

TPSM84203, TPSM84205, TPSM84212 1.5-A, 28-V Input, TO-220 Power Module

1 Features

- Complete Integrated Power Solution
- 3-Pin TO-220 Footprint
- Efficiencies up to 95%
- Fixed Output Voltage Options: 3.3 V, 5 V, and 12 V
- 400-kHz Switching Frequency
- Advanced Eco-mode™ Pulse Skip
- Pre-bias Output Start-up
- Over-Current Protection
- Output Over-Voltage Protection
- Thermal Shutdown
- Operating Junction Range: -40°C to $+125^{\circ}\text{C}$
- Operating Ambient Range: -40°C to $+85^{\circ}\text{C}$
- Meets EN55022 Class B Emissions
- Create a Custom Design Using the TPSM84203 with the [WEBENCH® Power Designer](#)

2 Applications

- 12-V, 24-V Distributed Power-Bus Supply
- Industrial White Goods
- Consumer
 - Audio
 - STB, DTV
 - Printer

3 Description

The TPSM842xx power module is an easy-to-use integrated power solution that combines a 1.5-A DC/DC converter with power MOSFETs, an inductor, and passives into a 3-pin, through-hole package. This total power solution requires adding only input and output capacitors and eliminates the loop compensation and magnetics part selection from the design process.

The standard TO-220 pin-out allows a much improved replacement of linear regulators packaged in this industry standard footprint. The TPSM842xx devices provide much higher efficiency without the need of a heatsink.

Device Information⁽¹⁾

PART NUMBER	PACKAGE	BODY SIZE (NOM)
TPSM84203	EAB	10 mm x 11 mm
TPSM84205		
TPSM84212

Pin Functions

PIN		I/O	DESCRIPTION
NAME	NO.		
GND	2		Ground. This is the return current path for the power stage of the device. Connect this pin to the bypass capacitors associated with VIN and VOUT.
VIN	1	I	Input Voltage. This pin supplies voltage to the control circuitry and power switches of the converter. Connect external bypass capacitors between this pin and GND.
VOUT	3	O	Output Voltage. This pin is connected to the internal output inductor. Connect this pin to the output load and connect external bypass capacitors between this pin and GND.

6 Specifications

6.1 Absolute Maximum Ratings

Over operating free-air temperature range (unless otherwise noted)⁽¹⁾

PARAMETER		MIN	MAX	UNIT
Input Voltage		−0.3	30	V
Output Voltage	TPSM84203	−0.3	3.9	V
	TPSM84205	−0.3	5.7	V
	TPSM84212	−0.3	13.0	V
Mechanical Shock	Mil-STD-883D, Method 2002.3, 1msec, 1/2 sine, mounted		1500	G
Mechanical Vibration	Mil-STD-883D, Method 2007.2, 20-2000Hz		10	G
Operating IC Junction Temperature range, T_J ⁽²⁾		−40	125	°C
Operating Ambient Temperature range, T_A ⁽²⁾		−40	85	°C
Storage temperature, T_{stg}		−60	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) The ambient temperature is the air temperature of the surrounding environment. The junction temperature is the temperature of the internal power IC when the device is powered. Operating below the maximum ambient temperature, as shown in the safe operating area (SOA) curves, ensures that the maximum junction temperature of any component inside the module is never exceeded.

6.2 Recommended Operating Conditions

Over operating free-air temperature range (unless otherwise noted)

PARAMETER		MIN	MAX	UNIT
V_{IN} Input voltage	TPSM84203	4.5	28	V
	TPSM84205	7	28	V
	TPSM84212	14.5	28	V
I_{OUT} Output current		0	1.5	A
T_A Operating ambient temperature range ⁽¹⁾		−40	85	°C
T_J Operating junction temperature range ⁽¹⁾		−40	125	°C

- (1) The ambient temperature is the air temperature of the surrounding environment. The junction temperature is the temperature of the internal power IC when the device is powered. Operating below the maximum ambient temperature, as shown in the safe operating area (SOA) curves, ensures that the maximum junction temperature of any component inside the module is never exceeded.

6.3 ESD Ratings

		VALUE	UNIT
$V_{(ESD)}$ Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	±2500	V
	Charged-device model (CDM), per JEDEC specification JESD22-C101 ⁽²⁾	±1500	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.4 Thermal Information

THERMAL METRIC ⁽¹⁾		TPSM842xx	
		EAB	UNIT
		3 PINS	
R _{θJA}	Junction-to-ambient thermal resistance ⁽²⁾	56	°C/W
ψ _{JT}	Junction-to-top characterization parameter ⁽³⁾	0.9	°C/W
ψ _{JB}	Junction-to-board characterization parameter ⁽⁴⁾	1.7	°C/W

- (1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) paper.
- (2) The junction-to-ambient thermal resistance, R_{θJA}, applies to devices soldered directly to a 50 mm × 50 mm double-sided PCB with 2 oz. copper and natural convection cooling. Additional airflow reduces R_{θJA}.
- (3) The junction-to-top characterization parameter, ψ_{JT}, estimates the junction temperature, T_J, of a device in a real system, using a procedure described in JESD51-2A (sections 6 and 7). T_J = ψ_{JT} × P_{dis} + T_T; where P_{dis} is the power dissipated in the device and T_T is the temperature of the top of the controller IC.
- (4) The junction-to-board characterization parameter, ψ_{JB}, estimates the junction temperature, T_J, of a device in a real system, using a procedure described in JESD51-2A (sections 6 and 7). T_J = ψ_{JB} × P_{dis} + T_B; where P_{dis} is the power dissipated in the device and T_B is the temperature of the module board 1 mm from the controller IC.

6.5 Electrical Characteristics

Over -40°C to +85°C free-air temperature range, V_{IN} = 24 V, I_{OUT} = I_{OUT} max, F_{SW} = 400 kHz, C_{IN} = 0.1μF, 50V ceramic; 10μF, 50V ceramic; 100μF, 35V electrolytic, and C_{OUT} = 2 × 47μF, 16V 1210 ceramic (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
INPUT VOLTAGE (VIN)						
V _{IN}	Input voltage range	Over V _{OUT} range	TPSM84203	4.5 ⁽¹⁾	28	V
			TPSM84205	7 ⁽¹⁾	28	V
			TPSM84212	14.5 ⁽¹⁾	28	V
V _{IN_UVLO}	V _{IN} under voltage lock out	V _{IN} increasing		4.1	4.4	V
		V _{IN} decreasing	3.3	3.6		V
OUTPUT VOLTAGE (VOUT)						
V _{OUT}	Output voltage	Over I _{OUT} range	TPSM84203	3.3		V
			TPSM84205	5.0		V
			TPSM84212	12.0		V
	Set-point voltage tolerance	T _A = 25°C, I _{OUT} = 0 A	-3%		+3%	
	Temperature variation ⁽²⁾	-40°C ≤ T _A ≤ 85°C, I _{OUT} = 0 A		0.4%		
	Line regulation	Over V _{IN} range, I _{OUT} = 1 A		0.4%		
	Load regulation	Over I _{OUT} range		0.5%		
	Output voltage ripple	20 MHz bandwidth, peak-to-peak, I _{OUT} > 500 mA		15		mV
OUTPUT CURRENT						
I _{OUT}	Output current	See SOA graph for derating over temperature.	0		1.5	A
	Overcurrent threshold			3.1		A
PERFORMANCE						
η	Efficiency ⁽³⁾	V _{IN} = 5 V, I _{OUT} = 1 A	V _{OUT} = 3.3 V	92%		
			V _{OUT} = 5.0 V	92%		
		V _{IN} = 12 V, I _{OUT} = 1 A	V _{OUT} = 3.3 V	91%		
			V _{OUT} = 5.0 V	92%		
			V _{OUT} = 3.3 V	87%		
			V _{OUT} = 5.0 V	90%		
V _{IN} = 24 V, I _{OUT} = 1 A	V _{OUT} = 12.0 V	94%				
	Transient response ⁽²⁾	1 A/μs load step, 25% to 75% I _{OUT} (max), C _{OUT} = 94 μF	V _{OUT} over/undershoot	4%		V _{OUT}
			Recovery time	100		μs

- (1) The minimum input voltage is the lowest ensured voltage that will produce the nominal output voltage. See the [Drop-Out Voltage](#) section for information on drop-out voltage.
- (2) Specified by design. Not production tested.
- (3) See the efficiency graphs in the Typical Characteristics section for efficiency over the entire load range.

Electrical Characteristics (continued)

Over -40°C to +85°C free-air temperature range, $V_{IN} = 24\text{ V}$, $I_{OUT} = I_{OUT\text{ max}}$, $F_{SW} = 400\text{ kHz}$, $C_{IN} = 0.1\mu\text{F}$, 50V ceramic; $10\mu\text{F}$, 50V ceramic; $100\mu\text{F}$, 35V electrolytic, and $C_{OUT} = 2 \times 47\mu\text{F}$, 16V 1210 ceramic (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
SOFT START						
T_{SS}	Internal soft start time ⁽²⁾			5		ms
THERMAL SHUTDOWN						
	Rising threshold ⁽²⁾			165		°C
	Hysteresis ⁽²⁾			10		°C
CAPACITANCE						
C_{IN}	External input capacitance	Ceramic type	10			μF
		Non-ceramic type	0	100		μF
C_{OUT}	External output capacitance	Ceramic type	TPSM84203	94	470	μF
			TPSM84205			
			TPSM84212	47	470	μF
		Total output capacitance	0	500 ⁽⁴⁾	μF	
	Equivalent series resistance (ESR)			35		m Ω

(4) The maximum output capacitance of 500 μF includes the combination of both ceramic and non-ceramic capacitors.

6.6 Switching Characteristics

Over operating free-air temperature range (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
F_{SW}	Switching frequency		290	400	510	kHz

6.7 Typical Characteristics ($V_{OUT} = 3.3\text{ V}$)

Typical characteristic data has been developed from actual products tested at 25°C. This data is considered typical for the device. Safe operating area curves were measured using a Texas Instruments evaluation module (EVM).

7 Detailed Description

7.1 Overview

The TPSM84203, TPSM84205, and TPSM84212 devices are 28 V input, 1.5 A, synchronous step down converters with PWM, MOSFETs, inductor, and control circuitry integrated into a TO-220 footprint package. The device integration enables small designs, while improving efficiency over a traditional linear regulator design. The TPSM842xx family provides fixed output voltages of 3.3 V, 5.0 V and 12.0 V. The fixed 400 kHz (typ) switching frequency allows small size and low output voltage ripple. Under light load conditions, these devices are designed to operate in high-efficiency pulse-skipping mode. These devices provide accurate voltage regulation for a variety of loads by using a precision internal voltage reference. These devices have been designed to safely start up into a pre-biased output voltage. Thermal shutdown and current limit features protect the device during an overload condition. The 3-pin, TO-220 footprint package offers improved performance over traditional linear regulators packaged in the standard footprint.

7.2 Functional Block Diagram

7.3 Feature Description

7.3.1 Input Capacitors

The TPSM842xx devices require a minimum input capacitance of 10 μF of ceramic type. High-quality ceramic type X5R or X7R capacitors with sufficient voltage rating are recommended. An additional 100 μF of non-ceramic capacitance is recommended for applications with transient load requirements. The voltage rating of input capacitors must be greater than the maximum input voltage.

Table 1. Recommended Input Capacitors⁽¹⁾

VENDOR	SERIES	PART NUMBER	CAPACITOR CHARACTERISTICS		
			WORKING VOLTAGE (V)	CAPACITANCE ⁽²⁾ (μF)	ESR ⁽³⁾ (m Ω)
Murata	X7R	GRM32ER71H475KA88L	50	4.7	2
TDK	X5R	C3225X5R1H106K250AB	50	10	3
Murata	X7R	GRM32ER71H106KA12	50	10	2
TDK	X7R	C3225X7R1H106M250AB	50	10	3
Panasonic	ZA	EEHZA1H101P	50	100	28

- (1) Consult capacitor suppliers regarding availability, material composition, RoHS and lead-free status, and manufacturing process requirements for any capacitors identified in this table.
 (2) Standard capacitance values
 (3) Maximum ESR @ 100kHz, 25°C.

7.3.2 Output Capacitors

The TPSM84203 and TPSM84205 devices require a minimum output capacitance of 94 μF (2x 47 μF) of ceramic type. The TPSM84212 device requires a minimum output capacitance of 47 μF of ceramic type. High-quality X5R or X7R ceramic capacitors with sufficient voltage rating are recommended. Additional output capacitance is recommended for applications with transient load requirements. The voltage rating of output capacitors must be greater than the maximum output voltage.

Table 2. Recommended Output Capacitors⁽¹⁾

VENDOR	SERIES	PART NUMBER	CAPACITOR CHARACTERISTICS		
			WORKING VOLTAGE (V)	CAPACITANCE ⁽²⁾ (μF)	ESR ⁽³⁾ (m Ω)
TDK	X5R	C3225X5R0J476K	6.3	47	2
Murata	X5R	GRM32ER61C476K	16	47	3

- (1) Consult capacitor suppliers regarding availability, material composition, RoHS and lead-free status, and manufacturing process requirements for any capacitors identified in this table.
 (2) Standard capacitance values.
 (3) Maximum ESR @ 100kHz, 25°C.

7.3.3 Drop-Out Voltage

The drop-out voltage of a voltage regulator is the difference between the input voltage and the output voltage that is required to maintain regulation. Figure 16 and Figure 17 show typical drop-out voltage graphs for TPSM84205 at ambient temperatures of 25°C and 85°C. Figure 18 and Figure 19 show typical drop-out voltage graphs for TPSM84212 at ambient temperatures of 25°C and 85°C.

7.3.4 Internal Soft-Start

The device starts up under control of the internal soft-start function. The internal soft start time is set to 5 ms typically.

7.3.5 Safe Startup into Pre-Biased Outputs

The device has been designed to prevent the low-side MOSFET from discharging a pre-biased output. During monotonic pre-biased startup, both high-side and low-side MOSFETs are not allowed to be turned on until the internal soft-start voltage is higher than the internal feedback voltage.

7.3.6 Over-Current Protection

The device is protected from overcurrent conditions by cycle-by-cycle current limiting. If an output overload condition occurs for more than 1.28 ms, the device shuts down and restarts after approximately 40 ms. The hiccup mode helps to reduce the device power dissipation under severe overcurrent conditions.

7.3.7 Output Over-Voltage Protection

An output over voltage protection circuit is incorporated to minimize output voltage overshoot when recovering from output fault conditions or strong unload transients. When the output voltage goes above $108\% \times V_{OUT}$, the high-side MOSFET is forced off. When the output voltage falls below $104\% \times V_{OUT}$, the high-side MOSFET is enabled again.

7.3.8 Thermal Shutdown

The internal thermal-shutdown circuitry forces the device to stop switching if the junction temperature exceeds 165°C typically. The device reinitiates the power-up sequence when the junction temperature drops below 155°C typically.

7.4 Device Functional Modes

7.4.1 Normal Operation

The TPSM842xx devices operate in Normal operation mode when the input voltage is above the minimum input voltage. In Normal operation mode, the device operates in continuous conduction mode (CCM) which occurs when inductor peak current is above 840 mA typically. In CCM, the TPSM842xx devices operate at a fixed frequency of 400 kHz (typ). In addition, to reduce EMI, the devices introduce frequency spread spectrum. The jittering frequency range is $\pm 6\%$ of the switching frequency with a 780 Hz modulation rate.

7.4.2 Eco-mode™ Operation

The TPSM842xx devices operate in Eco-mode operation in light load conditions. Eco-mode is a high-efficiency, pulse-skipping mode under light load conditions. Pulse skipping initiates when the switch current falls to 840 mA typically. During pulse skipping, the low-side FET turns off when the switch current falls to 0 A. The device takes on the characteristics of discontinuous conduction mode (DCM) operation and the apparent switching frequency decreases. As the output current decreases, the perceived time between switching pulses increases.

8 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Application Information

The TPSM842xx devices are step down DC-DC power modules. They convert a higher DC voltage to a lower DC voltage of 3.3 V, 5 V, or 12 V with a maximum output current of 1.5 A. The following design procedure can be used to select components for the TPSM842xx devices. Alternately, the WEBENCH® software may be used to generate complete designs. When generating a design, the WEBENCH software utilizes an iterative design procedure and accesses comprehensive databases of components. Please visit www.ti.com/WEBENCH for more details.

8.2 Typical Application

Copyright © 2017, Texas Instruments Incorporated

Figure 20. Typical Application

8.2.1 Design Requirements

For this design example, use the parameters listed in [Table 3](#) and follow the design procedures below.

Table 3. Design Parameters

DESIGN PARAMETER	VALUE
Input Voltage V_{IN}	24-V typical
Output Voltage V_{OUT}	5.0 V
Output Current Rating	1.5 A
Key care-about	TO-220 footprint, high efficiency

8.2.2 Detailed Design Procedure

8.2.2.1 Custom Design With WEBENCH® Tools

Click [here](#) to create a custom design using the TPSM84203 device with the WEBENCH® Power Designer.

1. Start by entering the input voltage (V_{IN}), output voltage (V_{OUT}), and output current (I_{OUT}) requirements.
2. Optimize the design for key parameters such as efficiency, footprint, and cost using the optimizer dial.
3. Compare the generated design with other possible solutions from Texas Instruments.

The WEBENCH Power Designer provides a customized schematic along with a list of materials with real-time pricing and component availability.

In most cases, these actions are available:

- Run electrical simulations to see important waveforms and circuit performance
- Run thermal simulations to understand board thermal performance
- Export customized schematic and layout into popular CAD formats
- Print PDF reports for the design, and share the design with colleagues

Get more information about WEBENCH tools at www.ti.com/WEBENCH.

8.2.2.2 Input and Output Capacitors

The TPSM842xx devices require both input and output capacitance for proper operation. The minimum required input capacitance for all of the TPSM842xx devices is 10 μF of ceramic capacitance placed directly at the device pins. The minimum required output capacitance for the TPSM84203 and TPSM84205 is $2 \times 47 \mu\text{F}$ of ceramic type. The TPSM84212 requires only one 47 μF ceramic output capacitor. Additional capacitance can be added to improve ripple or transient response.

For this application, the minimum required input capacitance of 10 μF , ceramic was added and $2 \times 47 \mu\text{F}$ ceramic capacitance was added to the output.

8.2.3 Application Curves

8.2.3.1 EMI

The TPSM842xx devices are all compliant with EN55022 Class B radiated emissions. Figure 23 to Figure 27 show typical examples of radiated emissions plots for the TPSM842xx devices. The EMI plots were taken using a web-orderable EVM with a resistive load. Input power was provided using a lead acid battery. All graphs show plots of the antenna in the horizontal and vertical positions.

Figure 23. Radiated Emissions 12-V Input, 3.3-V Output, 1.5-A Load, Horizontal and Vertical Antenna

Figure 24. Radiated Emissions 12-V Input, 5.0-V Output, 1.5-A Load, Horizontal and Vertical Antenna

Figure 26. Radiated Emissions 12-V Input, 5.0-V Output, 1.5-A Load, Horizontal and Vertical Antenna

Figure 27. Radiated Emissions 24-V Input, 12-V Output, 1.5-A Load, Horizontal and Vertical Antenna

9 Power Supply Recommendations

The TPSM842xx devices are designed to operate from an input voltage supply between 4.5 V and 28 V. This supply must be well regulated. Proper bypassing of input supply is critical for noise performance, as is PCB layout and grounding scheme. See the recommendations in the [Layout](#) section.

10 Layout

10.1 Layout Guidelines

To achieve optimal electrical and thermal performance, an optimized PCB layout is required. [Figure 28](#) shows a typical PCB layout. Some considerations for an optimized layout are:

- Use large copper areas for power planes (VIN, VOUT, and GND) to minimize conduction loss and thermal stress.
- Place ceramic input and output capacitors close to the device pins to minimize high frequency noise.
- Locate additional output capacitors between the ceramic capacitor and the load.
- Use multiple vias to connect the power planes to internal layers.

10.2 Layout Example

Figure 28.

11.6 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

11.7 Glossary

[SLYZ022](#) — *TI Glossary*.

This glossary lists and explains terms, acronyms, and definitions.

12 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

Orderable part number	Status (1)	Material type (2)	Package Pins	Package qty Carrier	RoHS (3)	Lead finish/ Ball material (4)	MSL rating/ Peak reflow (5)	Op temp (°C)	Part marking (6)
TPSM84203EAB	Active	Production	SIP MODULE (EAB) 3	80 TIW TRAY	Exempt	SN	N/A for Pkg Type	-40 to 125	
TPSM84205EAB	Active	Production	SIP MODULE (EAB) 3	80 TIW TRAY	Exempt	SN	N/A for Pkg Type	-40 to 125	
TPSM84212EAB	Active	Production	SIP MODULE (EAB) 3	80 TIW TRAY	Exempt	SN	N/A for Pkg Type	-40 to 125	

(1) **Status:** For more details on status, see our [product life cycle](#).

(2) **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

(3) **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

(4) **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

(5) **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.
