TPS62561
TPS62560, TPS62562

SLVS815D – JANUARY 2008 – REVISED OCTOBER 2016

TPS6256x 2.25-MHz, 600-mA Step-Down Converter in TSOT and 2 × 2 × 0.8-mm QFN Package

1 Features

- Output Current up to 600 mA
- Input Voltage Range from 2.5 V to 5.5 V
- Output Voltage Accuracy in PWM Mode ±2.5%
- Typical 15-μA Quiescent Current
- 100% Duty Cycle for Lowest Dropout
- Soft Start
- Available in a Small SOT, and 2 mm × 2 mm × 0.8 mm SON Package
- For Improved Features Set, See the TPS62290 device (SLVS764)

2 Applications

- PDAs, Pocket PCs, Portable Media Players
- Low-Power DSP Supply
- Point-of-Load (POL) Applications

3 Description

The TPS62560 device is a high efficiency synchronous step down converter, optimized for battery powered portable applications. It provides up to 600-mA output current from batteries, such as single Li-Ion or other common chemistry AA and AAA cells.

With an input voltage range of 2.5 V to 5.5 V, the device is targeted to power a large variety of portable handheld equipment or POL applications.

The TPS62560 family operates at 2.25-MHz fixed switching frequency and enters a Power Save Mode operation at light load currents to maintain a high efficiency over the entire load current range.

The Power Save Mode is optimized for low output voltage ripple. For low noise applications, the device can be forced into fixed frequency PWM mode by pulling the MODE pin high. In the shutdown mode the current consumption is reduced to less than 1 μA. The TPS62560 allows the use of small inductors and capacitors to achieve a small solution size.

TPS62560 and TPS62562 are available in a 2-mm × 2-mm, 6-pin SON package, whereas the TPS62561 is available in a 5-pin SOT package.

Device Information(1)

PART NUMBER	PACKAGE	BODY SIZE (NOM)
TPS62560, TPS62562	SON (6)	2.00 mm × 2.00 mm
TPS62561	SOT (5)	2.90 mm × 1.60 mm

(1) For all available packages, see the orderable addendum at the end of the data sheet.

4 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

Changes from Revision C (December 2009) to Revision D — **Page**

- Added *ESD Ratings* table, *Feature Description* section, *Device Functional Modes*, *Application and Implementation* section, *Power Supply Recommendations* section, *Layout* section, *Device and Documentation Support* section, and *Mechanical, Packaging, and Orderable Information* section. ... 1
- Removed *Ordering Information* table ... 1
- Changed text string From ".....up to 1000-mA output current.." To ".....up to 600-mA output current.." in Description. ... 1
- Corrected typographical errors in Figure 32; from "V_{IN}= 2 V to 6 V" to "V_{IN} = 2.5 V to 5.5 V" ... 18

Changes from Revision B (March 2009) to Revision C — **Page**

- Deleted High Efficiency Step Down Converter ... 1
- Deleted "Wide" from Features bullet ... 1
- Deleted "for Li-Ion Batteries With Extended Voltage Range" from Features ... 1
- Deleted "Adjustable and Fixed Output-Voltage Options" from Features ... 1
- Deleted "2.25 MHz Fixed Frequency Operation" from Features ... 1
- Deleted "Power Save Mode at Light Load Currents" from Features ... 1
- Deleted "Voltage Positioning at Light Loads" from Features ... 1
- Deleted "Allows < 1-mm Solution Height" from Features ... 1
- Changed Description to better reflect device capabilities and differences to TPS62260 ... 1

Changes from Revision A (July 2008) to Revision B — **Page**

- Added TPS62562 device number ... 1

Changes from Original (January 2008) to Revision A **Page**

- Changed at all levels. Revision A is a complete rewrite of this data sheet. 1

5 Device Comparison Table

Part Number	Package	Mode Pin	Output Voltage(1)	Device Marking(2)
TPS62560	SON (6)	yes	Adjustable	CEY
TPS62561	SOT (5)	forced PWM only	Adjustable	CVO
TPS62562	SON (6)	yes	1.8 V fixed	NXT

Pin Functions

PIN			I/O	DESCRIPTION
NAME	No. QFN-6	No. TSOT23-5		
EN	4	3	I	This is the enable pin of the device. Pulling this pin to low forces the device into shutdown mode. Pulling this pin to high enables the device. This pin must be terminated.
FB	3	4	I	Feedback pin for the internal regulation loop. Connect the external resistor divider to this pin. In the fixed-output-voltage option, connect this terminal directly to the output capacitor.
GND	6	2	—	GND supply pin
MODE	2	N/A	I	This pin is only available as a QFN package option. MODE pin = high forces the device to operate in the fixed-frequency PWM mode. MODE pin = low enables the power-save mode with automatic transition from PFM mode to fixed-frequency PWM mode.
SW	1	5	O	This is the switch pin and is connected to the internal MOSFET switches. Connect the external inductor between this pin and the output capacitor.
V_{IN}	5	1	—	V_{IN} power-supply pin
Exposed Thermal Pad	—	N/A	—	Must be soldered to achieve appropriate power dissipation. Should be connected to GND.

7 Specifications

7.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)(1)

		MIN	MAX	UNIT
	Input voltage range(2)	–0.3	7	V
	Voltage range at EN, MODE	–0.3	V_{IN} +0.3, ≤ 7	
	Voltage on SW	–0.3	7	
	Peak output current	Internally limited		A
T_J	Maximum operating junction temperature	–40	125	°C
T_{stg}	Storage temperature	–65	150	°C

(1) Stresses beyond those listed under *absolute maximum ratings* may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions beyond those indicated under *recommended operating conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
(2) All voltage values are with respect to the network ground terminal.

7.2 ESD Ratings

			VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge(1)	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001(2)	±2000	V
		Charged-device model (CDM), per JEDEC specification JESD22-C101(3)	±1000	
		Machine model	±200	

(1) The human-body model is a 100-pF capacitor discharged through a 1.5-kΩ resistor into each terminal. The machine model is a 200-pF capacitor discharged directly into each terminal.
(2) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process. Manufacturing with less than 500-V HBM is possible with the necessary precautions.
(3) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process. Manufacturing with less than 250-V CDM is possible with the necessary precautions.

7.3 Recommended Operating Conditions

		MIN	MAX	UNIT
V_{IN}	Supply voltage	2.5	5.5	V
V_{OUT}	Output voltage range for adjustable voltage	0.85	V_{IN}	V
T_A	Operating ambient temperature	–40	85	°C
T_J	Operating junction temperature	–40	125	°C

7.4 Thermal Information

THERMAL METRIC(1)		TPS62560, TPS62562	TPS62561	UNIT
		DRV (SON)	DDC (SOT)	
		6 PINS	5 PINS	
$R_{\theta JA}$	Junction-to-ambient thermal resistance	67.8	226.9	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	88.5	40.7	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	37.2	48.8	°C/W
ψ_{JT}	Junction-to-top characterization parameter	2.0	0.5	°C/W
ψ_{JB}	Junction-to-board characterization parameter	37.6	48.1	°C/W
$R_{\theta JC(bot)}$	Junction-to-case (bottom) thermal resistance	7.9	n/a	°C/W

(1) For more information about traditional and new thermal metrics, see the *Semiconductor and IC Package Thermal Metrics* application report, SPRA953.

7.5 Electrical Characteristics

Over full operating ambient temperature range, typical values are at T_A = 25°C. Unless otherwise noted, specifications apply for condition V_{IN} = EN = 3.6 V. External components C_{IN} = 4.7 µF 0603, C_{OUT} = 10 µF 0603, L = 2.2 µH

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
SUPPLY						
V_{IN}	Input voltage range		2.5		5.5	V
I_{OUT}	Output current	V_{IN} 2.5 V to 5.5 V			600	mA
I_Q	Operating quiescent current	I_{OUT} = 0 mA, PFM mode enabled (MODE = GND), device not switching		15		µA
		I_{OUT} = 0 mA, PFM mode enabled (MODE = GND), device switching, V_{OUT} = 1.8 V, See (1)		18.5		
		I_{OUT} = 0 mA, switching with no load (MODE = V_{IN}), PWM operation, V_{OUT} = 1.8 V, V_{IN} = 3 V		3.8		mA
I_{SD}	Shutdown current	EN = GND		0.5		µA
UVLO	Undervoltage lockout threshold	Falling		1.85		V
		Rising		1.95		
ENABLE, MODE						
V_{IH}	High-level input voltage, EN, MODE	2 V ≤ V_{IN} ≤ 5.5 V	1		V_{IN}	V
V_{IL}	Low-level input voltage, EN, MODE	2 V ≤ V_{IN} ≤ 5.5 V	0		0.4	V
I_{IN}	Input bias current, EN, MODE	EN, MODE = GND or V_{IN}		0.01	1	µA
POWER SWITCH						
$R_{DS(on)}$	High side MOSFET on-resistance	V_{IN} = V_{GS} = 3.6 V, T_A = 25°C		252	492	mΩ
	Low side MOSFET on-resistance			194	391	
I_{LIMF}	Forward current limit, high and low side MOSFET	V_{IN} = V_{GS} = 3.6 V	0.8	1	1.2	A
T_{SD}	Thermal shutdown	Increasing junction temperature		140		°C
	Thermal-shutdown hysteresis	Decreasing junction temperature		20		
OSCILLATOR						
f_{SW}	Oscillator frequency	2 V ≤ V_{IN} ≤ 5.5 V		2.25		MHz
OUTPUT						
V_{OUT}	Adjustable-output voltage range		0.85		V_{IN}	V
V_{OUT}	TPS62562 fixed output voltage	V_{IN} ≥ 1.8 V		1.8		V
V_{ref}	Reference voltage			600		mV
V_{FB}	Feedback voltage, PWM mode	MODE = V_{IN}, PWM operation, for fixed-output-voltage versions V_{FB} = V_{OUT}, 2.5 V ≤ V_{IN} ≤ 5.5 V, 0 mA ≤ I_{OUT} ≤ 600 mA (2)	–2.5%	0%	2.5%	
	Feedback voltage, PFM mode	MODE = GND, device in PFM mode, voltage positioning active (1)		1%		
	Load regulation	PWM mode		–1		%/A
$t_{Start\ Up}$	Start-up time	Time from active EN to reach 95% of V_{OUT} nominal		500		µs
t_{Ramp}	V_{OUT} ramp-up time	Time to ramp from 5% to 95% of V_{OUT}		250		µs
I_{lkg}	Leakage current into SW terminal	V_{IN} = 3.6 V, V_{IN} = V_{OUT} = V_{SW}, EN = GND (3)		0.5	1	µA

(1) In PFM mode, the internal reference voltage is set to typ. 1.01 × V_{ref}. See the section.
(2) For V_{IN} = V_{OUT} + 0.6 V
(3) In fixed-output-voltage versions, the internal resistor divider network is disconnected from the FB terminal.

8 Detailed Description

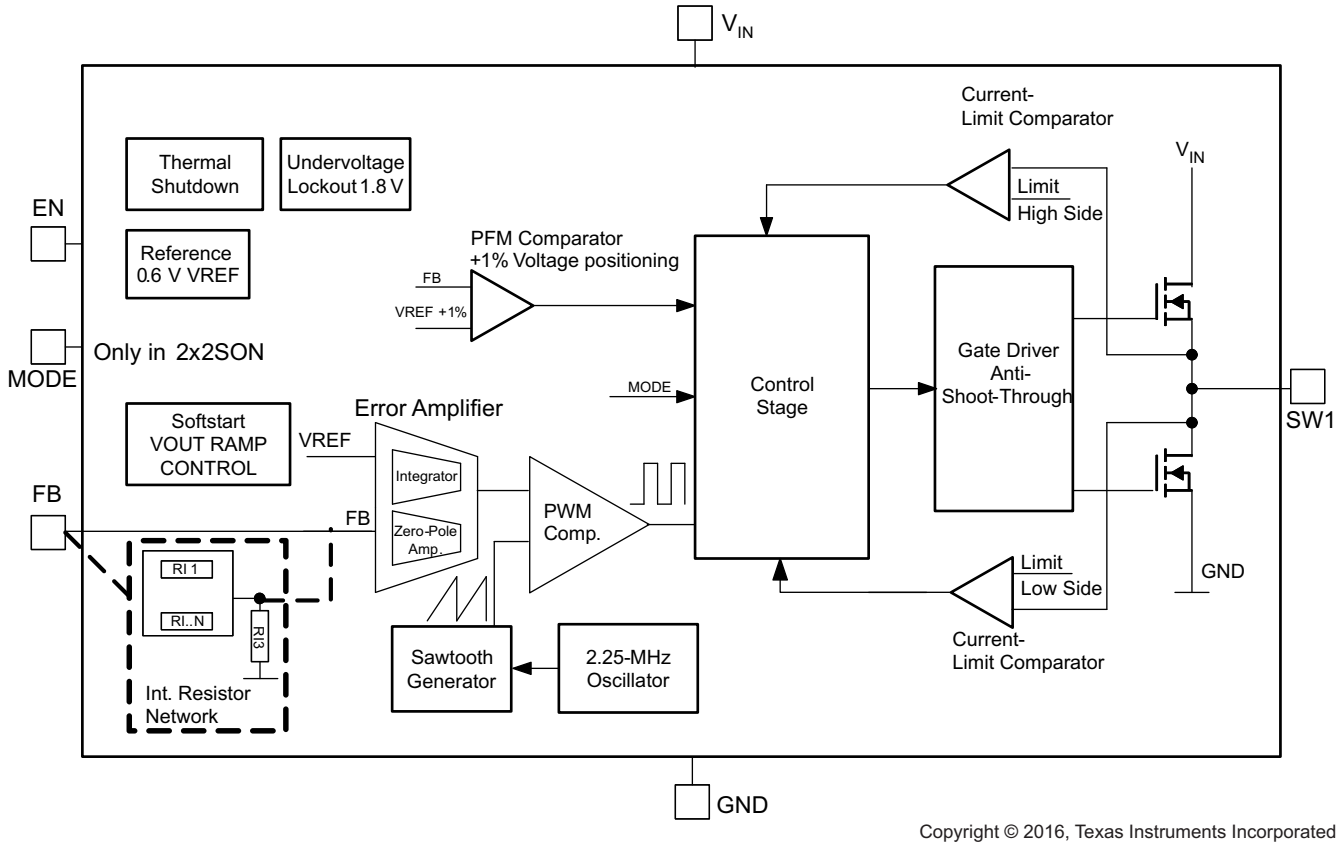
8.1 Overview

The TPS62560/62 step-down converters operate with typically 2.25-MHz fixed-frequency pulse-width modulation (PWM) at moderate to heavy load currents. At light load currents, the converter can automatically enter power-save mode, and then operates in PFM mode. However, the TPS62561 operates with fixed-frequency PWM only, also at light load conditions.

During PWM operation, the converter uses a unique fast-response voltage-mode control scheme with input-voltage feed-forward to achieve good line and load regulation, allowing the use of small ceramic input and output capacitors. At the beginning of each clock cycle initiated by the clock signal, the high-side MOSFET switch is turned on. The current flows from the input capacitor via the high-side MOSFET switch through the inductor to the output capacitor and load. During this phase, the current ramps up until the PWM comparator trips and the control logic turns off the switch. The current-limit comparator also turns off the switch in case the current limit of the high-side MOSFET switch is exceeded. After a dead time, which prevents shoot-through current, the low-side MOSFET rectifier is turned on and the inductor current ramps down. The current flows from the inductor to the output capacitor and to the load. It returns back to the inductor through the low-side MOSFET rectifier.

The next cycle is initiated by the clock signal again turning off the low-side MOSFET rectifier and turning on the on the high-side MOSFET switch.

8.2 Functional Block Diagram



8.3 Feature Description

8.3.1 Dynamic Voltage Positioning

This feature reduces the voltage under/overshoots at load steps from light to heavy load and vice versa. It is active in power-save mode and regulates the output voltage 1% higher than the nominal value. This provides more headroom for both the voltage drop at a load step, and the voltage increase at a load throw-off.

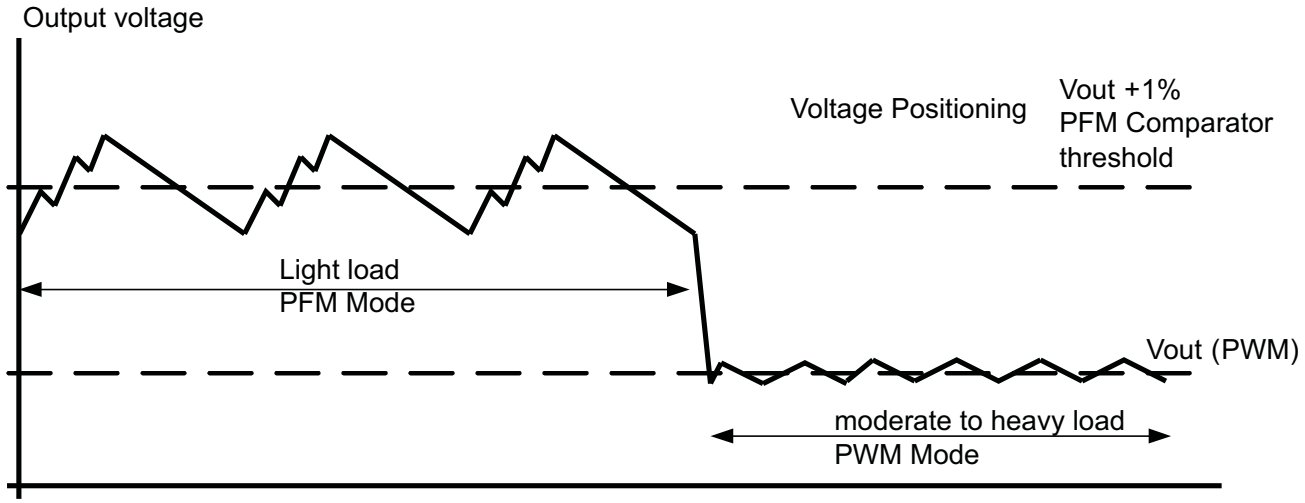


Figure 5. Power Save Mode Operation With Automatic Mode Transition

8.3.2 Undervoltage Lockout

The undervoltage lockout circuit prevents the device from malfunctioning at low input voltages and from excessive discharge of the battery and disables the output stage of the converter. The undervoltage lockout threshold is typically 1.85 V with falling V_{IN}.

8.3.3 Mode Selection

The MODE terminal allows mode selection between forced-PWM mode and power-save mode.

Connecting this terminal to GND enables the power-save mode with automatic transition between PWM and PFM modes. Pulling the MODE terminal high forces the converter to operate in fixed-frequency PWM mode even at light load currents. This allows simple filtering of the switching frequency for noise-sensitive applications. In this mode, the efficiency is lower compared to the power-save mode during light loads.

The state of the MODE terminal can be changed during operation to allow efficient power management by adjusting the operation mode of the converter to the specific system requirements.

8.3.4 Enable

The device is enabled by setting the EN terminal to high. During the start-up time $t_{Start\ Up}$, the internal circuits are settled and the soft-start circuit is activated. The EN input can be used to control power sequencing in a system with various dc/dc converters. The EN terminal can be connected to the output of another converter, to drive the EN terminal high to achieve a sequencing of the given supply rails. With EN = GND, the device enters shutdown mode, in which all internal circuits are disabled. In fixed-output-voltage versions, the internal resistor divider network is then disconnected from the FB terminal.

8.3.5 Thermal Shutdown

As soon as the junction temperature, T_J, exceeds 140°C (typical), the device goes into thermal shutdown. In this mode, the high-side and low-side MOSFETs are turned off. The device continues its operation when the junction temperature falls below the thermal shutdown hysteresis.

8.4 Device Functional Modes

8.4.1 Soft-Start

The TPS62560 has an internal soft-start circuit that controls the ramp-up of the output voltage. The output voltage ramps up from 5% to 95% of its nominal value typically within 250 μs. This limits the inrush current into the converter during ramp-up and prevents possible input voltage drops when a battery or high-impedance power source is used. The soft-start circuit is enabled within the start-up time $t_{Start\ Up}$.

8.4.2 Power-Save Mode

The power-save mode is enabled with the MODE terminal set to the low level. If the load current decreases, the converter enters the power-save mode of operation automatically. During power-save mode, the converter skips switching and operates with reduced frequency in PFM mode with a minimum quiescent current to maintain high efficiency. The converter positions the output voltage typically 1% above the nominal output voltage. This voltage positioning feature minimizes voltage drops caused by a sudden load step.

The transition from PWM mode to PFM mode occurs once the inductor current in the low-side MOSFET switch becomes zero, which indicates discontinuous conduction mode.

During the power-save mode, the output voltage is monitored with a PFM comparator. As the output voltage falls below the PFM comparator threshold of V_{OUT} nominal + 1%, the device starts a PFM current pulse. The high-side MOSFET switch turns on, and the inductor current ramps up. After the on-time expires, the switch is turned off and the low-side MOSFET switch is turned on until the inductor current becomes zero.

The converter effectively delivers a current to the output capacitor and the load. If the load is below the delivered current, the output voltage rises. If the output voltage is equal to or higher than the PFM comparator threshold, the device stops switching and enters a sleep mode with typical 15-μA current consumption.

If the output voltage is still below the PFM comparator threshold, a sequence of further PFM current pulses is generated until the PFM comparator threshold is reached. The converter starts switching again once the output voltage drops below the PFM comparator threshold.

With a fast single-threshold comparator, the output-voltage ripple during PFM-mode operation can be kept small. The PFM pulse is time controlled, which allows modifying the charge transferred to the output capacitor by the value of the inductor. The resulting PFM output-voltage ripple and PFM frequency depend primarily on the size of the output capacitor and the inductor value. Increasing output capacitor values and inductor values minimizes the output ripple. The PFM frequency decreases with smaller inductor values and increases with larger values.

The PFM mode is left and PWM mode entered in case the output current can no longer be supported in PFM mode. The power-save mode can be disabled by setting the MODE terminal to high. The converter then operates in the fixed-frequency PWM mode.

8.4.2.1 100% Duty-Cycle Low-Dropout Operation

The device starts to enter 100% duty-cycle mode once the input voltage comes close to the nominal output voltage. In order to maintain the output voltage, the high-side MOSFET switch is turned on 100% for one or more cycles.

With further decreasing V_{IN}, the high-side MOSFET switch is turned on completely. In this case, the converter offers a low input-to-output voltage difference. This is particularly useful in battery-powered applications to achieve longest operation time by taking full advantage of the whole battery-voltage range.

The minimum input voltage to maintain regulation depends on the load current and output voltage; and, can be calculated as:

$$V_{IN}min = V_{OUT}max + I_{OUT}max \times (R_{DS(on)}max + R_L) \quad (1)$$

where

- $I_{OUT}max$ = maximum output current plus inductor ripple current
- $R_{DS(on)}max$ = maximum P-channel switch $R_{DS(on)}$
- R_L = dc resistance of the inductor
- $V_{OUT}max$ = nominal output voltage plus maximum output voltage tolerance

Device Functional Modes (continued)

8.4.2.2 Short-Circuit Protection

The high-side and low-side MOSFET switches are short-circuit protected with maximum switch current = I_{LIMF}. The current in the switches is monitored by current-limit comparators. Once the current in the high-side MOSFET switch exceeds the threshold of its current-limit comparator, it turns off and the low-side MOSFET switch is activated to ramp down the current in the inductor and high-side MOSFET switch. The high-side MOSFET switch can only turn on again after the current in the low-side MOSFET switch has decreased below the threshold of its current-limit comparator.

9 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

9.1 Application Information

The TPS6256x devices are high-efficiency synchronous step-down DC–DC converter featuring power-save mode or 2.25-MHz fixed frequency operation.

9.2 Typical Application

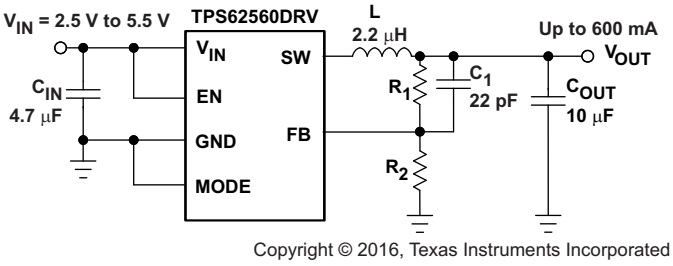

Figure 6. TPS62560DRV Adjustable

9.2.1 Design Requirements

The TPS6256x is a highly integrated DC/DC converter. The output voltage is set with an external voltage divider for the adjustable output voltage version. The output voltage is fixed to 1.8V for the TPS62562. For proper operation a input- and output capacitor and an inductor is required. Table 2 shows the components used for the application characteristic curves.

9.2.2 Detailed Design Procedure

9.2.2.1 Output Voltage Setting

For adjustable output voltage versions, the output voltage can be calculated by Equation 2 with the internal reference voltage V_{REF} = 0.6 V typically.

$$V_{OUT} = V_{REF} \times \left(1 + \frac{R_1}{R_2}\right) \quad (2)$$

To minimize the current through the feedback divider network, R_2 should be 180 kΩ or 360 kΩ. The sum of R_1 and R_2 should not exceed ~1 MΩ, to keep the network robust against noise. An external feed-forward capacitor C_1 is required for optimum load transient response. The value of C_1 should be in the range between 22 pF and 33 pF.

In case of using the fixed output voltage version (TPS62562), V_{out} has to be connected to the feedback pin FB.

Typical Application (continued)

Route the FB line away from noise sources, such as the inductor or the SW line.

9.2.2.2 Output Filter Design (inductor and Output Capacitor)

The TPS62560 is designed to operate with inductors in the range of 1.5 µH to 4.7 µH and with output capacitors in the range of 4.7 µF to 22 µF. The part is optimized for operation with a 2.2-µH inductor and 10-µF output capacitor.

Larger or smaller inductor values can be used to optimize the performance of the device for specific operation conditions. For stable operation, the L and C values of the output filter may not fall below 1 µH effective inductance and 3.5 µF effective capacitance.

9.2.2.2.1 Inductor Selection

The inductor value has a direct effect on the ripple current. The selected inductor must be rated for its dc resistance and saturation current. The inductor ripple current (ΔI_L) decreases with higher inductance and increases with higher V_{IN} or V_{OUT}.

The inductor selection also impacts the output voltage ripple in PFM mode. Higher inductor values lead to lower output voltage ripple and higher PFM frequency; lower inductor values lead to a higher output voltage ripple but lower PFM frequency.

Equation 3 calculates the maximum inductor current in PWM mode under static load conditions. The saturation current of the inductor should be rated higher than the maximum inductor current as calculated with Equation 4. This is recommended because during heavy load transients the inductor current rises above the calculated value.

$$\Delta I_L = V_{OUT} \times \frac{1 - \frac{V_{OUT}}{V_{IN}}}{L \times f} \tag{3}$$

$$I_L max = I_{out} max + \frac{\Delta I_L}{2} \tag{4}$$

where

- f = Switching frequency (2.25 MHz, typical)
- L = Inductor value
- ΔI_L = Peak-to-peak inductor ripple current
- $I_L$max = Maximum inductor current

A more conservative approach is to select the inductor current rating just for the switch current limit I_{LIMF} of the converter.

Accepting larger values of ripple current allows the use of lower inductance values, but results in higher output voltage ripple, greater core losses, and lower output current capability.

The total losses of the coil have a strong impact on the efficiency of the dc/dc conversion and consist of both the losses in the dc resistance ($R_{(DC)}$) and the following frequency-dependent components:

- The losses in the core material (magnetic hysteresis loss, especially at high switching frequencies)
- Additional losses in the conductor from the skin effect (current displacement at high frequencies)
- Magnetic field losses of the neighboring windings (proximity effect)
- Radiation losses

Table 1. List of Inductors

DIMENSIONS, mm	INDUCTANCE, µH	INDUCTOR TYPE	SUPPLIER(1)
2,5 × 2 × 1 max	2	MIPS2520D2R2	FDK
2,5 × 2 × 1,2 max	2	MIPSA2520D2R2	FDK
2,5 × 2 × 1 max	2.2	KSLI-252010AG2R2	Hitachi Metals

3 × 3 × 1,5 max	2.2	LPS3015 2R2	Coilcraft

(1) See *Third-Party Products Disclaimer*

9.2.2.2.2 Output Capacitor Selection

The advanced fast-response voltage-mode control scheme of the TPS62560 allows the use of tiny ceramic capacitors. Ceramic capacitors with low ESR values have the lowest output voltage ripple and are recommended. The output capacitor requires either an X7R or X5R dielectric. Y5V and Z5U dielectric capacitors, aside from their wide variation in capacitance over temperature, become resistive at high frequencies.

At nominal load current, the device operates in PWM mode, and the RMS ripple current is calculated by Equation 5:

$$I_{RMSC_{OUT}} = V_{OUT} \times \frac{1 - \frac{V_{OUT}}{V_{IN}}}{L \times f} \times \frac{1}{2\sqrt{3}} \quad (5)$$

At nominal load current, the device operates in PWM mode, and the overall output voltage ripple is the sum of the voltage spike caused by the output capacitor ESR plus the voltage ripple caused by charging and discharging the output capacitor shown in Equation 6:

$$\Delta V_{OUT} = V_{OUT} \times \frac{1 - \frac{V_{OUT}}{V_{IN}}}{L \times f} \times \left(\frac{1}{8 \times C_{OUT} \times f} + ESR \right) \quad (6)$$

At light load currents, the converter operates in power-save mode, and the output voltage ripple is dependent on the output capacitor and inductor values. Larger output capacitor and inductor values minimize the voltage ripple in PFM mode and tighten dc output accuracy in PFM mode.

9.2.2.2.3 Input Capacitor Selection

An input capacitor is required for best input voltage filtering and minimizing the interference with other circuits caused by high input voltage spikes. For most applications, a 4.7-µF to 10-µF ceramic capacitor is recommended. Because a ceramic capacitor loses up to 80% of its initial capacitance at 5 V, it is recommended that 10-µF input capacitors be used for input voltages > 4.5 V. The input capacitor can be increased without any limit for better input voltage filtering. Take care when using only small ceramic input capacitors. When a ceramic capacitor is used at the input and the power is being supplied through long wires, such as from a wall adapter, a load step at the output or V_{IN} step on the input can induce ringing at the V_{IN} terminal. This ringing can couple to the output and be mistaken as loop instability or could even damage the part by exceeding the maximum ratings.

Table 2. List of Capacitors(1)

CAPACITANCE	TYPE	SIZE	SUPPLIER
4.7 µF	GRM188R60J475K	0603—1,6 × 0,8 × 0,8 mm	Murata
10 µF	GRM188R60J106M69D	0603—1,6 × 0,8 × 0,8 mm	Murata

10 Power Supply Recommendations

The TPS6226x device has no special requirements for its input power supply. The input power supply output current must be rated according to the supply voltage, output voltage, and output current of the TPS6226x.

11 Layout

11.1 Layout Guidelines

As for all switching power supplies, the layout is an important step in the design. Proper function of the device demands careful attention to PCB layout. Take care in board layout to get the specified performance. If the layout is not carefully done, the regulator could show poor line and/or load regulation, stability issues as well as EMI problems. It is critical to provide a low inductance, impedance ground path. Therefore, use wide and short traces for the main current paths. The input capacitor should be placed as close as possible to the IC pins as well as the inductor and output capacitor.

Connect the GND pin of the device to the exposed thermal pad of the PCB and use this pad as a star point. Use a common power GND node and a different node for the signal GND to minimize the effects of ground noise. Connect these ground nodes together to the exposed thermal pad (star point) underneath the IC. Keep the common path to the GND pin, which returns the small signal components and the high current of the output capacitors as short as possible to avoid ground noise. The FB line should be connected right to the output capacitor and routed away from noisy components and traces (for example, the SW line).

11.2 Layout Examples

12.3 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on ti.com. In the upper right corner, click on *Alert me* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

12.4 Community Resources

The following links connect to TI community resources. Linked contents are provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's Terms of Use.

TI E2E™ Online Community ***TI's Engineer-to-Engineer (E2E) Community.*** Created to foster collaboration among engineers. At e2e.ti.com, you can ask questions, share knowledge, explore ideas and help solve problems with fellow engineers.

Design Support ***TI's Design Support*** Quickly find helpful E2E forums along with design support tools and contact information for technical support.

12.5 Trademarks

E2E is a trademark of Texas Instruments.
All other trademarks are the property of their respective owners.

12.6 Electrostatic Discharge Caution

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

12.7 Glossary

SLYZ022 — *TI Glossary*.

This glossary lists and explains terms, acronyms, and definitions.

13 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

(1) **Status:** For more details on status, see our product life cycle.

(2) **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

(3) **RoHS values:** Yes, No, RoHS Exempt. See the TI RoHS Statement for additional information and value definition.

(4) **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

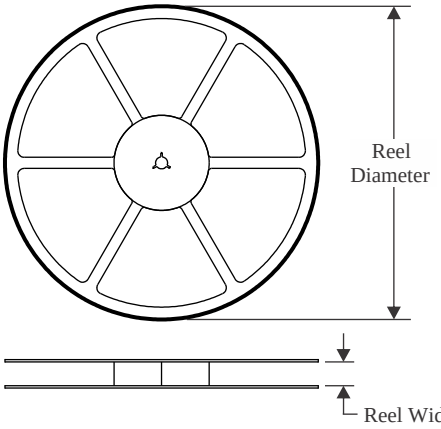
(5) **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

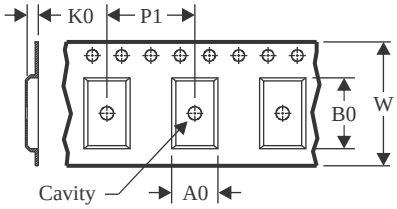
Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

TAPE AND REEL INFORMATION

REEL DIMENSIONS



TAPE DIMENSIONS



A0	Dimension designed to accommodate the component width
B0	Dimension designed to accommodate the component length
K0	Dimension designed to accommodate the component thickness
W	Overall width of the carrier tape
P1	Pitch between successive cavity centers

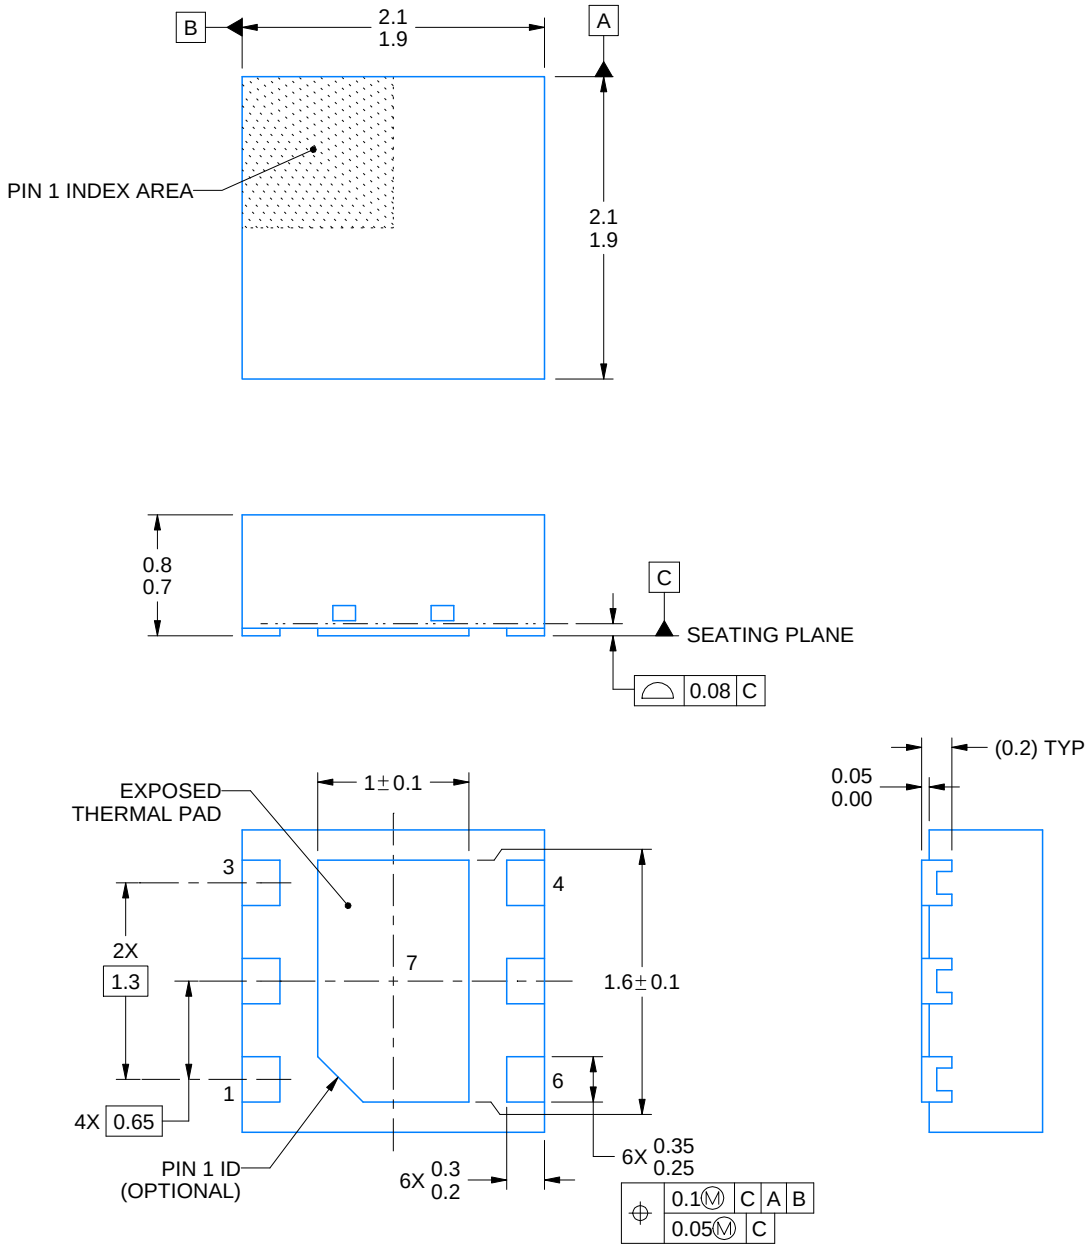
PACKAGE OUTLINE

WSON - 0.8 mm max height

PLASTIC SMALL OUTLINE - NO LEAD



4225563/A 12/2019

NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. The package thermal pad must be soldered to the printed circuit board for thermal and mechanical performance.
