

# LMX2694-SEP Radiation Hardened 15-GHz Wideband PLLatinum™ RF Synthesizer With Phase Synchronization

## 1 Features

- VID V62/19616-02XE
- 39.3-MHz to 15.1-GHz output frequency
- $-110$  dBc/Hz phase noise at 100-kHz offset with 15-GHz carrier
- 54-fs RMS jitter at 8 GHz (100 Hz to 100 MHz)
- Programmable output power
- PLL key specifications
  - Figure of merit:  $-236$  dBc/Hz
  - Normalized  $1/f$  noise:  $-129$  dBc/Hz
  - Up to 200-MHz phase detector frequency
- Synchronization of output phase across multiple devices
- Support for SYSREF with 9-ps resolution programmable delay
- 3.3-V single power supply operation
- Operating temperature range:  $-55^{\circ}\text{C}$  to  $125^{\circ}\text{C}$
- Radiation specifications
  - Single event latch-up  $>43$  MeV-cm<sup>2</sup>/mg
  - Total ionizing dose to 30 krad(Si)

## 2 Applications

- Command & data handling (C&DH)
- Communications payload
- Optical imaging payload
- Radar imaging payload
- [Aerospace and defense](#)

## 3 Description

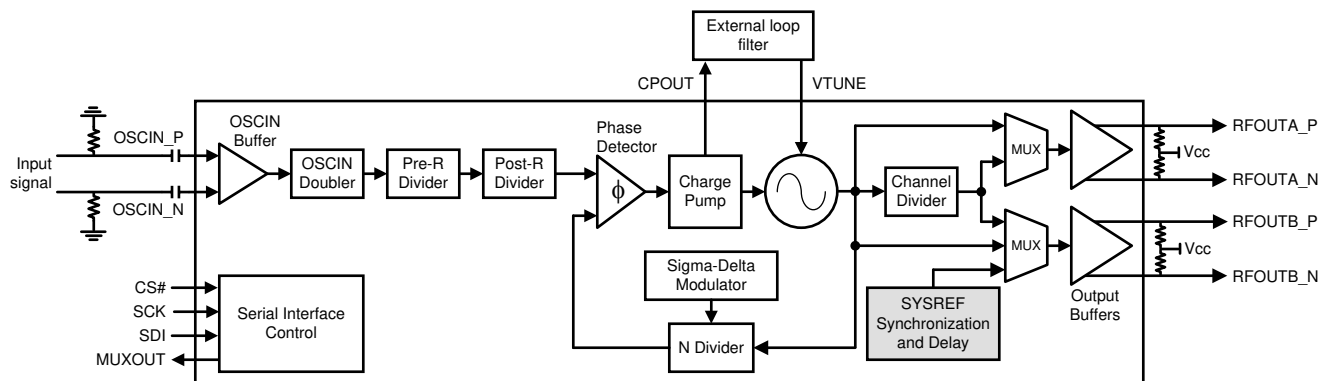

The LMX2694-SEP device is a high-performance, wideband phase-locked loop (PLL) with an integrated voltage-controlled oscillator (VCO) and voltage regulators that can output any frequency between 39.3 MHz and 15.1 GHz without a doubler, eliminating the need for  $\frac{1}{2}$  harmonic filters. The VCO on this device covers an entire octave to complete the frequency coverage down to 39.3 MHz. The high-performance PLL, with a  $-236$ -dBc/Hz figure of merit and high-phase detector frequency, can achieve very low in-band noise and integrated jitter.

The LMX2694-SEP allows designers to synchronize the output of multiple instances of the device. This means that deterministic phase can be obtained from a device in any use case, including one with the fractional engine or output divider enabled. The device also allows designers to generate or repeat SYSREF (compliant to JESD204B standard) to use the device as a low-noise clock source for high-speed data converters.

### Device Information<sup>(1)</sup>

PART NUMBER	PACKAGE	BODY SIZE (NOM)
LMX2694-SEP	VQFN (48)	7.00 mm × 7.00 mm

(1) For all available packages, see the orderable addendum at the end of the data sheet.

Simplified Schematic

## 4 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

Changes from Revision B (June 2021) to Revision C (March 2022)	Page
• Changed VID V62/19616 orderable number to “VID V62/19616-02XE” in <i>Features</i> .....	1
• Changed the application examples listed in <i>Applications</i> .....	1
• Moved the VID V62/19616-02XE orderable number in the <i>Device Information</i> table to the <i>Packaging Information</i> table at the end of the data sheet.....	1
Changes from Revision A (May 2020) to Revision B (June 2021)	Page
• Changed device and documentation visibility from custom to catalog.....	1
• Added VID document number “VID V62/19616” in <i>Features</i> .....	1
• Added orderable part number “V62/19616-02XE” to <i>Device Information</i> table.....	1
• Changed the JESD_DACx values in <a href="#">Table 7-15</a> .....	23
• Changed the R1 register bit name 3 in <a href="#">Figure 7-11</a> from: 1 to: MUXOUT_CTRL.....	37
• Changed the OUTA_MUX register description in <a href="#">Table 7-65</a> .....	51
• Changed the OUTB_MUX register description in <a href="#">Table 7-66</a> .....	52
Changes from Revision * (November 2019) to Revision A (May 2020)	Page
• Changed maximum operating temperature to 125°C.....	1
• Changed total ionizing dose to 30 krad(Si).....	1
• Changed maximum T <sub>C</sub> to 125°C in Recommended Operating Conditions.....	5
• Changed maximum T <sub>C</sub> to 125°C in Electrical Characteristics.....	6
• Changed maximum T <sub>C</sub> to 125°C in Timing Requirements.....	8

## 5 Pin Configuration and Functions

**Figure 5-1. RTC Package 48-Pin VQFN Top View**

**Table 5-1. Pin Functions**

PIN		I/O	DESCRIPTION
NAME	NO.		
BIASVARAC	41	BP	VCO varactor bias. Connect a 10- $\mu$ F decoupling capacitor to ground.
BIASVCO	3	BP	VCO bias. Connect a 10- $\mu$ F decoupling capacitor to ground. Place close to pin.
BIASVCO2	34	BP	VCO bias. Connect a 1- $\mu$ F decoupling capacitor to ground. Place close to pin.
CE	1	I	Chip Enable. High impedance CMOS input. 1.8-V to 3.3-V logic. Active HIGH powers on the device.
CPOUT	14	O	Charge pump output. Recommend connecting C1 of loop filter close to this pin.
CS#	28	I	SPI latch. High impedance CMOS input. 1.8-V to 3.3-V logic.
GND	2, 4, 32, 40, 42, 47	G	VCO ground.
GND	6, 16, 48	G	Digital ground.
GND	15	G	Charge pump ground.
GND	27, 29	G	Buffer ground.
MUXOUT	23	O	Multiplexed output. Can output: lock detect, SPI readback and diagnostics.
NC	11, 12, 20, 30, 31, 37, 38, 39	NC	Pins may be grounded or left unconnected.
OSCIN_N	9	I	Reference input clock (-). High impedance self-biasing pin. Requires AC-coupling capacitor. (0.1 $\mu$ F recommended)
OSCIN_P	8	I	Reference input clock (+). High impedance self-biasing pin. Requires AC-coupling capacitor. (0.1 $\mu$ F recommended)
REFVCO	44	BP	VCO supply reference. Connect a 10- $\mu$ F decoupling capacitor to ground.
REFVCO2	36	BP	VCO supply reference. Connect a 10- $\mu$ F decoupling capacitor to ground.
REGIN	10	BP	Input reference path regulator decoupling. Connect a 1- $\mu$ F decoupling capacitor to ground. Place close to pin.
REGVCO	46	BP	VCO regulator node. Connect a 1- $\mu$ F decoupling capacitor to ground.
RFOUTA_N	25	O	Differential output A (-). Requires connecting 50- $\Omega$ resistor pullup to $V_{CC}$ as close as possible to pin.

**Table 5-1. Pin Functions (continued)**

PIN		I/O	DESCRIPTION
NAME	NO.		
RFOUTA_P	26	O	Differential output A (+). Requires connecting 50-Ω resistor pullup to V <sub>CC</sub> as close as possible to pin.
RFOUTB_N	21	O	Differential output B (-). Requires connecting 50-Ω resistor pullup to V <sub>CC</sub> as close as possible to pin.
RFOUTB_P	22	O	Differential output B (+). Requires connecting 50-Ω resistor pullup to V <sub>CC</sub> as close as possible to pin.
SCK	18	I	SPI clock. High impedance CMOS input. 1.8-V to 3.3-V logic.
SDI	19	I	SPI data. High impedance CMOS input. 1.8-V to 3.3-V logic.
SYNC	5	I	Phase synchronization input. Has programmable threshold. Connect to ground if not being used.
SYSREFREQ	35	I	SYSREF request input for JESD204B support. Connect to ground if not being used.
VCCBUF	24	P	Output buffer supply. Connect to 3.3-V and a 0.1-μF decoupling capacitor to ground.
VCCCP	13	P	Charge pump supply. Connect to 3.3-V and a 0.1-μF decoupling capacitor to ground.
VCCDIG	7	P	Digital supply. Connect to 3.3-V and a 0.1-μF decoupling capacitor to ground.
VCCMASH	17	P	Digital supply. Connect to 3.3-V and a 1-μF decoupling capacitor to ground.
VCCVCO	45	P	VCO supply. Connect to 3.3-V and a 1-μF decoupling capacitor to ground.
VCCVCO2	33	P	VCO supply. Connect to 3.3-V and a 1-μF decoupling capacitor to ground.
VTUNE	43	I	VCO tuning voltage input. Connect a 1.5-nF or more capacitor to VCO ground. See <a href="#">External Loop Filter</a> for details.
Thermal pad	—	—	Connect the GND pin to the exposed thermal pad for correct operation. Connect the thermal pad to any internal PCB ground plane using multiple vias for good thermal performance.

## 6 Specifications

### 6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)<sup>(1)</sup>

		MIN	MAX	UNIT
V <sub>CC</sub>	Power supply voltage	-0.3	3.6	V
V <sub>IN</sub>	IO input voltage		V <sub>CC</sub> + 0.3	V
T <sub>J</sub>	Junction temperature	-55	150	°C
T <sub>stg</sub>	Storage temperature	-65	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Rating* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Condition*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

### 6.2 ESD Ratings

			VALUE	UNIT
V <sub>(ESD)</sub>	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 <sup>(1)</sup>	±1000	V
		Charged device model (CDM), per JEDEC specification JESD22-C101, all pins <sup>(2)</sup>	±1000	

- (1) JEDEC document JEP155 states that 500 V HBM allows safe manufacturing with a standard ESD control process.  
(2) JEDEC document JEP157 states that 250 V CDM allows safe manufacturing with a standard ESD control process.

### 6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
T <sub>C</sub>	Case temperature	-55		125	°C
V <sub>CC</sub>	Supply input voltage	3.2	3.3	3.45	V

### 6.4 Thermal Information

THERMAL METRIC <sup>(1)</sup>		LMX2694-EP	UNIT
		RTC (VQFN)	
		48 PINS	
R <sub>θJA</sub>	Junction-to-ambient thermal resistance	22.4	°C/W
R <sub>θJC(top)</sub>	Junction-to-case (top) thermal resistance	10.0	°C/W
R <sub>θJB</sub>	Junction-to-board thermal resistance	6.1	°C/W
Ψ <sub>JT</sub>	Junction-to-top characterization parameter	0.1	°C/W
Ψ <sub>JB</sub>	Junction-to-board characterization parameter	6.0	°C/W
R <sub>θJC(bot)</sub>	Junction-to-case (bottom) thermal resistance	0.7	°C/W

- (1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.

## 6.5 Electrical Characteristics

$3.2\text{ V} \leq V_{CC} \leq 3.45\text{ V}$ ,  $-50^\circ\text{C} \leq T_C \leq 125^\circ\text{C}$ . Typical values are at  $V_{CC} = 3.3\text{ V}$ ,  $25^\circ\text{C}$  (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
<b>POWER SUPPLY</b>						
$I_{CC}$	Supply current	OUTA_PD = 0; OUTB_PD = 1; OUTA_MUX = OUTB_MUX = 1; OUTA_PWR = 31; CPG = 7; $f_{OSC} = f_{PD} = 100\text{ MHz}$ ; $f_{VCO} = f_{OUT} = 14.5\text{ GHz}$		360		mA
	Power on reset current	RESET = 1		289		
	Power down current	POWERDOWN = 1		6		
<b>OUTPUT CHARACTERISTICS</b>						
$P_{OUT}$	Single-ended output power <sup>(1)</sup> <sup>(2)</sup>	50- $\Omega$ resistor pull-up OUTx_PWR = 31	$f_{OUT} = 8\text{ GHz}$	2		dBm
			$f_{OUT} = 15\text{ GHz}$	0		
<b>INPUT SIGNAL PATH</b>						
$f_{OSC}$	Reference input frequency	OSC_2X = 0	5		1000	MHz
		OSC_2X = 1	5		200	
$V_{OSC}$	Reference input voltage <sup>(3)</sup>	$f_{OSC} \geq 20\text{ MHz}$	0.4		2	$V_{PP}$
		$10\text{ MHz} \leq f_{OSC} < 20\text{ MHz}$	0.8		2	
		$5\text{ MHz} \leq f_{OSC} < 10\text{ MHz}$	1.6		2	
<b>PHASE DETECTOR AND CHARGE PUMP</b>						
$f_{PD}$	Phase detector frequency <sup>(4)</sup>	MASH_ORDER = 0	0.125		250	MHz
		MASH_ORDER > 0	5		200	
$I_{CPOUT}$	Charge-pump leakage current	CPG = 0		20		nA
	Effective charge pump current	Sum of the up and down currents	3		15	mA
$PN_{PLL\_1f}$	Normalized PLL 1/f noise	$f_{PD} = 100\text{ MHz}$ ; $f_{VCO} = 12\text{ GHz}$ <sup>(5)</sup>		-129		dBc/Hz
$PN_{PLL\_FOM}$	Normalized PLL noise floor			-236		
<b>VCO CHARACTERISTICS</b>						
$f_{VCO}$	VCO frequency		7550		15100	MHz

$3.2\text{ V} \leq V_{CC} \leq 3.45\text{ V}$ ,  $-50^\circ\text{C} \leq T_C \leq 125^\circ\text{C}$ . Typical values are at  $V_{CC} = 3.3\text{ V}$ ,  $25^\circ\text{C}$  (unless otherwise noted)

PARAMETER		TEST CONDITIONS		MIN	TYP	MAX	UNIT

H3	VCO third harmonic	f <sub>VCO</sub> = 8 GHz; divider disabled		-25			
<b>DIGITAL INTERFACE</b>							
V <sub>IH</sub>	High-level input voltage			1.4			V
V <sub>IL</sub>	Low-level input voltage					0.4	V
I <sub>IH</sub>	High-level input current			-100		100	μA
I <sub>IL</sub>	Low-level input current			-100		100	μA

$3.2\text{ V} \leq V_{CC} \leq 3.45\text{ V}$ ,  $-50^\circ\text{C} \leq T_C \leq 125^\circ\text{C}$ . Typical values are at  $V_{CC} = 3.3\text{ V}$ ,  $25^\circ\text{C}$  (unless otherwise noted)

PARAMETER		TEST CONDITIONS		MIN	TYP	MAX	UNIT
$V_{OH}$	High-level output voltage	Load current = -5 mA	MUXOUT pin	$V_{CC} - 0.6$			V
$V_{OL}$	High-level output current	Load current = 5 mA		0.6			V

- Single ended output power obtained after de-embedding microstrip trace losses and matching with a manual tuner. Unused port terminated to 50- $\Omega$  load.
- Output power, spurs, and harmonics can vary based on board layout and components.
- Single-ended AC coupled sine wave input with complementary side AC coupled to ground with 50- $\Omega$  resistor.
- For lower VCO frequencies, the N divider minimum value can limit the phase-detector frequency.
- The PLL noise contribution is measured using a clean reference and a wide loop bandwidth and is composed into flicker and flat components.  $PLL\_flat = PLL\_FOM + 20 \times \log(f_{VCO}/f_{PD}) + 10 \times \log(f_{PD}/1\text{ Hz})$ .  $PLL\_flicker(\text{offset}) = PLL\_1/f + 20 \times \log(f_{VCO}/1\text{ GHz}) - 10 \times \log(\text{offset}/10\text{ kHz})$ . Once these two components are found, the total PLL noise can be calculated as  $PLL\_Noise = 10 \times \log(10^{PLL\_Flat/10} + 10^{PLL\_flicker/10})$ .
- See [Section 7.3.7.1](#) for details.

## 6.6 Timing Requirements

 $3.2\text{ V} \leq V_{CC} \leq 3.45\text{ V}$ ,  $-50^\circ\text{C} \leq T_C \leq 125^\circ\text{C}$ . Typical values are at  $V_{CC} = 3.3\text{ V}$ ,  $25^\circ\text{C}$  (unless otherwise noted)

				MIN	NOM	MAX	UNIT
<b>SYNC AND SYSREFREQ TIMING</b>							
$t_{SETUP}$	Setup time for pin relative to OSCIN rising edge	See <a href="#">Figure 6-1</a>		9			ns
$t_{HOLD}$	Hold time for pin relative to OSCIN rising edge			4			ns
<b>DIGITAL INTERFACE WRITE SPECIFICATIONS</b>							
$f_{SPIWrite}$	SPI write speed	$t_{CWL} + t_{CWH} \geq 25\text{ ns}$				40	MHz
$t_{CE}$	Clock to enable low time	See <a href="#">Figure 6-2</a>		5			ns
$t_{CS}$	Data to clock setup time			2			ns
$t_{CH}$	Data to clock hold time			2			ns
$t_{CWH}$	Clock pulse width high			5			ns
$t_{CWL}$	Clock pulse width low			5			ns
$t_{CES}$	Enable to clock setup time			5			ns
$t_{EWH}$	Enable pulse width high			2			ns
<b>DIGITAL INTERFACE READBACK SPECIFICATIONS</b>							
$f_{SPIReadback}$	SPI readback speed	See <a href="#">Figure 6-3</a>				40	MHz
$t_{CE}$	Clock to enable low time			5			ns
$t_{CS}$	Clock to data wait time			2			ns
$t_{CH}$	Clock to data hold time			2			ns
$t_{CWH}$	Clock pulse width high			10			ns
$t_{CWL}$	Clock pulse width low			10			ns
$t_{CES}$	Enable to clock setup time			5			ns
$t_{EWH}$	Enable pulse width high			2			ns
$t_{CD}$	Falling clock edge to data wait time						8

## 6.7 Timing Diagrams

**Figure 6-1. Trigger Signals Timing Diagram**

**Figure 6-2. Serial Data Input Timing Diagram**

There are several other considerations for writing on the SPI:

- The R/W bit must be set to 0.
- The data on SDI pin is clocked into a shift register on each rising edge on the SCK pin.
- The CS# must be held low for data to be clocked. Device will ignore clock pulses if CS# is held high.
- The CS# transition from high to low must occur when SCK is low.
- When SCK and SDI lines are shared between devices, TI recommends to hold the CS# line high on the device that is not to be clocked.

**Figure 6-3. Serial Data Readback Timing Diagram**

There are several other considerations for SPI readback:

- The R/W bit must be set to 1.
- The MUXOUT pin will always be low for the address portion of the transaction.
- The data on MUXOUT becomes available momentarily after the falling edge of SCK, and therefore, should be read back on the rising edge of SCK.
- The data portion of the transition on the SDI line is always ignored.

## 6.8 Typical Characteristics

At  $T_A = 25^\circ\text{C}$ , unless otherwise noted

$f_{\text{OSC}} = 100 \text{ MHz}$     Jitter = 61.2 fs (100 Hz - 100 MHz)  
 $f_{\text{PD}} = 200 \text{ MHz}$

**Figure 6-4. Closed Loop Phase Noise at 8.1 GHz**

$f_{\text{OSC}} = 100 \text{ MHz}$     Jitter = 61.8 fs (100 Hz - 100 MHz)  
 $f_{\text{PD}} = 200 \text{ MHz}$

**Figure 6-5. Closed Loop Phase Noise at 9.3 GHz**

$f_{\text{OSC}} = 100 \text{ MHz}$     Jitter = 61.8 fs (100 Hz - 100 MHz)  
 $f_{\text{PD}} = 200 \text{ MHz}$

**Figure 6-6. Closed Loop Phase Noise at 10.4 GHz**

$f_{\text{OSC}} = 100 \text{ MHz}$     Jitter = 61.7 fs (100 Hz - 100 MHz)  
 $f_{\text{PD}} = 200 \text{ MHz}$

**Figure 6-7. Closed Loop Phase Noise at 11.4 GHz**

$f_{\text{OSC}} = 100 \text{ MHz}$     Jitter = 68.8 fs (100 Hz - 100 MHz)  
 $f_{\text{PD}} = 200 \text{ MHz}$

**Figure 6-8. Closed Loop Phase Noise at 12.5 GHz**

$f_{\text{OSC}} = 100 \text{ MHz}$     Jitter = 67.8 fs (100 Hz - 100 MHz)  
 $f_{\text{PD}} = 200 \text{ MHz}$

**Figure 6-9. Closed Loop Phase Noise at 13.6 GHz**

## 6.8 Typical Characteristics (continued)

At  $T_A = 25^\circ\text{C}$ , unless otherwise noted

$f_{\text{OSC}} = 100 \text{ MHz}$       Jitter = 67.8 fs (100 Hz - 100 MHz)  
 $f_{\text{PD}} = 200 \text{ MHz}$

Figure 6-10. Closed Loop Phase Noise at 14.7 GHz

$f_{\text{PD}} = 200 \text{ MHz}$       FOM = -237.5 dBc/Hz  
 $f_{\text{VCO}} = 10 \text{ GHz}$       Flicker = -130.5 dBc/Hz

Figure 6-11. Calculation of PLL Noise Metrics

$f_{\text{OSC}} = 200 \text{ MHz}$   
 $f_{\text{VCO}} = 14.8 \text{ GHz}$

### 6.8 Typical Characteristics (continued)

At  $T_A = 25^\circ\text{C}$ , unless otherwise noted

## 7 Detailed Description

### 7.1 Overview

The LMX2694-SEP is a high-performance, wideband frequency synthesizer with an integrated VCO and output divider. The VCO operates from 7550 to 15100 MHz, and can be combined with the output divider to produce any frequency in the range of 39.3 MHz to 15.1 GHz. There are two dividers within the input path.

The PLL is fractional-N PLL with a programmable delta-sigma modulator up to the 3<sup>rd</sup> order. The fractional denominator is a programmable 32-bit long that can provide fine frequency steps easily below 1-Hz resolution, as well as be used to do exact fractions like 1/3, 7/1000, and so on.

For applications where deterministic or adjustable phase is desired, the SYNC pin can be used to get the phase relationship between the OSCIN and RFOUTx pins deterministic. Once this is done, the phase can be adjusted in very fine steps of the VCO period divided by the fractional denominator.

The ultra-fast VCO calibration is designed for applications where the frequency must be swept or abruptly changed. The frequency can be manually programmed.

For JESD204B support, the RFOUTB output can be used as a differential SYSREF output that can be either a single pulse or a series of pulses that occur at a programmable distance away from the rising edges of the output signal.

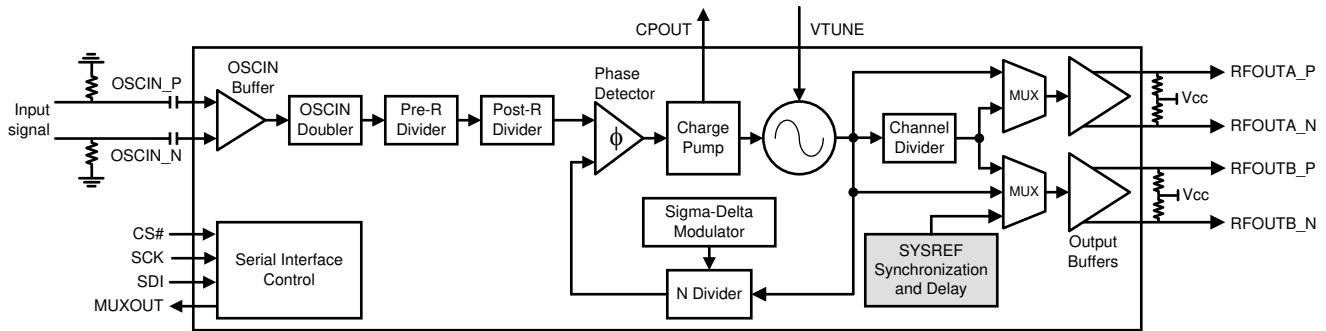

The LMX2694-SEP device requires only a single 3.3-V power supply. The internal power supplies are provided by integrated LDOs, eliminating the need for high-performance external LDOs.

[Table 7-1](#) shows the range of several of the doubler, dividers, and fractional settings.

**Table 7-1. Range of Doubler, Divider, and Fractional Settings**

PARAMETER	MIN	MAX	COMMENTS
OSCIN doubler	0 (1X)	1 (2X)	The low noise doubler can be used to increase the phase detector frequency to improve phase noise and avoid spurs. This is in reference to the OSC_2X bit.
Pre-R divider	1 (bypass)	128	Only use the Pre-R divider if the input frequency is too high for the Post-R divider.
Post-R divider	1 (bypass)	255	The maximum input frequency for the Post-R divider is 250 MHz. Use the Pre-R divider if necessary.
N divider	≥ 28	524287	The minimum divide depends on modulator order and VCO frequency. See <a href="#">N Divider and Fractional Circuitry</a> for more details.
Fractional numerator / denominator	1 (integer mode)	$2^{32} - 1 = 4294967295$	The fractional denominator is programmable and can assume any value between 1 and $2^{32} - 1$ . It is not a fixed denominator.
Fractional order	0	3	Order 0 is integer mode, and the order can be programmed.
Channel divider	1 (bypass)	192	This is the series of several dividers. Also, be aware that above 10 GHz, the maximum allowable channel divider value is 6.
Output frequency	39.3 MHz	15.1 GHz	This is implied by the minimum VCO frequency divided by the maximum channel divider value.

## 7.2 Functional Block Diagram

## 7.3 Feature Description

### 7.3.1 Reference Oscillator Input

The OSCIN pins are used as a frequency reference input to the device. The input is high impedance and requires AC-coupling caps at the pin. The OSCIN pins can be driven single-ended with a CMOS clock or XO. Differential clock input is also supported, making it easier to interface with high-performance system clock devices such as TI’s LMK series clock devices. As the OSCIN signal is used as a clock for the VCO calibration, a proper reference signal must be applied at the OSCIN pin at the time of programming FCAL\_EN.

### 7.3.2 Reference Path

The reference path consists of an OSCIN doubler (OSC\_2X), Pre-R divider, and a Post-R divider.

Figure 7-1. Reference Path Diagram

The OSCIN doubler (OSC\_2X) can double up low OSCIN frequencies. Pre-R (PLL\_R\_PRE) and Post-R (PLL\_R) dividers both divide frequency down. Use Equation 1 to calculate the phase detector frequency,  $f_{PD}$ :

$$f_{PD} = f_{OSC} \times OSC\_2X / (PLL\_R\_PRE \times PLL\_R) \tag{1}$$

- If the OSCIN doubler is used, the OSCIN signal should have a 50% duty cycle as both the rising and falling edges are used.
- If the OSCIN doubler is not used, only rising edges of the OSCIN signal are used and duty cycle is not critical.

#### 7.3.2.1 OSCIN Doubler (OSC\_2X)

The OSCIN doubler allows the user to double the input reference frequency at up to 400 MHz, while adding minimal noise. It may be advantageous to use the doubler to go higher than the maximum phase detector frequency in some situations, because the Pre-R divider may be able to divide down this frequency to a phase detector frequency that is advantageous for fractional spurs.

#### 7.3.2.2 Pre-R Divider (PLL\_R\_PRE)

The Pre-R divider is useful for reducing the input frequency to help meet the maximum 250-MHz input frequency limitation to the PLL-R divider. Otherwise, it does not have to be used.

#### 7.3.2.3 Post-R Divider (PLL\_R)

The Post-R divider can be used to further divide down the frequency to the phase detector frequency. When  $PLL\_R > 1$ , the input frequency to this divider is limited to 250 MHz.

### 7.3.3 State Machine Clock

The state machine clock is a divided-down version of the OSCIN signal that is used internally in the device. This divide value 1, 2, 4, 8, 16, or 32 and is determined by CAL\_CLK\_DIV programming word (described in the [Programming](#) section). This state machine clock impacts various features like the VCO calibration. The state machine clock is calculated as  $f_{SM} = f_{OSC} / 2^{CAL\_CLK\_DIV}$ .

### 7.3.4 PLL Phase Detector and Charge Pump

The phase detector compares the outputs of the Post-R divider and N divider, and will generate a correction current corresponding to the phase error until the two signals are aligned in-phase. This charge-pump current is software-programmable to many different levels, which allows the user to modify the closed-loop bandwidth of the PLL.

### 7.3.5 N Divider and Fractional Circuitry

The N divider includes fractional compensation that can achieve any fractional denominator from 1 to  $(2^{32} - 1)$ . The integer portion of N is the whole part of the N divider value, while the fractional portion ( $N_{frac} = NUM / DEN$ ) is the remaining fraction. In general, the total N divider value is determined by  $N + NUM / DEN$ . The N, NUM and DEN are software-programmable. The higher the denominator, the finer the resolution step of the output. For example, even when using  $f_{PD} = 200$  MHz, the output can increment in steps of  $200 \text{ MHz} / (2^{32} - 1) = 0.047 \text{ Hz}$ . [Equation 2](#) shows the relationship between the phase detector and VCO frequencies. Note that in SYNC mode, there is an extra divider that is not shown in [Equation 2](#).

$$f_{VCO} = f_{PD} \times [N + NUM/DEN] \tag{2}$$

The sigma-delta modulator that controls this fractional division is also programmable from integer mode to the third order. To make the fractional spurs consistent, the modulator is reset any time that the R0 register is programmed.

The N divider has minimum value restrictions based on the modulator order (MASH\_ORDER) and VCO frequency. Furthermore, the PFD\_DLY\_SEL bit must be programmed in accordance to [Table 7-2](#). IncludedDivide may be larger than one in SYNC mode. In all other modes, IncludedDivide is just one.

**Table 7-2. Minimum N Divider Restrictions**

MASH_ORDER	$f_{VCO} / \text{IncludedDivide}$ (MHz)	MINIMUM N	PFD_DLY_SEL
0	≤ 12500	29	1
	> 12500	33	2
1	≤ 10000	30	1
	10000 - 12500	34	2
	> 12500	38	3
2	≤ 4000 (SYNC mode)	31	1
	4000 - 7500 (SYNC mode)	31	2
	7500 - 10000	32	2
	> 10000	36	3
3	≤ 4000 (SYNC mode)	33	1
	4000 - 7500 (SYNC mode)	37	2
	7500 - 10000	41	3
	> 10000	45	4

### 7.3.6 MUXOUT Pin

The MUXOUT pin can be configured as either a lock detect indicator for the PLL or as a serial data output for the SPI interface to read back registers. Field MUXOUT\_LD\_SEL (register R0[2]) configures this output.

**Table 7-3. MUXOUT Pin Configurations**

MUXOUT_LD_SEL	FUNCTION
0	Serial data output for readback
1	Lock detect indicator

When the lock detect indicator is selected, there are two types of indicators that can be selected with the field LD\_TYPE (register R59[0]). The first indicator is called “VCOCal” (LD\_TYPE = 0), and the second indicator is called “Vtune and VCOCal” (LD\_TYPE = 1).

### 7.3.6.1 Serial Data Output for Readback

In this mode, the MUXOUT pin can be used as the serial data output of the SPI interface. This output cannot be in a tri-state condition, therefore no line sharing is possible. Details of this pin operation are described in [Timing Requirements](#). Readback is very useful when a device is used in full-assist mode, because the VCO calibration data are retrieved and saved for future use. It can also be used to read back the lock detect status using the field rb\_LD\_VTUNE(register R110[10:9]).

### 7.3.6.2 Lock Detect Indicator Set as Type “VCOCal”

In this mode, the MUXOUT pin will be low when the VCO is calibrating or when the lock detect delay timer is running. Otherwise, the MUXOUT will be high. The programmable timer (LD\_DLY, register R60[15:0]) adds an additional delay after the VCO calibration finishes and before the lock detect indicator is asserted high. LD\_DLY is a 16-bit unsigned quantity that corresponds to the 4 times the number of phase detector cycles in absolute delay. For example, a phase detector frequency of 100 MHz and the LD\_DLY = 10000 will add a delay of 400  $\mu$ s before the indicator is asserted. This indicator will remain in its current state (high or low) until register R0 is programmed with FCAL\_EN = 1 with a valid input reference. In other words, if the PLL goes out of lock or the input reference goes away when the current state is high, then the current state will remain high.

### 7.3.6.3 Lock Detect Indicator Set as Type “Vtune and VCOCal”

In this mode the MUXOUT pin will be high when the VCO calibration has finished, the lock detect delay timer is finished running, and the PLL is locked. This indicator may remain in its current state (high or low) if the OSCin signal is lost. The true status of the indicator will be updated and resume its operation only when a valid input reference to the OSCin pin is returned. An alternative method to monitor the OSCin of the PLL is recommended. This indicator is reliable as long as the reference to OSCin is present.

The output of the device can be automatically muted when lock detect indicator “Vtune and VCOCal” is low. This feature is enabled with the field OUT\_MUTE (register R0[9]) asserted.

## 7.3.7 VCO (Voltage-Controlled Oscillator)

The LMX2694-SEP includes a fully integrated VCO. The VCO takes the voltage from the loop filter and converts this into a frequency. The VCO frequency is related to the other frequencies and as follows:

$$f_{VCO} = f_{PD} \times N \text{ divider} \times \text{IncludedDivide} \quad (3)$$

### 7.3.7.1 VCO Calibration

To reduce the VCO tuning gain, and therefore improve the VCO phase-noise performance, the VCO frequency range is divided into several different frequency bands. The entire range (7550 to 15100 MHz) covers an octave that allows the divider to take care of frequencies below the lower bound. This creates the need for frequency calibration to determine the correct frequency band given a desired output frequency. The frequency calibration routine is activated any time that the R0 register is programmed with the FCAL\_EN = 1. It is important that a valid OSCIN signal must present before VCO calibration begins.

The VCO also has an internal amplitude calibration algorithm to optimize the phase noise, which is also activated any time the R0 register is programmed.

The optimum internal settings for this are temperature-dependent. If the temperature is allowed to drift too much without being recalibrated, some minor phase noise degradation could result. The maximum allowable drift for

continuous lock,  $\Delta T_{CL}$ , is stated in the electrical specifications. For this device, a number of 125°C means the device never loses lock if the device is operated under recommended operating conditions.

The LMX2694-SEP allows the user to assist the VCO calibration. In general, there are three kinds of assistance, as shown in [Table 7-4](#).

**Table 7-4. Assisting the VCO Calibration Speed**

ASSISTANCE LEVEL	DESCRIPTION	VCO_SEL	VCO_SEL_FORCE VCO_CAPCTRL_FORCE VCO_DACISSET_FORCE	VCO_CAPCTRL VCO_DACISSET
No assist	User does nothing to improve VCO calibration speed.	7	0	Don't care
Partial assist	Upon every frequency change, before the FCAL_EN bit is checked, the user provides the initial starting VCO_SEL.	Choose by table	0	Don't care
Full assist	The user forces the VCO core (VCO_SEL), amplitude settings (VCO_DACISSET), and frequency band (VCO_CAPCTRL) and manually sets the value.	Choose by readback	1	Choose by readback

For the no-assist method, just set VCO\_SEL = 7 and this is done. For partial-assist, the VCO calibration speed can be improved by changing the VCO\_SEL bit according to frequency. Note that the frequency is not the actual VCO core range, but actually favors choosing the VCO. This is not only optimal for VCO calibration speed, but required for reliable locking.

**Table 7-5. Minimum VCO\_SEL for Partial Assist**

f <sub>vco</sub>	VCO CORE (MIN)
7550 - 8740 MHz	VCO1
8740 - 10000 MHz	VCO2
10000 - 10980 MHz	VCO3
10980 - 12100 MHz	VCO4
12100 - 13080 MHz	VCO5
13080 - 14180 MHz	VCO6
14180 - 15100 MHz	VCO7

For fastest calibration time, it is ideal to use the minimum VCO core as recommended in [Table 7-5](#). The [Table 7-6](#) shows typical VCO calibration times (in  $\mu$ s) for this choice in bold as well as showing how long the calibration time is increased if a higher than necessary VCO core is chosen. Realize that these calibration times are specific to these f<sub>OSC</sub> and f<sub>PD</sub> conditions specified and at the boundary of two cores, sometimes the calibration time can be increased.

**Table 7-6. Typical Calibration Times for f<sub>OSC</sub> = f<sub>PD</sub> = 100 MHz Based on VCO\_SEL**

f <sub>vco</sub> (GHz)	VCO_SEL						
	VCO7	VCO6	VCO5	VCO4	VCO3	VCO2	VCO1
8.1	650	540	550	440	360	230	110
9.3	610	530	540	430	320	<b>220</b>	Invalid
10.4	590	520	530	430	<b>240</b>	Invalid	
11.4	340	290	280	<b>180</b>	Invalid		
12.5	270	170	<b>120</b>	Invalid			
13.6	240	<b>130</b>	Invalid				
14.7	<b>160</b>	Invalid					

### 7.3.7.2 Determining the VCO Gain

The VCO gain varies between the seven cores, and is the lowest at the lowest end of the band and highest at the highest end of each band. For a more accurate estimation, use [Table 7-7](#).

**Table 7-7. VCO Gain**

f1	f2	K <sub>VCO1</sub>	K <sub>VCO2</sub>
7550	8740	78	114
8740	10000	91	125
10000	10980	112	136
10980	12100	136	168
12100	13080	171	206
13080	14180	188	218
14180	15100	218	248

Based on [Table 7-7](#), [Equation 4](#) can estimate the VCO gain for an arbitrary VCO frequency of  $f_{VCO}$ :

$$K_{VCO} = K_{VCO1} + (K_{VCO2} - K_{VCO1}) \times (f_{VCO} - f1) / (f2 - f1) \quad (4)$$

### 7.3.8 Channel Divider

To go below the VCO lower bound of 7550 MHz, the channel divider can be used. The channel divider consists of four segments, and the total division value is equal to the multiplication of them. Therefore, not all values are valid.

**Figure 7-2. Channel Divider**

When the channel divider is used, there are limitations on the values. [Table 7-8](#) shows how these values are implemented and which segments are used.

**Table 7-8. Channel Divider Segments**

EQUIVALENT DIVISION VALUE	FREQUENCY LIMITATION	OUTPUT FREQUENCY (MHz)		CHDIV[4:0]	SEG0	SEG1	SEG2	SEG3
		MIN	MAX					
2	None	3775	7550	0	2	1	1	1
4		1887.5	3775	1	2	2	1	1
6		1258.333	2516.667	2	2	3	1	1
8	$f_{VCO} \leq 11.5$ GHz	943.75	1437.5	3	2	2	2	1
12		629.167	958.333	4	2	3	2	1
16		471.875	718.75	5	2	2	4	1
24		314.583	469.167	6	2	3	4	1
32		235.938	359.375	7	2	2	8	1
48		157.292	239.583	8	2	3	8	1
64		117.969	179.688	9	2	2	8	2
96		78.646	119.792	10	2	3	8	2
128		58.984	89.844	11	2	2	8	4
192		39.323	59.896	12	2	3	8	4
Invalid	n/a	n/a	n/a	13 - 31	n/a	n/a	n/a	n/a

The channel divider is powered up whenever an output (OUT<sub>x</sub>\_MUX) is selected to the channel divider or SYSREF, regardless of whether it is powered down or not. When an output is not used, TI recommends selecting the VCO output to ensure that the channel divider is not unnecessarily powered up.

**Table 7-9. Channel Divider**

OUTA MUX	OUTB MUX	CHANNEL DIVIDER
Channel Divider	X	Powered up
X	Channel Divider or SYSREF	Powered up
All other cases		Powered down

### 7.3.9 Output Buffer

The RF output buffer type is open-collector that requires an external pullup to  $V_{CC}$ . This component may be a 50- $\Omega$  resistor or an inductor. The inductor has less controlled impedance, but higher power. For the inductor case, it is often helpful to follow this with a resistive pad. The output power can be programmed to various levels or disabled while still keeping the PLL in lock.

**Table 7-10. OUTx\_PWR Recommendations**

$f_{OUT}$	RESTRICTIONS	COMMENTS
$10 \text{ MHz} \leq f_{OUT} \leq 5 \text{ GHz}$	None	At lower frequencies, the output buffer impedance is high, so the 50- $\Omega$ pullup will make the output impedance look somewhat like 50 $\Omega$ .
$5 \text{ GHz} \leq f_{OUT} \leq 10 \text{ GHz}$	$OUTx\_PWR \leq 31$	In this range, parasitic inductances have some impact, so the output setting is restricted.
$10 \text{ GHz} < f_{OUT}$	$OUTx\_PWR \leq 20$	At these higher frequency ranges, it is best to keep below 20 for highest power and optimal noise floor.

### 7.3.10 Powerdown Modes

The LMX2694-SEP can be powered up and down using the CE pin or the POWERDOWN bit. When the device comes out of the powered-down state, either by resuming the POWERDOWN bit to zero or by pulling back CE pin HIGH (if it was powered down by CE pin), register R0 must be programmed with FCAL\_EN high again to recalibrate the device.

### 7.3.11 Treatment of Unused Pins

This device has several pins for many features and there is a preferred way to treat these pins if not needed. For the input pins, a series resistor is recommended, but they can be directly shorted.

**Table 7-11. Recommended Treatment of Pins**

PINS	RECOMMENDED TREATMENT IF NOT USED
CE	$V_{CC}$ with 1 k $\Omega$ .
SYNC, SYSREFREQ	Ground with 1 k $\Omega$ .
OSCIN_P, OSCIN_N	Ground with 50 $\Omega$ after AC-coupling capacitors. If one of the complimentary sides is used and other side is not, impedance looking out should be similar for both of these pins.
SCK, SDI	Ground with 1 k $\Omega$ .
CS#	$V_{CC}$ with 1 k $\Omega$ .
RFOUTx	$V_{CC}$ with 50 $\Omega$ . If one of the complimentary sides is used and the other side is not, impedance looking out should be similar for both of these pins.
MUXOUT	Ground with 10 k $\Omega$ .

### 7.3.12 Phase Synchronization

#### 7.3.12.1 General Concept

The SYNC pin allows the user to synchronize the LMX2694-SEP such that the delay from the rising edge of the OSCIN signal to the output signal is deterministic. Initially, the devices are locked to the input, but are not synchronized. The user sends a synchronization pulse that is reclocked to the next rising edge of the OSCIN pulse. After a given time,  $t_1$ , the phase relationship from OSCIN to  $f_{OUT}$  will be deterministic. This time is dominated by the sum of the VCO calibration time, the analog setting time of the PLL loop, and the MASH\_RST\_CNT if used in fractional mode.

**Figure 7-3. Phase SYNC Mechanism**

When the SYNC feature is enabled, part of the channel divide may be included in the feedback path.

**Table 7-12. IncludedDivide With VCO\_PHASE\_SYNC = 1**

OUTx_MUX	CHANNEL DIVIDER	IncludedDivide
OUTA_MUX = OUTB_MUX = 1 ("VCO")	Don't care	1
All other valid conditions	Divisible by 3 but NOT 24 or 192	SEG0 x SEG1 = 6
	All other values	SEG0 x SEG1 = 4

**Figure 7-4. Phase SYNC Diagram**

### 7.3.12.2 Categories of Applications for SYNC

The requirements for SYNC depend on certain setup conditions. In cases that the SYNC is not timing critical, it can be done through software by toggling the VCO\_PHASE\_SYNC bit from 0 to 1. Figure 7-5 gives the different categories. When it is timing critical, then it must be done through the pin and the setup and hold times for the OSCIN pin are critical. For timing critical SYNC (Category 3 only), adhere to the following guidelines.

**Table 7-13. SYNC Pin Timing Characteristics for Category 3 SYNC**

PARAMETER		MIN	MAX	UNIT
f <sub>OSC</sub>	Input reference frequency		40	MHz
t <sub>SETUP</sub>	Setup time between SYNC and OSCIN rising edges	9		ns
t <sub>HOLD</sub>	Hold time between SYNC and OSCIN rising edges	4		ns

Figure 7-5. Determining the SYNC Category

### 7.3.12.3 Procedure for Using SYNC

This procedure must be used to put the device in SYNC mode.

1. Use the flowchart to determine the SYNC category.
2. Make determinations for OSCIN and using SYNC based on the category.
  - a. If category 4, SYNC cannot be performed in this setup.
  - b. If category 3, ensure that the maximum  $f_{OSC}$  frequency for SYNC is not violated and there are hardware accommodations to use the SYNC pin.
3. If the channel divide is used, determine the included channel divide value which will be  $2 \times \text{SEG1}$  of the channel divide.
  - a. If OUTA\_MUX is not channel divider and OUTB\_MUX is not channel divider or SYSREF, then IncludedDivide = 1.

- b. Otherwise,  $\text{IncludedDivide} = 2 \times \text{SEG1}$ . In the case that the channel divider is 2, then  $\text{IncludedDivide} = 4$ .
4. If not done already, divide the N divider and fractional values by the included channel divide to account for the included channel divide.
5. Program the device with the  $\text{VCO\_PHASE\_SYNC} = 1$ . Note that this does not count as applying a SYNC to device (for category 2).
6. Apply the SYNC, if required.
  - a. If category 2,  $\text{VCO\_PHASE\_SYNC}$  can be toggled from 0 to 1. Alternatively, a rising edge can be sent to the SYNC pin and the timing of this is not critical.
  - b. If category 3, the SYNC pin must be used, and the timing must be away from the rising edge of the OSCIN signal.

#### 7.3.12.4 SYNC Input Pin

If not using SYNC mode ( $\text{VCO\_PHASE\_SYNC} = 0$ ), the  $\text{INPIN\_IGNORE}$  bit must be set to one, otherwise it causes issues with lock detect. If the pin is desired for to be used and  $\text{VCO\_PHASE\_SYNC} = 1$ , then set  $\text{INPIN\_IGNORE} = 0$ .

#### 7.3.13 Phase Adjust

The  $\text{MASH\_SEED}$  word can use the sigma-delta modulator to shift output signal phase with respect to the input reference. If a SYNC pulse is sent (software or pin) or the MASH is reset with  $\text{MASH\_RST\_N}$ , then this phase shift is from the initial phase of zero. If the  $\text{MASH\_SEED}$  word is written to, then this phase is added. The phase shift is calculated as below.

$$\text{Phase shift in degrees} = 360 \times (\text{MASH\_SEED} / \text{PLL\_DEN}) \times (\text{IncludedDivide} / \text{CHDIV}) \quad (5)$$

For example:

$\text{MASH\_SEED} = 1$ ;  $\text{PLL\_DEN} = 12$ ;  $\text{CHDIV} = 16$

If  $\text{VCO\_PHASE\_SYNC} = 0$ ,  $\text{Phase shift} = 360 \times (1 / 12) \times (1 / 16) = 1.875$  degrees.

If  $\text{VCO\_PHASE\_SYNC} = 1$ ,  $\text{Phase shift} = 360 \times (1 / 12) \times (4 / 16) = 7.5$  degrees.

There are several considerations when using  $\text{MASH\_SEED}$ .

- Phase shift can be done with a  $\text{PLL\_NUM} = 0$ , but  $\text{MASH\_ORDER}$  must be greater than zero. For  $\text{MASH\_ORDER} = 1$ , the phase shifting only occurs when  $\text{MASH\_SEED}$  is a multiple of  $\text{PLL\_DEN}$ .
- For the 2<sup>nd</sup> order modulator,  $\text{PLL\_N} \geq 45$ . For the 3<sup>rd</sup> order modulator,  $\text{PLL\_N} \geq 49$ .

When using  $\text{MASH\_SEED}$  in the case where  $\text{IncludedDivide} > 1$ , there are several additional considerations in order to get the phase shift to be monotonically increasing with  $\text{MASH\_SEED}$ .

- TI recommends to use  $\text{MASH\_ORDER} \leq 2$ .
- When using the 2<sup>nd</sup> order modulator for VCO frequencies below 10 GHz (when  $\text{IncludedDivide} = 6$ ) or 9 GHz (when  $\text{IncludedDivide} = 4$ ), it may be necessary to increase the  $\text{PLL\_N}$  value much higher or change to the 1<sup>st</sup> order modulator. When this is necessary depends on the VCO frequency,  $\text{IncludedDivide}$ , and  $\text{PLL\_N}$  value.

#### 7.3.14 Fine Adjustments for Phase Adjust and Phase SYNC

Phase SYNC refers to the process of getting the same phase relationship for every power up cycle and each time assuming that a given programming procedure is followed. However, there are some adjustments that can be made to get the most accurate results. As for the consistency of the phase SYNC, the only source of variation could be if the VCO calibration chooses a different VCO core and capacitor, which can introduce a bimodal distribution with about 10 ps of variation. If this 10 ps is not desirable, then it can be eliminated by reading back the VCO core, capcode, and DACSET values and forcing these values to ensure the same calibration settings every time. The delay through the device varies from part to part and can be on the order of 60 ps. This part to part variation can be calibrated out with the  $\text{MASH\_SEED}$ . The variation in delay through the device also changes on the order of +2.5 ps/°C, but devices on the same board likely have similar temperatures, so this will somewhat track. In summary, the device can be made to have consistent delay through the part and there are

means to adjust out any remaining errors with the MASH\_SEED. This tends only to be an issue at higher output frequencies when the period is shorter.

### 7.3.15 SYSREF

The LMX2694-SEP can generate a SYSREF output signal that is synchronized to  $f_{OUT}$  with a programmable delay. This output can be a single pulse, series of pulses, or a continuous stream of pulses. To use the SYSREF capability, the PLL must first be placed in SYNC mode with  $VCO\_PHASE\_SYNC = 1$ .

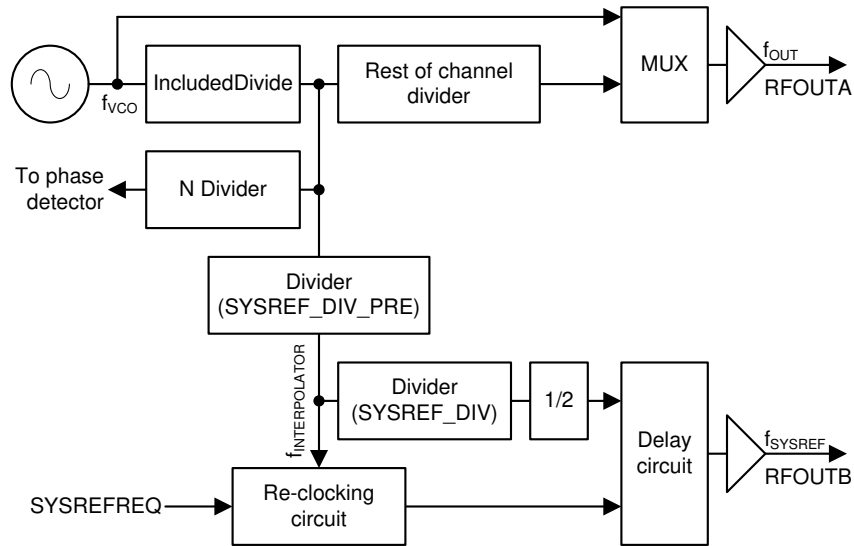

Figure 7-6. SYSREF Setup

As Figure 7-6 shows, the SYSREF feature uses IncludedDivide and SYSREF\_DIV\_PRE divider to generate  $f_{INTERPOLATOR}$ . This frequency is used for re-clocking of the rising and falling edges at the SYSREFREQ pin. In master mode, the  $f_{INTERPOLATOR}$  is further divided by  $2 \times SYSREF\_DIV$  to generate finite series or continuous stream of pulses.

Table 7-14. SYSREF Setup

PARAMETER	MIN	TYP	MAX	UNIT
$f_{VCO}$	7550		15100	MHz
$f_{INTERPOLATOR}$	0.8		1.5	GHz
IncludedDivide		4 or 6		
SYSREF_DIV_PRE		1, 2, or 4		
SYSREF_DIV		4, 6, 8, ..., 4098		
$f_{INTERPOLATOR}$	$f_{INTERPOLATOR} = f_{VCO} / (\text{IncludedDivide} \times \text{SYSREF\_DIV\_PRE})$			
$f_{SYSREF}$	$f_{SYSREF} = f_{INTERPOLATOR} / (2 \times \text{SYSREF\_DIV})$			
Delay step size		9		ps
Pulses for pulsed mode (SYSREF_PULSE_CNT)	0		15	

The delay can be programmed using the JESD\_DAC1\_CTRL, JESD\_DAC2\_CTRL, JESD\_DAC3\_CTRL, and JESD\_DAC4\_CTRL words. By concatenating these words into a larger word called "SYSREFPHASESHIFT", the relative delay can be found. The sum of these words must always be 63.

Table 7-15. SYSREF Delay

SYSREFPHASESHIFT	DELAY	JESD_DAC1	JESD_DAC2	JESD_DAC3	JESD_DAC4
0	Minimum	36	27	0	0
...				0	0

**Table 7-15. SYSREF Delay (continued)**

SYSREFPHASESHIFT	DELAY	JESD_DAC1	JESD_DAC2	JESD_DAC3	JESD_DAC4
36		0	63	0	0
37		0	62	1	0

226		62	1	0	0
247	Maximum	41	22	0	0
> 247	Invalid	Invalid	Invalid	Invalid	Invalid

### 7.3.15.1 Programmable Fields

Table 7-16 has the programmable fields for the SYSREF functionality.

**Table 7-16. SYSREF Programming Fields**

FIELD	PROGRAMMING	DEFAULT	DESCRIPTION
SYSREF_EN	0 = Disabled 1 = Enabled	0	Enables the SYSREF mode. SYSREF_EN must be 1 if and only if OUTB_MUX = 2 (SYSREF).
SYSREF_DIV_PRE	1 = DIV1 2 = DIV2 4 = DIV4 Other states = Invalid		The output of this divider is the $f_{\text{INTERPOLATOR}}$ .
SYSREF_REPEAT	0 = Master mode 1 = Repeater mode	0	In master mode, the device creates a series of SYSREF pulses. In repeater mode, SYSREF pulses are generated with the SYSREFREQ pin.
SYSREF_PULSE	0 = Continuous mode 1 = Pulsed mode	0	Continuous mode continuously makes SYSREF pulses, where pulsed mode makes a series of SYSREF_PULSE_CNT pulses
SYSREF_PULSE_CNT	0 to 15	4	In the case of using pulsed mode, this is the number of pulses. Setting this to zero is an allowable, but not practical state.
SYSREF_DIV	0 = Divide by 4 1 = Divide by 6 2 = Divide by 8 ... 2047 = Divide by 4098	0	The SYSREF frequency is at the VCO frequency divided by this value.

### 7.3.15.2 Input and Output Pin Formats

#### 7.3.15.2.1 SYSREF Output Format

The SYSREF output comes in differential format through RFOUTB. This will have a minimum voltage of about 2.3 V and a maximum of 3.3 V. If DC coupling cannot be used, there are two strategies for AC coupling.

Figure 7-7. SYSREF Output

1. Send a series of pulses to establish a DC-bias level across the AC-coupling capacitor.
2. Establish a bias voltage at the data converter that is below the threshold voltage by using a resistive divider.

### 7.3.15.3 SYSREF Examples

The SYSREF can be used in a repeater mode, which just echos the input, after the SYSREF is relocked to the  $f_{\text{INTERPOLATOR}}$  frequency and then RFOUT—or it can be used in a repeater. In repeater mode, it can repeat 1, 2, 4, 8, or infinite (continuous) pulses. The frequency for repeater mode is equal to the RFOUT frequency divided by the SYSREF divider.

Figure 7-8. SYSREF Out in Repeater Mode

In master mode, the SYSREFREQ pin is pulled high to allow the SYSREF output.

Figure 7-9. SYSREF Out in Pulsed / Continuous Mode

### 7.3.15.4 SYSREF Procedure

To use SYSREF, do the these steps:

1. Put the device in SYNC mode using the procedure already outlined.
2. Figure out IncludedDivide the same way it is done for SYNC mode.
3. Calculate the SYSREF\_DIV\_PRE value such that the interpolator frequency ( $f_{\text{INTERPOLATOR}}$ ) is in the range of 800 to 1500 MHz.  $f_{\text{INTERPOLATOR}} = f_{\text{VCO}} / \text{IncludedDivide} / \text{SYSREF\_DIV\_PRE}$ . Make this frequency a multiple of  $f_{\text{OSC}}$  if possible.
4. If using master mode (SYSREF\_REPEAT = 0), ensure SYSREFREQ pin is high.
5. If using repeater mode (SYSREF\_REPEAT = 1), set up the pulse count if desired. Pulses are created by toggling the SYSREFREQ pin.
6. Adjust the delay between the RFOUTA and RFOUTB signal using the JESD\_DACx\_CTRL fields.

## 7.4 Device Functional Modes

Table 7-17 shows the function modes of the LMX2694-SEP.

**Table 7-17. Functional Modes**

MODE	DESCRIPTION	SOFTWARE SETTINGS
RESET	Registers are held in their reset state. This device does have a power-on reset, but it is good practice to also do a software reset if there is any possibility of noise on the programming lines, especially if there is sharing with other devices. Also realize that there are registers not disclosed in the data sheet that are reset as well.	RESET = 1 POWERDOWN = 0
POWERDOWN	Device is powered down.	POWERDOWN = 1
Normal operating mode	This is used with at least one output on as a frequency synthesizer and the device can be controlled through the SPI interface.	
SYNC mode	This is used where part of the channel divider is in the feedback path to ensure deterministic phase.	VCO_PHASE_SYNC = 1
SYSREF mode	In this mode, RFOUTB is used to generate pulses for SYSREF.	VCO_PHASE_SYNC = 1 SYSREF_EN = 1

## 7.5 Programming

The LMX2694-SEP is programmed using 24-bit shift registers. The shift register consists of a R/W bit (MSB), followed by a 7-bit address field and a 16-bit data field. For the R/W bit, 0 is for write, and 1 is for read. The address field ADDRESS[6:0] is used to decode the internal register address. The remaining 16 bits form the data field DATA[15:0]. While CS# is low, serial data is clocked into the shift register upon the rising edge of clock (data is programmed MSB first). When CS# goes high, data is transferred from the data field into the selected register bank. See Figure 6-2 for timing details.

### 7.5.1 Recommended Initial Power-Up Sequence

For the most reliable programming, TI recommends this procedure:

1. Apply power to device.
2. Program RESET = 1 to reset registers.
3. Program RESET = 0 to remove reset.
4. Program registers as shown in the register map in REVERSE order from highest to lowest.
5. Programming of registers R113 down to R79 is not required, but if they are programmed, they should be done so as the register map shows. Programming of registers R79 down to R0 is required. Registers in this range that only 1's and 0's should also be programmed in accordance to the register map. Do NOT assume that the power-on reset state and the recommended value are the same.
6. Wait 10 ms.
7. Program register R0 one additional time with FCAL\_EN = 1 to ensure that the VCO calibration runs from a stable state.

### 7.5.2 Recommended Sequence for Changing Frequencies

The recommended sequence for changing frequencies is as follows:

1. Change the N-divider value.
2. Program the PLL numerator and denominator.
3. Program FCAL\_EN (R0[3]) = 1.

R/W-0x0	R/W-0x0			R/W-0x1	R/W-0x1	R/W-0x0	R/W-0x0

**Table 7-20. R0 Register Field Descriptions**

Bit	Field	Type	Reset	Description
15	RESERVED	R/W	0x0	Program 0x0 to this field.
14	VCO_PHASE_SYNC	R/W	0x0	Enables phase SYNC. In this state, part of the channel divider is put in the feedback path to ensure deterministic phase. The action of toggling this bit from 0 to 1 also sends an asynchronous SYNC pulse. 0x0 = Normal operation 0x1 = Phase SYNC enabled
13-10	RESERVED	R/W	0x8	Program 0x8 to this field.
9	OUT_MUTE	R/W	0x0	Mute the outputs (RFOUTA / RFOUTB) when the VCO is calibrating. 0x0 = Disabled 0x1 = Muted
8-7	FCAL_HPFADJ	R/W	0x0	Set this field in accordance to the phase detector frequency for optimal VCO calibration. 0x0 = $f_{PD} \leq 100$ MHz 0x1 = $100 \text{ MHz} < f_{PD} \leq 150$ MHz 0x2 = $150 \text{ MHz} < f_{PD} \leq 200$ MHz 0x3 = $f_{PD} > 200$ MHz
6-4	RESERVED	R/W	0x0	Program 0x1 to this field.
3	FCAL_EN	R/W	0x1	Writing register R0 with this bit set to a '1' enables and triggers the VCO frequency calibration. 0x0 = No VCO frequency calibration 0x1 = Enabled
2	MUXOUT_LD_SEL	R/W	0x1	Selects the functionality of the MUXOUT pin. 0x0 = Register readback 0x1 = Lock detect
1	RESET	R/W	0x0	Register reset. This resets all registers and state machines. After writing a '1', you must write a '0' to remove the reset. It is recommended to toggle the RESET bit before programming the part to ensure consistent performance. 0x0 = Normal operation 0x1 = Reset
0	POWERDOWN	R/W	0x0	Powers down device. 0x0 = Normal operation 0x1 = Powered down

### 7.6.2 R1 Register (Offset = 0x1) [reset = 0x80C]

R1 is shown in [Figure 7-11](#) and described in [Table 7-21](#).

Return to [Table 7-18](#).

Bit	Field	Type	Reset	Description
15-4	RESERVED	R/W	0x80	Program 0x80 to this field.
3	MUXOUT_CTRL	R/W	0x1	Sets the MUXOUT pin status. 0x0 = Tri-state 0x1 = Normal operation
2-0	CAL_CLK_DIV	R/W	0x4	Divides down the $f_{OSC}$ frequency to the state machine clock frequency. $f_{SM} = f_{OSC} / (2^{CAL\_CLK\_DIV})$ . Ensure that the state machine clock frequency is 50 MHz or less. 0x0 = $f_{OSC} \leq 50$ MHz 0x1 = $50 \text{ MHz} < f_{OSC} \leq 100$ MHz 0x2 = $100 \text{ MHz} < f_{OSC} \leq 200$ MHz 0x3 = $200 \text{ MHz} < f_{OSC} \leq 400$ MHz 0x4 = $400 \text{ MHz} < f_{OSC} \leq 800$ MHz 0x5 = $f_{OSC} > 800$ MHz All other values are not used.

## 8 Application and Implementation

### Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

### 8.1 Application Information

#### 8.1.1 OSCIN Configuration

OSCIN supports single or differential-ended clock. There must be a AC-coupling capacitor in series before the device pin. The OSCIN inputs are high-impedance CMOS with internal bias voltage. TI recommends putting termination shunt resistors to terminate the differential traces (if there are 50-Ω characteristic traces, place 50-Ω resistors). The OSCIN\_P and OSCIN\_N side must be matched in layout. A series AC-coupling capacitors must immediately follow OSCIN pins in the board layout, then the shunt termination resistors to ground must be placed after.

Input clock definitions are shown in [Figure 8-1](#).

**Figure 8-1. Input Clock Definitions**

#### 8.1.2 OSCIN Slew Rate

The slew rate of the OSCIN signal can have an impact on the spurs and phase noise of the LMX2694-SEP if it is too low. In general, the best performance is for a high slew rate, but lower amplitude signal, such as LVDS.

#### 8.1.3 RF Output Buffer Power Control

The OUTA\_PWR and OUTB\_PWR registers control the amount of drive current for the output. This current creates a voltage across the pullup component and load. TI generally recommends to keep the OUTx\_PWR setting at 31 or less, as higher settings consume more current consumption and can also lead to higher output power. Optimal noise floor is typically obtained by setting OUTx\_PWR in the range of 15 to 25.

#### 8.1.4 RF Output Buffer Pullup

The choice of output buffer components is very important and can have a profound impact on the output power. The pullup component can be a resistor or inductor or combination thereof. The signal swing is created by a current flowing this pullup, so a higher impedance implies a higher signal swing. However, as this pullup component can be treated as if it is in parallel with the load impedance, there are diminishing returns as the impedance gets much larger than the load impedance. The output impedance of the device varies as a function of frequency and is a complex number, but typically has a magnitude on the order of 100 Ω, but this decreases with frequency.

The output can be used differentially or single-ended. If using single-ended, the pullup is still needed, and user needs to terminate the unused complimentary side such that the impedance as seen from the pin looking out is similar to the pin that is being used. Following are some typical components that might be useful.

**Table 8-1. Output Pullup Configuration**

COMPONENT	VALUE	PART NUMBER
Inductor	1 nH, 13.6 GHz SRF	Toko LL1005-FH1N0S
	3.3 nH, 6.8 GHz SRF	Toko LL1005-FH3N3S
	10 nH, 3.8 GHz SRF	Toko LL1005-FH10NU
Resistor	50 $\Omega$	Vishay FC0402E50R0BST1
Capacitor	Varies with frequency	ATC 520L103KT16T ATC 504L50R0FTNCFT

#### 8.1.4.1 Resistor Pullup

One strategy for the choice of the pullup component is to use a resistor (R). This is typically chosen to be 50- $\Omega$  and under the assumption that the part output impedance is high, then the output impedance will theoretically be 50  $\Omega$ , regardless of output frequency. As the output impedance of the device is not infinite, the output impedance when the pullup resistor is used will be less than 50  $\Omega$ , but will be reasonably close. There will be some drop across the resistor, but this does not seem to have a large impact on signal swing for a 50- $\Omega$  resistor provided that  $OUT_x\_PWR \leq 31$ .

**Figure 8-2. Resistor Pullup**

#### 8.1.4.2 Inductor Pullup

Another strategy is to choose an inductor pullup (L). This allows a higher impedance without any concern of creating any DC drop across the component. Ideally, the inductor should be chosen large enough so that the impedance is high relative to the load impedance and also be operating away from its self-resonant frequency. For instance, consider a 3.3-nH pullup inductor with a self-resonant frequency of 7 GHz driving a 25- $\Omega$  spectrum analyzer input. This inductor theoretically has  $j50\text{-}\Omega$  input impedance around 2.4 GHz. At this frequency, this in parallel with load is about  $j35\text{-}\Omega$ , which is a 3-dB power reduction. At 1.4 GHz, this inductor has impedance of about 29  $\Omega$ . This in parallel with the 50- $\Omega$  load has a magnitude of 25  $\Omega$ , which is the same result seen with the 50- $\Omega$  pullup. The main issue with the inductor pullup is that the impedance does not look nicely matched to the load.

**Figure 8-3. Inductor Pullup**

As the output impedance is not so nicely matched, but there is higher output power, it makes sense to use a resistive pad to get the best impedance control. A 6-dB pad ( $R1 = 18 \Omega$ ,  $R2 = 68 \Omega$ ) is likely more attenuation than necessary. A 3-dB or even 1-dB pad might suffice. Two AC-coupling capacitors are required before the pad. In Figure 8-4, one of them is placed by the resistor to ground to minimize the number of components in the high frequency path for lower loss.

**Figure 8-4. Inductor Pullup With Pad**

For the resistive pad, [Table 8-2](#) shows some common values:

**Table 8-2. Resistive T-Pad Values**

ATTENUATION	R1	R2
1 dB	2.7 Ω	420 Ω
2 dB	5.6 Ω	220 Ω
3 dB	6.8 Ω	150 Ω
4 dB	12 Ω	100 Ω
5 dB	15 Ω	82 Ω
6 dB	18 Ω	68 Ω

### 8.1.4.3 Combination Pullup

The resistor gives a good low frequency response, while the inductor gives a good high frequency response with worse matching. It is desirable to have the impedance of the pullup to be high, but if a resistor is used, then there could be too much DC drop. If an inductor is used, it is hard to find one good at low frequencies and around its self-resonant frequency. One approach to address this is to use a series resistor and inductor followed by resistive pad.

**Figure 8-5. Inductor and Resistor Pullup**

### 8.1.5 RF Output Treatment for the Complimentary Side

Regardless of whether both sides of the differential outputs are used, both sides should see a similar load.

### 8.1.5.1 Single-Ended Termination of Unused Output

The unused output should see a roughly the same impedance as looking out of the pin to minimize harmonics and get the best output power. As placement of the pull-up components is critical for the best output power, the routing does not need to be perfectly symmetrical. It makes sense to give highest priority routing to the used output (RFOUTA\_P in this case).

**Figure 8-6. Termination of Unused Output - Single-Ended**

### 8.1.5.2 Differential Termination

For differential termination this can be done by doing the same termination to both sides, or it is also possible to connect the grounds together. This approach can also be accompanied by a differential to single-ended balun for the highest possible output power.

**Figure 8-7. Termination of Unused Output - Differential**

**LMX2694-SEP**

SNAS788C – NOVEMBER 2019 – REVISED MARCH 2022

**8.1.6 External Loop Filter**

The LMX2694-SEP requires an external loop filter that is application-specific and can be configured by PLLatinum Sim. For the LMX2694-SEP, it matters what impedance is seen from the VTUNE pin looking outwards. This impedance is dominated by the component C3 for a third order filter or C1 for a second order filter. If there is at least 1.5 nF for the capacitance that is shunt with this pin, the VCO phase noise will be close to the best it can be. If there is less, the VCO phase noise in the 100-kHz to 1-MHz region will degrade. This capacitor should be placed close to the VTUNE pin.

**Figure 8-8. External Loop Filter**

**8.2 Typical Application**

**Figure 8-9. Typical Application Schematic**

### 8.2.1 Design Requirements

The design of the loop filter is complex and is typically done with software. The PLLatinum Sim software is an excellent resource for doing this and the design is shown in Figure 8-10.

Figure 8-10. PLLatinum Sim Tool

### 8.2.2 Detailed Design Procedure

The integration of phase noise over a certain bandwidth (jitter) is an performance specification that translates to signal-to-noise ratio. Phase noise inside the loop bandwidth is dominated by the PLL, while the phase noise outside the loop bandwidth is dominated by the VCO. Generally, jitter is lowest if loop bandwidth is designed to the point where the two intersect. A higher phase margin loop filter design has less peaking at the loop bandwidth and thus lower jitter. The tradeoff with this is that longer lock times and spurs must be considered in design as well.

### 8.2.3 Application Curve

Using the settings described, the performance measured using a clean 100-MHz input reference is shown. Note the loop bandwidth is about 350 kHz, as simulations predict.

Figure 8-11. Results for Loop Filter Design

## 9 Power Supply Recommendations

TI recommends placement of bypass capacitors close to the pins. Consult the EVM instructions for layout examples. If fractional spurs are a large concern, using a ferrite bead to each of these power supply pins can reduce spurs to a small degree. This device has integrated LDOs, which improves the resistance to power supply noise. However, the pullup components on the RFOUTA and RFOUTB pins on the outputs have a direct connection to the power supply, so take extra care to ensure that the voltage is clean for these pins.

## 10 Layout

### 10.1 Layout Guidelines

In general, the layout guidelines are similar to most other PLL devices. Here are some specific guidelines.

- GND pins may be routed on the package back to the DAP.
- The OSCIN pins, these are internally biased and must be AC coupled.
- If not used, the SYSREFREQ may be grounded to the DAP.
- For optimal VCO phase noise in the 200 kHz to 1 MHz range, it is ideal that the capacitor closest to the VTUNE pin be at least 3.3 nF. As requiring this larger capacitor may restrict the loop bandwidth, this value can be reduced (to say 1.5 nF) at the expense of VCO phase noise.
- For the outputs, keep the pullup component as close as possible to the pin and use the same component on each side of the differential pair.
- If a single-ended output is needed, the other side must have the same loading and pullup. However, the routing for the used side can be optimized by routing the complementary side through a via to the other side of the board. On this side, use the same pullup and make the load look equivalent to the side that is used.
- Ensure DAP on device is well-grounded with many vias, preferably copper filled.
- Have a thermal pad that is as large as the LMX2694-SEP exposed pad. Add vias to the thermal pad to maximize thermal performance.
- Use a low loss dielectric material, such as Rogers 4350B, for optimal output power.

### 10.2 Layout Example

In addition to the layout guidelines already given, here are some additional comments for this specific layout example.

- The most critical part of the layout that the placement of the pull-up components (R19, R20, R21, and R22) is close to the pin for optimal output power.
- For this layout, all of the loop filter (C1LF, C2LF, C3LF, C4LF, R2LF, R3LF, and R4LF) are on the back side of the board. C4LF is located right underneath to the VTUNE pin. In the event that this C4LF capacitor would be open, it is recommended to move one of loop capacitors in this spot. For instance, if a 3<sup>rd</sup> order loop filter was used, technically C3LF would be non-zero and C4LF would be open. However, for this layout example that is designed for a 4<sup>th</sup> order loop filter, it would be optimal to make R3LF = 0  $\Omega$ , C3LF = open, and C4LF to be whatever C3LF would have been.

**Figure 10-1. Layout Example**

## 11 Device and Documentation Support

### 11.1 Device Support

#### 11.1.1 Development Support

Texas Instruments has several software tools to aid in the development at [www.ti.com](http://www.ti.com). Among these tools are:

- [PLLatinum Sim](#) program for designing loop filters, simulating phase noise and spurs.
- [TICS Pro](#) software to understand how to program the device and for programming the EVM board.

### 11.2 Documentation Support

#### 11.2.1 Related Documentation

For related documentation see the following:

- [AN-1879 Fractional N Frequency Synthesis](#) (SNAA062)

### 11.3 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on [ti.com](http://ti.com). Click on *Subscribe to updates* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

### 11.4 Support Resources

[TI E2E™ support forums](#) are an engineer's go-to source for fast, verified answers and design help — straight from the experts. Search existing answers or ask your own question to get the quick design help you need.

Linked content is provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

### 11.5 Trademarks

PLLatinum™ is a trademark of Texas Instruments.

TI E2E™ is a trademark of Texas Instruments.

All trademarks are the property of their respective owners.

### 11.6 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

### 11.7 Glossary

[TI Glossary](#) This glossary lists and explains terms, acronyms, and definitions.

## 12 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

**PACKAGE OUTLINE**

**RTC0048G**

**VQFN - 0.9 mm max height**

PLASTIC QUAD FLATPACK - NO LEAD

**NOTES:**

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. The package thermal pad must be soldered to the printed circuit board for thermal and mechanical performance.

## EXAMPLE BOARD LAYOUT

**RTC0048G**

**VQFN - 0.9 mm max height**

PLASTIC QUAD FLATPACK - NO LEAD

NOTES: (continued)

4. This package is designed to be soldered to a thermal pad on the board. For more information, see Texas Instruments literature number SLUA271 ([www.ti.com/lit/sluea271](http://www.ti.com/lit/sluea271)).
5. Vias are optional depending on application, refer to device data sheet. If any vias are implemented, refer to their locations shown on this view. It is recommended that vias under paste be filled, plugged or tented.

## EXAMPLE STENCIL DESIGN

**RTC0048G**

**VQFN - 0.9 mm max height**

PLASTIC QUAD FLATPACK - NO LEAD

NOTES: (continued)

6. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.

**PACKAGING INFORMATION**

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
LMX2694SRTCTSEP	ACTIVE	VQFN	RTC	48	260	RoHS & Green	Call TI   NIPDAUAG	Level-3-260C-168 HR	-55 to 125	LMX2694 SEP	<a href="#">Samples</a>

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:**The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

**OTHER QUALIFIED VERSIONS OF LMX2694-SEP :**

- Enhanced Product : [LMX2694-EP](#)

## NOTE: Qualified Version Definitions:

- Enhanced Product - Supports Defense, Aerospace and Medical Applications

## IMPORTANT NOTICE AND DISCLAIMER

TI PROVIDES TECHNICAL AND RELIABILITY DATA (INCLUDING DATA SHEETS), DESIGN RESOURCES (INCLUDING REFERENCE DESIGNS), APPLICATION OR OTHER DESIGN ADVICE, WEB TOOLS, SAFETY INFORMATION, AND OTHER RESOURCES "AS IS" AND WITH ALL FAULTS, AND DISCLAIMS ALL WARRANTIES, EXPRESS AND IMPLIED, INCLUDING WITHOUT LIMITATION ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE OR NON-INFRINGEMENT OF THIRD PARTY INTELLECTUAL PROPERTY RIGHTS.

These resources are intended for skilled developers designing with TI products. You are solely responsible for (1) selecting the appropriate TI products for your application, (2) designing, validating and testing your application, and (3) ensuring your application meets applicable standards, and any other safety, security, regulatory or other requirements.

These resources are subject to change without notice. TI grants you permission to use these resources only for development of an application that uses the TI products described in the resource. Other reproduction and display of these resources is prohibited. No license is granted to any other TI intellectual property right or to any third party intellectual property right. TI disclaims responsibility for, and you will fully indemnify TI and its representatives against, any claims, damages, costs, losses, and liabilities arising out of your use of these resources.

TI's products are provided subject to [TI's Terms of Sale](#) or other applicable terms available either on [ti.com](https://www.ti.com) or provided in conjunction with such TI products. TI's provision of these resources does not expand or otherwise alter TI's applicable warranties or warranty disclaimers for TI products.

TI objects to and rejects any additional or different terms you may have proposed.
