

ONET8501PB 11.3-Gbps Rate-Selectable Limiting Amplifier

1 Features

- Up to 11.3-Gbps Operation
- 2-Wire Digital Interface
- Digitally Selectable Input Bandwidth
- Adjustable LOS Threshold
- Digitally Selectable Output Voltage
- Digitally Selectable Output Preemphasis
- Adjustable Input Threshold Voltage
- Low Power Consumption
- Input Offset Cancellation
- CML Data Outputs With On-Chip 50- Ω Back-Termination to VCC
- Single 3.3-V Supply
- Output Disable
- Surface Mount Small Footprint 3-mm × 3-mm, 16-Pin, RoHS compliant VQFN Package

2 Applications

- 10-Gigabit Ethernet Optical Receivers
- 2x, 4x, 8x, and 10x Fiber Channel Optical Receivers
- SONET OC-192/SDH-64 Optical Receivers
- SFP+ and XFP Transceiver Modules
- XENPAK, XPAK, X2, and 300-Pin MSA Transponder Modules
- Cable Drivers and Receivers

3 Description

The ONET8501PB device is a high-speed, 3.3-V limiting amplifier for multiple fiber optic and copper cable applications with data rates from 2 Gbps up to 11.3 Gbps.

The device provides a two-wire serial interface which allows digital control of the bandwidth, output amplitude, output preemphasis, input threshold voltage (slice level), and the loss of signal assert level. Predetermined settings for bandwidth and LOS assert levels can also be selected with external rate selection pins.

5 Description (continued)

The ONET8501PB provides a gain of about 34 dB which ensures a fully differential output swing for input signals as low as 20 mV_{pp}. The output amplitude can be adjusted to 350 mV_{pp}, 650 mV_{pp}, or 850 mV_{pp}. To compensate for frequency-dependent loss of microstrips or striplines connected to the output of the device, programmable preemphasis is included in the output stage. A settable loss of signal detection and output disable are also provided.

The device, available in RoHS compliant small footprint 3-mm × 3-mm, 16-pin VQFN package, typically dissipates less than 170 mW and is characterized for operation from -40°C to 100°C .

6 Pin Configuration and Functions

Pin Functions

PIN		TYPE	DESCRIPTION
NAME	NO.		
COC1	5	Analog	Offset cancellation filter capacitor plus terminal. An external capacitor can be connected between this pin and COC2 to reduce the low frequency cutoff. To disable the offset cancellation loop, connect COC1 and COC2 together.
COC2	6	Analog	Offset cancellation filter capacitor minus terminal. An external capacitor can be connected between this pin and COC1 to reduce the low frequency cutoff. To disable the offset cancellation loop, connect COC1 and COC2 together.
DIN+	2	Analog-input	Noninverted data input. Differentially 100 Ω terminated to DIN-.
DIN-	3	Analog-input	Inverted data input. Differentially 100 Ω terminated to DIN+.
DIS	7	Digital-input	Disables the output stage when set to a high level.
DOUT-	10	CML-out	Inverted data output. On-chip 50 Ω back-terminated to VCC.
DOUT+	11	CML-out	Noninverted data output. On-chip 50 Ω back-terminated to VCC.
GND	1,4, EP	Supply	Circuit ground. Exposed die pad (EP) must be grounded.
LOS	8	Open-drain MOS	High level indicates that the input signal amplitude is below the programmed threshold level. Open-drain output. Requires an external 10-k Ω pullup resistor to VCC for proper operation.
RATE1	13	Digital-input	Bandwidth selection for noise suppression.
RATE0	14	Digital-input	Bandwidth selection for noise suppression.
SCK	15	Digital-input	Serial interface clock input. Connect a pullup resistor (10 k Ω typical) to VCC.
SDA	16	Digital-input	Serial interface data input. Connect a pullup resistor (10 k Ω typical) to VCC.
VCC	9, 12	Supply	3.3-V \pm 10% supply voltage.

7 Specifications

7.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)⁽¹⁾

		MIN	MAX	UNIT
V_{CC}	Supply voltage ⁽²⁾	–0.3	4	V
V_{DIN+}, V_{DIN-}	Voltage at DIN+, DIN– ⁽²⁾	0.5	4	V
$V_{LOS}, V_{COC1}, V_{COC2}, V_{DOUT+}, V_{DOUT-}, V_{DIS}, V_{RATE0}, V_{RATE1}, V_{SDA}, V_{SCK}$	Voltage at LOS, COC1, COC2, DOUT+, DOUT–, DIS, RATE0, RATE1, SDA, SCK ⁽²⁾	–0.3	4	V
$V_{DIN,DIFF}$	Differential voltage between DIN+ and DIN–		±2.5	V
$I_{DIN+}, I_{DIN-}, I_{DOUT+}, I_{DOUT-}$	Continuous current at inputs and outputs		25	mA
T_{LEAD}	Lead temperature 1.6mm (1/16 inch) from case for 10 s		260	°C
T_A	Characterized free-air operating temperature	–40	100	°C
$T_{J,max}$	Maximum junction temperature		125	°C
T_{stg}	Storage temperature	–65	150	°C

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

(2) All voltage values are with respect to network ground terminal.

7.2 ESD Ratings

		VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	±2000
		Charged-device model (CDM), per JEDEC specification JESD22-C101 ⁽²⁾	±750

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

7.3 Recommended Operating Conditions

		MIN	NOM	MAX	UNIT
V_{CC}	Supply voltage	2.95	3.3	3.6	V
T_A	Operating free-air temperature	–40	100		°C
	DIGITAL input high voltage		2		V
	DIGITAL input low voltage			0.8	V

7.4 DC Electrical Characteristics

Over recommended operating conditions, outputs connected to a 50- Ω load, AMP1 = 0, AMP0 = 1 (Register 3) unless otherwise noted. Typical operating condition is at $V_{CC} = 3.3$ V and $T_A = 25^\circ\text{C}$.

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
V_{CC}	Supply voltage	2.95	3.3	3.6	V
I_{VCC}	Supply current DIS = 0, CML currents included		50	63	mA
R_{IN}	Data input resistance Differential		100		Ω
R_{OUT}	Data output resistance Single-ended, referenced to V_{CC}		50		Ω
LOS HIGH voltage	$I_{SOURCE} = 50 \mu\text{A}$ with 10-k Ω pullup to V_{CC}	2.4			V
LOS LOW voltage	$I_{SINK} = 10 \text{ mA}$ with 10-k Ω pullup to V_{CC}			0.4	V

7.5 AC Electrical Characteristics

Over recommended operating conditions, outputs connected to a $50\text{-}\Omega$ load, $\text{AMP1} = 0$, $\text{AMP0} = 1$ (Register 3) and maximum bandwidth unless otherwise noted. Typical operating condition is at $V_{\text{CC}} = 3.3\text{ V}$ and $T_A = 25^\circ\text{C}$.

PARAMETER	TEST CONDITION	MIN	TYP	MAX	UNIT

8 Detailed Description

8.1 Overview

This compact, low-power, 11.3-Gbps limiting amplifier consists of a high-speed data path with offset cancellation block (DC feedback) combined with an analog settable input threshold adjust, a loss-of-signal detection block using two peak detectors, a two-wire interface with a control-logic block and a band-gap voltage reference and bias current generation block.

See [Functional Block Diagram](#) for a simplified block diagram of the ONET8501PB.

8.2 Functional Block Diagram

8.3 Feature Description

8.3.1 High-Speed Data Path

The high-speed data signal is applied to the data path by means of input signal pins DIN+ / DIN-. The data path consists of a $100\text{-}\Omega$ differential termination resistor followed by a digitally controlled bandwidth switch input buffer for rate select. The RATE1 and RATE0 pins can be used to control the bandwidth of the filter. Default bandwidth settings are used; however, these can be changed using registers 4 through 7 through the serial interface. For details regarding the rate selection, see [Table 19](#). A gain stage and an output buffer stage follow the input buffer, which together provide a gain of 34 dB. The device can accept input amplitude levels from 5 mV_{pp} up to $2000\text{ mV}_{\text{pp}}$. The amplified data output signal is available at the output pins DOUT+ and DOUT, which includes on-chip $2 \times 50\text{-}\Omega$ back-termination to VCC.

Offset cancellation compensates for internal offset voltages and thus ensures proper operation even for very small input data signals. The offset cancellation can be disabled so that the input threshold voltage can be adjusted to optimize the bit error rate or change the eye crossing to compensate for input signal pulse width distortion. The offset cancellation can be disabled by setting OCDIS = 1 (bit 1 of register 0). The input threshold level can be adjusted using register settings THADJ[0..7] (register 1). For details regarding input threshold adjust, see [Table 19](#).

The low frequency cutoff is as low as 80 kHz with the built-in filter capacitor. For applications, which require even lower cutoff frequencies, an additional external filter capacitor may be connected to the COC1 and COC2 pins. A value of 330 pF results in a low frequency cutoff of 10 kHz.

8.3.2 Band-gap Voltage and Bias Generation

The ONET8501PB limiting amplifier is supplied by a single 3.3-V supply voltage connected to the VCC pins. This voltage is referred to ground (GND).

On-chip band-gap voltage circuitry generates a reference voltage, independent of supply voltage, from which all other internally required voltages and bias currents are derived.

8.4 Device Functional Modes

8.4.1 High-Speed Output Buffer

The output amplitude of the buffer can be set to $350\text{ mV}_{\text{pp}}$, $650\text{ mV}_{\text{pp}}$, or $850\text{ mV}_{\text{pp}}$ using register settings AMP[0..1] (register 3) through the serial interface. To compensate for frequency dependant losses of transmission lines connected to the output, the ONET8501PB has adjustable preemphasis of the output stage. The preemphasis can be set from 0 to 8 dB in 1-dB steps using register settings PEADJ[0..3] (register 2).

8.4.2 Rate Select

There are 16 possible internal filter settings (4 bit) to adjust the small signal bandwidth to the data rate. For fast rate selection, 4 default values can be selected with the RATE1 and RATE0 pins. Using the serial interface, the bandwidth settings can be customized instead of using the default values. The default bandwidths and the registers used to change the bandwidth settings are shown in [Table 1](#).

Table 1. Rate Selection Default Settings and Registers Used for Adjustment

RATE1	RATE0	DEFAULT BANDWIDTH (GHz)	REGISTER USED FOR ADJUSTMENT
0	0	2.4	RSA (Register 4)
0	1	7.6	RSB (Register 5)
1	1	8.4	RSC (Register 6)
1	0	9	RSD (Register 7)

If the rate select register selection bit is set LOW, for example RSASEL = 0 (bit 7 of register 4), then the default bandwidth for that register is used. If the register selection bit is set HIGH, for example RSASEL = 1 (bit 7 of register 4), then the content of RSA[0..3] (register 4) is used to set the input filter bandwidth when RATE0 = 0 and RATE1 = 0. The settings of the rate selection registers RSA, RSB, RSC, RSD, and the corresponding filter bandwidths are shown in [Table 2](#).

Table 2. Available Bandwidth Settings

RSX3	RSX2	RSX1	RSX0	TYPICAL BANDWIDTH (GHz)
0	0	0	0	9
0	0	0	1	8.6
0	0	1	0	8.4
0	0	1	1	8.1
0	1	0	0	7.9
0	1	0	1	7.6
0	1	1	0	6.9
0	1	1	1	6.2
1	0	0	0	5.2
1	0	0	1	4.2
1	0	1	0	3.7
1	0	1	1	3.4
1	1	0	0	3.2
1	1	0	1	2.8
1	1	1	0	2.6
1	1	1	1	2.4

The RATE1 and RATE0 pins do not have to be used if the serial interface is being used. If RATE1 is not connected it is internally pulled HIGH and if RATE0 is not connected it is internally pulled LOW, thus selecting register 7. Therefore, changing the contents of RSD[0..3] (register 7) through the serial interface can be used to adjust the bandwidth.

8.4.3 Loss-of-Signal Detection

The loss of signal detection is done by 2 separate level detectors to cover a wide dynamic range. The peak values of the input signal and the output signal of the gain stage are monitored by the peak detectors. The peak values are compared to a predefined loss of signal threshold voltage inside the loss of signal detection block. As a result of the comparison, the LOS signal, which indicates that the input signal amplitude is below the defined threshold level, is generated. The LOS assert level is settable through the serial interface. There are 2 LOS ranges settable with the LOSRNG bit (bit 2 register 0) through the serial interface. By setting the bit LOSRNG = 1, the high range of the LOS assert values are used (35 mV_{pp} to 80 mV_{pp}) and by setting the bit LOSRNG = 0, the low range of the LOS assert values are used (15 mV_{pp} to 35 mV_{pp}).

There are 128 possible internal LOS settings (7 bit) for each LOS range to adjust the LOS assert level. For fast LOS selection, 4 default values can be selected with the RATE1 and RATE0 pins; however, the LOS settings can be customized instead of using the default values. The default LOS assert levels and the registers used to change the LOS settings are shown in [Table 3](#).

Table 3. LOS Assert Level Default Settings and Registers Used for Adjustment

RATE1	RATE0	DEFAULT LOS ASSERT LEVEL (mV _{pp})	REGISTER USED FOR ADJUSTMENT
0	0	15	LOSA (Register 8)
0	1	18	LOSB (Register 9)
1	1	26	LOSC (Register 10)
1	0	26	LOSD (Register 11)

If the LOS register selection bit is set low, for example LOSASEL = 0 (bit 7 of register 8), then the default LOS assert level for that register is used. If the register selection bit is set high, for example LOSASEL = 1 (bit 7 of register 8), then the content of LOSA[0..6] (register 8) is used to set the LOS assert level when RATE1 = 0 and RATE0 = 0. The RATE1 and RATE0 pins do not have to be used if the serial interface is being used. If RATE1 is not connected it is internally pulled HIGH and if RATE0 is not connected it is internally pulled LOW, thus selecting register 11. Therefore, changing the content of LOSD[0..6] (register 11) through the serial interface can be used to adjust the LOS assert level.

8.5 Programming

8.5.1 2-Wire Interface and Control Logic

The ONET8501PB uses a 2-wire serial interface for digital control. The two circuit inputs, SDA and SCK, are driven, respectively, by the serial data and serial clock from a microcontroller, for example. Both inputs include 100-kΩ pullup resistors to VCC. For driving these inputs, TI recommends an open-drain output.

The 2-wire interface allows write access to the internal memory map to modify control registers and read access to read out control and status signals. The ONET8501PB is a slave device only which means that it can not initiate a transmission itself; it always relies on the availability of the SCK signal for the duration of the transmission. The master device provides the clock signal as well as the START and STOP commands. The protocol for a data transmission is as follows:

1. START command
2. 7-bit slave address (1000100) followed by an eighth bit which is the data direction bit (R/W). A zero indicates a WRITE and a 1 indicates a READ.
3. 8-bit register address
4. 8-bit register data word
5. STOP command

Regarding timing, the ONET8501PB is I²C compatible. The typical timing is shown in [Figure 13](#) and a complete data transfer is shown in [Figure 14](#). Parameters for [Figure 13](#) are defined in [Table 4](#).

Bus Idle: Both SDA and SCK lines remain HIGH

Start Data Transfer: A change in the state of the SDA line, from HIGH to LOW, while the SCK line is HIGH, defines a START condition (S). Each data transfer begins with a START condition.

Stop Data Transfer: A change in the state of the SDA line from LOW to HIGH while the SCK line is HIGH defines a STOP condition (P). Each data transfer ends with a STOP condition; however, if the master still wishes to communicate on the bus, it can generate a repeated START condition and address another slave without first generating a STOP condition.

Data Transfer: Only one data byte can be transferred between a START and a STOP condition. The receiver acknowledges the transfer of data.

Acknowledge: Each receiving device, when addressed, is obliged to generate an acknowledge bit. The transmitter releases the SDA line and a device that acknowledges must pull down the SDA line during the acknowledge clock pulse in such a way that the SDA line is stable LOW during the HIGH period of the acknowledge clock pulse. Setup and hold times must be taken into account. When a slave-receiver doesn't acknowledge the slave address, the data line must be left HIGH by the slave. The master can then generate a STOP condition to abort the transfer. If the slave-receiver does acknowledge the slave address but some time later in the transfer cannot receive any more data bytes, the master must abort the transfer. This is indicated by the slave generating the not acknowledge on the first byte to follow. The slave leaves the data line HIGH and the master generates the STOP condition.

Figure 13. I²C Timing Diagram

Programming (continued)

Table 4. Timing Diagram Definitions

PARAMETER		MIN	MAX	UNIT
f_{SCK}	SCK clock frequency		400	kHz
t_{BUF}	Bus free time between START and STOP conditions	1.3		μs
t_{HDSTA}	Hold time after repeated START condition. After this period, the first clock pulse is generated	0.6		μs
t_{LOW}	Low period of the SCK clock	1.3		μs
t_{HIGH}	High period of the SCK clock	0.6		μs
t_{SUSTA}	Setup time for a repeated START condition	0.6		μs
t_{HDDAT}	Data HOLD time	0		μs
t_{SUDAT}	Data setup time	100		ns
t_R	Rise time of both SDA and SCK signals		300	ns
t_F	Fall time of both SDA and SCK signals		300	ns
t_{SUSTO}	Setup time for STOP condition	0.6		μs

9 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

9.1 Application Information

Figure 15 shows a typical application with digital control. In this case DIN+ and DIN- are connected to Transimpedance Amplifier (ROSA) and DOUT+ and DOUT- to SFP connector. SDA and SCK are connected to a microprocessor.

9.2 Typical Application

Figure 15 shows a typical application circuit using the ONET8501PB.

Figure 15. Typical Application Circuit

9.2.1 Design Requirements

For this design example, use the parameters listed in [Table 20](#) as the input parameters.

Table 20. Design Parameters

PARAMETER	EXAMPLE VALUE
Supply voltage	3.3 V
V_{IN}	20 mV _{pp} to 2000 mV _{pp}
Data rate	8.5 Gbps to 10.3 Gbps
AC capacitors	0.1 μ F
COC capacitor	330 pF

9.2.2 Detailed Design Procedure

The purpose of the series resistors is to improve the signal integrity between the VCSEL driver and the VCSEL. Because the VCSEL impedance varies depending on its type, the series resistor provides a better matching impedance for the modulation current outputs.

The output amplitude adjustments are set as: AMP0 = 1 and AMP1 = 0 (see [Register 3](#)). DIN+, DIN–, DOUT+, and DOUT– are AC-coupled with 0.1 μ F.

9.2.3 Application Curves

Figure 16. Output Eye-Diagram at 10.3 GBPS vs and Input Voltage (20 mV_{pp})

Figure 17. Output Eye-Diagram at 10.3 GBPS vs and Maximum Input Voltage (2000 mV_{pp})

Figure 18. Output Eye-Diagram at 8.5 GBPS and Input Voltage (20 mV_{pp})

Figure 19. Output Eye-Diagram at 8.5 GBPS and Maximum Input Voltage (2000 mV_{pp})

10 Power Supply Recommendations

The ONET8401PB is designed to operate with an input supply voltage range from 2.95 V to 3.6 V.

For SFP+ modules, the ONET8501PB must be used because of its low AC common-mode voltage.

The supply current of the ONET8501PB is dependent upon the output amplitude setting.

The typical setting for an SFP+ module is the 650-mV_{pp} output voltage. The typical supply current in this case is 50 mA leading to 165 mW.

11 Layout

11.1 Layout Guidelines

For optimum performance, use 50- Ω transmission lines (100- Ω differential) for connecting the high-speed inputs and outputs. The length of transmission lines must be kept as short as possible to reduce loss and pattern-dependent jitter. TI recommends maximizing the separation of the DOUT+ and DOUT- transmission lines from the DIN+ and DIN- transmission lines to minimize transmitter to receiver crosstalk.

11.2 Layout Example

Figure 20. ONET8501PB Layout Example

12 Device and Documentation Support

12.1 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on ti.com. In the upper right corner, click on *Alert me* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

12.2 Community Resource

The following links connect to TI community resources. Linked contents are provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

TI E2E™ Online Community *TI's Engineer-to-Engineer (E2E) Community*. Created to foster collaboration among engineers. At e2e.ti.com, you can ask questions, share knowledge, explore ideas and help solve problems with fellow engineers.

Design Support *TI's Design Support* Quickly find helpful E2E forums along with design support tools and contact information for technical support.

12.3 Trademarks

E2E is a trademark of Texas Instruments.

All other trademarks are the property of their respective owners.

12.4 Electrostatic Discharge Caution

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

12.5 Glossary

[SLYZ022](#) — *TI Glossary*.

This glossary lists and explains terms, acronyms, and definitions.

13 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

Orderable part number	Status (1)	Material type (2)	Package Pins	Package qty Carrier	RoHS (3)	Lead finish/ Ball material (4)	MSL rating/ Peak reflow (5)	Op temp (°C)	Part marking (6)
ONET8501PBRGTR	Obsolete	Production	VQFN (RGT) 16	-	-	Call TI	Call TI	-40 to 100	85PB
ONET8501PBRGTT	Obsolete	Production	VQFN (RGT) 16	-	-	Call TI	Call TI	-40 to 100	85PB

⁽¹⁾ **Status:** For more details on status, see our [product life cycle](#).

⁽²⁾ **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

⁽³⁾ **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

⁽⁴⁾ **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

⁽⁵⁾ **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

⁽⁶⁾ **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.
