

# TPS723Q1

## 200mA, Low-Noise, High-PSRR, Negative-Output, Low-Dropout Linear Regulator

### 1 Features

- AEC-Q100 qualified for automotive applications
- Input voltage range:  $-2.7\text{V}$  to  $-10\text{V}$  ( $-11\text{V}$  absolute maximum)
- Available in  $-2.5\text{V}$  (fixed) and  $-1.186\text{V}$  to  $-10\text{V}$  (adjustable) versions
- $V_{\text{OUT}}$  accuracy (across line, load and temperature):
  - $\pm 1.6\%$  for new chip
  - $\pm 2.0\%$  for legacy chip
- Output current: Up to 200mA
- Ultra-low noise:  $60\mu\text{V}_{\text{RMS}}$  (typ) with 10nF NR cap
- Low  $I_{\text{Q}}$  (new chip):  $30\mu\text{A}$  at  $I_{\text{LOAD}} = 0\text{mA}$
- High PSRR: 65dB (typical) at 1kHz, 40dB (typical) at 100kHz
- Low dropout voltage:
  - 140mV (typical) at 200mA,  $-2.5\text{V}$  (new chip)
  - 280mV (typical) at 200mA,  $-2.5\text{V}$  (legacy chip)
- Stable with a  $2.2\mu\text{F}$  ceramic output capacitor
- Less than  $2\mu\text{A}$  (maximum) quiescent current in shutdown mode
- Thermal and overcurrent protection
- Operating junction temperature ( $T_{\text{J}}$ ):  $-40^{\circ}\text{C}$  to  $+125^{\circ}\text{C}$
- Packages:
  - New chip:
    - 5-pin SOT-23 (DBV) [ $R_{\theta\text{JA}}$ :  $153.7^{\circ}\text{C}/\text{W}$ ]
  - Legacy chip:
    - 5-pin SOT-23 (DBV) [ $R_{\theta\text{JA}}$ :  $180^{\circ}\text{C}/\text{W}$ ]

### 2 Applications

- [Infotainment and cluster](#)
- [Hybrid, electric and powertrain systems](#)
- [Advanced driver assistance systems \(ADAS\)](#)
- [Data centers](#)

### 3 Description

The TPS723-Q1 low-dropout (LDO) negative voltage regulator offers an ideal combination of features to support low noise analog and mixed-signal applications. The TPS723 supports input voltages from  $-10\text{V}$  to  $-2.7\text{V}$ , and outputs from  $-10\text{V}$  to  $-1.186\text{V}$  (in adjustable configuration). This regulator is stable with small, low-cost ceramic capacitors (up-to  $2.2\mu\text{F}$ ), and includes enable (EN) and noise reduction (NR) functions.

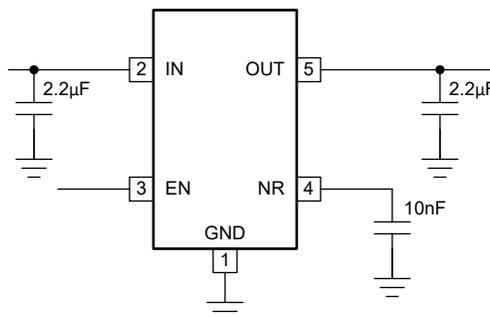

The TPS723Q1 supports very tight DC accuracy of  $\pm 1.6\%$  (new chip) over line, load and temperature range. The device responds quickly to line and load transients. The TPS723Q1 supports a low dropout of typically 140mV (typical, new chip) at 200mA of load current. The device has built-in protection mechanism for over-current and overtemperature for reliable operation of the LDO.

The TPS723Q1 supports low noise on output ( $60\mu\text{V}_{\text{RMS}}$  with NR cap of 10nF) and available in a small 5-pin SOT-23 package, with performance fully specified over a temperature range of  $-40^{\circ}\text{C}$  to  $+125^{\circ}\text{C}$ .

#### Package Information

PART NUMBER	PACKAGE <sup>(1)</sup>	PACKAGE SIZE <sup>(2)</sup>
TPS723Q1	DBV (SOT-23, 5)	2.90mm × 2.80mm

- (1) For all available packages, see the orderable addendum at the end of the data sheet.
- (2) The package size (length × width) is a nominal value and includes pins, where applicable.

Typical Application Circuit

## 4 Pin Configuration and Functions

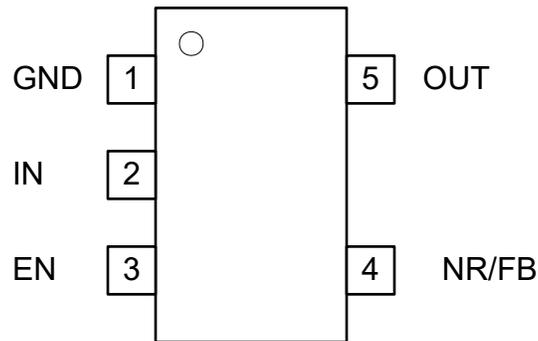

Figure 4-1. DBV Package, 5-Pin SOT-23 (Top View)

Table 4-1. Pin Functions

PIN		I/O	DESCRIPTION
NAME	NO.		
GND	1	—	Ground pin.
IN	2	I	Input supply pin. See the <a href="#">Section 5.3</a> table and the <a href="#">Section 8.1.3</a> section for more information.
EN	3	I	Bipolar enable pin. Driving this pin above the positive enable threshold or below the negative enable threshold turns on the regulator. Driving this pin below the positive disable threshold and above the negative disable threshold puts the regulator into shutdown mode. High and low thresholds are listed in the <a href="#">Section 5.6</a> table. This pin has a weak internal pulldown and can be left floating to enable. Refer to the <a href="#">Section 7.3.1</a> (EN) section for more details.
NR	4	—	Fixed voltage versions only. Connecting an external capacitor between this pin and ground, bypasses noise generated by the internal band gap. This configuration allows output noise to be reduced to very low levels. The capacitor on NR pin also helps in controlling the inrush current by introducing RC delay during start-up. Refer to the <a href="#">Section 7.3.7</a> section for more details.
FB	4	I	When using the adjustable device, this pin sets the output voltage with the help of a feedback divider. This functionality is only available in the adjustable configuration, and the pin must be connected through a resistor divider to the output for the device to function.
OUT	5	O	Output of the regulator. A capacitor is required from OUT to ground for stability. For best transient response, use the nominal recommended value or larger ceramic capacitor from OUT to ground; see the <a href="#">Section 5.3</a> table and the <a href="#">Section 8.1.3</a> section. Place the output capacitor as close to output of the device as possible.

## 5 Specifications

### 5.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)<sup>(1)</sup>

			MIN	MAX	UNIT
Voltage	IN	Input supply voltage range	-11	0.3	V
	EN	Enable voltage range	-V <sub>IN</sub>	5.5	
	OUT	Output voltage range	-11	0.3	
	NR	NR voltage range (legacy chip)	-11	5.5	
		NR voltage range (new chip)	-6	0.3	
Current	Latch-up performance meets 100 mA per AEC-Q100   Class I (legacy chip)		100		mA
Current		OUT	Internally limited		A
Output short-circuit duration			Indefinite		
Continuous total power dissipation			See Thermal Information table		
T <sub>J</sub>	Operating junction temperature		-65	150	°C
T <sub>stg</sub>	Storage temperature		-65	150	°C

- (1) Operation outside the Absolute Maximum Ratings may cause permanent device damage. Absolute Maximum Ratings do not imply functional operation of the device at these or any other conditions beyond those listed under Recommended Operating Conditions. If used outside the Recommended Operating Conditions but within the Absolute Maximum Ratings, the device may not be fully functional, and this may affect device reliability, functionality, performance, and shorten the device lifetime.

### 5.2 ESD Ratings

			VALUE (New chip)	VALUE (Legacy chip)	UNIT
V <sub>(ESD)</sub>	Electrostatic discharge	Human body model (HBM), per AEC Q100-002 <sup>(1)</sup>	±2000	±2000	V
		Charged device model (CDM), per V AEC Q100-011, all pins	±750	±500	
		Machine model	±750	±200	

- (1) AEC Q100-002 indicates that HBM stressing shall be in accordance with the ANSI/ESDA/JEDEC JS-001 specification.

### 5.3 Recommended Operating Conditions

over operating junction temperature range (unless otherwise noted)

			MIN	NOM	MAX	UNIT
V <sub>IN</sub>	Input supply voltage range		-10		-2.7	V
V <sub>OUT</sub>	Output voltage range		-10		-1.186	
V <sub>EN</sub>	Enable voltage range		-10		5.0	
I <sub>OUT</sub>	Output current		0		200	mA
C <sub>IN</sub> <sup>(1)</sup>	Input capacitor (legacy chip)		0.1		2.2	μF
	Input capacitor (new chip)			0.47		
C <sub>OUT</sub> <sup>(2)</sup>	Output capacitor		2.2		100	
C <sub>NR</sub>	NR capacitor			0.01		
C <sub>FF</sub> <sup>(3)</sup>	Feed-forward capacitor (for adjustable, new chip only)			0.01		
C <sub>OUT</sub> ESR	Output capacitor ESR (for new chip)				0.5	Ω
T <sub>J</sub>	Operating junction temperature		-40		125	°C

- (1) An input capacitor is not required for LDO stability. However, an input capacitance with an effective value of 0.1 μF minimum is recommended to counteract the effect of source resistance and inductance, which can in some cases cause symptoms of system level instability such as ringing or oscillation, especially in the presence of load transients.

- (2) All capacitor values listed are the nominal value and the effective capacitance is assumed to derate to 50% of the nominal capacitor value.
- (3) The  $C_{FF}$  capacitor improves transient, noise, and PSRR performance, but is not required for regulator stability. Using a higher capacitance  $C_{FF}$  is permissible but start-up time increases.

### 5.4 Power Dissipation Ratings (legacy chip)

BOARD	PACKAGE	$R_{\theta JC}$	$R_{\theta JA}$	DERATING FACTOR ABOVE $T_A = 25^\circ\text{C}$	$T_A \leq 25^\circ\text{C}$ POWER RATING	$T_A = 70^\circ\text{C}$ POWER RATING	$T_A = 85^\circ\text{C}$ POWER RATING
Low-K <sup>(1)</sup>	DBV	64°C/W	255°C/W	3.9mW/°C	390mW	215mW	155mW
High-K <sup>(2)</sup>	DBV	64°C/W	180°C/W	5.6mW/°C	560mW	310mW	225mW

- (1) The JEDEC low-K (1s) board design used to derive this data was a 3-inch × 3-inch (7,62-cm × 7,62-cm), two-layer board with 2-ounce (0.071-mm thick) copper traces on top of the board.
- (2) The JEDEC High-K (2s2p) board design used to derive this data was a 3 inch × 3 inch (7,62-cm × 7,62-cm), multilayer board with 1-ounce (0.035-mm thick) internal power and ground planes and 2-ounce (0.071-mm thick) copper traces on the top and bottom of the board.

### 5.5 Thermal Information (new chip)

THERMAL METRIC <sup>(1)</sup>		TPS723 <sup>(2)</sup>	UNIT
		DBV (SOT23)	
		5 PINS	
$R_{\theta JA}$	Junction-to-ambient thermal resistance	153.7	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	73.4	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	34.8	°C/W
$\Psi_{JT}$	Junction-to-top characterization parameter	7.6	°C/W
$\Psi_{JB}$	Junction-to-board characterization parameter	34.5	°C/W
$R_{\theta JC(bot)}$	Junction-to-case (bottom) thermal resistance	N/A	°C/W

- (1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.
- (2) Thermal performance results are based on the JEDEC standard of 2s2p PCB configuration. These thermal metric parameters can be further improved by 35-55% based on thermally optimized PCB layout designs. See the analysis of the [Impact of board layout on LDO thermal performance](#) application report.

### 5.6 Electrical Characteristics

Over operating junction temperature range ( $T_J = -40^\circ\text{C}$  to  $+125^\circ\text{C}$ ),  $V_{IN} = -2.7\text{V}$  or  $V_{IN} = V_{OUT(nom)} - 0.5\text{V}$  (whichever is lower),  $I_{OUT} = 1\text{mA}$ ,  $V_{EN} = +1.5\text{V}$ ,  $C_{OUT} = 1\mu\text{F}$ , and  $C_{NR} = 0.01\mu\text{F}$ , unless otherwise noted. Typical values are at  $T_J = 25^\circ\text{C}$ .

PARAMETER		TEST CONDITIONS		MIN	TYP	MAX	UNIT
$V_I$	Input voltage range			-10		-2.7	V
$V_O$	Nominal	Legacy chip (TPS723xx-Q1)	$T_J = 25^\circ\text{C}$	-1		1	%
	Accuracy (both fixed, adjustable)		$-10\text{V} \leq V_I \leq V_O - 0.5\text{V}$ , $10\mu\text{A} \leq I_O \leq 200\text{mA}$	-2	±1	2	
	Accuracy (both fixed, adjustable)	New chip (TPS723xx-Q1)		-1.6	±0.04	1.6	
$\Delta V_O(\Delta V_I)$	Line regulation	Legacy chip	$-10\text{V} \leq V_I \leq V_{O(nom)} - 0.5\text{V}$	0.04		% / V	
		New chip		-0.003			
$\Delta V_O(\Delta I_O)$	Load regulation	Legacy chip	$0\text{mA} \leq I_O \leq 200\text{mA}$	0.002		% / mA	
		New chip		0.0001			
$V_{DO}$	Dropout voltage	Legacy chip	$I_O = 200\text{mA}$ , $V_O = 0.96 \times V_{O(NOM)}$	280		500	mV
		New chip		140		245	

## 5.6 Electrical Characteristics (continued)

Over operating junction temperature range ( $T_J = -40^\circ\text{C}$  to  $+125^\circ\text{C}$ ),  $V_{IN} = -2.7\text{V}$  or  $V_{IN} = V_{OUT(nom)} - 0.5\text{V}$  (whichever is lower),  $I_{OUT} = 1\text{mA}$ ,  $V_{EN} = +1.5\text{V}$ ,  $C_{OUT} = 1\mu\text{F}$ , and  $C_{NR} = 0.01\mu\text{F}$ , unless otherwise noted. Typical values are at  $T_J = 25^\circ\text{C}$ .

PARAMETER			TEST CONDITIONS	MIN	TYP	MAX	UNIT
$V_{UVLO+}$	Rising input supply UVLO	New chip		-2.4	-2.1		V
$V_{UVLO-}$	Falling input supply UVLO	New chip			-1.9	-1.4	V
$I_{LIM}$	Output current limit	Legacy chip	$V_O = 0.85 \times V_{O(NOM)}$	300	550	800	mA
		New chip	$V_O = 0.85 \times V_{O(NOM)}$	300	385	485	
$I_{GND}$	Ground pin current	Legacy chip	$I_O = 0\text{ mA } (I_Q), -10\text{V} \leq V_I \leq V_O - 0.5\text{V}$		130	200	$\mu\text{A}$
			$I_O = 200\text{ mA}, -10\text{V} \leq V_I \leq V_O - 0.5\text{V}$		350	500	
		New chip	$I_O = 0\text{ mA } (I_Q), -10\text{V} \leq V_I \leq V_O - 0.5\text{V}$		30.0	55	
			$I_O = 200\text{ mA}, -10\text{V} \leq V_I \leq V_O - 0.5\text{V}$		290	450	
$I_{SHDN}$	Shutdown ground pin current	Legacy chip	$-0.4\text{V} \leq V_{EN} \leq 0.4\text{V}, -10\text{V} \leq V_I \leq V_O - 0.5\text{V}$		0.1	2.0	$\mu\text{A}$
		New chip	$-0.4\text{V} \leq V_{EN} \leq 0.4\text{V}, -10\text{V} \leq V_I \leq V_O - 0.5\text{V}$		0.7	2.0	
$I_{FB}$	Feedback pin current	Legacy chip	$-10\text{V} \leq V_I \leq V_O - 0.5\text{V}$		0.05	1.0	$\mu\text{A}$
		New chip			0.001	0.1	
$I_{EN}$	EN pin current	Legacy chip	$-10\text{V} \leq V_I \leq V_O - 0.5\text{V}, -10\text{V} \leq V_{EN} \leq \pm 3.5\text{V}$		0.1	2.0	$\mu\text{A}$
		New chip			0.6	2.0	
$V_{EN(HI)}$	Enable threshold (positive)	Legacy chip		1.5			V
$V_{EN(LO)}$	Enable threshold (negative)					-1.5	V
$V_{DIS(HI)}$	Disable threshold (positive)					0.4	V
$V_{DIS(LO)}$	Disable threshold (negative)			-0.4			V
$V_{EN(HI)}$	Enable threshold (positive)	New chip		1.5			V
$V_{EN(LO)}$	Enable threshold (negative)					-1.5	V
$V_{DIS(HI)}$	Disable threshold (positive)					0.4	V
$V_{DIS(LO)}$	Disable threshold (negative)			-0.4			V
$T_{sd+}$	Thermal shutdown temperature	Legacy chip	Shutdown, temperature increasing		165		$^\circ\text{C}$
$T_{sd-}$			Reset, temperature decreasing		145		$^\circ\text{C}$
$T_{sd+}$		New chip	Shutdown, temperature increasing		175		$^\circ\text{C}$
$T_{sd-}$			Reset, temperature decreasing		155		$^\circ\text{C}$
PSRR	Power-supply ripple rejection	$I_O = 200\text{mA}, 1\text{kHz}, C_I = C_O = 10\mu\text{F}$			65		dB
		$I_O = 200\text{mA}, 10\text{kHz}, C_I = C_O = 10\mu\text{F}$			48		
$V_n$	Output noise voltage	Bandwidth = 10Hz to 100kHz, $V_O = 2.5\text{V}, I_O = 200\text{mA}, C_{NR/SS} = 0.01\mu\text{F}, C_O = 1\mu\text{F}$			60		$\mu\text{VRMS}$
$t_{STR}$	Start-up time	Legacy chip	$V_O = -2.5\text{V}, C_O = 1\mu\text{F}, R_L = 25\Omega$		1		ms
$t_{STR}$	Start-up time	New chip	$V_O = -2.5\text{V}, C_O = 1\mu\text{F}, R_L = 25\Omega$		8		ms

## 6 Typical Characteristics

## 7 Detailed Description

### 7.1 Overview

The TPS723Q1 is a low-dropout, negative linear voltage regulator with an output tolerance of  $\pm 1.6\%$  across load, and temperature variation (new chip) and a rated load current of 200mA. The device is offered in trimmed output voltages between  $-1.5\text{V}$  and  $-5.2\text{V}$  and as an adjustable regulator from  $-1.186\text{V}$  to  $-10\text{V}$ . The device features very low noise ( $60\mu\text{V}_{\text{RMS}}$  with NR cap of 10nF) and high power-supply rejection ratio (40dB typical at 100kHz), making the TPS723Q1 designed for high-sensitivity automotive analog applications. A shutdown mode is available, reducing ground current to  $2\mu\text{A}$  maximum over temperature and process.

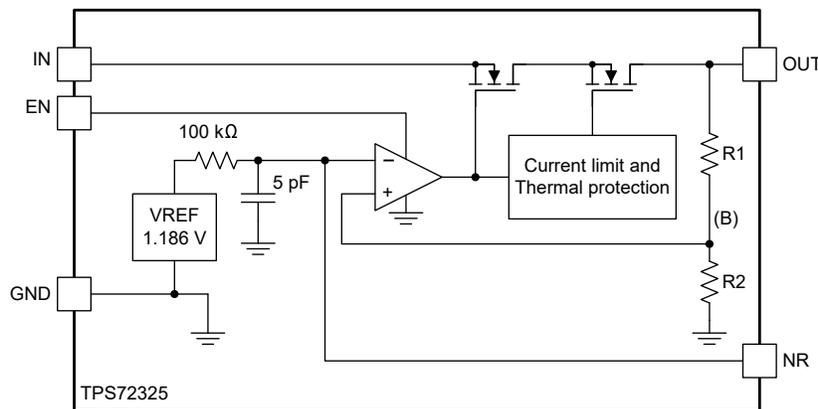

### 7.2 Functional Block Diagram

**Figure 7-3. Functional Block Diagram (Adjustable, New Chip)**

**Figure 7-4. Functional Block Diagram (Fixed, New Chip)**

## 7.3 Feature Description

### 7.3.1 Enable

For TPS723Q1, The enable pin (EN) is an active-high pin and supports a bipolar logic. The output is enabled when the voltage applied to EN is greater than  $V_{EN(HI)} (\geq +1.5V)$  or is lower than  $V_{EN(LO)} (\leq -1.5V)$ . The device will be disabled when EN is lower than  $V_{DIS(HI)} (\leq 0.4V)$  and higher than  $V_{DIS(LO)} (\geq -0.4V)$ . If external control of the output voltage is not needed, connect EN to IN. When devices is disabled, most internal circuitry is turned off, putting the TPS723Q1 into shutdown mode, drawing  $2\mu A$  maximum ground current. See the [Section 5.6](#) table for details on the values of  $V_{EN(HI)}$ ,  $V_{EN(LO)}$ ,  $V_{DIS(HI)}$ , and  $V_{DIS(LO)}$ .

In new chip only, the EN pin also has a weak internal pull-down functionality toward input supply and the EN pin can be left floating to enable the device. The internal pull-down current on the EN pin is captured in the [Section 5.6](#) table as Enable current. However, care must be taken to verify that when EN is tied toward positive logic, the

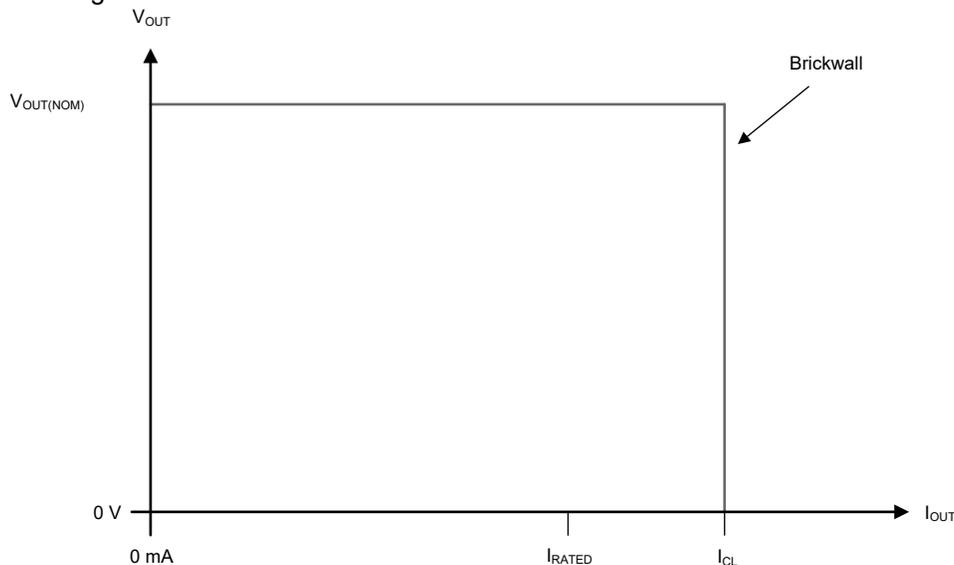

external logic driver must be able to provide the required pull-down current. The new chip also has an internal pullup circuit that activates when the device is disabled and actively charges the output voltage toward ground.

### 7.3.2 Current Limit

The device has an internal current limit circuit that protects the regulator during transient high-load current faults or shorting events. The current limit is a brick-wall scheme. In a high-load current fault, the brick-wall scheme limits the output current to the current limit ( $I_{CL}$ ).  $I_{CL}$  is listed in the [Section 5.6](#) table. Also see, [Figure 6-17](#) in the [Section 6](#) section.

The output voltage is not regulated when the device is in current limit. When a current limit event occurs, the device begins to heat up because of the increase in power dissipation. When the device is in brick-wall current limit, the pass transistor dissipates power  $[(V_{IN} - V_{OUT}) \times I_{CL}]$ . If thermal shutdown is triggered, the device turns off. After the device cools down, the internal thermal shutdown circuit turns the device back on. If the output current fault condition continues, the device cycles between current limit and thermal shutdown. For more information on current limits, see the [Know Your Limits application note](#).

[Figure 7-5](#) shows a diagram of the current limit.

**Figure 7-5. Current Limit**

Do not drive the output less than 0.3V below the input. An output voltage less than 0.3V below the input voltage biases the body diode in the pass transistor, and allows current to flow from the input to the output. This current is not limited by the device. If this condition is expected, make sure to externally limit the reverse current. See the Reverse Current section for more details.

### 7.3.3 Dropout Voltage

Dropout voltage ( $V_{DO}$ ) is defined as the output voltage minus the input voltage ( $V_{OUT} - V_{IN}$ ) at the rated output current ( $I_{RATED}$ ), where the pass transistor is fully on.  $I_{RATED}$  is the maximum  $I_{OUT}$  listed in the [Section 5.3](#) table. The pass transistor is in the ohmic or triode region of operation, and acts as a switch. The dropout voltage indirectly specifies a maximum input voltage lower than the nominal programmed output voltage at which the output voltage is expected to stay in regulation. If the input voltage rises to more than the nominal output regulation, then the output voltage rises as well.

For a CMOS regulator, the dropout voltage is determined by the drain-source on-state resistance ( $R_{DS(ON)}$ ) of the pass transistor. Therefore, if the linear regulator operates at less than the rated current, the dropout voltage for that current scales accordingly. The following equation calculates the  $R_{DS(ON)}$  of the device.

$$R_{DS(ON)} = \frac{V_{DO}}{I_{RATED}} \quad (1)$$

### 7.3.4 Output Pullup

The new chip has an output pullup circuit. The output pullup activates in the following conditions:

- When the device is disabled ( $V_{EN} > V_{DIS(LO)}$  or  $V_{EN} < V_{EN(LO)}$ )
- If  $V_{UVLO} < V_{IN} < -1.0V$

Do not rely on the output pullup circuit for charging a large amount of output capacitance toward ground after the input supply has collapsed because reverse current can flow from the input to the output. This reverse current flow can cause damage to the device. See the [Section 8.1.4](#) section for more details.

### 7.3.5 Thermal Shutdown

The device contains a thermal shutdown protection circuit to disable the device when the junction temperature ( $T_J$ ) of the pass transistor rises to  $T_{SD(shutdown)}$  (typical). Thermal shutdown hysteresis assures that the device resets (turns on) when the temperature falls to  $T_{SD(reset)}$  (typical).

The thermal time-constant of the semiconductor die is fairly short, thus the device can cycle on and off when thermal shutdown is reached until power dissipation is reduced. Power dissipation during start up can be high from large  $V_{OUT} - V_{IN}$  voltage drops across the device or from high inrush currents charging large output capacitors. Under some conditions, the thermal shutdown protection disables the device before start up completes.

For reliable operation, limit the junction temperature to the maximum listed in the [Section 5.3](#) table. Operation above this maximum temperature causes the device to exceed operational specifications. Although the internal protection circuitry of the device is designed to protect against thermal overall conditions, this circuitry is not intended to replace proper heat sinking. Continuously running the device into thermal shutdown or above the maximum recommended junction temperature reduces long-term reliability.

### 7.3.6 Undervoltage Lockout (UVLO)

The new chip has an independent undervoltage lockout (UVLO) circuit that monitors the input voltage, allowing a controlled and consistent turn on and off of the output voltage. To prevent the device from turning off if the input drops during turn on, the UVLO has hysteresis as specified in the [Section 5.6](#) table.

### 7.3.7 NR and Programmable Soft-Start

For TPS723Q1, the NR (noise reduction) capacitor in conjunction with the noise-reduction resistor, forms a low-pass filter (LPF) that filters out the noise from the reference before being gained up with the error amplifier, thereby reducing the device noise floor. The LPF is a single-pole filter and the cutoff frequency can be calculated with [Equation 2](#). The typical value of  $R_F$  is 400k $\Omega$  (typical). Increasing the  $C_{NR}$  capacitor has a greater affect because the output voltage increases when the noise from the reference is gained up even more at higher output voltages. For low-noise applications, a 10nF (typical)  $C_{NR}$  is recommended.

$$f_{cutoff} = \frac{1}{2 \times \pi \times R_F \times C_{NR}} \quad (2)$$

In new chip version, this NR capacitor ( $C_{NR}$ ) also helps in controlling the inrush current by introducing RC delay during start-up on the internal reference ( $V_{NR}$ ). For any external  $C_{NR}$ , approx. start-up time, when the internal reference ( $V_{NR}$ ) would charge to 90% of the typical value can be calculated with [Equation 3](#).

$$T_{start-up} \approx 2.2 \times \tau = 2.2 \times R_F \times C_{NR} \quad (3)$$

For more information on current limits, see the [How a Noise-reduction Pin Improves System Performance application note](#).

## 7.4 Device Functional Modes

### 7.4.1 Device Functional Mode Comparison

Table 7-1 shows the conditions that lead to the different modes of operation. See the [Section 5.6](#) table for parameter values.

**Table 7-1. Device Functional Mode Comparison**

OPERATING MODE	PARAMETER			
	$V_{IN}$	$V_{EN}$	$I_{OUT}$	$T_J$
Normal operation	$V_{IN} < V_{OUT(nom)} - V_{DO}$ and $V_{IN} < V_{IN(max)}$	$V_{EN} > V_{EN(HI)}$ or $V_{EN} < V_{EN(LO)}$	$I_{OUT} < I_{OUT(max)}$	$T_J < T_{SD(shutdown)}$
Dropout operation	$V_{OUT(nom)} - V_{DO} < V_{IN} < V_{IN(max)}$	$V_{EN} > V_{EN(HI)}$ or $V_{EN} < V_{EN(LO)}$	$I_{OUT} < I_{OUT(max)}$	$T_J < T_{SD(shutdown)}$
Disabled (any true condition disables the device)	$V_{IN} > V_{UVLO}$	$V_{EN} < V_{DIS(HI)}$ or $V_{EN} > V_{DIS(LO)}$	Not applicable	$T_J > T_{SD(shutdown)}$

### 7.4.2 Normal Operation

The device regulates to the nominal output voltage when the following conditions are met:

- The input voltage is lower than the nominal output voltage minus the dropout voltage ( $V_{OUT(nom)} - V_{DO}$ )
- The output current is less than the current limit ( $I_{OUT} < I_{CL}$ )
- The device junction temperature is less than the thermal shutdown temperature ( $T_J < T_{SD}$ )
- The EN voltage has previously crossing the  $V_{EN(HI)}$  or  $V_{EN(LO)}$  threshold voltage and has not yet crossed the disable thresholds ( $V_{DIS(HI)}$  or  $V_{DIS(LO)}$ )

### 7.4.3 Dropout Operation

If the input voltage is more positive (higher) than the nominal output voltage minus the specified dropout voltage, but all other conditions are met for normal operation, the device operates in dropout mode. In this mode, the output voltage tracks the input voltage. During this mode, the transient performance of the device becomes significantly degraded because the pass transistor is in the ohmic or triode region, and acts as a switch. Line or load transients in dropout can result in large output-voltage deviations.

When the device is in a steady dropout state (defined as when the device is in dropout,  $V_{IN} > V_{OUT(NOM)} - V_{DO}$ , directly after being in a normal regulation state, but *not* during start up), the pass transistor is driven into the ohmic or triode region. When the input voltage returns to a value lower than or equal to the nominal output voltage minus the dropout voltage ( $V_{OUT(NOM)} - V_{DO}$ ), the output voltage can overshoot for a short period of time while the device pulls the pass transistor back into the linear region.

### 7.4.4 Disabled

The output of the device can be shutdown by forcing the voltage of the EN pin either higher than the maximum  $V_{DIS(LO)}$  or lower than the minimum  $V_{DIS(HI)}$  pin input voltage (see the [Section 5.6](#) table). When disabled, the pass transistor is turned off, internal circuits are shutdown, and the output voltage is actively charged to ground by an internal discharge circuit from the output to ground.

## 8 Application and Implementation

### Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

### 8.1 Application Information

#### 8.1.1 Adjustable Device Feedback Resistor Selection

The adjustable-version device requires external feedback divider resistors to set the output voltage.  $V_{OUT}$  is set using the feedback divider resistors,  $R_1$  and  $R_2$ , according to the following equation:

$$V_{OUT} = V_{FB} \times (1 + R_1 / R_2) \quad (4)$$

To ignore the FB pin current error term in the  $V_{OUT}$  equation, set the feedback divider current to 100x the FB pin current ( $I_{FB}$ ) listed in the [Section 5.6](#) table. This setting provides the maximum feedback divider series resistance, as shown in the following equation:

$$R_1 + R_2 \leq V_{OUT} / (I_{FB} \times 100) \quad (5)$$

#### 8.1.2 Recommended Capacitor Types

The new chip is designed to be stable using low equivalent series resistance (ESR) ceramic capacitors at the input and output. Multilayer ceramic capacitors have become the industry standard for these types of applications and are recommended, but must be used with good judgment. Ceramic capacitors that employ X7R-, X5R-, and C0G-rated dielectric materials provide relatively good capacitive stability across temperature, whereas the use of Y5V-rated capacitors is discouraged because of large variations in capacitance.

Regardless of the ceramic capacitor type selected, the effective capacitance varies with operating voltage and temperature. As a general rule, expect the effective capacitance to decrease by as much as 50%. For new chip, the input and output capacitors recommended in the [Section 5.3](#) table account for an effective capacitance of approximately 50% of the nominal value.

#### 8.1.3 Input and Output Capacitor Selection

**For new chip:** The TPS723Q1 (new chip) requires an output capacitor of 2.2 $\mu$ F or larger (1.0 $\mu$ F or larger capacitance) for stability and an equivalent series resistance (ESR) between 0.0 $\Omega$  and 0.5 $\Omega$ . For best transient performance, use X5R- and X7R-type ceramic capacitors because these capacitors have minimal variation in value and ESR over temperature. When choosing a capacitor for a specific application, be mindful of the DC bias characteristics for the capacitor. Higher output voltages cause a significant derating of the capacitor.

**For new chip:** Although an input capacitor is not required for stability, good analog design practice is to connect a capacitor from IN to GND. Some input supplies have a high impedance, thus placing the input capacitor on the input supply helps reduce the input impedance. This capacitor counteracts reactive input sources and improves transient response, input ripple, and PSRR. If the input supply has a high impedance over a large range of frequencies, several input capacitors can be used in parallel to lower the impedance over frequency. Use a higher-value capacitor if large, fast, rise-time load transients are anticipated, or if the device is located several inches from the input power source.

**For legacy chip:** Appropriate input and output capacitors should be used for the intended application. The TPS723Q1 (legacy chip) only requires a 2.2 $\mu$ F ceramic output capacitor to be used for stable operation. Both the capacitor value and equivalent series resistance (ESR) affect stability, output noise, PSRR, and transient response. For typical applications, a 2.2 $\mu$ F ceramic output capacitor located close to the regulator is sufficient.

### 8.1.4 Reverse Current

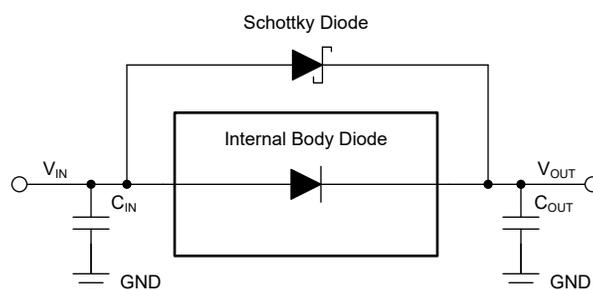

Excessive reverse current can damage this device. Reverse current flows through the intrinsic body diode of the pass transistor instead of the normal conducting channel. At high magnitudes, this current flow degrades the long-term reliability of the device.

Conditions where reverse current can occur are outlined in this section, all of which can exceed the absolute maximum rating of  $V_{OUT} \geq V_{IN} - 0.3V$ .

- If the device has a large  $C_{OUT}$  and the input supply collapses with little or no load current
- The output is biased when the input supply is not established
- The output is biased below the input supply

If reverse current flow is expected in the application, external protection is recommended to protect the device. Reverse current is not limited in the device, so external limiting is required if extended reverse voltage operation is anticipated.

Figure 8-1 shows one approach for protecting the device.

**Figure 8-1. Example Circuit for Reverse Current Protection Using a Schottky Diode**

### 8.1.5 Feed-Forward Capacitor ( $C_{FF}$ )

For the adjustable-voltage version device, a feed-forward capacitor ( $C_{FF}$ ) can be connected from the OUT pin to the FB pin.  $C_{FF}$  improves transient, noise, and PSRR performance, but is not required for regulator stability. Recommended  $C_{FF}$  values (for new chip) are listed in the [Section 5.3](#) table. A higher capacitance  $C_{FF}$  can be used; however, the start-up time increases. For a detailed description of  $C_{FF}$  tradeoffs, see the [Pros and Cons of Using a Feedforward Capacitor with a Low-Dropout Regulator](#) application report.

$C_{FF}$  and  $R_1$  form a zero in the loop gain at frequency  $f_z$ , while  $C_{FF}$ ,  $R_1$ , and  $R_2$  form a pole in the loop gain at frequency  $f_p$ .  $C_{FF}$  zero and pole frequencies can be calculated from the following equations:

$$f_z = 1 / (2 \times \pi \times C_{FF} \times R_1) \quad (6)$$

$$f_p = 1 / (2 \times \pi \times C_{FF} \times (R_1 \parallel R_2)) \quad (7)$$

$C_{FF} \geq 10pF$  is required for stability if the feedback divider current is less than  $10\mu A$ . [Equation 8](#) calculates the feedback divider current.

$$I_{FB\_Divider} = V_{OUT} / (R_1 + R_2) \quad (8)$$

To avoid start-up time increases from  $C_{FF}$ , limit the product  $C_{FF} \times R_1 < 50\mu s$ .

### 8.1.6 Power Dissipation ( $P_D$ )

Circuit reliability requires consideration of the device power dissipation, location of the circuit on the printed circuit board (PCB), and correct sizing of the thermal plane. The PCB area around the regulator must have few or no other heat-generating devices that cause added thermal stress.

To first-order approximation, power dissipation in the regulator depends on the input-to-output voltage difference and load conditions. The following equation calculates power dissipation ( $P_D$ ).

$$P_D = (V_{OUT} - V_{IN}) \times I_{OUT} \quad (9)$$

---

### Note

For negative voltage rails, the headroom across the LDO is calculated as  $V_{OUT} - V_{IN}$ . Power dissipation can be minimized, and therefore greater efficiency can be achieved, by correct selection of the system voltage rails. For the lowest power dissipation use the minimum input voltage required for correct output regulation.

---

For devices with a thermal pad, the primary heat conduction path for the device package is through the thermal pad to the PCB. Solder the thermal pad to a copper pad area under the device. This pad area must contain an array of plated vias that conduct heat to additional copper planes for increased heat dissipation.

The maximum power dissipation determines the maximum allowable ambient temperature ( $T_A$ ) for the device. According to the following equation, power dissipation and junction temperature are most often related by the junction-to-ambient thermal resistance ( $R_{\theta JA}$ ) of the combined PCB and device package and the temperature of the ambient air ( $T_A$ ).

$$T_J = T_A + (R_{\theta JA} \times P_D) \quad (10)$$

Thermal resistance ( $R_{\theta JA}$ ) is highly dependent on the heat-spreading capability built into the particular PCB design, and therefore varies according to the total copper area, copper weight, and location of the planes. The junction-to-ambient thermal resistance listed in the [Section 5.5](#) table is determined by the JEDEC standard PCB and copper-spreading area, and is used as a relative measure of package thermal performance.

#### 8.1.7 Estimating Junction Temperature

The JEDEC standard now recommends the use of psi ( $\Psi$ ) thermal metrics to estimate the junction temperatures of the linear regulator when in-circuit on a typical PCB board application. These metrics are not thermal resistance parameters and instead offer a practical and relative way to estimate junction temperature. These psi metrics are determined to be significantly independent of the copper area available for heat-spreading. The [Section 5.5](#) table lists the primary thermal metrics, which are the junction-to-top characterization parameter ( $\psi_{JT}$ ) and junction-to-board characterization parameter ( $\psi_{JB}$ ). These parameters provide two methods for calculating the junction temperature ( $T_J$ ), as described in the following equations. Use the junction-to-top characterization parameter ( $\psi_{JT}$ ) with the temperature at the center-top of device package ( $T_T$ ) to calculate the junction temperature. Use the junction-to-board characterization parameter ( $\psi_{JB}$ ) with the PCB surface temperature 1mm from the device package ( $T_B$ ) to calculate the junction temperature.

$$T_J = T_T + \psi_{JT} \times P_D \quad (11)$$

where:

- $P_D$  is the dissipated power
- $T_T$  is the temperature at the center-top of the device package

$$T_J = T_B + \psi_{JB} \times P_D \quad (12)$$

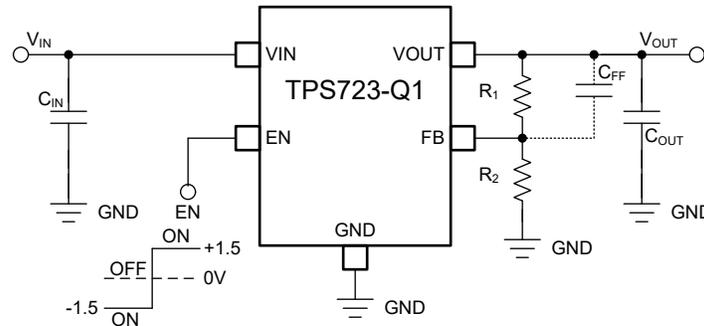

where

- $T_B$  is the PCB surface temperature measured 1mm from the device package and centered on the package edge

For detailed information on the thermal metrics and how to use them, see the [Semiconductor and IC Package Thermal Metrics application note](#).

## 8.2 Typical Application

The TPS72301Q1 allows designers to specify any output voltage from  $-10\text{V}$  to  $-1.186\text{V}$ . As shown in the application circuit in [Figure 8-2](#), an external resistor divider is used to scale the output voltage ( $V_O$ ) to the reference voltage. For best accuracy, use precision resistors for  $R_1$  and  $R_2$ . Use the equations in [Figure 8-2](#) to determine the values for the resistor divider.

### Note

$V_{OUT} = -1.186 \times (1 + R_1 / R_2)$ , where  $R_1 + R_2 \cong 100\text{k}\Omega$  (for legacy chip) and  $R_2 \leq 118.6\text{k}\Omega$  (for new chip)

**Figure 8-2. TPS72301Q1 Adjustable LDO Regulator Programming**

### 8.2.1 Output Noise

Without external bypassing, output noise of the TPS723Q1 from 10Hz to 100kHz is  $200\mu\text{V}_{\text{RMS}}$  typical. The dominant contributor to output noise is the internal band-gap reference. Adding an external  $0.01\mu\text{F}$  capacitor to ground reduces noise to  $60\mu\text{V}_{\text{RMS}}$ . Best noise performance is achieved using appropriate low ESR capacitors for bypassing noise at the NR and OUT pins. See [Figure 6-55](#) and [Figure 6-59](#) in the [Section 6](#) section.

### 8.2.2 Design Requirements

For this design example, use the parameters listed in [Table 8-1](#) as the input parameters.

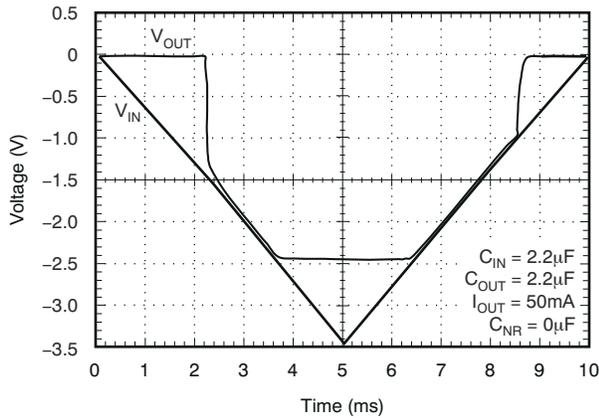

**Table 8-1. Design Parameters**

DESIGN PARAMETER	EXAMPLE VALUE
Input voltage range	$-10\text{V}$ to $-2.7\text{V}$
Output voltage	$-2.5\text{V}$
Output current	200mA
Output capacitor	$2.2\mu\text{F}$

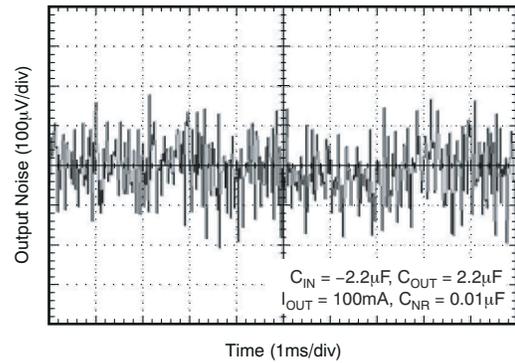

### 8.2.3 Power-Supply Rejection

The TPS723Q1 offers a very high PSRR for applications with noisy input sources or highly sensitive output supply lines. For best PSRR, use high-quality input and output capacitors.

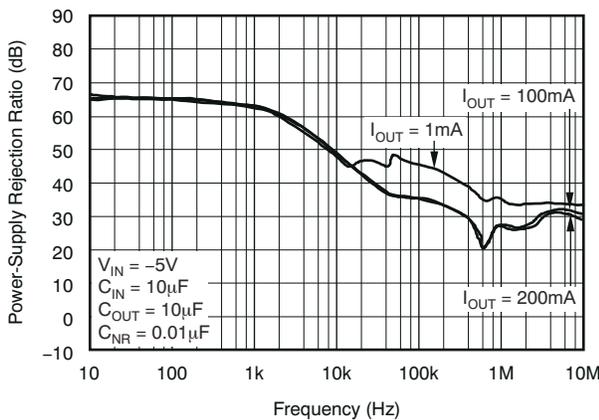

### 8.2.4 Application Curves

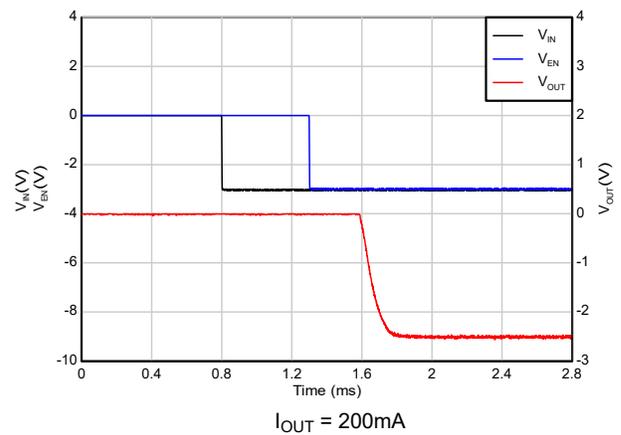

**Figure 8-3. TPS72325Q1 Power-Up, Power-Down (Legacy Device)**

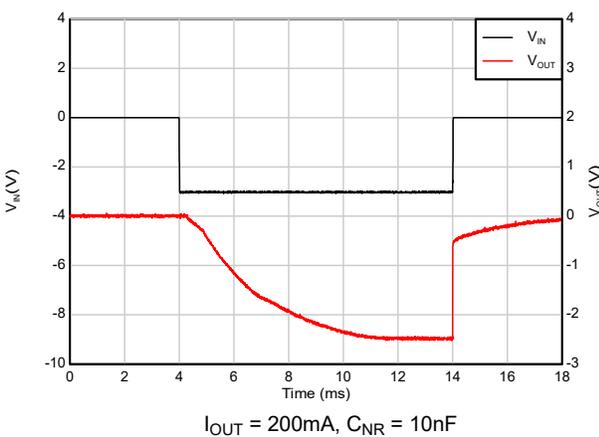

**Figure 8-4. TPS72325Q1 Output Noise vs Time (Legacy Device)**

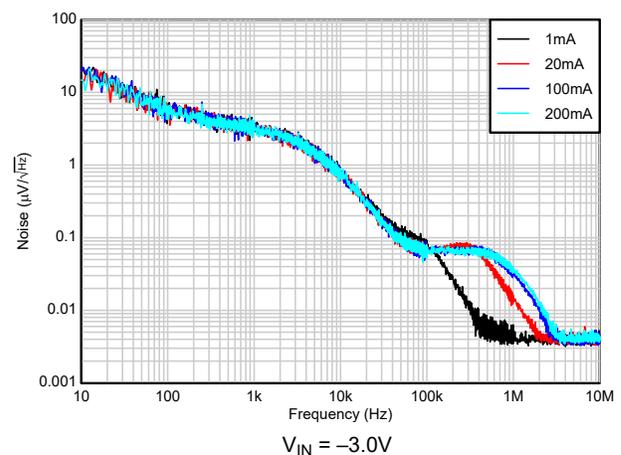

**Figure 8-5. PSRR vs Frequency (Legacy Device)**

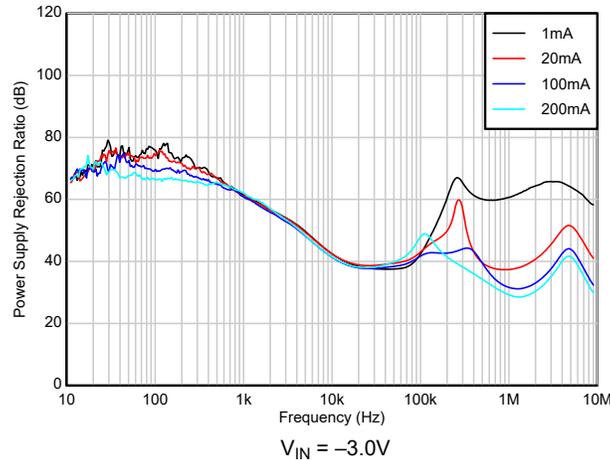

**Figure 8-6. Start-up Response ( $V_{IN}$  Ramping Before EN) (New Device)**

**Figure 8-7. Start-up Response ( $V_{IN}$  and EN Tied Together) (New Device)**

**Figure 8-8. Total Noise vs  $I_{OUT}$  (10Hz to 100kHz) (New Device)**

**Figure 8-9. PSRR vs  $I_{OUT}$  (New Device)**

### 8.3 Best Design Practices

Do place at least one 2.2 $\mu$ F ceramic capacitor as close as possible to the OUT pin of the regulator.

Do not place the output capacitor more than 10mm away from the regulator.

Do connect a 0.1 $\mu$ F to 2.2 $\mu$ F low ESR capacitor across the IN pin and GND input of the regulator.

Do not exceed the absolute maximum ratings.

### 8.4 Power Supply Recommendations

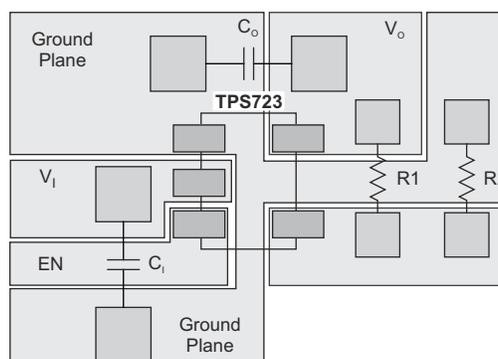

These devices are designed to operate from an input voltage supply range between  $-10V$  and  $-2.7V$ . The input voltage range must provide adequate headroom in order for the device to have a regulated output. This input supply must be well-regulated and stable. If the input supply is noisy, additional input capacitors with low ESR can help improve the output noise performance.

### 8.5 Layout

#### 8.5.1 Layout Guidelines

To improve ac performance (such as PSRR, output noise, and transient response), design the board with separate ground planes for  $V_I$  and  $V_O$ , with each ground plane connected only at the GND pin of the device. In addition, connect the bypass capacitor directly to the GND pin of the device.

#### 8.5.2 Layout Example

**Figure 8-10. Example Layout**

## 9 Device and Documentation Support

### 9.1 Device Support

#### 9.1.1 Development Support

##### 9.1.1.1 Spice Models

Computer simulation of circuit performance using SPICE is often useful when analyzing the performance of analog circuits and systems. A SPICE model for the TPS723Q1 is available through the product folders under *Simulation Models*.

##### 9.1.2 Device Nomenclature

**Table 9-1. Device Nomenclature**

PRODUCT <sup>(1)</sup>	V <sub>OUT</sub>
TPS723xxQyyyzQ1 or TPS723xxQyyyzM3Q1	xx is nominal output voltage (for example, 25 = 2.5V, 01 = Adjustable). yyy is package designator. z is package quantity. This device either ships with the legacy chip (CSO: DLN ) or the new chip (CSO: DM6), which uses the latest manufacturing flow. The reel packaging label provides CSO information to distinguish which chip is used. Device performance for new and legacy chips is denoted throughout the document. M3 is a suffix designator only significant for the new chip with CSO:DM6, which uses the latest manufacturing flow.

(1) For the most current package and ordering information see the Package Option Addendum at the end of this document, or visit the device product folder at [www.ti.com](http://www.ti.com).

### 9.2 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on [ti.com](http://ti.com). Click on *Notifications* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

### 9.3 Support Resources

[TI E2E™ support forums](#) are an engineer's go-to source for fast, verified answers and design help — straight from the experts. Search existing answers or ask your own question to get the quick design help you need.

Linked content is provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

### 9.4 Trademarks

TI E2E™ is a trademark of Texas Instruments.  
All trademarks are the property of their respective owners.

### 9.5 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

### 9.6 Glossary

[TI Glossary](#) This glossary lists and explains terms, acronyms, and definitions.

## 10 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

<b>Changes from Revision C (October 2017) to Revision D (March 2026)</b>	<b>Page</b>
• Changed document title for GPN name correction from TPS723xx-Q1 to TPS723-Q1.....	1
• Changed Features section to add information about the new chip.....	1
• Updated Applications section to add Automotive End-equipment.....	1
• Updated Description section to highlight key device performance parameters for both new and legacy chip...	1
• Updated Pin Configuration and Functions section to add detailed functionality about each pin.....	3
• Updated Specifications Section: <i>Absolute Maximum Ratings</i> , <i>ESD Ratings</i> , <i>Recommended Operating Conditions</i> and <i>Electrical Characteristics</i> sections updated to add performance details about the new chip and comparison with the legacy chip.....	4
• Added Thermal Information for the new chip.....	4
• Updated Typical Characteristics section to show performance comparison between legacy and new chip.....	7
• Added functional block diagrams for the new chip and updated functional block diagrams for the fixed and adjustable devices.....	22
• Updated <i>Feature Description</i> Section: Added <i>Enable</i> , <i>Current limit</i> , <i>Dropout voltage</i> , <i>Output pullup</i> , <i>Thermal shutdown</i> , <i>UVLO</i> and <i>NR/Programmable soft-start</i> section to show detailed information about device functionality.....	23
• Added Device functional modes section in Feature Description section to show functionality of the device...	26
• Added Application and Implementation section: Added <i>Adjustable Device Feedback Resistor Selection</i> , <i>Recommended Capacitor Types</i> , <i>Input/Output capacitor</i> sections to show detailed application information of the device.....	27
• Added key sections about Device application usage such as <i>Power Dissipation</i> , <i>Estimating Junction Temperature</i> for detailed information about the device.....	28
• Updated Device and Documentation support section to show details about <i>Device Nomenclature</i> section....	33

<b>Changes from Revision B (September 2012) to Revision C (October 2017)</b>	<b>Page</b>
• Added <i>Device Information</i> table, <i>ESD Ratings</i> table, <i>Pin Configuration and Functions</i> section, <i>Feature Description</i> section, <i>Device and Documentation Support</i> section, and <i>Mechanical, Packaging, and Orderable Information</i> section .....	1
• Added <i>AEC-Q100 Qualified With the Following Results</i> bullets.....	1
• Deleted Ordering Information table .....	3

## 11 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

**PACKAGING INFORMATION**

Orderable part number	Status (1)	Material type (2)	Package   Pins	Package qty   Carrier	RoHS (3)	Lead finish/ Ball material (4)	MSL rating/ Peak reflow (5)	Op temp (°C)	Part marking (6)
<a href="#">TPS72301QDBVRQ1</a>	Active	Production	SOT-23 (DBV)   5	3000   LARGE T&R	Yes	NIPDAU	Level-1-260C-UNLIM	-40 to 125	PPHQ
TPS72301QDBVRQ1.A	Active	Production	SOT-23 (DBV)   5	3000   LARGE T&R	Yes	NIPDAU	Level-1-260C-UNLIM	-40 to 125	PPHQ
<a href="#">TPS72325QDBVRQ1</a>	Active	Production	SOT-23 (DBV)   5	3000   LARGE T&R	Yes	NIPDAU	Level-1-260C-UNLIM	-40 to 125	PSBQ
TPS72325QDBVRQ1.A	Active	Production	SOT-23 (DBV)   5	3000   LARGE T&R	Yes	NIPDAU	Level-1-260C-UNLIM	-40 to 125	PSBQ

(1) **Status:** For more details on status, see our [product life cycle](#).

(2) **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

(3) **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

(4) **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

(5) **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

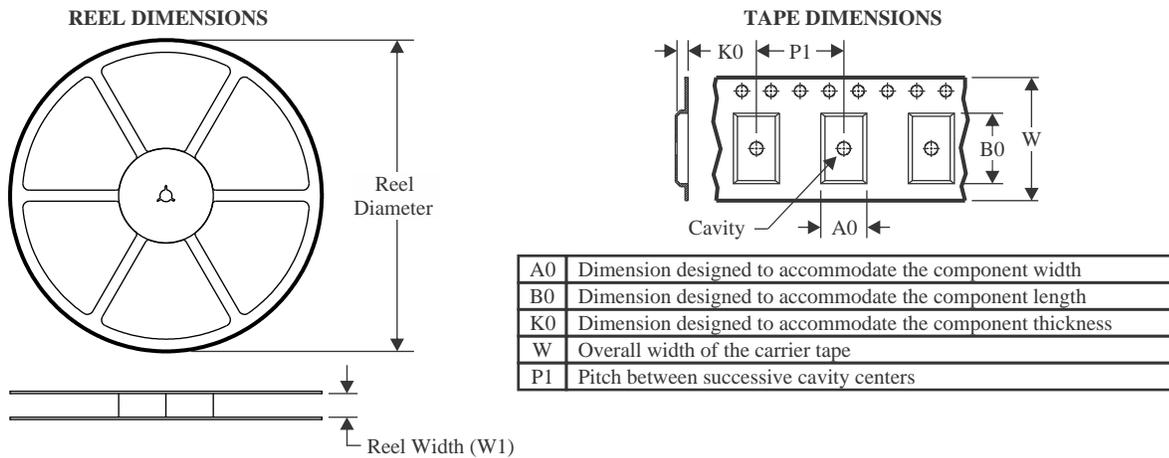

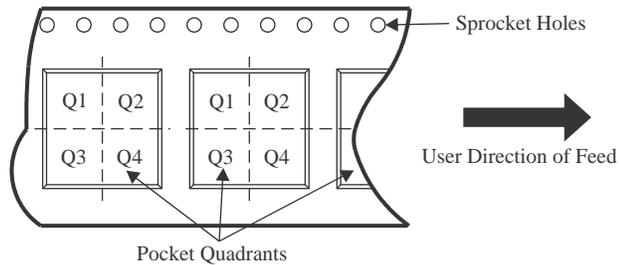

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

**OTHER QUALIFIED VERSIONS OF TPS723-Q1 :**

- Catalog : [TPS723](#)

NOTE: Qualified Version Definitions:

- Catalog - TI's standard catalog product

**TAPE AND REEL INFORMATION**

**QUADRANT ASSIGNMENTS FOR PIN 1 ORIENTATION IN TAPE**

\*All dimensions are nominal

Device	Package Type	Package Drawing	Pins	SPQ	Reel Diameter (mm)	Reel Width W1 (mm)	A0 (mm)	B0 (mm)	K0 (mm)	P1 (mm)	W (mm)	Pin1 Quadrant
TPS72301QDBVRQ1	SOT-23	DBV	5	3000	179.0	8.4	3.2	3.2	1.4	4.0	8.0	Q3
TPS72325QDBVRQ1	SOT-23	DBV	5	3000	179.0	8.4	3.2	3.2	1.4	4.0	8.0	Q3

**TAPE AND REEL BOX DIMENSIONS**

\*All dimensions are nominal

Device	Package Type	Package Drawing	Pins	SPQ	Length (mm)	Width (mm)	Height (mm)
TPS72301QDBVRQ1	SOT-23	DBV	5	3000	200.0	183.0	25.0
TPS72325QDBVRQ1	SOT-23	DBV	5	3000	200.0	183.0	25.0

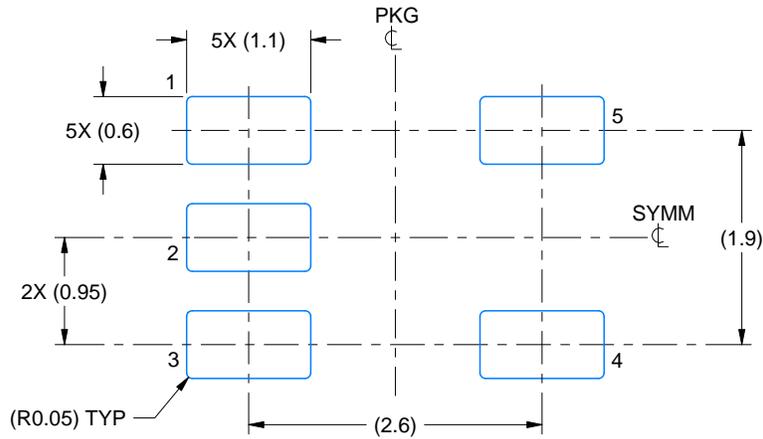

# EXAMPLE BOARD LAYOUT

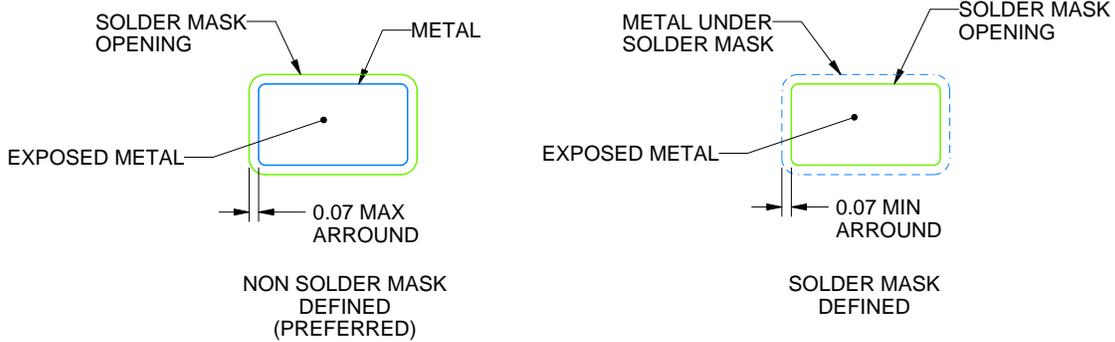

DBV0005A

SOT-23 - 1.45 mm max height

SMALL OUTLINE TRANSISTOR

LAND PATTERN EXAMPLE  
EXPOSED METAL SHOWN  
SCALE:15X

SOLDER MASK DETAILS

4214839/K 08/2024

NOTES: (continued)

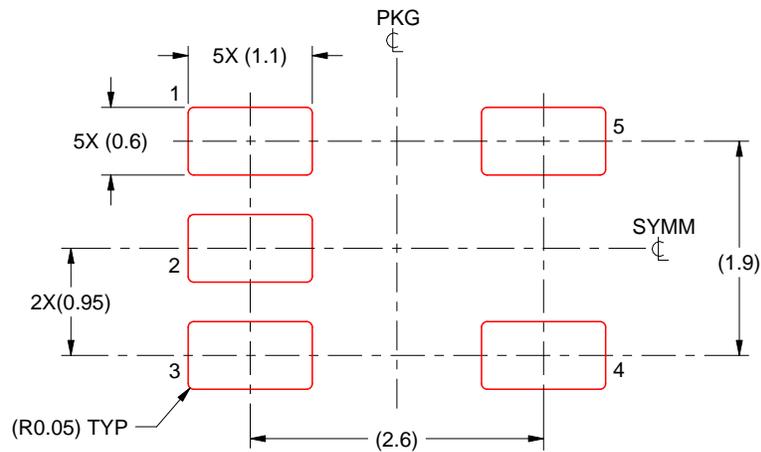

- 6. Publication IPC-7351 may have alternate designs.
- 7. Solder mask tolerances between and around signal pads can vary based on board fabrication site.

# EXAMPLE STENCIL DESIGN

DBV0005A

SOT-23 - 1.45 mm max height

SMALL OUTLINE TRANSISTOR

SOLDER PASTE EXAMPLE  
BASED ON 0.125 mm THICK STENCIL  
SCALE:15X

4214839/K 08/2024

NOTES: (continued)

8. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
9. Board assembly site may have different recommendations for stencil design.

## IMPORTANT NOTICE AND DISCLAIMER

TI PROVIDES TECHNICAL AND RELIABILITY DATA (INCLUDING DATASHEETS), DESIGN RESOURCES (INCLUDING REFERENCE DESIGNS), APPLICATION OR OTHER DESIGN ADVICE, WEB TOOLS, SAFETY INFORMATION, AND OTHER RESOURCES "AS IS" AND WITH ALL FAULTS, AND DISCLAIMS ALL WARRANTIES, EXPRESS AND IMPLIED, INCLUDING WITHOUT LIMITATION ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE OR NON-INFRINGEMENT OF THIRD PARTY INTELLECTUAL PROPERTY RIGHTS.

These resources are intended for skilled developers designing with TI products. You are solely responsible for (1) selecting the appropriate TI products for your application, (2) designing, validating and testing your application, and (3) ensuring your application meets applicable standards, and any other safety, security, regulatory or other requirements.

These resources are subject to change without notice. TI grants you permission to use these resources only for development of an application that uses the TI products described in the resource. Other reproduction and display of these resources is prohibited. No license is granted to any other TI intellectual property right or to any third party intellectual property right. TI disclaims responsibility for, and you fully indemnify TI and its representatives against any claims, damages, costs, losses, and liabilities arising out of your use of these resources.

TI's products are provided subject to [TI's Terms of Sale](#), [TI's General Quality Guidelines](#), or other applicable terms available either on [ti.com](http://ti.com) or provided in conjunction with such TI products. TI's provision of these resources does not expand or otherwise alter TI's applicable warranties or warranty disclaimers for TI products. Unless TI explicitly designates a product as custom or customer-specified, TI products are standard, catalog, general purpose devices.

TI objects to and rejects any additional or different terms you may propose.
