SINGLE-ENDED ANALOG-INPUT 20-BIT STEREO ANALOG-TO-DIGITAL CONVERTER

FEATURES

- **Dual 20-Bit Monolithic ΔΣ ADC**
- **Single-Ended Voltage Input**
- **64× Oversampling Decimation Filter:**
  - **Pass-Band Ripple: ±0.05 dB**
  - **Stop-Band Attenuation: –65 dB**
- **High Performance:**
  - **THD+N: –88 dB (typical)**
  - **SNR: 95 dB (typical)**
  - **Dynamic Range: 95 dB (typical)**
  - **Internal High-Pass Filter**
- **PCM Audio Interface:**
  - **Master/Slave Modes**
  - **Four Data Formats**
- **Sampling Rate: 4 kHz to 48 kHz**
- **System Clock: 256 f_S, 384 f_S, or 512 f_S**
- **Single 5-V Power Supply**
- **Small 24-Pin SSOP Package**

APPLICATIONS

- **DVD Recorders**
- **DVD Receivers**
- **AV Amplifier Receivers**
- **Electric Musical Instruments**

DESCRIPTION

The PCM1800 is a low-cost, single-chip stereo analog-to-digital converter (ADC) with single-ended analog voltage inputs. The PCM1800 uses a delta-sigma modulator with 64 times oversampling, including a digital decimation filter and a serial interface which supports both master and slave modes and four data formats. The PCM1800 is suitable for a wide variety of cost-sensitive consumer applications where good performance is required.

The PCM1800 is fabricated using a highly advanced CMOS process and is available in a small 24-pin SSOP package.
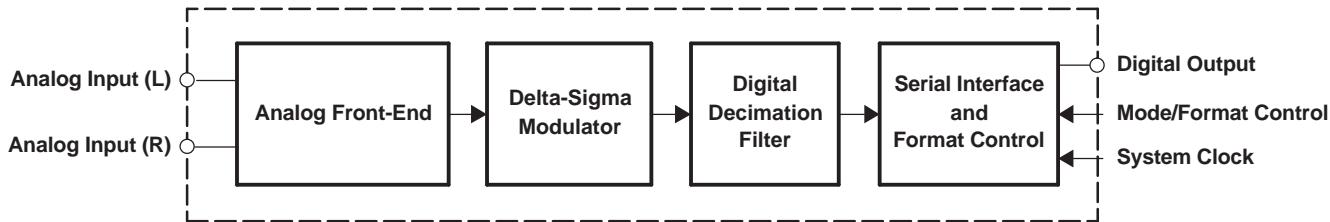

B0003-01

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

System Two, Audio Precision are trademarks of Audio Precision, Inc.
All other trademarks are the property of their respective owners.

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

ELECTRICAL CHARACTERISTICS

All specifications at T_A = 25°C, V_{DD} = V_{CC} = 5 V, slave mode, f_S = 44.1 kHz, 20-bit input data, and SYSCLK = 384 f_S, unless otherwise noted

## THEORY OF OPERATION

The PCM1800 consists of a band-gap reference, two channels of a single-to-differential converter, a fully differential 5th-order delta-sigma modulator, a decimation filter (including digital high pass), and a serial interface circuit. The block diagram illustrates the total architecture of the PCM1800 and the analog front-end diagram illustrates the architecture of the single-to-differential converter and the antialiasing filter. Figure 18 illustrates the architecture of the 5th-order delta-sigma modulator and transfer functions.

An internal high-precision reference with two external capacitors provides all the reference voltages that are required by the converter, and defines the full-scale voltage range of both channels. The internal single-to-differential voltage converter saves the design, space, and extra parts needed for external circuitry required by many delta-sigma converters. The internal full-differential architecture provides a wide dynamic range and excellent power-supply rejection performance.

The input signal is sampled at a 64× oversampling rate, eliminating the need for a sample-and-hold circuit, and simplifying antialias filtering requirements. The 5th-order delta-sigma noise shaper consists of five integrators which use a switched-capacitor topology, a comparator, and a feedback loop consisting of a 1-bit DAC. The delta-sigma modulator shapes the quantization noise, shifting it out of the audio band in the frequency domain. The high order of the modulator enables it to randomize the modulator outputs, reducing idle tone levels.

The 64-f_S, 1-bit stream from the modulator is converted to 1-f_S, 20-bit digital data by the decimation filter, which also acts as a low-pass filter to remove the shaped quantization noise. The dc components are removed by a high-pass filter, and the filtered output is converted to time-multiplexed serial signals through a serial interface which provides flexible serial formats and master/slave modes.

Y(z) = STF(z) * X(z) + NTF(z) * Qn(z)
Signal Transfer Function   STF(z) = H(z) / [1 + H(z)]
Noise Transfer Function   NTF(z) = 1 / [1 + H(z)]
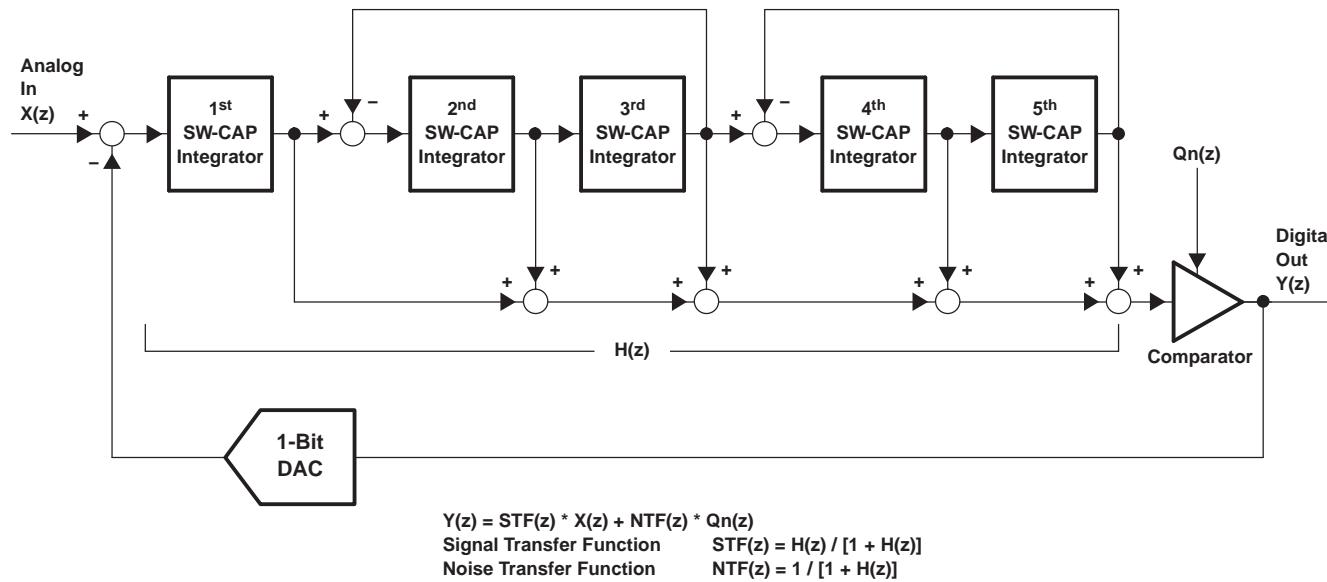

B0005-01

Figure 18. Simplified Diagram of the PCM1800 5th-Order Delta-Sigma Modulator

SYSTEM CLOCK

The system clock for the PCM1800 must be either 256 f_S, 384 f_S, or 512 f_S, where f_S is the audio sampling frequency. The system clock must be supplied on SYSCLK (pin 16).

The PCM1800 also has a system-clock detection circuit which automatically senses if the system clock is operating at 256 f_S, 384 f_S, or 512 f_S.

When the 384-f_S or 512-f_S system clock is in slave mode, the system clock is divided into 256 f_S automatically. The 256-f_S clock is used to operate the digital filter and the modulator. Table 1 lists the relationship of typical sampling frequencies and system clock frequencies. Figure 19 illustrates the system clock timing.

Table 1. System Clock Frequencies

SAMPLING RATE FREQUENCY (kHz)	SYSTEM CLOCK FREQUENCY (MHz)		
	256 f_s	384 f_s	512 f_s
32	8.1920	12.2880	16.3840
44.1	11.2896	16.9344	22.5792
48	12.2880	18.4320	24.5760
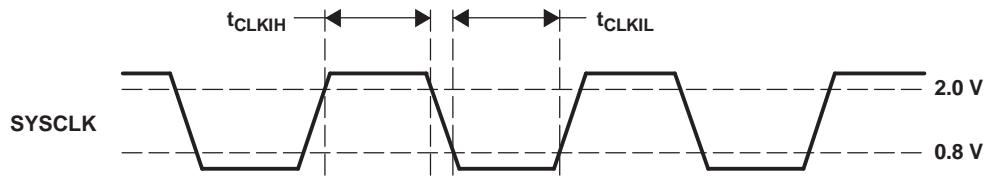

System clock pulse duration, HIGH	$t_{(CLKIH)}$	12 ns (min)
System clock pulse duration, LOW	$t_{(CLKIL)}$	12 ns (min)

Figure 19. System Clock Timing

RESET AND POWER DOWN

The PCM1800 has both an internal power-on reset circuit and an external forced reset (RSTB, pin 6). The internal power-on reset initializes (resets) when the supply voltage (V_{CC}/V_{DD}) exceeds 4 V (typical). To initiate the reset sequence externally, apply a logic-level LOW to the RSTB pin.

The RSTB pin is terminated by an internal pulldown resistor. If the RSTB pin is unconnected, the ADC remains in the reset state. Because the system clock is used as the clock signal for the reset circuit, the system clock must be supplied as soon as power is applied; more specifically, the device must receive at least three system clock cycles before $V_{DD} > 4$ V and RSTB = HIGH. If this system clock requirement cannot be assured in an application, RSTB must be held LOW until the system clock is supplied. While $V_{CC}/V_{DD} < 4$ V (typical), RSTB = LOW, and for 1024 system clock periods after $V_{CC}/V_{DD} > 4.0$ V and RSTB = HIGH, the PCM1800 stays in the reset state and the digital output is forced to zero. The digital output is valid 18,436 f_S periods after release from the reset state. During reset, the logic circuits and the digital filter stop operating and enter the power-down mode. Figure 20 and Figure 21 illustrate the internal power-on reset and external reset timing.
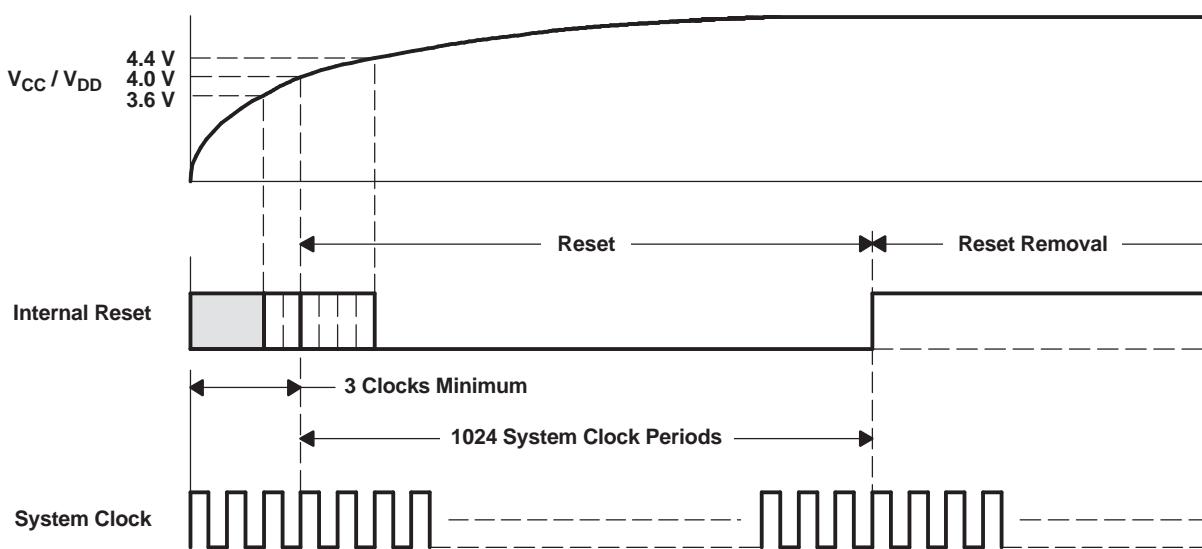

**Figure 20. Internal Power-On Reset Timing**
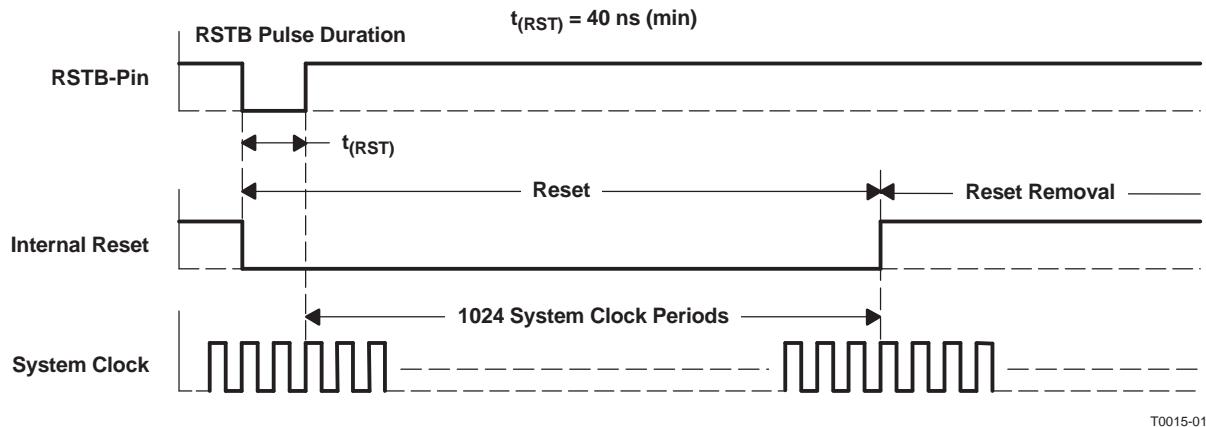

Figure 21. RSTB-Pin Reset Timing

SERIAL AUDIO DATA INTERFACE

The PCM1800 interfaces with the audio system through BCK (pin 14), LRCK (pin 13), FSYNC (pin 12), and DOUT (pin 15).

INTERFACE MODE

The PCM1800 supports master and slave modes as interface modes, which are selected by MODE1 (pin 11) and MODE0 (pin 10), as shown in Table 2. When in master mode, the PCM1800 provides the timing for serial audio data communications between the PCM1800 and the digital audio processor or external circuit. When in slave mode, the PCM1800 receives the timing for data transfer from an external controller.

Table 2. Interface Mode

MODE1	MODE0	INTERFACE MODE
0	0	Slave mode (256/384/512 f_S)
0	1	Master mode (512 f_S)
1	0	Master mode (384 f_S)
1	1	Master mode (256 f_S)

MASTER MODE

In master mode, BCK, LRCK, and FSYNC are output pins and are controlled by timing generated in the clock circuitry of the PCM1800.

FSYNC is used to designate the valid data from the PCM1800. The rising edge of FSYNC indicates the starting point of the converted audio data, and the following edge of this signal indicates the ending point of data. The frequency of this signal is fixed at 2× LRCK, and the duty-cycle ratio depends on the data bit length. The frequency of BCK is fixed at 64× LRCK.

SLAVE MODE

In slave mode, BCK, LRCK, and FSYNC are input pins. The PCM1800 accepts 64-BCK/LRCK, 48-BCK/LRCK (only for a 384-f_S system clock) or 32-BCK/LRCK format (only for 16-bit, right-justified format). FSYNC is used to enable the BCK signal, and the PCM1800 can shift out the converted data when FSYNC is HIGH.

DATA FORMAT

The PCM1800 supports four audio data formats in both master and slave modes. These data formats are selected by FMT1 (pin 9) and FMT0 (pin 8), as shown in Table 3. Figure 22 and Figure 23 illustrate the data formats in slave mode and master mode, respectively.

Table 3. Data Format

FORMAT NO.	FMT1[1]	FMT0[1]	DATA FORMAT

NOTE: Timing measurement reference level is $(V_{IH} + V_{IL})/2$. Rising and falling time is measured from 10% to 90% of the I/O
signal swing. Load capacitance of the DOUT signal is 20 pF.

Figure 25. Audio Data Interface Timing (Master Mode: FSYNC, LRCK, and BCK Are Outputs)

SYNCHRONIZATION WITH DIGITAL AUDIO SYSTEM

In slave mode, the PCM1800 operates with LRCK synchronized to the system clock (SYSCLK). The PCM1800 does not require a specific phase relationship between LRCK and SYSCLK, but does require the synchronization of LRCK and SYSCLK. If the relationship between LRCK and SYSCLK changes more than 6 bit clocks (BCK) during one sample period due to LRCK or SYSCLK jitter, internal operation of the ADC halts within 1/f_S and the digital output is forced into the BPZ mode until resynchronization between LRCK and SYSCLK is completed. In case of changes less than 5 bit clocks (BCK), resynchronization does not occur, and the previously described digital output control and discontinuity does not occur.

ADC DATA OUTPUT AT RESET

Figure 26 and Figure 27 illustrate the ADC digital output when the reset operation is done and when synchronization is lost, respectively. During undefined data, some noise may be generated in the audio signal. Also, the transition of normal to undefined data and undefined or zero data to normal makes a discontinuity in the data on the digital output, and may generate some noise in the audio signal.

Figure 26. ADC Digital Output for Power-On Reset and RSTB Control
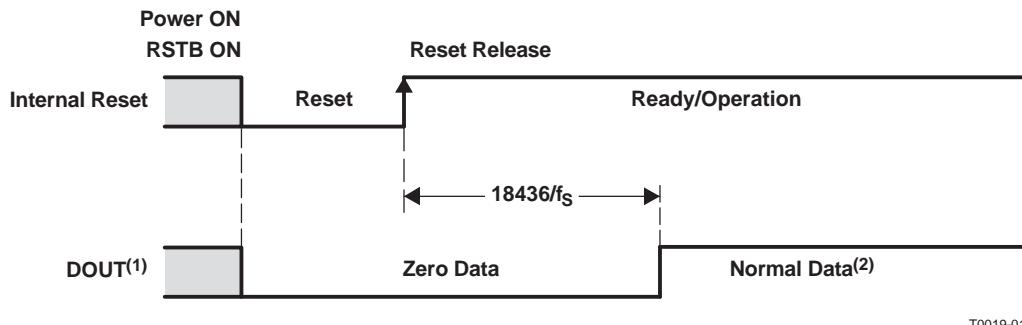

(1)   In the master mode, FSYNC, BCK, and LRCK are outputs similar to DOUT.

(2)   The HPF transient response (exponentially attenuated signal from ±0.2% dc of FSR with 200-ms time constant) appears initially.
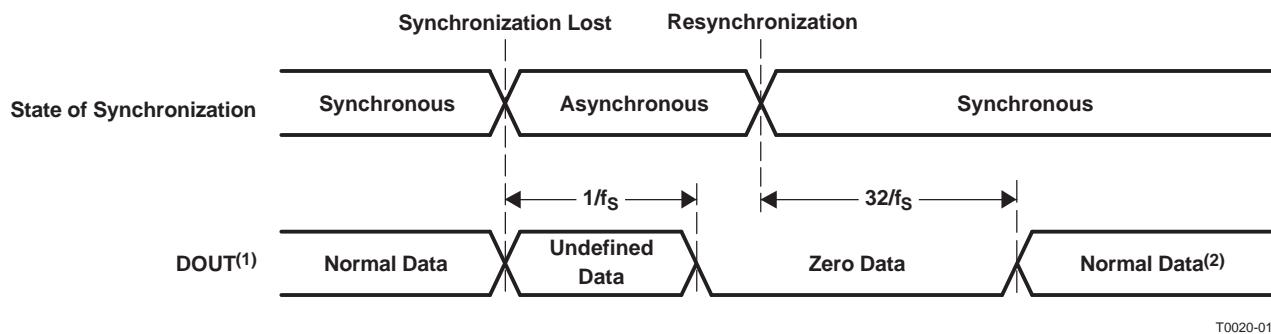

(1)   Applies only for slave mode—the loss of synchronization never occurs in master mode.

(2)   The HPF transient response (exponentially attenuated signal from ±0.2% dc of FSR with 200-ms time constant) appears initially.

Figure 27. ADC Digital Output During Loss of Synchronization Resynchronization

HPF BYPASS CONTROL

The built-in function for dc component rejection can be bypassed by BYPAS (pin 7) control (see Table 4). In bypass mode, the dc component of the input analog signal, the internal dc offset, etc., are also converted and output in the digital output data.

Table 4. HPF Bypass Control

BYPAS	HIGH-PASS FILTER (HPF) MODE
Low	Normal (dc cut) mode
High	Bypass (through) mode

APPLICATION INFORMATION

BOARD DESIGN AND LAYOUT CONSIDERATIONS

V_{CC}, V_{DD} PINS

The digital and analog power supply lines to the PCM1800 should be bypassed to the corresponding ground pins with both 0.1-µF ceramic and 10-µF tantalum capacitors as close to the pins as possible to maximize the dynamic performance of the ADC. Although the PCM1800 has two power lines to maximize the potential of dynamic performance, using one common power supply is recommended to avoid unexpected power supply problems, such as latch-up or power supply sequence.

AGND, DGND PINS

To maximize the dynamic performance of the PCM1800, the analog and digital grounds are not internally connected. These points should have low impedance to avoid digital noise feedback into the analog ground. They should be connected directly to each other under the part to reduce potential noise problems.

V_{IN} PINS

A 1-µF tantalum capacitor is recommended as an ac-coupling capacitor, which establishes a 5.3-Hz cutoff frequency. If a higher full-scale input voltage is required, the input voltage range can be increased by adding a series resistor to the V_{IN} pins.

V_{REF} INPUTS

A 4.7-µF tantalum capacitor is recommended between $V_{REF}1$, $V_{REF}2$, and REFCOM to ensure low source impedance for the ADC references. These capacitors should be located as close as possible to the $V_{REF}1$ and $V_{REF}2$ pins to reduce dynamic errors on the ADC references. The REFCOM pin also should be connected directly to AGND under the part.

$C_{IN}P$ and $C_{IN}N$ INPUTS

A 470-pF to 1000-pF film capacitor is recommended between $C_{IN}PL$ and $C_{IN}NL$, $C_{IN}PR$ and $C_{IN}NR$ to create an antialiasing filter which has a 170-kHz to 80-kHz cutoff frequency. These capacitors should be located as close as possible to the $C_{IN}P$ and $C_{IN}N$ pins to avoid introducing unexpected noise or dynamic errors into the delta-sigma modulator. Four 10-pF–47-pF capacitors between $C_{IN}XX$ and AGND may improve dynamic performance under disadvantageous actual conditions.

DOUT, BCK, LRCK, FSYNC PINS

In master mode, the DOUT, BCK, LRCK and FSYNC pins have a large load-drive capability, but locating the buffer near the PCM1800 and minimizing the load capacitance is recommended in order to minimize the digital-analog crosstalk and to maximize dynamic performance potential.

SYSTEM CLOCK

The quality of the system clock can influence dynamic performance in the PCM1800. The duty cycle, jitter, and threshold voltage at the system clock input pin must be carefully managed. When power is supplied to the part, the system clock, bit clock (BCK), and word clock (LRCK) should also be supplied simultaneously. Failure to supply the audio clocks results in a power dissipation increase of up to three times normal dissipation and can degrade long-term reliability if the maximum power dissipation limit is exceeded.

RSTB CONTROL

If the capacitance between $V_{REF}1$ and $V_{REF}2$ exceeds 4.7 µF, an external reset control with a delay-time circuit must be used.

TYPICAL CIRCUIT CONNECTION DIAGRAM

Figure 28 is a typical circuit connection diagram for which the cutoff frequency of the input HPF is about 5 Hz.
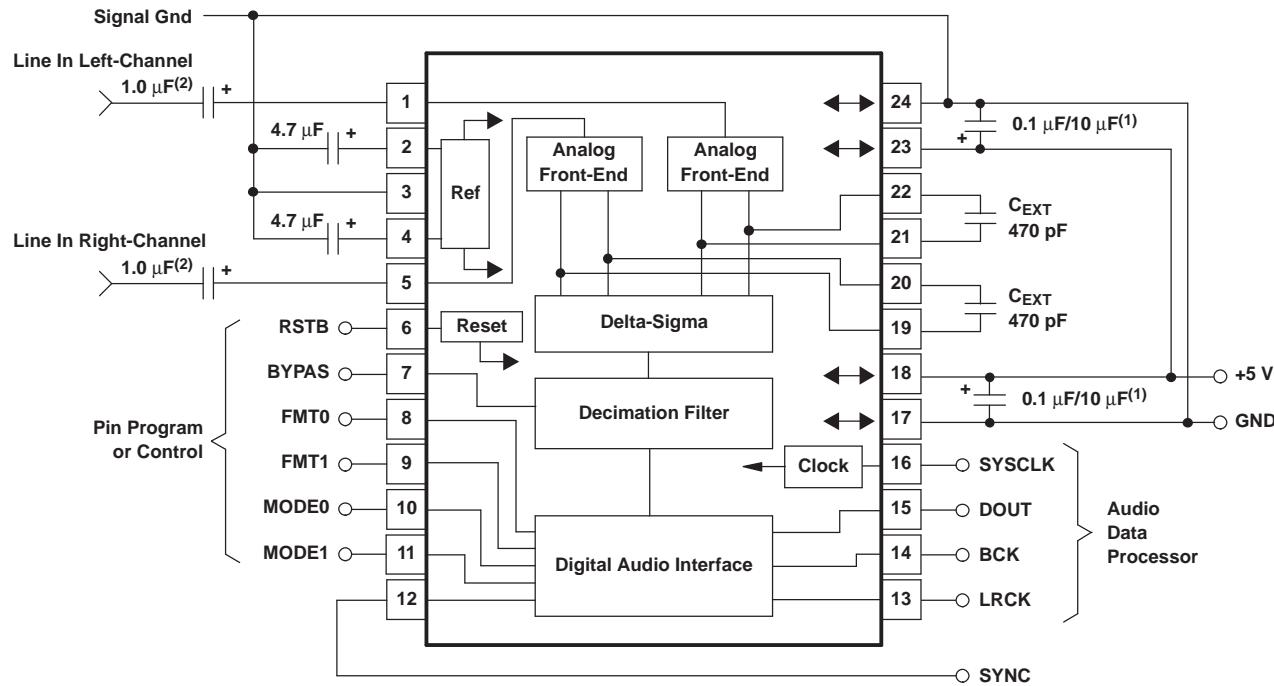

S0012-01

(1) Bypass capacitor = 0.1-µF ceramic and 10-µF tantalum, depending on layout and power supply.

(2) A 1-µF capacitor gives a 5.3-Hz cutoff frequency for the input HPF in normal operation and requires a power-on settling period with a 30-ms time constant during power-on initialization.

PACKAGE OPTION ADDENDUM

PACKAGING INFORMATION

Orderable part number	Status (1)	Material type (2)	Package | Pins	Package qty | Carrier	RoHS (3)	Lead finish/ Ball material (4)	MSL rating/ Peak reflow (5)	Op temp (°C)	Part marking (6)
PCM1800E	Last Time Buy	Production	SSOP (DB) | 24	58 | TUBE	Yes	NIPDAU	Level-1-260C-UNLIM	-	PCM1800E
PCM1800E.B	Last Time Buy	Production	SSOP (DB) | 24	58 | TUBE	Yes	NIPDAU	Level-1-260C-UNLIM	See PCM1800E	PCM1800E
PCM1800E/2K	Last Time Buy	Production	SSOP (DB) | 24	2000 | LARGE T&R	Yes	NIPDAU	Level-1-260C-UNLIM	-	PCM1800E
PCM1800E/2K.B	Last Time Buy	Production	SSOP (DB) | 24	2000 | LARGE T&R	Yes	NIPDAU	Level-1-260C-UNLIM	See PCM1800E/2K	PCM1800E

(1) **Status:** For more details on status, see our product life cycle.

(2) **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

(3) **RoHS values:** Yes, No, RoHS Exempt. See the TI RoHS Statement for additional information and value definition.

(4) **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

(5) **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.
