CDCDB800 DB800ZL-Compliant 8-Output Clock Buffer for PCIe Gen 1 to Gen 7

1 Features

- 8 LP-HCSL outputs with programmable integrated 85Ω (default) or 100Ω differential output terminations
- 8 hardware output enable (OE#) controls
- Additive phase jitter after PCIE Gen 7 filter: 11.3fs, RMS (maximum)
- Additive phase jitter after PCIE Gen 6 filter: 16.1fs, RMS (maximum)
- Additive phase jitter after PCIE Gen 5 filter: 25fs, RMS (maximum)
- Additive phase jitter after DB2000Q filter: 38fs, RMS (maximum)
- Supports Common Clock (CC) and Individual Reference (IR) architectures
  - Spread spectrum-compatible
- Output-to-output skew: < 50ps
- Input-to-output delay: < 3ns
- Fail-safe input
- Programmable output slew rate control
- 3.3V core and IO supply voltages
- Hardware-controlled low power mode (PD#)
- Current consumption: 72mA maximum
- 6mm × 6mm, 48-pin VQFN package

2 Applications

- Microserver & tower server
- Storage area network & host bus adapter card
- Network attached storage
- Hardware accelerator
- Rack server

3 Description

The CDCDB800 is a 8-output LP-HCSL, DB800ZL-compliant, clock buffer capable of distributing the reference clock for PCIe Gen 1-7, QuickPath Interconnect (QPI), UPI, SAS, and SATA interfaces. The SMBus interface and eight output enable pins allow the configuration and control of all eight outputs individually. The CDCDB800 is a DB800ZL derivative buffer and meets or exceeds the system parameters in the DB800ZL specification. The device also meets or exceeds the parameters in the DB2000Q specification. The CDCDB800 is packaged in a 6mm × 6mm, 48-pin VQFN package.

Package Information

PART NUMBER	PACKAGE(1)	PACKAGE SIZE(2)
CDCDB800	RSL (VQFN, 48)	6.00mm × 6.00mm

(1) For all available packages, see the orderable addendum at the end of the data sheet.
(2) The package size (length × width) is a nominal value and includes pins, where applicable.

Table of Contents

4 Pin Configuration and Functions

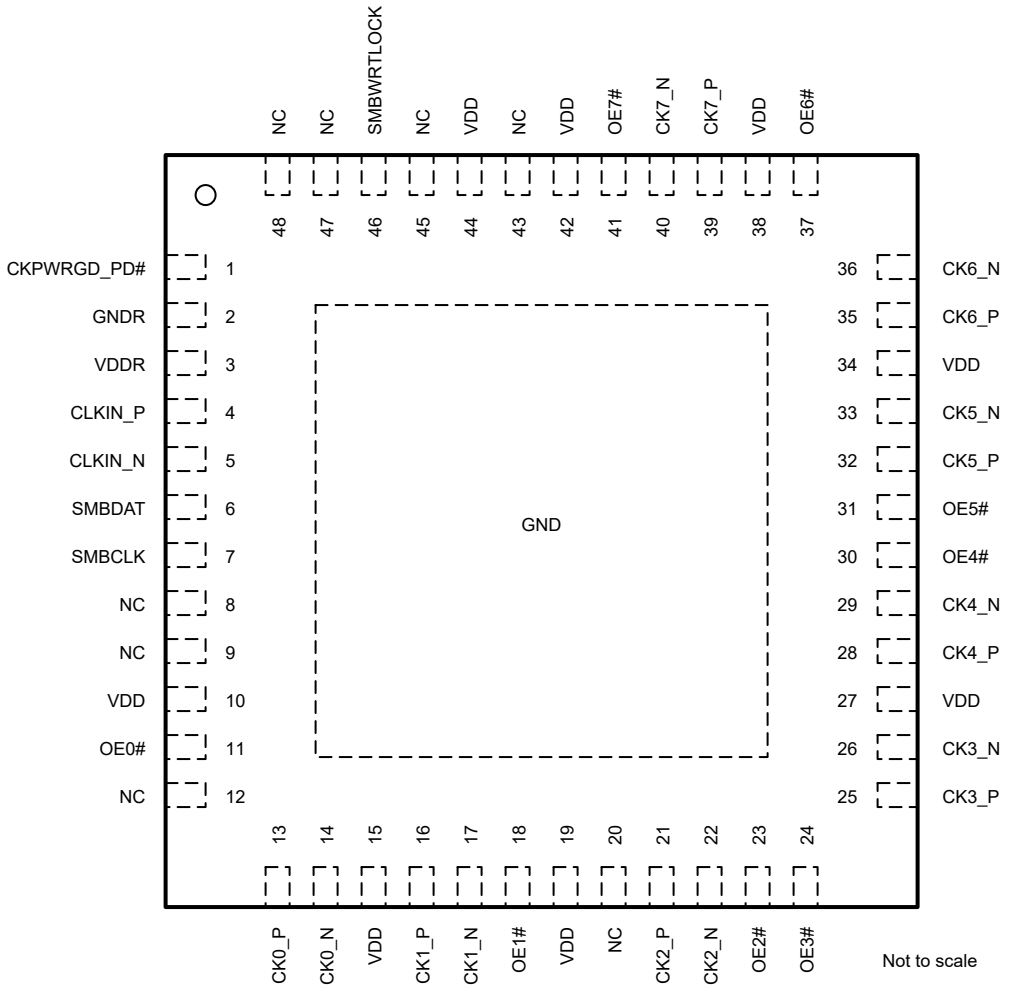

Figure 4-1. CDCDB800 RSL Package 48-Pin VQFN Top View

Table 4-1. Pin Functions CDCDB800

PIN		TYPE[2]	DESCRIPTION
NAME	NO.		
INPUT CLOCK			
CLKIN_P	4	I	LP-HCSL differential clock input. Typically connected directly to the differential output of clock source.
CLKIN_N	5	I	
OUTPUT CLOCKS			
CK0_P	13	O	LP-HCSL differential clock output of channel 0. Typically connected directly to PCIe differential clock input. If unused, the pins can be left no connect.
CK0_N	14	O	
CK1_P	16	O	LP-HCSL differential clock output of channel 1. Typically connected directly to PCIe differential clock input. If unused, the pins can be left no connect.
CK1_N	17	O	

Table 4-1. Pin Functions CDCDB800 (continued)

PIN		TYPE[2]	DESCRIPTION
NAME	NO.		
CK2_P	21	O	LP-HCSL differential clock output of channel 2. Typically connected directly to PCIe differential clock input. If unused, the pins can be left no connect.
CK2_N	22	O	
CK3_P	25	O	LP-HCSL differential clock output of channel 3. Typically connected directly to PCIe differential clock input. If unused, the pins can be left no connect.
CK3_N	26	O	
CK4_P	28	O	LP-HCSL differential clock output of channel 4. Typically connected directly to PCIe differential clock input. If unused, the pins can be left no connect.
CK4_N	29	O	
CK5_P	32	O	LP-HCSL differential clock output of channel 5. Typically connected directly to PCIe differential clock input. If unused, the pins can be left no connect.
CK5_N	33	O	
CK6_P	35	O	LP-HCSL differential clock output of channel 6. Typically connected directly to PCIe differential clock input. If unused, the pins can be left no connect.
CK6_N	36	O	
CK7_P	39	O	LP-HCSL differential clock output of channel 7. Typically connected directly to PCIe differential clock input. If unused, the pins can be left no connect.
CK7_N	40	O	
MANAGEMENT AND CONTROL [1]			
CKPWRGD_PD#	1	I, S, PD	Clock Power Good and Power Down multi-function input pin with internal 180kΩ pulldown. Typically connected to GPIO of microcontroller. If unused, the pin can be left no connect. After PWRGD has been asserted high for the first time, the pin becomes a PD# pin and the pin controls power-down mode: LOW: Power-down mode, all output channels tri-stated. HIGH: Normal operation mode.
OE0#	11	I, S, PD	Output Enable for channel 0 with internal 180kΩ pulldown, active low. Typically connected to GPIO of microcontroller. If unused, the pin can be left no connect. LOW: enable output channel 0. HIGH: disable output channel 0.
OE1#	18	I, S, PD	Output Enable for channel 1 with internal 180kΩ pulldown, active low. Typically connected to GPIO of microcontroller. If unused, the pin can be left no connect. LOW: enable output channel 1. HIGH: disable output channel 1.
OE2#	23	I, S, PD	Output Enable for channel 2 with internal 180kΩ pulldown, active low. Typically connected to GPIO of microcontroller. If unused, the pin can be left no connect. LOW: enable output channel 2. HIGH: disable output channel 2.
OE3#	24	I, S, PD	Output Enable for channel 3, with internal 180kΩ pulldown, active low. Typically connected to GPIO of microcontroller. If unused, the pin can be left no connect. LOW: enable output channel 3. HIGH: disable output channel 3.
OE4#	30	I, S, PD	Output Enable for channel 4, with internal 180kΩ pulldown, active low. Typically connected to GPIO of microcontroller. If unused, the pin can be left no connect. LOW: enable output channel 4. HIGH: disable output channel 4.
OE5#	31	I, S, PD	Output Enable for channel 5, with internal 180kΩ pulldown, active low. Typically connected to GPIO of microcontroller. If unused, the pin can be left no connect. LOW: enable output channel 5. HIGH: disable output channel 5.
OE6#	37	I, S, PD	Output Enable for channel 6 with internal 180kΩ pulldown, active low. Typically connected to GPIO of microcontroller. If unused, the pin can be left no connect. LOW: enable output channel 6. HIGH: disable output channel 6.
OE7#	41	I, S, PD	Output Enable for channel 7 with internal 180kΩ pulldown, active low. Typically connected to GPIO of microcontroller. If unused, the pin can be left no connect. LOW: enable output channel 7. HIGH: disable output channel 7.
SMBUS AND SMBUS ADDRESS			

Table 4-1. Pin Functions CDCDB800 (continued)

PIN		TYPE[2]	DESCRIPTION
NAME	NO.		
SMBDAT	6	I / O	Data pin of SMBus interface. Typically pulled up to 3.3V VDD using external pullup resistor. The recommended pullup resistor value is > 8.5k.
SMBCLK	7	I	Clock pin of SMBus interface. Typically pulled up to 3.3V VDD using external pullup resistor. The recommended pullup resistor value is > 8.5k.
SMBWRTLOCK	46	I, PD	SMBWRTLOCK: Disables write commands on SMBus. All writes is ignored when SMBWRTLOCK is asserted (reads are not affected). Internal 180kΩ pulldown, active high. 0 = SMBus write enabled. 1 = SMBus write disabled.
SUPPLY VOLTAGE AND GROUND			
GNDR	2	G	Ground.
VDDR	3	P	Power supply input for input clock receiver. Connect to 3.3V power supply rail with decoupling capacitor to GND. Place a 0.1µF capacitor close to each supply pin between power supply and ground.
VDD	10, 15, 19, 27, 34, 38, 42, 44	P	3.3V power supply for output channels and core voltage.
GND	DAP	G	Ground. Connect ground pad to system ground.
NO CONNECT			
NC	8, 9, 12, 20, 43, 45	—	Do not connect to GND or VDD.
NC	47, 48	—	No connect. Pins can be connected to GND, VDD, or otherwise tied to any potential within the Supply Voltage range stated in the Absolute Maximum Ratings.

(1) The “#” symbol at the end of a pin name indicates that the active state occurs when the signal is at a low voltage level. When “#” is not present, the signal is active high.

(2) The definitions below define the I/O type for each pin.

- I = Input
- O = Output
- I / O = Input / Output
- PU / PD = Internal 180kΩ pullup / Pulldown network biasing to VDD/2
- PD = Internal 180kΩ pulldown
- S = Hardware Configuration Pin
- P = Power Supply
- G = Ground

5 Specifications

5.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)(1)

		MIN	MAX	UNIT
V_{DD}, V_{DD_R}	Power supply voltage	−0.3	3.6	V
V_{IN}	IO input voltage	−0.3	3.6	V
T_J	Junction temperature		125	°C
T_{stg}	Storage temperature	−65	150	°C

(1) Operation outside the *Absolute Maximum Ratings* may cause permanent device damage. *Absolute Maximum Ratings* do not imply functional operation of the device at these or any other conditions beyond those listed under *Recommended Operating Conditions*. If used outside the *Recommended Operating Conditions* but within the *Absolute Maximum Ratings*, the device may not be fully functional, and this may affect device reliability, functionality, performance, and shorten the device lifetime.

5.2 ESD Ratings

			VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins(1)	±3500	V
		Charged device model (CDM), per JEDEC specification JESD22-C101, all pins(2)	±1000	

(1) JEDEC document JEP155 states that 500VHBM allows safe manufacturing with a standard ESD control process.
(2) JEDEC document JEP157 states that 250VCDM allows safe manufacturing with a standard ESD control process.

5.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
V_{DD}	IO, Core supply voltage	3	3.3	3.6	V
V_{DD_R}	Input supply voltage	3	3.3	3.6	V
T_A	Ambient temperature	−40		105	°C

5.4 Thermal Information

THERMAL METRIC(1)		Device Package RSL (QFN) 48 PINS	UNIT
$R_{\theta JA}$	Junction-to-ambient thermal resistance	32.2	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	22.3	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	14.3	°C/W
Ψ_{JT}	Junction-to-top characterization parameter	0.5	°C/W
Ψ_{JB}	Junction-to-board characterization parameter	14.2	°C/W
$R_{\theta JC(bot)}$	Junction-to-case (bottom) thermal resistance	6.1	°C/W

(1) For more information about traditional and new thermal metrics, see the Semiconductor and IC Package Thermal Metrics application note.

5.5 Electrical Characteristics

VDD, VDD_R = 3.3V ±5%, −40°C≤ T_A ≤ 105°C. Typical values are at VDD = VDD_R = 3.3V, 25°C(unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
CURRENT CONSUMPTION						
I_{DD_R}	Core supply current	Active mode. CKPWRGD_PD# = 1			9	mA
		Power down mode. CKPWRGD_PD# = 0			2.2	
I_{DD}	IO supply current	All outputs disabled			18	mA
		All outputs active, 100MHz (Per output)			7.8	
		Power down mode. CKPWRGD_PD# = 0			1.5	
CLOCK INPUT						
f_{IN}	Input frequency		50	100	250	MHz
V_{IN}	Input voltage swing	Differential voltage between CLKIN_P and CLKIN_N(1)	200		2300	$mV_{Diff-peak}$
dV/dt	Input voltage edge rate	20% - 80% of input swing	0.7			V/ns
DV_{CROSS}	Total variation of V_{CROSS}	Total variation across V_{CROSS}		140		mV
DC_{IN}	Input duty cycle		40		60	%
C_{IN}	Input capacitance(2)	Differential capacitance between CLKIN_P and CLKIN_N pins		2.2		pF
CLOCK OUTPUT						
f_{OUT}	Output frequency		50	100	250	MHz
C_{OUT}	Output capacitance(1)	Differential capacitance between CKx_P and CKx_N pins		4		pF
V_{OH}	Output high voltage	Single-ended(2) (3)	225		270	mV
V_{OL}	Output low voltage		10		150	
V_{HIGH}	Output high voltage	Measured into an AC load as defined in DB800ZL	660		850	
V_{LOW}	Output low voltage	Measured into an AC load as defined in DB800ZL	–150		150	
V_{MAX}	Output Max voltage	Measured into an AC load as defined in DB800ZL			1150	
V_{CROSS}	Crossing point voltage	(3) (4)	130		200	
$V_{CROSSAC}$	Crossing point voltage (AC load)	Measured into an AC load as defined in DB800ZL	250		550	
DV_{CROSS}	Total variation of V_{CROSS}	Variation of V_{CROSS} (3) (4)		35	140	
V_{ovs}	Overshoot voltage	(3)			V_{OH}+75	
$V_{ovs(AC)}$	Overshoot voltage (AC load)	Measured into an AC load as defined in DB800ZL			V_{HIGH}+300	
V_{uds}	Undershoot voltage	(3)			V_{OL}–75	
$V_{uds(AC)}$	Undershoot voltage	Measured into an AC load as defined in DB800ZL			V_{LOW}–300	mV
V_{rb}	Ringback Voltage	Measured into an AC load as defined in DB800ZL and taken from Single Ended waveform (relative to V_{HIGH} and V_{LOW})	-0.2		0.2	V
Z_{DIFF}	Differential impedance (Default setting, 85Ω)	Measured at V_{OL}/V_{OH}	81	85	89	Ω
	Differential impedance (Output impedance selection bit =1, 100Ω)	Measured at V_{OL}/V_{OH}	95	100	105	
Z_{DIFF_CROSS}	Differential impedance (Default setting, 85Ω)	Measured at V_{CROSS}	68	85	102	
	Differential impedance (Output impedance selection bit = 1, 100Ω)	Measured at V_{CROSS}	80	100	120	

VDD, VDD_R = 3.3V ±5%, −40°C≤ T_A ≤ 105°C. Typical values are at VDD = VDD_R = 3.3V, 25°C(unless otherwise noted)

PARAMETER		TEST CONDITIONS		MIN	TYP	MAX	UNIT
t_{EDGE}	Differential edge rate	Measured (±150mV) around V_{CROSS} (7)		2		4	V/ns
Dt_{EDGE}	Edge rate matching	Measured (±75mV) V_{CROSS} (7)				20	%
t_{STABLE}	Power good assertion to stable clock output	CKPWRGD_PD# pin transitions from 0 to 1, f_{IN} = 100MHz	Measured when positive output reaches 0.2V			1.8	ms
$t_{DRIVE\_PD\#}$	Power good assertion to outputs driven high	CKPWRGD_PD# pin transitions from 0 to 1, f_{IN} = 100MHz	Measured when positive output reaches 0.2V			300	µs
t_{OE}	Output enable assertion to stable clock output	OEx# pin transitions from 1 to 0				10	CLKIN Periods
t_{OD}	Output enable de-assertion to no clock output	OEx# pin transitions from 0 to 1				10	
t_{PD}	Power down assertion to no clock output	CKPWRGD_PD# pin transitions from 1 to 0				3	
t_{DCD}	Duty cycle distortion	Differential; f_{IN} = 100MHz, f_{IN_DC} = 50%		–1		1	%
t_{DLY}	Propagation delay	(5)		0.5		3	ns
t_{SKEW}	Skew between outputs	(6)				50	ps
$t_{DELAY(IN-OUT)}$	Input to output delay variation	Input-to-output delay variation at 100MHz across voltage and temperature		–250		250	ps
$J_{CKx\_DB2000Q}$ (7)	Additive jitter for DB2000Q	DB2000Q filter, for input of 200mV differential swing at 1.5V/ns				0.038	ps, RMS
J_{CKx_PCIE} (7)	Additive jitter for PCIe7.0	PCIe7.0 filter	PCIe7.0 filter			11.3	fs, RMS
J_{CKx_PCIE} (7)	Additive jitter for PCIe6.0	PLL BW: 0.5 - 1MHz; CDR = 10MHz	Input clock slew rate = 2V/ns			16.1	fs, RMS
	Additive jitter for PCIe5.0	PCIe5.0 filter				25	
	Additive jitter for PCIe4.0	PLL BW = 2 to 5MHz; CDR = 10MHz	Input clock slew rate ≥ 1.8V/ns			62	
	Additive jitter for PCIe3.0		Input clock slew rate ≥ 0.6V/ns			100	
J_{CKx}	Additive jitter	f_{IN} = 100MHz; slew rate ≥ 3V/ns; 12kHzto 20MHz integration bandwidth.			100	160	fs, RMS
NF	Noise floor	f_{IN} = 100MHz; f_{Offset} ≥ 10MHz	Input clock slew rate ≥ 3V/ns		–160	-155	dBc/Hz
SMBUS INTERFACE, OEx#, CKPWRGD_PD#							
V_{IH}	High level input voltage			2.0			V
V_{IL}	Low level input voltage					0.8	
I_{IH}	Input leakage current	With internal pull-up/pull-down	GND ≤ V_{IN} ≤ V_{DD}	–30		30	µA
I_{IL}	Input leakage current	With internal pull-up/pull-down	GND ≤ V_{IN} ≤ V_{DD}	–30		30	µA
I_{IH}	Input leakage current	Without internal pull-up/pull-down	GND ≤ V_{IN} ≤ V_{DD}	−5		5	µA

VDD, VDD_R = 3.3V ±5%, −40°C≤ T_A ≤ 105°C. Typical values are at VDD = VDD_R = 3.3V, 25°C(unless otherwise noted)

PARAMETER		TEST CONDITIONS		MIN	TYP	MAX	UNIT
I_{IL}	Input leakage current	Without internal pull-up/pull-down	GND ≤ V_{IN} ≤ V_{DD}	−5		5	µA
C_{IN}	Input capacitance				4.5		pF
C_{OUT}	Output capacitance				4.5		pF
I_{IH}	Input leakage current	With internal pull-up/pull-down	V_{IN} = V_{DD}	–30		30	µA
C_{IN}	Input capacitance(1)				4.5		pF

(1) Voltage swing includes overshoot.
(2) Not tested in production. Verified by design and characterization.
(3) Measured into DC test load.
(4) V_{CROSS} is single-ended voltage when CKx_P = CKx_N with respect to system ground. Only valid on rising edge of CKx, when CKx_P is rising.
(5) Measured from rising edge of CLK_IN to any CKx output.
(6) Measured from rising edge of any CKx output to any other CKx output.
(7) Measured into AC test load.

5.6 Timing Requirements

VDD, VDD_R = 3.3V± 5 %, −40°C≤ T_A ≤ 105 °C. Typical values are at VDD = VDD_A = 3.3 V, 25°C(unless otherwise noted)

			MIN	NOM	MAX	UNIT
SMBUS-COMPATIBLE INTERFACE TIMING						
f_{SMB}	SMBus operating frequency		10		400	kHz
t_{BUF}	Bus free time between STOP and START		4.7			µs
t_{HD_STA}	START condition hold time	SMBCLK low after SMBDAT low	4			
t_{SU_STA}	START condition setup time	SMBCLK high before SMBDAT low	4.7			
t_{SU_STO}	STOP condition setup time		4			
t_{HD_DAT}	SMBDAT hold time		300			ns
t_{SU_DAT}	SMBDAT setup time		250			
$t_{TIMEOUT}$	Detect SMBCLK low timeout	In terms of device input clock frequency	1e6			cycles
t_{LOW}	SMBCLK low period		4.7			µs
t_{HIGH}	SMBCLK high period		4		50	
t_F	SMBCLK/SMBDAT fall time(1)				300	ns
t_R	SMBCLK/SMBDAT rise time(2)				1000	

(1) TF = (VIHMIN + 0.15) to (VILMAX - 0.15)
(2) TR = (VILMAX - 0.15) to (VIHMIN + 0.15)

5.7 Typical Characteristics

Figure 5-1 shows both the phase noise of the source as well as the output of the DUT (CDCDB800). The phase noise plot shows that the DUT has a very low phase noise profile with total jitter of 71 fs, rms. By rms subtracting the clock reference noise, the additive jitter of CDCDB800 under typical conditions is lower than 71fs, rms.

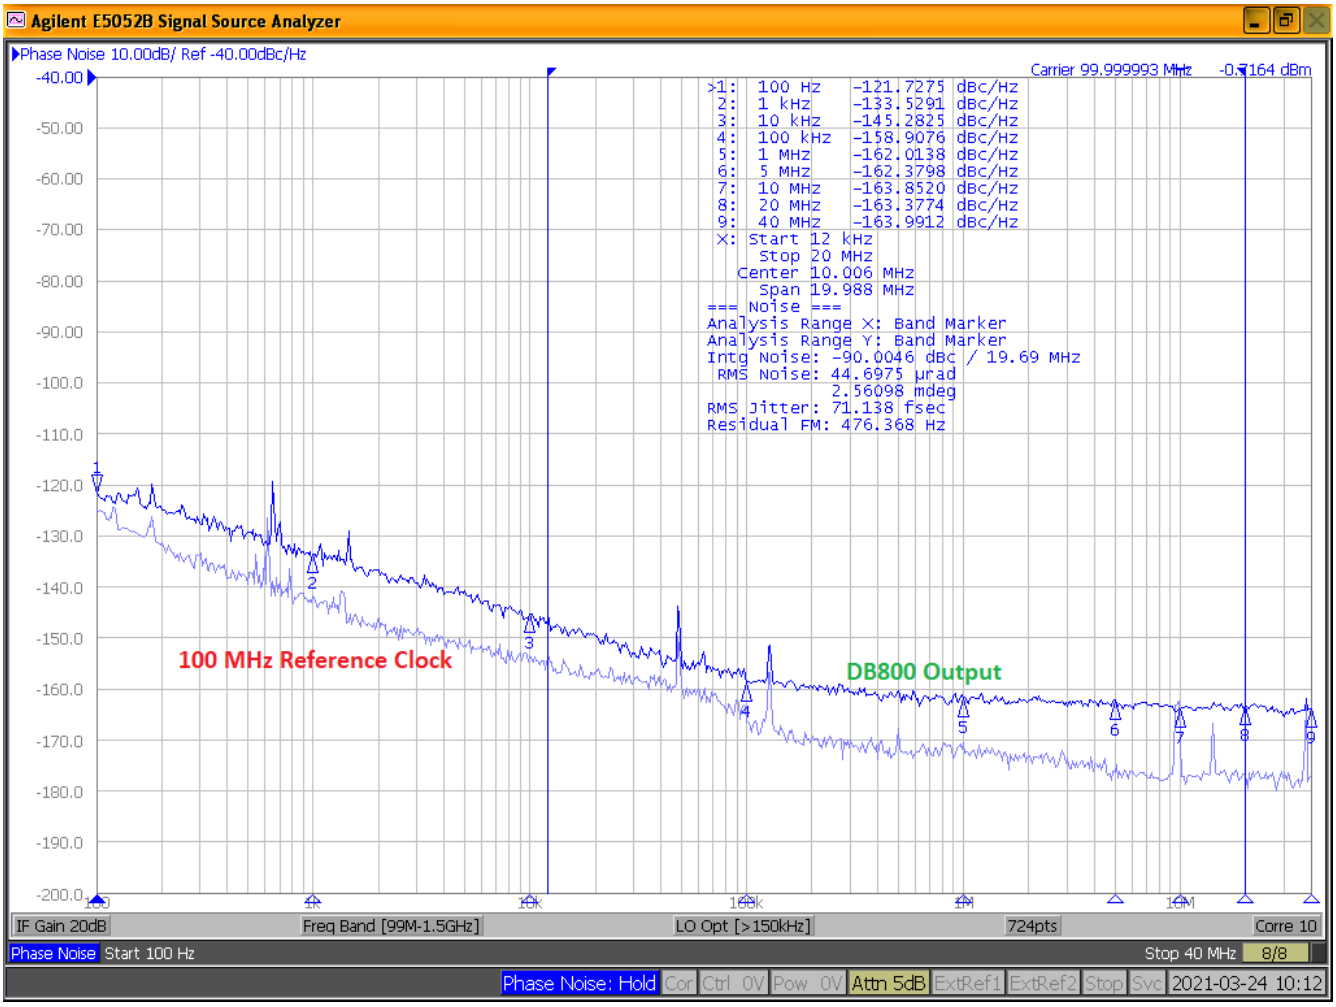

Figure 5-1. CDCDB800 Clock Out (CK0:8) Phase Noise

6 Parameter Measurement Information

R1 = 47Ω and R2 = 147Ω.

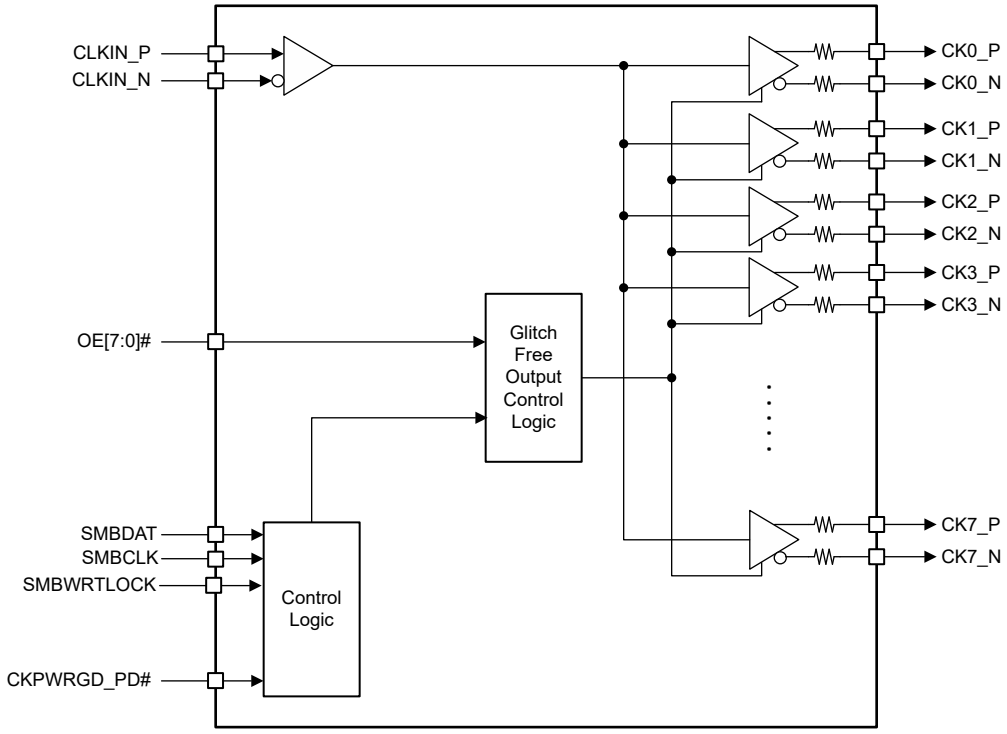
Figure 6-2. DC Simulation Load (Referencing Intel DB2000QL Document)

7 Detailed Description

7.1 Overview

The CDCDB800 is a low additive-jitter, low propagation delay clock buffer designed to meet the strict performance requirements for PCIe Gen 1-7, QPI, UPI, SAS, and SATA reference clocks. The CDCDB800 allows buffering and replication of a single clock source to up to eight individual outputs in the LP-HCSL format. The CDCDB800 also includes status and control registers accessible by an SMBus version 2.0 compliant interface. The device integrates a large amount of external passive components to reduce overall system cost.

7.2 Functional Block Diagram



7.3 Feature Description

7.3.1 Fail-Safe Input

The CDCDB800 is designed to support fail-safe input operation feature. This feature allows the user to drive the device inputs before V_{DD} is applied without damaging the device. Refer to the *Absolute Maximum Ratings* table for more information on the maximum input supported by the device.

7.3.2 Output Enable Control

The CDCDB800 uses SMBus and OE# to control the state of the output channels. The OE# pins control the state of the output with the same number. For example, the OE5# pin controls the state of the CK5 output driver. The SMBus registers can enable or disable the output when the corresponding OE# pin is held low.

7.3.3 SMBus

The CDCDB800 has an SMBus interface that is active only when CKPWRGD_PD# = 1. The SMBus allows individual enable/disable of each output.

When CKPWRGD_PD# = 0, the SMBus pins are placed in a Hi-Z state, but all register settings are retained. The SMBus register values are only retained while V_{DD} remains inside of the recommended operating voltage.

7.3.3.1 SMBus Address Assignment

The CDCDB800 responds to SMBus address of 0xD8 for write operations (Read/Write = 0), and 0xD9 for read operations (Read/Write = 1).

7.4 Device Functional Modes

7.4.1 CKPWRGD_PD# Function

The CKPWRGD_PD# pin is used to set two state variables inside of the device: PWRGD and PD#. The PWRGD and PD# variables control which functions of the device are active at any time, as well as the state of the input and output pins.

The PWRGD and PD# states are multiplexed on the CKPWRGD_PD# pin. CKPWRGD_PD# must remain below V_{OL} and not exceed V_{DDR} + 0.3V until V_{DD} and V_{DDR} are present and within the recommended operating conditions. After CKPWRGD_PD# is set high, a valid CLKIN must be present to use PD#.

The first rising edge of the CKPWRGD_PD# pin sets PWRGD = 1. After PWRGD is set to 1, the CKPWRGD_PD# pin is used to assert PD# mode only. PWRGD variable only clears to 0 with the removal of V_{DD} and V_{DDR}.

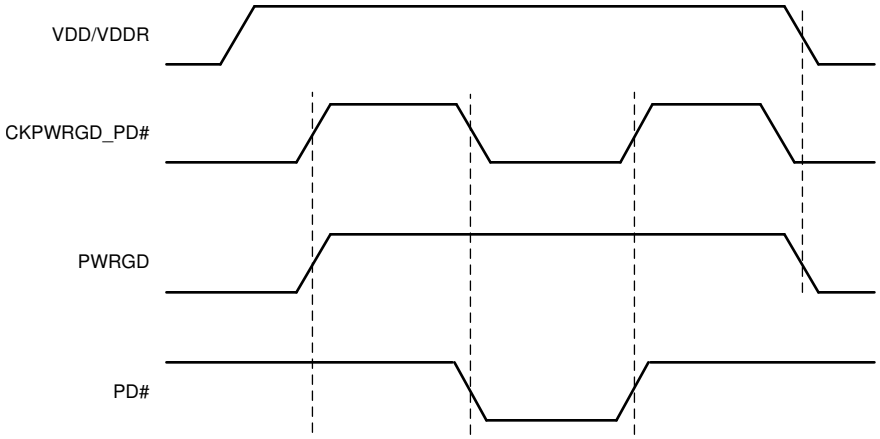


Figure 7-1. PWRGD and PD# State Changes

7.4.2 OE[7:0]# and SMBus Output Enables

Each output channel, 0 to 7, can be individually enabled or disabled by a SMBus control register bit, called SMB enable bits. Additionally, each output channel has a dedicated, corresponding, OE[7:0]# hardware pin. The OE[7:0]# pins are asynchronously asserted-low signals that can enable or disable the output.

Refer to Table 7-1 for enabling and disabling outputs through the hardware and software. Note that both the SMB enable bit must be a 1 and the OEx# pin must be an input low voltage 0 for the output channel to be active.

Table 7-1. OE[7:0]# Functionality

Control Inputs	Power State Variables (Internal)		CLKIN	OE[7:0]# HARDWARE PINS AND SMBus CONTROL REGISTER BITS			CK[7:0]_P/ CK[7:0]_N
CKPWRGD_PD#	PWRGD	PD#		OE[7:0]#	OUT_EN_CLK[7:0]	DRIVE_OP_STATE_CTRL	
0	0	0	X	X	X	X	LOW/LOW
1	1	1	X[1]	X	0	0	LOW/LOW
						1	TRI-STATE
				1	X	0	LOW/LOW
						1	TRI-STATE
			Running[1]	0	1	X	Running
0		0	X[2]	X	X	0	LOW/LOW
						1	TRI-STATE

(1) To enter the power-down state, CLKIN must remain active for at least 3 clock cycles after CKPWRGD_PD# transitions from 1 to 0.
(2) To enter the powered-up state with active clock outputs, CLKIN must be active before CKPWRGD_PD# transitions from 0 to 1.

7.4.3 Output Slew Rate Control

The CDCDB800 provides output slew rate control feature which customer can use to compensate for increased output trace length based on the board design. The slew rate of a bank of 4 outputs 0 to 3 and 4 to 7, can be changed within a given range by a SMBus control register called CAPTRIM. Refer to Table 8-13 for more information.

7.4.4 Output Impedance Control

The integrated termination on the CDCDB800 can be programmed either for 85Ω or 100Ω. This flexibility verifies that the customer can use the same device across various applications irrespective of the characteristic board impedance which is typically either 85Ω or 100Ω. This termination resistor can be changed for all the outputs as whole using bit 5 of a register called OUTSET. Refer to Table 8-11 for more information.

7.5 Programming

The CDCDB800 uses SMBus to program the states of the eight output drivers. See *SMBus* for more information on the SMBus programming, and *Register Maps* for information on the registers.

Table 7-2. Command Code Definition

BIT	DESCRIPTION
7	0 = *Block Read* or *Block Write* operation 1 = *Byte Read* or *Byte Write* operation
(6:0)	Register address for *Byte* operations, or starting register address for *Block*, operations

8 Register Maps

8.1 CDCDB800 Registers

Table 8-1 lists the CDCDB800 registers. All register locations not listed in Table 8-1 must be considered as reserved locations and the register contents must not be modified.

Table 8-1. CDCDB800 Registers

Address	Acronym	Register Name	Section
0h	RCR1	Reserved Control Register 1	Go
1h	OECR1	Output Enable Control 1	Go
2h	OECR2	Output Enable Control 2	Go
3h	OERDBK	Output Enable# Pin Read Back	Go
4h	RCR2	Reserved Control Register 2	Go
5h	VDRREVID	Vendor/Revision Identification	Go
6h	DEVID	Device Identification	Go
7h	BTRDCNT	Byte Read Count Control	Go
8h	OUTSET	Output Setting Control	Go
4Ch	CAPTRIM	Slew Rate Capacitor Cluster 1 & 2	Go

Complex bit access types are encoded to fit into small table cells. Table 8-2 shows the codes that are used for access types in this section.

Table 8-2. CDCDB800 Access Type Codes

Access Type	Code	Description
Read Type		
R	R	Read
Write Type		
W	W	Write
Reset or Default Value		
-n		Value after reset or the default value

8.1.1 RCR1 Register (Address = 0h) [reset = 47h]

RCR1 is shown in Table 8-3.

Return to the Summary Table.

The RCR1 register contains reserved bits.

Table 8-3. RCR1 Register Field Descriptions

Bit	Field	Type	Reset	Description
7-4	Reserved	R	4h	Reserved.
3-0	Reserved	R/W	7h	Writing to these bits does not affect the functionality of the device.

8.1.2 OECR1 Register (Address = 1h) [reset = FFh]

OECR1 is shown in OECR1 Register Field Descriptions.

Return to the Summary Table.

The OECR1 register contains bits that enable or disable individual output clock channels [5:0].

Table 8-4. OECR1 Register Field Descriptions

Bit	Field	Type	Reset	Description
7	OUT_EN_CLK5	R/W	1h	This bit controls the output enable signal for output channel CK5_P/CK5_N. 0h = Output Disabled 1h = Output Enabled
6	OUT_EN_CLK4	R/W	1h	This bit controls the output enable signal for output channel CK4_P/CK4_N. 0h = Output Disabled 1h = Output Enabled
5	OUT_EN_CLK3	R/W	1h	This bit controls the output enable signal for output channel CK3_P/CK3_N. 0h = Output Disabled 1h = Output Enabled
4	OUT_EN_CLK2	R/W	1h	This bit controls the output enable signal for output channel CK2_P/CK2_N. 0h = Output Disabled 1h = Output Enabled
3	Reserved	R/W	1h	Writing to this bit does not affect the functionality of the device.
2	OUT_EN_CLK1	R/W	1h	This bit controls the output enable signal for output channel CK1_P/CK1_N. 0h = Output Disabled 1h = Output Enabled
1	OUT_EN_CLK0	R/W	1h	This bit controls the output enable signal for output channel CK0_P/CK0_N. 0h = Output Disabled 1h = Output Enabled
0	Reserved	R/W	1h	Writing to this bit does not affect the functionality of the device.

8.1.3 OECR2 Register (Address = 2h) [reset = 0Fh]

OECR2 is shown in OECR2 Register Field Descriptions.

Return to the Summary Table.

The OECR2 register contains bits that enable or disable individual output clock channels [7:6].

Table 8-5. OECR2 Register Field Descriptions

Bit	Field	Type	Reset	Description
7-3	Reserved	R/W	1h	Writing to these bits does not affect the functionality of the device.
2	OUT_EN_CLK7	R/W	1h	This bit controls the output enable signal for output channel CK7_P/CK7_N. 0h = Output Disabled 1h = Output Enabled
1	Reserved	R/W	1h	Writing to this bit does not affect the functionality of the device.
0	OUT_EN_CLK6	R/W	1h	This bit controls the output enable signal for output channel CK6_P/CK6_N. 0h = Output Disabled 1h = Output Enabled

8.1.4 OERDBK Register (Address = 3h) [reset = 0h]

OERDBK is shown in Table 8-6.

Return to the Summary Table.

The OERDBK register contains bits that report the current state of the OE[7:0]# input pins.

Table 8-6. OERDBK Register Field Descriptions

Bit	Field	Type	Reset	Description
7	RB_OE7	R	0h	This bit reports the logic level present on the OE7# pin.
6	RB_OE6	R	0h	This bit reports the logic level present on the OE6# pin.
5	RB_OE5	R	0h	This bit reports the logic level present on the OE5# pin.
4	RB_OE4	R	0h	This bit reports the logic level present on the OE4# pin.
3	RB_OE3	R	0h	This bit reports the logic level present on the OE3# pin.
2	RB_OE2	R	0h	This bit reports the logic level present on the OE2# pin.
1	RB_OE1	R	0h	This bit reports the logic level present on the OE1# pin.
0	RB_OE0	R	0h	This bit reports the logic level present on the OE0# pin.

8.1.5 RCR2 Register (Address = 4h) [reset = 0h]

RCR2 is shown in RCR2 Register Field Descriptions.

Return to the Summary Table.

The RCR2 register contains reserved bits.

Table 8-7. RCR2 Register Field Descriptions

Bit	Field	Type	Reset	Description
7-0	Reserved	R	0h	Reserved.

8.1.6 VDRREVID Register (Address = 5h) [reset = 0Ah]

VDRREVID is shown in Table 8-8.

Return to the Summary Table.

The VDRREVID register contains a vendor identification code and silicon revision code.

Table 8-8. VDRREVID Register Field Descriptions

Bit	Field	Type	Reset	Description
7-4	REV_ID	R	0h	Silicon revision code. Silicon revision code bits [3:0] map to register bits [7:4] directly.
3-0	VENDOR_ID	R	Ah	Vendor identification code. Vendor ID bits [3:0] map to register bits [3:0] directly.

8.1.7 DEVID Register (Address = 6h) [reset = E7h]

DEVID is shown in Table 8-9.

Return to the Summary Table.

The DEVID register contains a device identification code.

Table 8-9. DEVID Register Field Descriptions

Bit	Field	Type	Reset	Description
7-0	DEV_ID	R	E7h	Device ID code. Device ID bits[7:0] map to register bits[7:0] directly.

8.1.8 BTRDCNT Register (Address = 7h) [reset = 8h]

BTRDCNT is shown in Table 8-10.

Return to the Summary Table.

The BTRDCNT register contains bits [4:0] which configure the number of bytes which is read back.

Table 8-10. BTRDCNT Register Field Descriptions

Bit	Field	Type	Reset	Description
7-5	Reserved	R/W	0h	Writing to these bits does not affect the functionality of the device.
4	BYTE_COUNTER	R/W	0h	Writing to this register configures how many bytes are read back.
3-0	BYTE_COUNTER	R/W	8h	

8.1.9 OUTSET Register (Address = 8h) [reset = 0h]

OUTSET is shown in Table 8-11.

Return to the Summary Table.

Bit5 of the OUTSET register sets the termination for all the outputs while bit4 can be used to set the power-down state for all outputs. The remaining bits for this register are reserved.

Table 8-11. OUTSET Register Field Descriptions

Bit	Field	Type	Reset	Description
7-6	Reserved	R	0h	Reserved.
5	CH_ZOUT_SEL	R/W	0h	Select between 85Ω (0) and 100Ω (1) Output impedance
4	d_DRIVE_OP_STATE_CTRL	R/W	0h	Power-down state of all output clocks. 0: LOW/LOW 1: TRI_STATE
3-0	Reserved	R/W	0h	Register bits can be written to 0. Writing a different value than 0 affects the device functionality.

8.1.10 CAPTRIM Register (Address = 4Ch) [reset = 66h]

CAPTRIM is shown in Table 8-13.

Return to the Summary Table.

Bits [7:4] of the CAPTRIM register is used to control the slew rate for output channel cluster 2. Bits [3:0] control the slew rate for output channel cluster 1. Refer below for cluster identification.

Table 8-12. Cluster Identification

Cluster	Outputs
1	CK3, CK2, CK1, CK0
2	CK7, CK6, CK5, CK4

Table 8-13. CAPTRIM Register Field Descriptions

Bit	Field	Type	Reset	Description
7-4	CLUSTER2_CAP_TRIM	R/W	6h	Slew Rate Reduction Cap Trim for Cluster 2. Default value of 6h. 0: minimum F: maximum
3-0	CLUSTER1_CAP_TRIM	R/W	6h	Slew Rate Reduction Cap Trim for Cluster 1. Default value of 6h. 0: minimum F: maximum

9 Application and Implementation

Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

9.1 Application Information

The CDCDB800 is a fanout buffer that supports PCIe generation 6 and PCIe generation 7 REFCLK distribution. The device is used to distribute up to eight copies of a typically 100MHzclock.

9.2 Typical Application

Figure 9-1 shows a CDCDB800 typical application. In this application, a clock generator provides a 100MHz reference to the CDCDB800 which then distributes that clock to PCIe endpoints. The clock generator can be a discrete clock generator like the CDCI6214 or the clock generator can be integrated in a larger component such as a Platform Controller Hub (PCH) or application processor.

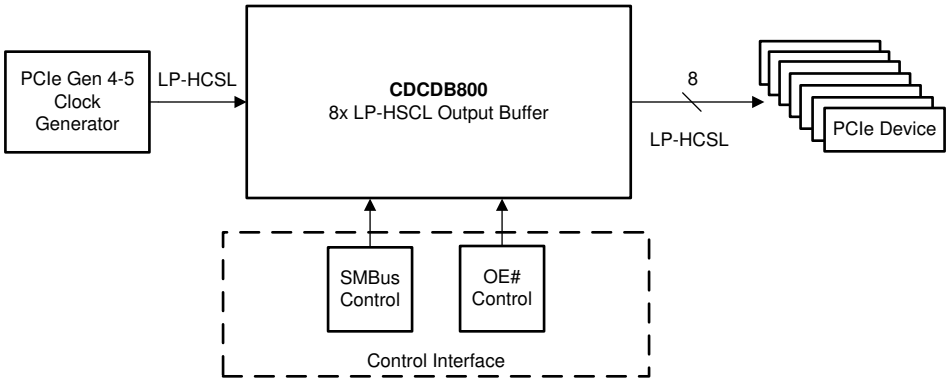

Figure 9-1. Typical Application

9.2.1 Design Requirements

Consider a typical server motherboard application which must distribute a 100MHz PCIe reference clock from the PCH of a processor chipset to multiple endpoints. An example of clock input and output requirements is:

- Clock Input:
  - 100MHz LP-HCSL
- Clock Output:
  - 2x 100MHz to processors, LP-HCSL
  - 3x 100MHz to riser/retimer, LP-HCSL
  - 3x 100MHz to DDR memory controller, LP-HCSL

9.2.2 Detailed Design Procedure

The following items must be determined before starting design of a CDCDB2000 socket:

- Output Enable Control Method

9.2.2.1 Output Enable Control Method

The device provides an option to either use SMBus programmed registers (software) to control the outputs or by using the hardware OE# pins. In case of using software to control the outputs, the hardware OE# pins can be left floating as each of these pins have a pulldown to ground. Refer to the *Register Maps* section for more information on programming the register.

When the user wants to control the outputs with the hardware OE# pins, the user can do so for example by connecting these pins to a GPIO controller and follow the *Pin Configuration and Functions* section to set the outputs to HIGH/LOW. The bits OUT_EN_CLK7 to OUT_EN_CLK0 used to control the outputs are shown in registers OECR1 field descriptions. These register bits are set to 1 by default to verify that the outputs are "software enabled" and the state is therefore set by hardware OE# pins.

9.2.3 Application Curves

Figure 5-1 in the *Typical Characteristics* section can be used as both an application curve and a typical characteristics plot in this example.

The Figure 9-2 and Figure 9-3 show characterization data for the Output slew rate for various CAPTRIM codes and across temperature. Customers can use these plots as reference for choosing the appropriate output slew rate based on the system requirement.

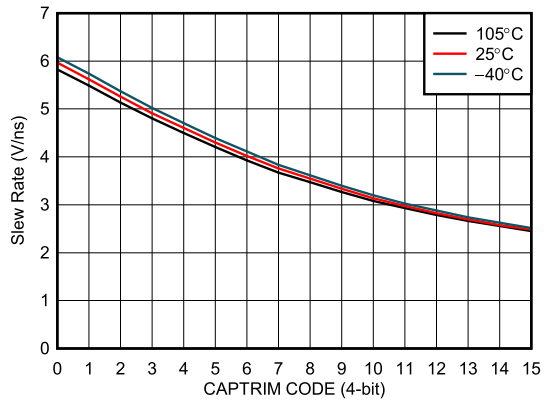

Figure 9-2. Output Slew Rate vs. CAPTRIM Code

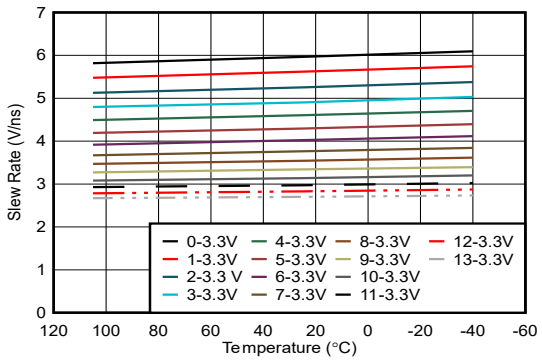

Figure 9-3. Slew Rate Variation Across Temperature for Different CAPTRIM Code

9.3 Power Supply Recommendations

High-performance clock buffers are sensitive to noise on the power supply, which can dramatically increase the additive jitter of the buffer. Thus, reducing noise from the system power supply is essential, especially when the jitter and phase noise is critical to applications.

Filter capacitors are used to eliminate the low-frequency noise from the power supply, where the bypass capacitors provide the very low impedance path for high-frequency noise and guards the power-supply system against induced fluctuations. These bypass capacitors also provide instantaneous current surges as required by the device and must have low equivalent series resistance (ESR). To properly use the bypass capacitors, place the capacitors very close to the power-supply terminals and lay out with short loops to minimize inductance. TI recommends to insert a ferrite bead between the board power supply and the chip power supply that isolates the high-frequency switching noises generated by the clock buffer. These beads prevent the switching noise from leaking into the board supply. Selecting an appropriate ferrite bead with very low DC resistance is imperative for

providing adequate isolation between the board supply and the chip supply, as well as to maintain a voltage at the supply terminals that is greater than the minimum voltage required for proper operation.

Figure 9-4 shows the recommended power supply filtering and decoupling method.

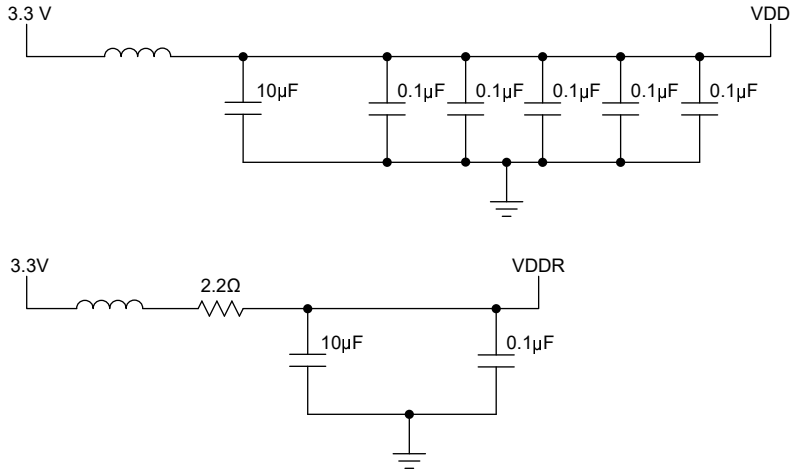

Figure 9-4. Power Supply Decoupling

9.4 Layout

9.4.1 Layout Guidelines

The following section provides the layout guidelines to ensure good thermal performance and power supply connections for the CDCDB800.

In *Layout Examples*, the CDCDB800 has 85Ωdifferential output impedance LP-HCSL format drivers as per register default settings. All transmission lines connected to CKx pins should be 85Ωdifferential impedance, 42.5Ω single-ended impedance to avoid reflections and increased radiated emissions. If 100Ωoutput impedance is enabled, the transmission lines connected to CKx pins should be 100-Ω differential impedance, 50Ωsingle-ended impedance. Take care to eliminate or reduce stubs on the transmission lines.

9.4.2 Layout Examples

Figure 9-5 through Figure 9-7 are printed circuit board (PCB) layout examples that show the application of thermal design practices and a low-inductance ground connection between the device DAP and the PCB.

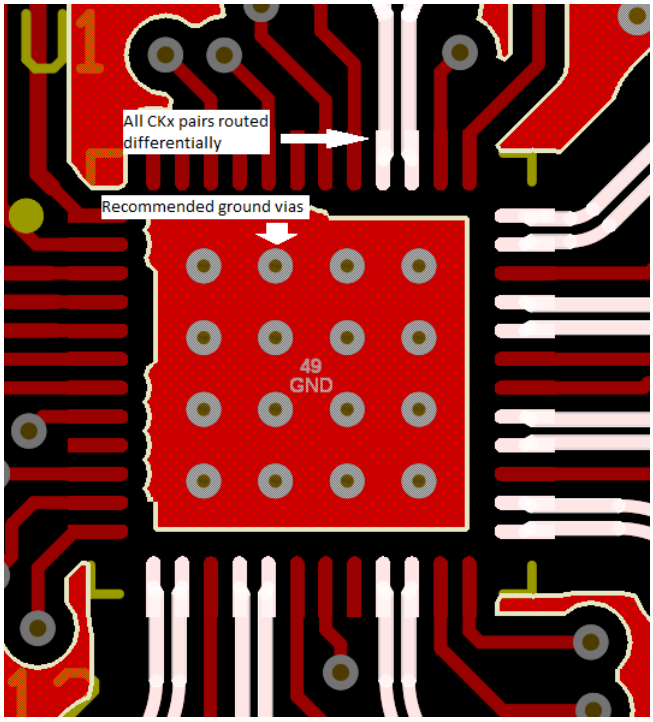

Figure 9-5. PCB Layout Example for CDCDB800, Top layer

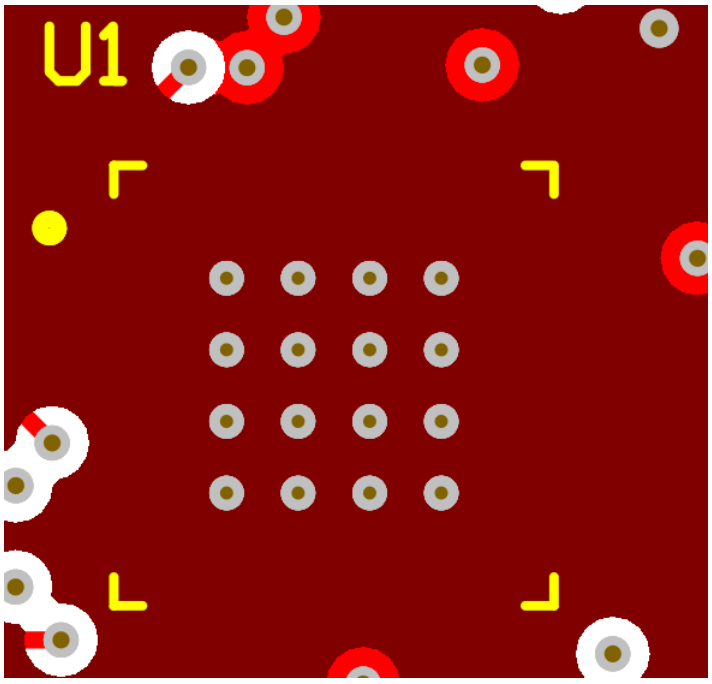

Figure 9-6. PCB Layout Example for CDCDB800, GND Layer

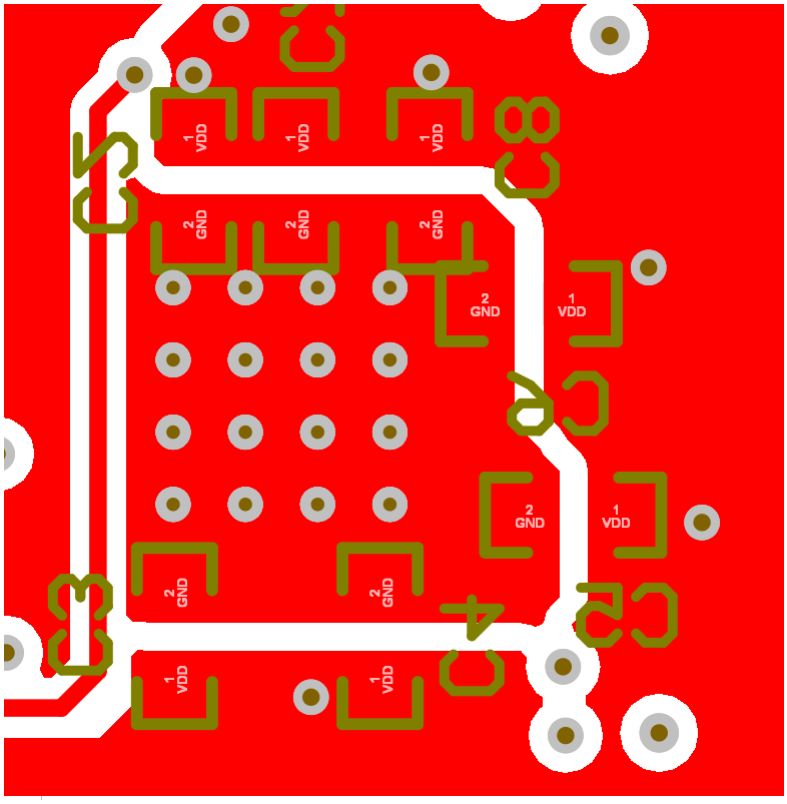

Figure 9-7. PCB Layout Example for CDCDB800, Bottom Layer

10 Device and Documentation Support

10.1 Device Support

10.1.1 TICS Pro

TICS Pro is an offline software tool for EVM programming and also for register map generation to program a device configuration for a specific application. For TICS Pro, go to https://www.ti.com/tool/TICSPRO-SW.

10.2 Documentation Support

10.2.1 Related Documentation

- Texas Instruments, CDCDB800/803 Ultra-Low Additive Jitter, 8-Output PCIe Gen1 to Gen5 Clock Buffer

10.3 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on ti.com. Click on *Notifications* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

10.4 Support Resources

TI E2E™ support forums are an engineer's go-to source for fast, verified answers and design help — straight from the experts. Search existing answers or ask your own question to get the quick design help you need.

Linked content is provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's Terms of Use.

10.5 Trademarks

TI E2E™ is a trademark of Texas Instruments.
All trademarks are the property of their respective owners.

10.6 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

10.7 Glossary

TI Glossary	This glossary lists and explains terms, acronyms, and definitions.

11 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

Changes from Revision B (May 2022) to Revision C (August 2025)	Page
• Added PCIe Gen 7 specifications in the *Features*, *Applications*, and *Description* sections	1
• Added PCIe Gen 7 specifications in the *Overview* section	12

Changes from Revision A (September 2021) to Revision B (May 2022)	Page
• Changed the data sheet title	1
• Added PCIe Gen 6 to the data sheet	1
• Changed the pin description for pin 46	3

Changes from Revision * (July 2021) to Revision A (September 2021) **Page**

- Changed pin descriptions for pins 47 and 48 ... 3
- Changed *Absolute Maximum Ratings* note 1 ... 6
- Changed the SPI terminology for the generic programming sequence and protocol figures ... 14
- Changed the reset values and description for the *Register Field Description* tables ... 16

12 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

Orderable part number	Status (1)	Material type (2)	Package | Pins	Package qty | Carrier	RoHS (3)	Lead finish/ Ball material (4)	MSL rating/ Peak reflow (5)	Op temp (°C)	Part marking (6)
CDCDB800RSLR	Active	Production	VQFN (RSL) | 48	4000 | LARGE T&R	Yes	NIPDAU	Level-1-260C-UNLIM	-40 to 105	CDCB800
CDCDB800RSLR.A	Active	Production	VQFN (RSL) | 48	4000 | LARGE T&R	Yes	NIPDAU	Level-1-260C-UNLIM	-40 to 105	CDCB800
CDCDB800RSLT	Active	Production	VQFN (RSL) | 48	250 | SMALL T&R	Yes	NIPDAU	Level-1-260C-UNLIM	-40 to 105	CDCB800
CDCDB800RSLT.A	Active	Production	VQFN (RSL) | 48	250 | SMALL T&R	Yes	NIPDAU	Level-1-260C-UNLIM	-40 to 105	CDCB800

(1) **Status:** For more details on status, see our product life cycle.

(2) **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

(3) **RoHS values:** Yes, No, RoHS Exempt. See the TI RoHS Statement for additional information and value definition.

(4) **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

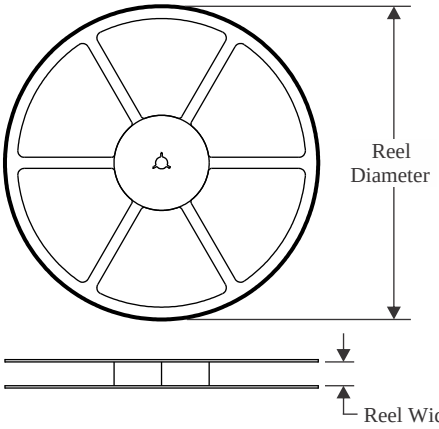
(5) **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

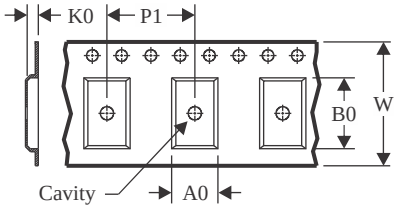
Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

TAPE AND REEL INFORMATION

REEL DIMENSIONS

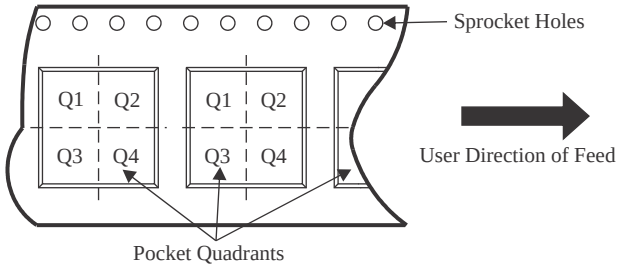


TAPE DIMENSIONS



A0	Dimension designed to accommodate the component width
B0	Dimension designed to accommodate the component length
K0	Dimension designed to accommodate the component thickness
W	Overall width of the carrier tape
P1	Pitch between successive cavity centers

QUADRANT ASSIGNMENTS FOR PIN 1 ORIENTATION IN TAPE



*All dimensions are nominal
