $P_{dis}$ is the power dissipated in the device and $T_B$ is the temperature of the board 1mm from the device.

### 6.5 Electrical Characteristics

Limits apply over $T_A = -40°C$ to $+105°C$, $V_{IN} = 12$ V, $V_{OUT} = 3.3$ V, $I_{OUT} = I_{OUT\,\text{max}}$, (unless otherwise noted); $C_{IN1} = 2 \times 10 \, \mu F$, 50-V, 1206 ceramic; $C_{IN2} = 100 \, n F$, 50-V, 0603 ceramic; $C_{OUT} = 3 \times 22 \, \mu F$, 25-V, 1210 ceramic. Minimum and maximum limits are specified through production test or by design. Typical values represent the most likely parametric norm and are provided for reference only.

7 Detailed Description

7.1 Overview

The TPSM53603 is a full-featured, 36-V input, 3-A, synchronous step-down converter with PWM, MOSFETs, shielded inductor, and control circuitry integrated into a low-profile, over-molded package. The device integration enables small designs while providing the ability to adjust key parameters to meet specific design requirements. The TPSM53603 provides an output voltage range of 1 V to 7 V. An external resistor divider is used to adjust the output voltage to the desired value. The device provides accurate voltage regulation over a wide load range by using a precision internal voltage reference. Input undervoltage lockout is internally set at 3.55 V (typical), but can be adjusted upward using a resistor divider on the EN pin of the device. The EN pin can also be pulled low to put the device into standby mode to reduce input current draw. A power-good signal is provided to indicate when the output is within its nominal voltage range. Thermal shutdown and current limit features protect the device during an overload condition. A 15-pin, QFN package that includes exposed bottom pads provides a thermally enhanced solution for space-constrained applications.

7.2 Functional Block Diagram
7.3 Feature Description

7.3.1 Adjusting the Output Voltage

A resistor divider connected to the FB pin (pin 9) sets the output voltage of the TPSM53603. The output voltage adjustment range is from 1 V to 7 V. Figure 7-1 shows the feedback resistor connections for setting the output voltage. The recommended value of $R_{FBT}$ is 10 kΩ. The value for $R_{FBB}$ can be calculated using Equation 1. Table 7-1 lists the standard resistor values for several output voltages. The minimum required output capacitance for each output voltage is also included in Table 7-1. The capacitance values listed represent the effective capacitance, taking into account the effects of DC bias and temperature variation.

$$R_{FBB} = \frac{10}{(V_{OUT} - 1)} \text{ (kΩ)} \tag{1}$$

7.3.2 Switching Frequency

The switching frequency of the TPSM53603 is set to 1.4 MHz, internal to the device. The switching frequency cannot be adjusted. When the load current is high enough and the device is operating in PWM mode, the device operates at a fixed frequency. As the load current drops and the device switches to PFM mode, the switching frequency is reduced, resulting in reduced power dissipation. See Section 7.4.2 for typical information on when the device switches from PWM mode to PFM mode.
### 7.3.3 Input Capacitors

The TPSM53603 requires a minimum input capacitance of 20 μF ($2 \times 10$ μF) of ceramic type. High-quality, ceramic-type X5R or X7R capacitors with sufficient voltage rating are recommended. TI recommends an additional 47 μF of non-ceramic capacitance for applications with transient load requirements. The voltage rating of input capacitors must be greater than the maximum input voltage.

### 7.3.4 Output Capacitors

Table 7-1 lists the TPSM53603 minimum output capacitance. The effects of DC bias and temperature variation must be considered when using ceramic capacitance. For ceramic capacitors, the package size, voltage rating, and dielectric material contribute to differences between the standard rated value and the actual effective value of the capacitance.

When adding additional capacitance above $C_{\text{OUT(min)}}$, the capacitance can be ceramic type, low-ESR polymer type, or a combination of the two. See Table 7-3 for a preferred list of output capacitors by vendor.

(2) Standard capacitance values.
7.3.5 Output On/Off Enable (EN)

The voltage on the EN pin provides electrical ON/OFF control of the device. This input features precision thresholds, allowing the use of an external voltage divider to provide a programmable UVLO (see Section 7.3.6). Applying a voltage of $V_{EN} \geq V_{EN-LDO_H}$ causes the device to enter standby mode, powering the internal LDO, but not producing an output voltage. Increasing the EN voltage to $V_{EN-H}$ fully enables the device, allowing it to enter start-up mode and begin the soft-start period. When the EN input is brought below $V_{EN-H}$ by $V_{EN-HYS}$, the regulator stops running and enters standby mode. Further decrease in the EN voltage to below $V_{EN-LDO-L}$ completely shuts down the device. Figure 7-2 shows this behavior. The values for the various EN thresholds can be found in Section 6.5.

![Figure 7-2. Precision Enable Behavior](image)

The EN pin cannot be open circuit or floating. The simplest way to enable the operation of the TPSM53603 is to connect the EN pin to VIN directly as shown in Figure 7-3. This allows self start-up of the TPSM53603 when VIN is within the operation range.

If an application requires controlling the EN pin, an external logic signal can be used to drive the EN pin as shown in Figure 7-4. Applications using an open-drain/collector device to interface with this pin require a pullup resistor to a voltage above the enable threshold.

![Figure 7-3. Enabling the Device](image)

![Figure 7-4. Typical Enable Control](image)
7.3.6 Programmable Undervoltage Lockout (UVLO)

The TPSM53603 implements internal UVLO circuitry on the VIN pin. The device is disabled when the VIN pin voltage falls below the internal VIN UVLO threshold. The internal VIN UVLO rising threshold is 3.55 V (typical) with a typical hysteresis of 500 mV.

If an application requires a higher UVLO threshold, a resistor divider can be placed between VIN, the EN pin, and AGND as shown in Figure 7-5. The enable rising threshold (\(V_{\text{EN-H}}\)) is 1.23 V (typ) with 100 mV (typ) hysteresis. Table 7-4 lists recommended resistor values for \(R_{\text{ENT}}\) and \(R_{\text{ENB}}\) to adjust the ULVO voltage.

To ensure proper start-up and reduce input current surges, TI recommends to set the UVLO threshold to approximately 80% to 85% of the minimum expected input voltage.

</tr>
</tbody>
</table>

7.3.7 Power Good (PGOOD)

The TPSM53603 has a built-in power-good signal (PGOOD) which indicates whether the output voltage is within its regulation range. The PGOOD pin is an open-drain output that requires a pullup resistor to a nominal voltage source of 18 V or less. The internal 5-V LDO output (V5V pin) can be used as the pullup voltage source. A typical pullup resistor value is between 10 kΩ and 100 kΩ. The maximum recommended PGOOD sink current is 3 mA.

Once the output voltage rises above 94% of the set voltage, the PGOOD pin rises to the pullup voltage level. The PGOOD pin is pulled low when the output voltage drops lower than 92% or rises higher than 107% of the nominal set voltage. See Figure 7-6 for typical power-good thresholds.
7.3.8 Light Load Operation

In light load conditions, the device turns on the high-side MOSFET until the inductor current reaches a controlled minimum value of approximately 1 A. As the input voltage decreases, reducing the voltage headroom between $V_{IN}$ and $V_{OUT}$, the amount of time required to reach this minimum current increases. During this time, additional energy flows from $V_{IN}$ to $V_{OUT}$, resulting in increased output voltage ripple. To eliminate this behavior, the EN UVLO function must be used to maintain at least 1 V of headroom above $V_{OUT}$. Alternatively, additional output capacitance can be added to reduce the output voltage ripple in applications that operate at light loads with very low $V_{IN}$ to $V_{OUT}$ headroom.

7.3.9 Voltage Dropout

Voltage dropout is the difference between the input voltage and output voltage that is required to maintain output voltage regulation while providing the rated output current.

To ensure the TPSM53603 maintains output voltage regulation over the operating temperature range, the minimum $V_{IN}$ is 3.8 V or ($V_{OUT}$ + 1 V), whichever is greater.

The TPSM53603 operates in a frequency foldback mode when the dropout voltage is less than the recommendation above. Frequency foldback reduces the switching frequency to allow the output voltage to maintain regulation as input voltage decreases. At light load, the TPSM53603 operates in PFM mode, which is a reduced frequency operation. See Section 7.4.2 for more information on PFM mode. Figure 7-7 through Figure 7-12 show typical dropout voltage and frequency foldback curves for 3.3 V, 5 V, and 7 V outputs at $T_A = 25°C$.

**Note**

As ambient temperature increases, dropout voltage and frequency foldback occur at higher input voltage.
**Figure 7-7. Voltage Dropout**

\[ V_{\text{OUT}} = 3.3 \text{ V} \]

\[ V_{\text{OUT}} = 5 \text{ V} \]

**Figure 7-11. Voltage Dropout**

\[ V_{\text{OUT}} = 7 \text{ V} \]

**Figure 7-12. Frequency Foldback**

\[ V_{\text{OUT}} = 7 \text{ V} \]
7.3.10 Overcurrent Protection (OCP)

The TPSM53603 is protected from overcurrent conditions. Cycle-by-cycle current limit is used for overloads while hiccup mode is used for short circuits. Hiccup mode is activated if a fault condition persists on the output. Hiccup mode reduces power dissipation under severe overcurrent conditions and prevents overheating and potential damage to the device. In hiccup mode, the regulator is shut down and kept off for 94 ms typical before the TPSM53603 tries to start again. If overcurrent or short-circuit fault condition still exist, hiccup repeats until the fault condition is removed. Once the fault is removed, the module automatically recovers with a normal soft-start power up.

The typical current limit threshold for the TPSM53603 varies slightly as a function of input voltage and output voltage. Figure 7-13 shows the typical current limit threshold for several output voltages over the input voltage range.

![Figure 7-13. Current Limit Threshold](image)

7.3.11 Thermal Shutdown

The internal thermal shutdown circuitry forces the device to stop switching if the junction temperature exceeds 165°C typically. The device reinitiates the power-up sequence when the junction temperature drops below 148°C typically.
7.4 Device Functional Modes

7.4.1 Active Mode

The TPSM53603 is in active mode when VIN is above the turn-on threshold and the EN pin voltage is above the EN high threshold. The most direct way to enable the TPSM53603 is to connect the EN pin to VIN. This allows self-start-up of the TPSM53603 when the input voltage is in the operation range of 3.8 V to 36 V. Connecting a resistor divider between VIN, EN, and AGND adjusts the UVLO to delay the turn on until V_IN is closer to its regulated voltage.

7.4.2 Auto Mode

In auto mode, the device moves between Pulse-Width Modulation (PWM) and Pulse-Frequency Modulation (PFM) as the load changes. At light loads, the regulator operates in PFM mode. At higher loads, the mode changes to PWM mode. The typical load current for which the device moves from PFM to PWM can be found in Figure 7-14 and Figure 7-15. The output current at which the device changes modes depends on the input voltage and the output voltage. For output currents above the curve, the device is in PWM mode. If the curve is a solid line, the PWM switching frequency is 1.4 MHz nominal. If the curve is a dashed line, the PWM switching frequency is reduced due to the minimum on-time of the internal controller to maintain output voltage regulation. For currents below the curves, the device is in PFM mode. For applications where the switching frequency must be known for a given condition, the above mentioned effects must be carefully tested before the design is finalized.

In PWM mode, the regulator operates at a constant frequency using PWM to regulate the output voltage. While operating in this mode, the output voltage is regulated by switching at a constant frequency and modulating the duty cycle to control the power to the load. This provides excellent line and load regulation and low output voltage ripple.

In PFM mode, the high-side MOSFET is turned on in a burst of one or more pulses to provide energy to the load. The duration of the burst and the actual switching frequency depends on the input voltage, output voltage, and load current. The frequency of these bursts is adjusted to regulate the output while diode emulation is used to maximize efficiency. This mode provides high light-load efficiency by reducing the amount of input supply current required to regulate the output voltage at small loads. However, in this mode, expect larger output voltage ripple and variable switching frequency.

![Figure 7-14. PFM/PWM Thresholds (3.3 V, 5 V, and 7 V)](image1)

![Figure 7-15. PFM/PWM Thresholds (1 V and 1.8 V)](image2)

7.4.3 Shutdown Mode

The EN pin provides electrical ON and OFF control for the TPSM53603. When the EN pin voltage is below the EN low threshold, the device is in shutdown mode. In shutdown mode, the standby current is 5 μA typical.
8 Application and Implementation

Note
Information in the following applications sections is not part of the TI component specification, and TI
does not warrant its accuracy or completeness. TI’s customers are responsible for determining
suitability of components for their purposes. Customers should validate and test their design
implementation to confirm system functionality.

8.1 Application Information
The TPSM53603 is a synchronous, step-down, DC/DC power module. It is used to convert a higher DC voltage
to a lower DC voltage with a maximum output current of 3 A. The TPSM53603 can be configured in a negative
output voltage, inverting buck-boost (IBB) topology. For more details, see the Negative Output Voltage using the
TPSM53602/3/4 application note. The following design procedure can be used to select components for the
TPSM53603. Alternately, the WEBENCH® software can be used to generate complete designs. When
generating a design, the WEBENCH® software uses an iterative design procedure and accesses comprehensive
databases of components. See www.ti.com for more details.

8.2 Typical Application
The TPSM53603 only requires a few external components to convert from a wide input voltage supply range to a
wide range of output voltages. Figure 8-1 shows a basic TPSM53603 schematic for a typical design.

![Figure 8-1. TPSM53603 Typical Schematic](Image)

8.2.1 Design Requirements
For this design example, use the parameters listed in Table 8-1 as the input parameters and follow the design
procedures in Section 8.2.2.

8.2.2 Detailed Design Procedure

8.2.2.1 Custom Design With WEBENCH® Tools

Click here to create a custom design using the TPSM53603 device with the WEBENCH® Power Designer.

1. Start by entering the input voltage (V\textsubscript{IN}), output voltage (V\textsubscript{OUT}), and output current (I\textsubscript{OUT}) requirements.
2. Optimize the design for key parameters such as efficiency, footprint, and cost using the optimizer dial.
3. Compare the generated design with other possible solutions from Texas Instruments.

The WEBENCH Power Designer provides a customized schematic along with a list of materials with real-time pricing and component availability.

In most cases, these actions are available:

- Run electrical simulations to see important waveforms and circuit performance
- Run thermal simulations to understand board thermal performance
- Export customized schematic and layout into popular CAD formats
- Print PDF reports for the design, and share the design with colleagues

Get more information about WEBENCH tools at www.ti.com/WEBENCH.

8.2.2.2 Output Voltage Setpoint

The output voltage of the TPSM53603 device is externally adjustable using a resistor divider. The recommended value of R\textsubscript{FBT} is 10 kΩ. The value for R\textsubscript{FBB} can be selected from Table 7-1 or calculated using Equation 2:

\[
R_{FBB} = \frac{10}{(V_{OUT} - 1)} \text{ (kΩ)}
\]

For the desired output voltage of 5 V, the formula yields a value of 2.5 kΩ. Choose the closest available value of 2.49 kΩ for R\textsubscript{FBB}.

8.2.2.3 Input Capacitors

The TPSM53603 requires a minimum input capacitance of 20 µF (or 2 × 10 µF) ceramic type. High-quality ceramic type X5R or X7R capacitors with sufficient voltage rating are recommended. An additional 47 µF of non-ceramic capacitance is recommended for applications with transient load requirements. The voltage rating of the input capacitors must be greater than the maximum input voltage.

For this design example, two 10-µF, 50-V, ceramic capacitors are used.

8.2.2.4 Output Capacitor Selection

The TPSM53603 requires a minimum amount of output capacitance for proper operation. The minimum amount of required output varies depending on the output voltage. See Table 7-1 for the required output capacitance.

For this design example, two 47-µF, 10-V, ceramic capacitors are used.
8.2.3 Application Curves

- **Figure 8-2. Enable Turn-ON**
  - $V_{IN} = 24\,\text{V}$
  - $V_{OUT} = 5\,\text{V}$
  - $C_{OUT} = 2 \times 47\,\mu\text{F}$

- **Figure 8-3. Enable Turn-OFF**
  - $V_{IN} = 24\,\text{V}$
  - $V_{OUT} = 5\,\text{V}$
  - $C_{OUT} = 2 \times 47\,\mu\text{F}$

- **Figure 8-4. Transient Response**
  - $V_{IN} = 24\,\text{V}$
  - $I_{OUT} = 0.75\,\text{A}\text{ to } 2.25\,\text{A}$
  - $V_{OUT} = 5\,\text{V}$
  - $C_{OUT} = 2 \times 47\,\mu\text{F}$
  - Slew rate: $1\,\text{A/µs}$

9 Power Supply Recommendations

The TPSM53603 is designed to operate from an input voltage supply range between 3.8 V and 36 V. This input supply must be well-regulated and able to withstand maximum input current and maintain a stable voltage. The resistance of the input supply rail must be low enough that an input current transient does not cause a high enough drop at the TPSM53603 supply voltage that can cause a false UVLO fault triggering and system reset.

If the input supply is located more than a few centimeters from the TPSM53603, additional bulk capacitance can be required in addition to the ceramic bypass capacitors. The typical amount of bulk capacitance is a 47-µF electrolytic capacitor.
10 Layout

The performance of any switching power supply depends as much upon the layout of the PCB as the component selection. The following guidelines help users design a PCB with the best power conversion performance, optimal thermal performance, and minimized generation of unwanted EMI.

10.1 Layout Guidelines

To achieve optimal electrical and thermal performance, an optimized PCB layout is required. Figure 10-1 through Figure 10-3 show a typical PCB layout. The following are some considerations for an optimized layout.

- Use large copper areas for power planes (VIN, VOUT, and PGND) to minimize conduction loss and thermal stress.
- Place ceramic input and output capacitors close to the device pins to minimize high frequency noise.
- Locate additional output capacitors between the ceramic capacitor and the load.
- Connect AGND to PGND at a single point.
- Place $R_{FBT}$ and $R_{FBB}$ as close as possible to the FB pin.
- Use multiple vias to connect the power planes to internal layers.
- Download the EVM Design Files for fast board design

10.2 Layout Examples

![Figure 10-1. Typical Top-Layer Layout](image1)

![Figure 10-2. Typical Layer-2 Layout](image2)

![Figure 10-3. Typical PGND Layer](image3)
10.3 Theta JA versus PCB Area

The amount of PCB copper affects the thermal performance of the device. Figure 10-4 shows the effects of copper area on the junction-to-ambient thermal resistance ($R_{θJA}$) of the TPSM53603. The junction-to-ambient thermal resistance is plotted for a 4-layer PCB with PCB area from 30 cm$^2$ to 80 cm$^2$.

To determine the required copper area for an application:

1. Determine the maximum power dissipation of the device in the application by referencing the power dissipation graphs in Section 6.6 through Section 6.9.

2. Calculate the maximum $R_{θJA}$ using Equation 3 and the maximum ambient temperature of the application.

   $$R_{θJA} = \frac{(125°C - T_{A(max)})}{P_{D(max)}} \text{ (°C / W)}$$

   (3)

3. Reference Figure 10-4 to determine the minimum required PCB area for the application conditions.

Figure 10-4. $R_{θJA}$ versus PCB Area (per Layer)

11.2 Documentation Support

11.2.1 Related Documentation

For related documentation see the following:
- Texas Instruments, *Negative Output Voltage using the TPSM53602/3/4* application report

11.3 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on ti.com. Click on *Subscribe to updates* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

11.4 Support Resources

TI E2E™ support forums are an engineer's go-to source for fast, verified answers and design help — straight from the experts. Search existing answers or ask your own question to get the quick design help you need.

Linked content is provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's Terms of Use.

11.5 Trademarks

HotRod™ and TI E2E™ are trademarks of Texas Instruments.
are registered trademarks of Texas Instruments.
All other trademarks are the property of their respective owners.

11.6 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.
11.7 Glossary

**TI Glossary**

This glossary lists and explains terms, acronyms, and definitions.

12 Mechanical, Packaging, and Orderable Information

The following pages include mechanical packaging and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.
## PACKAGING INFORMATION

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines “RoHS” to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, “RoHS” products are suitable for use in specified lead-free processes. TI may reference these types of products as “Pb-Free”.

**RoHS Exempt:** TI defines “RoHS Exempt” to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines “Green” to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) **MSL, Peak Temp.** - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a “~” will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) **Lead finish/Ball material** - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.
NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. The package thermal pad must be soldered to the printed circuit board for optimal thermal and mechanical performance.
NOTES: (continued)

4. This package is designed to be soldered to a thermal pad on the board. For more information, see Texas Instruments literature number SLUA271 (www.ti.com/lit/slua271).

5. Vias are optional depending on application, refer to device data sheet. If any vias are implemented, refer to their locations shown on this view. It is recommended that vias under paste be filled, plugged or tented.
SOLDER PASTE EXAMPLE
BASED ON 0.125 mm THICK STENCIL

EXPOSED PAD 15:
56% PRINTED SOLDER COVERAGE BY AREA
SCALE: 16X

NOTES: (continued)

6. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
IMPORTANT NOTICE AND DISCLAIMER

TI PROVIDES TECHNICAL AND RELIABILITY DATA (INCLUDING DATASHEETS), DESIGN RESOURCES (INCLUDING REFERENCE DESIGNS), APPLICATION OR OTHER DESIGN ADVICE, WEB TOOLS, SAFETY INFORMATION, AND OTHER RESOURCES “AS IS” AND WITH ALL FAULTS, AND DISCLAIMS ALL WARRANTIES, EXPRESS AND IMPLIED, INCLUDING WITHOUT LIMITATION ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE OR NON-INFRINGEMENT OF THIRD PARTY INTELLECTUAL PROPERTY RIGHTS.
