

TPS7A24 200-mA, 18-V, Ultra-Low I_Q , Low-Dropout Voltage Regulator

1 Features

- Ultra-low I_Q : 2.0 μ A
- Input voltage: 2.4 V to 18 V
- Output voltage options available:
 - Fixed: 1.25 V to 5.5 V
 - Adjustable: 1.24 V to 17.75 V
- 1.25% accuracy over temperature
- Low dropout: 250 mV (max) at 200 mA
- Active overshoot pulldown protection
- Thermal shutdown and overcurrent protection
- Operating junction temperature: -40°C to $+125^{\circ}\text{C}$
- Stable with 1- μ F output capacitors
- Package: 5-pin SOT-23

2 Applications

- [Smoke and heat detectors](#)
- [Thermostats](#)
- [Motion detectors \(PIR, uWave, and so forth\)](#)
- [Cordless power tools](#)
- [Appliance battery packs](#)
- [Electricity meters](#)
- [Water meters](#)

3 Description

The TPS7A24 low-dropout (LDO) linear voltage regulator supports a 2.4-V to 18-V input voltage range with ultra-low quiescent current (I_Q). These features help modern appliances meet increasingly stringent energy requirements and help extend battery life in portable-power solutions.

The TPS7A24 is available in both fixed and adjustable versions. The fixed-voltage version eliminates external resistors and minimizes printed circuit board (PCB) area. For more flexibility or higher output voltages, the adjustable version uses feedback resistors to set the output voltage from 1.24 V to 17.75 V. Both versions have 1.25% output regulation accuracy that provides precision regulation for microcontroller (MCU) references.

The TPS7A24 LDO operates more efficiently than standard linear regulators because the maximum dropout voltage is less than 250 mV at 200 mA of current. This maximum dropout voltage allows for 92.8% efficiency from a 3.55-V input voltage (V_{IN}) to a 3.3-V output voltage (V_{OUT}).

Package Information⁽¹⁾

PART NUMBER	PACKAGE	BODY SIZE (NOM)
TPS7A24	DBV (SOT-23, 5)	2.90 mm \times 1.60 mm

- (1) For all available packages, see the package option addendum at the end of the data sheet.

4 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

Changes from Revision D (May 2022) to Revision E (September 2022)	Page
• Changed <i>Dropout Voltage vs V_{IN}</i> and <i>Dropout Voltage vs I_{OUT}</i> figures in <i>Typical Characteristics</i> section.....	7

Changes from Revision C (January 2022) to Revision D (May 2022)	Page
• Added Output voltage accuracy at 25 °C to <i>Electrical Characteristics</i> table.....	6

5 Pin Configuration and Functions

Figure 5-1. DBV Package (Adjustable), 5-Pin SOT-23 (Top View)

Figure 5-2. DBV Package (Fixed), 5-Pin SOT-23 (Top View)

Table 5-1. Pin Functions

NAME	PIN		I/O	DESCRIPTION
	DBV (Adjustable)	DBV (Fixed)		
EN	3	3	Input	Enable pin. Drive EN greater than $V_{EN(HI)}$ to enable the regulator. Drive EN less than $V_{EN(LOW)}$ to put the regulator into low-current shutdown. Do not float this pin. If not used, connect EN to IN.
FB	4	—	Input	Feedback pin. Input to the control-loop error amplifier. This pin is used to set the output voltage of the device with the use of external resistors. For adjustable-voltage version devices only.
GND	2	2	—	Ground pin.
IN	1	1	Input	Input pin. For best transient response and to minimize input impedance, use the recommended value or larger capacitor from IN to ground as listed in the Recommended Operating Conditions table. Place the input capacitor as close to the IN and GND pins of the device as possible.
NC	—	4	—	No internal connection. For fixed-voltage version devices only. This pin can be floated but the device has better thermal performance with this pin tied to GND.
OUT	5	5	Output	Output pin. A capacitor is required from OUT to ground for stability. For best transient response, use the nominal recommended value or larger capacitor from OUT to ground. Follow the recommended capacitor value as listed in the Recommended Operating Conditions table. Place the output capacitor as close to the OUT and GND pins of the device as possible.

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)⁽¹⁾

		MIN	MAX	UNIT
Voltage ⁽²⁾	V _{IN}	–0.3	20	V
	V _{OUT}	–0.3	V _{IN} + 0.3 ⁽³⁾	
	V _{FB}	–0.3	5.5	
	V _{EN}	–0.3	20	
Current	Maximum output	Internally limited		A
Temperature	Operating junction, T _J	–50	150	°C
	Storage, T _{stg}	–65	150	

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) All voltages with respect to GND.
- (3) V_{IN} + 0.3 V or 20 V (whichever is smaller).

6.2 ESD Ratings

			VALUE	UNIT
V _(ESD)	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	±2000	V
		Charged device model (CDM), per JEDEC specification JESD22-C101 ⁽²⁾	±1000	

- (1) JEDEC document JEP155 states that 2-kV HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 500-V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

		MIN	NOM	MAX	UNIT
V _{IN}	Input voltage	2.4		18	V
V _{OUT}	Output voltage (adjustable version)	1.24		18 - V _{DO}	V
V _{OUT}	Output voltage (fixed version)	1.25		5.5	V
I _{OUT}	Output current	0		200	mA
V _{EN}	Enable voltage	0		18	V
C _{IN} ⁽¹⁾	Input capacitor		1		μF
C _{OUT} ⁽¹⁾	Output capacitor	1	2.2	100	μF
T _J	Operating junction temperature	-40		125	°C

(1) All capacitor values are assumed to derate to 50% of the nominal capacitor value.

6.4 Thermal Information

THERMAL METRIC ⁽¹⁾		TPS7A24	UNIT
		DBV (SOT23-5)	
		5 PINS	
R _{θJA}	Junction-to-ambient thermal resistance	167.8	°C/W
R _{θJC(top)}	Junction-to-case (top) thermal resistance	86.7	°C/W
R _{θJB}	Junction-to-board thermal resistance	38.4	°C/W
ψ _{JT}	Junction-to-top characterization parameter	14.5	°C/W
ψ _{JB}	Junction-to-board characterization parameter	38.1	°C/W
R _{θJC(bot)}	Junction-to-case (bottom) thermal resistance	n/a	°C/W

(1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics application reports application report](#).

6.5 Electrical Characteristics

specified at $T_J = -40^{\circ}\text{C}$ to $+125^{\circ}\text{C}$, $V_{IN} = V_{OUT(nom)} + 0.5\text{ V}$ or $V_{IN} = 2.4\text{ V}$ (whichever is greater), FB tied to OUT, $I_{OUT} = 1\text{ mA}$, $V_{EN} = 2\text{ V}$, and $C_{IN} = 1\text{ }\mu\text{F}$, $C_{OUT} = 2.2\text{ }\mu\text{F}$ ceramic (unless otherwise noted); typical values are at $T_J = 25^{\circ}\text{C}$

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
V_{OUT}	Output voltage accuracy	Adjustable version, $V_{OUT} = V_{FB}$	1.22	1.24	1.26	V
		Fixed output versions, $T_J = -40^{\circ}\text{C}$ to 125°C	-1.25		1.25	%
V_{OUT}	Output voltage accuracy	Fixed output versions, $T_J = 25^{\circ}\text{C}$	-0.5		0.5	%
V_{FB}	Feedback voltage	Adjustable version only		1.24		V
$\Delta V_{OUT(\Delta V_{IN})}$	Line regulation ⁽¹⁾	$(V_{OUT(nom)} + 0.5\text{ V or }2.4\text{ V}) \leq V_{IN} \leq 18\text{ V}$	-0.25		0.25	%
$\Delta V_{OUT(\Delta I_{OUT})}$	Load regulation	$1\text{ mA} \leq I_{OUT} \leq 200\text{ mA}$	-0.5		0.5	%
I_{GND}	Ground pin current	$I_{OUT} = 0\text{ mA}$		2	4.5	μA
		$I_{OUT} = 1\text{ mA}$		15		
$I_{SHUTDOWN}$	Shutdown current	$V_{EN} \leq 0.4\text{ V}$, $V_{IN} = 2.4\text{ V}$, $I_{OUT} = 0\text{ mA}$		325	650	nA
I_{CL}	Output current limit	$V_{OUT} = 0.9 \times V_{OUT(nom)}$	250	410	620	mA
I_{FB}	FB pin current			10		nA
V_{DO}	Dropout voltage ⁽²⁾	$I_{OUT} = 100\text{ mA}$		110	160	mV
		$I_{OUT} = 200\text{ mA}$		160	250	
PSRR	Power-supply rejection ratio	$f = 10\text{ Hz}$		75		dB
		$f = 100\text{ Hz}$		70		
		$f = 1\text{ kHz}$		62		
V_n	Output noise voltage	$\text{BW} = 10\text{ Hz to }100\text{ kHz}$, $V_{OUT} = 1.24\text{ V}$		300		μV_{RMS}
$V_{UVLO(RISING)}$	UVLO threshold rising	V_{IN} rising	1.95	2.15	2.35	V
$V_{UVLO(HYS)}$	UVLO hysteresis			70		mV
$V_{UVLO(FALLING)}$	UVLO threshold falling	V_{IN} falling	1.85	2.09	2.25	V
$V_{EN(HI)}$	Enable pin high-level input voltage	Device enabled	0.9			V
$V_{EN(LOW)}$	Enable pin low-level input voltage	Device disabled			0.4	V
I_{EN}	EN pin current	$V_{EN} = 18\text{ V}$		10		nA
$T_{SD(shutdown)}$	Thermal shutdown temperature	Shutdown, temperature increasing		165		$^{\circ}\text{C}$
$T_{SD(reset)}$	Thermal shutdown reset temperature	Reset, temperature decreasing		145		$^{\circ}\text{C}$

(1) $V_{out(nom)} + 0.5\text{ V}$ or 2.4 V (whichever is greater).

(2) V_{DO} is measured with $V_{IN} = 0.97 \times V_{OUT(nom)}$ for fixed output voltage versions. V_{DO} is not measured for fixed output voltage versions when $V_{OUT} \leq 2.5\text{ V}$. For the adjustable output device, V_{DO} is measured with $V_{FB} = 0.97 \times V_{FB(nom)}$.

6.6 Typical Characteristics

at operating temperature $T_J = 25^\circ\text{C}$, $I_{OUT} = 1\text{ mA}$, $V_{EN} = 0.9\text{ V}$, $C_{IN} = 2.2\text{ }\mu\text{F}$, $C_{OUT} = 2.2\text{ }\mu\text{F}$, and $V_{IN} = V_{OUT(typ)} + 0.8\text{ V}$ or 2.4 V (whichever is greater), unless otherwise noted; typical values are at $T_J = 25^\circ\text{C}$

7 Detailed Description

7.1 Overview

The TPS7A24 is an 18-V, low quiescent current, low-dropout (LDO) linear regulator. The low I_Q performance makes the TPS7A24 an excellent choice for battery-powered or line-power applications that are expected to meet increasingly stringent standby-power standards. The fixed-output versions have the advantage of providing better accuracy with fewer external components, whereas the adjustable version has the flexibility for a far wider output voltage range.

The 1.25% accuracy over temperature makes this device an excellent choice for meeting a wide range of microcontroller power requirements.

For increased reliability, the TPS7A24 also incorporates overcurrent, overshoot pulldown, and thermal shutdown protection. The operating junction temperature is -40°C to $+125^{\circ}\text{C}$, and adds margin for applications concerned with higher working ambient temperatures.

7.2 Functional Block Diagrams

Figure 7-1. Adjustable Version Block Diagram

Figure 7-2. Fixed Version Block Diagram

7.3 Feature Description

7.3.1 Output Enable

The enable pin for the device is an active-high pin. The output voltage is enabled when the voltage of the enable pin is greater than the high-level input voltage of the EN pin and disabled with the enable pin voltage is less than the low-level input voltage of the EN pin. If independent control of the output voltage is not needed, connect the enable pin to the input of the device.

7.3.2 Dropout Voltage

Dropout voltage (V_{DO}) is defined as the input voltage minus the output voltage ($V_{IN} - V_{OUT}$) at the rated output current (I_{RATED}), where the pass transistor is fully on. I_{RATED} is the maximum I_{OUT} listed in the [Recommended Operating Conditions](#) table. The pass transistor is in the ohmic or triode region of operation, and acts as a switch. The dropout voltage indirectly specifies a minimum input voltage greater than the nominal programmed output voltage at which the output voltage is expected to stay in regulation. If the input voltage falls to less than the nominal output regulation, then the output voltage falls as well.

For a CMOS regulator, the dropout voltage is determined by the drain-source on-state resistance ($R_{DS(ON)}$) of the pass transistor. Therefore, if the linear regulator operates at less than the rated current, the dropout voltage for that current scales accordingly. The following equation calculates the $R_{DS(ON)}$ of the device.

$$R_{DS(ON)} = \frac{V_{DO}}{I_{RATED}} \quad (1)$$

7.3.3 Current Limit

The device has an internal current limit circuit that protects the regulator during transient high-load current faults or shorting events. The current limit is a brick-wall scheme. In a high-load current fault, the brick-wall scheme limits the output current to the current limit (I_{CL}). I_{CL} is listed in the [Electrical Characteristics](#) table.

The output voltage is not regulated when the device is in current limit. When a current limit event occurs, the device begins to heat up because of the increase in power dissipation. When the device is in brick-wall current limit, the pass transistor dissipates power $[(V_{IN} - V_{OUT}) \times I_{CL}]$. If thermal shutdown is triggered, the device turns off. After the device cools down, the internal thermal shutdown circuit turns the device back on. If the output current fault condition continues, the device cycles between current limit and thermal shutdown. For more information on current limits, see the [Know Your Limits application report](#).

Figure 7-3 shows a diagram of the current limit.

Figure 7-3. Current Limit

7.3.4 Undervoltage Lockout (UVLO)

The device has an independent undervoltage lockout (UVLO) circuit that monitors the input voltage, allowing a controlled and consistent turn on and off of the output voltage. To prevent the device from turning off if the input drops during turn on, the UVLO has hysteresis as specified in the [Electrical Characteristics](#) table.

7.3.5 Thermal Shutdown

The device contains a thermal shutdown protection circuit to disable the device when the junction temperature (T_J) of the pass transistor rises to $T_{SD(shutdown)}$ (typical). Thermal shutdown hysteresis assures that the device resets (turns on) when the temperature falls to $T_{SD(reset)}$ (typical).

The thermal time-constant of the semiconductor die is fairly short, thus the device may cycle on and off when thermal shutdown is reached until power dissipation is reduced. Power dissipation during start up can be high from large $V_{IN} - V_{OUT}$ voltage drops across the device or from high inrush currents charging large output capacitors. Under some conditions, the thermal shutdown protection disables the device before start up completes.

When the thermal limit is triggered with load currents near the value of the current limit, the output may oscillate prior to the output switching off.

For reliable operation, limit the junction temperature to the maximum listed in the [Recommended Operating Conditions](#) table. Operation above this maximum temperature causes the device to exceed operational specifications. Although the internal protection circuitry of the device is designed to protect against thermal overall conditions, this circuitry is not intended to replace proper heat sinking. Continuously running the device into thermal shutdown or above the maximum recommended junction temperature reduces long-term reliability.

7.3.6 Active Overshoot Pulldown Circuitry

This device has pulldown circuitry connected to V_{OUT} . This circuitry is a 100- μ A current sink, in series with a 5.5-k Ω resistor, controlled by V_{EN} . When V_{EN} is below $V_{EN(LOW)}$, the pulldown circuitry is disabled and the LDO output is in high-impedance mode.

If the output voltage is more than 2% above nominal voltage when $V_{EN} \geq V_{EN(LOW)}$, the pulldown circuitry turns on and the output is pulled down until the output voltage is within 2% from the nominal voltage. This feature helps reduce overshoot during the transient response.

7.4 Device Functional Modes

7.4.1 Device Functional Mode Comparison

Table 7-1 shows the conditions that lead to the different modes of operation. See the *Electrical Characteristics* table for parameter values.

Table 7-1. Device Functional Mode Comparison

OPERATING MODE	PARAMETER			
	V_{IN}	V_{EN}	I_{OUT}	T_J
Normal operation	$V_{IN} > V_{OUT(nom)} + V_{DO}$ and $V_{IN} > V_{IN(min)}$	$V_{EN} > V_{EN(HI)}$	$I_{OUT} < I_{OUT(max)}$	$T_J < T_{SD(shutdown)}$
Dropout operation	$V_{IN(min)} < V_{IN} < V_{OUT(nom)} + V_{DO}$	$V_{EN} > V_{EN(HI)}$	$I_{OUT} < I_{OUT(max)}$	$T_J < T_{SD(shutdown)}$
Disabled (any true condition disables the device)	$V_{IN} < V_{UVLO}$	$V_{EN} < V_{EN(LOW)}$	Not applicable	$T_J > T_{SD(shutdown)}$

7.4.2 Normal Operation

The device regulates to the nominal output voltage when the following conditions are met:

- The input voltage is greater than the nominal output voltage plus the dropout voltage ($V_{OUT(nom)} + V_{DO}$)
- The output current is less than the current limit ($I_{OUT} < I_{CL}$)
- The device junction temperature is less than the thermal shutdown temperature ($T_J < T_{SD}$)
- The enable voltage has previously exceeded the enable rising threshold voltage and has not yet decreased to less than the enable falling threshold

7.4.3 Dropout Operation

If the input voltage is lower than the nominal output voltage plus the specified dropout voltage, but all other conditions are met for normal operation, the device operates in dropout mode. In this mode, the output voltage tracks the input voltage. During this mode, the transient performance of the device becomes significantly degraded because the pass transistor is in the ohmic or triode region, and acts as a switch. Line or load transients in dropout can result in large output-voltage deviations.

When the device is in a steady dropout state (defined as when the device is in dropout, $V_{IN} < V_{OUT(NOM)} + V_{DO}$, directly after being in a normal regulation state, but *not* during start up), the pass transistor is driven into the ohmic or triode region. When the input voltage returns to a value greater than or equal to the nominal output voltage plus the dropout voltage ($V_{OUT(NOM)} + V_{DO}$), the output voltage can overshoot for a short period of time while the device pulls the pass transistor back into the linear region.

7.4.4 Disabled

The output of the device can be shutdown by forcing the voltage of the enable pin to less than the maximum EN pin low-level input voltage (see the *Electrical Characteristics* table). When disabled, the pass transistor is turned off and internal circuits are shutdown.

8 Application and Implementation

Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

8.1 Application Information

8.1.1 Adjustable Device Feedback Resistors

The adjustable-version device requires external feedback divider resistors to set the output voltage. V_{OUT} is set using the feedback divider resistors, R_1 and R_2 , according to the following equation:

$$V_{OUT} = V_{FB} \times (1 + R_1 / R_2) \quad (2)$$

To ignore the FB pin current error term in the V_{OUT} equation, set the feedback divider current to 100x the FB pin current listed in the [Electrical Characteristics](#) table. This setting provides the maximum feedback divider series resistance, as shown in the following equation:

$$R_1 + R_2 \leq V_{OUT} / (I_{FB} \times 100) \quad (3)$$

8.1.2 Recommended Capacitor Types

The device is designed to be stable using low equivalent series resistance (ESR) capacitors at the input and output. Multilayer ceramic capacitors have become the industry standard for these types of applications and are recommended, but must be used with good judgment. Ceramic capacitors that employ X7R-, X5R-, and C0G-rated dielectric materials provide relatively good capacitive stability across temperature, whereas the use of Y5V-rated capacitors is discouraged because of large variations in capacitance.

Regardless of the ceramic capacitor type selected, the effective capacitance varies with operating voltage and temperature. As a rule of thumb, expect the effective capacitance to decrease by as much as 50%. The input and output capacitors recommended in the [Recommended Operating Conditions](#) table account for an effective capacitance of approximately 50% of the nominal value.

8.1.3 Input and Output Capacitor Requirements

Although an input capacitor is not required for stability, good analog design practice is to connect a capacitor from IN to GND. This capacitor counteracts reactive input sources and improves transient response, input ripple, and PSRR. An input capacitor is recommended if the source impedance is more than 0.5 Ω . A higher value capacitor may be necessary if large, fast load transient or line transients are anticipated or if the device is located several inches from the input power source.

Dynamic performance of the device is improved with the use of an output capacitor. Use an output capacitor within the range specified in the [Recommended Operating Conditions](#) table for stability.

The effective output capacitance value is recommended to not exceed 50 μ F.

8.1.4 Reverse Current

Excessive reverse current can damage this device. Reverse current flows through the intrinsic body diode of the pass transistor instead of the normal conducting channel. At high magnitudes, this current flow degrades the long-term reliability of the device.

Conditions where reverse current can occur are outlined in this section, all of which can exceed the absolute maximum rating of $V_{OUT} \leq V_{IN} + 0.3$ V.

- If the device has a large C_{OUT} and the input supply collapses with little or no load current
- The output is biased when the input supply is not established
- The output is biased above the input supply

If reverse current flow is expected in the application, external protection is recommended to protect the device. Reverse current is not limited in the device, so external limiting is required if extended reverse voltage operation is anticipated.

Figure 8-1 shows one approach for protecting the device.

Figure 8-1. Example Circuit for Reverse Current Protection Using a Schottky Diode

Figure 8-2 shows another, more commonly used, approach in high input voltage applications.

Figure 8-2. Reverse Current Prevention Using a Diode Before the LDO

8.1.5 Feed-Forward Capacitor (C_{FF})

For the adjustable-voltage version device, a feed-forward capacitor (C_{FF}) can be connected from the OUT pin to the FB pin. C_{FF} improves transient, noise, and PSRR performance, but is not required for regulator stability. Recommended C_{FF} values are listed in the [Recommended Operating Conditions](#) table. A higher capacitance C_{FF} can be used; however, the start-up time increases. For a detailed description of C_{FF} tradeoffs, see the [Pros and Cons of Using a Feedforward Capacitor with a Low-Dropout Regulator](#) application report.

8.1.6 Power Dissipation (P_D)

Circuit reliability requires consideration of the device power dissipation, location of the circuit on the printed circuit board (PCB), and correct sizing of the thermal plane. The PCB area around the regulator must have few or no other heat-generating devices that cause added thermal stress.

To first-order approximation, power dissipation in the regulator depends on the input-to-output voltage difference and load conditions. Equation 4 calculates power dissipation (P_D).

$$P_D = (V_{IN} - V_{OUT}) \times I_{OUT} \quad (4)$$

Note

Power dissipation can be minimized, and therefore greater efficiency can be achieved, by correct selection of the system voltage rails. For the lowest power dissipation use the minimum input voltage required for correct output regulation.

For devices with a thermal pad, the primary heat conduction path for the device package is through the thermal pad to the PCB. Solder the thermal pad to a copper pad area under the device. This pad area must contain an array of plated vias that conduct heat to additional copper planes for increased heat dissipation.

The maximum power dissipation determines the maximum allowable ambient temperature (T_A) for the device. According to [Equation 5](#), power dissipation and junction temperature are most often related by the junction-to-ambient thermal resistance ($R_{\theta JA}$) of the combined PCB and device package and the temperature of the ambient air (T_A).

$$T_J = T_A + (R_{\theta JA} \times P_D) \quad (5)$$

Thermal resistance ($R_{\theta JA}$) is highly dependent on the heat-spreading capability built into the particular PCB design, and therefore varies according to the total copper area, copper weight, and location of the planes. The junction-to-ambient thermal resistance listed in the [Thermal Information](#) table is determined by the JEDEC standard PCB and copper-spreading area, and is used as a relative measure of package thermal performance.

8.1.7 Estimating Junction Temperature

The JEDEC standard now recommends the use of psi (Ψ) thermal metrics to estimate the junction temperatures of the linear regulator when in-circuit on a typical PCB board application. These metrics are not thermal resistance parameters and instead offer a practical and relative way to estimate junction temperature. These psi metrics are determined to be significantly independent of the copper area available for heat-spreading. The [Thermal Information](#) table lists the primary thermal metrics, which are the junction-to-top characterization parameter (ψ_{JT}) and junction-to-board characterization parameter (ψ_{JB}). These parameters provide two methods for calculating the junction temperature (T_J). As described in [Equation 6](#), use the junction-to-top characterization parameter (ψ_{JT}) with the temperature at the center-top of device package (T_T) to calculate the junction temperature. As described in [Equation 7](#), use the junction-to-board characterization parameter (ψ_{JB}) with the PCB surface temperature 1 mm from the device package (T_B) to calculate the junction temperature.

$$T_J = T_T + \psi_{JT} \times P_D \quad (6)$$

where:

- P_D is the dissipated power
- T_T is the temperature at the center-top of the device package

$$T_J = T_B + \psi_{JB} \times P_D \quad (7)$$

where

- T_B is the PCB surface temperature measured 1 mm from the device package and centered on the package edge

For detailed information on the thermal metrics and how to use them, see the [Semiconductor and IC Package Thermal Metrics](#) application report.

8.1.8 Special Consideration for Line Transients

During a line transient, the response of this LDO to a very large or fast input voltage change can cause a brief shutdown lasting up to a few hundred microseconds from the voltage transition. This shutdown can be avoided by reducing the voltage step size, increasing the transition time, or a combination of both. Figure 8-3 provides a boundary to follow to avoid this behavior. If necessary, reduce slew rate and the voltage step size to stay below the curve.

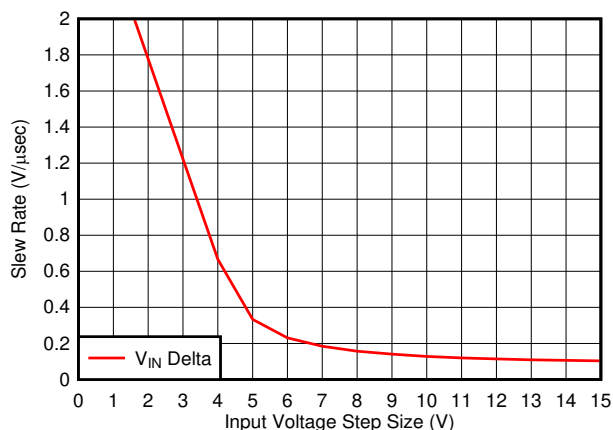

Figure 8-3. Recommended Input Voltage Step and Slew Rate in a Line Transient

8.2 Typical Application

Figure 8-4. Generating a 3.3-V Rail From a Multicell Power Bank

8.2.1 Design Requirements

Table 8-1 summarizes the design requirements for Figure 8-4.

Table 8-1. Design Parameters

PARAMETER	DESIGN VALUES
V_{IN}	5.3 V
V_{OUT}	3.3 V \pm 1.25%
$I_{(IN)}$ (no load)	< 5 μ A
I_{OUT} (max)	200 mA
T_A	57.88°C (max)

8.2.2 Detailed Design Procedure

Select a 3.3-V output, fixed or adjustable device to generate the 3.3-V rail. The fixed-version LDO has internal feedback divider resistors, and thus has lower quiescent current. The adjustable-version LDO requires external feedback divider resistors, and is described in the [Selecting Feedback Divider Resistors](#) section.

8.2.2.1 Transient Response

As with any regulator, increasing the output capacitor value reduces over- and undershoot magnitude, but increases transient response duration.

8.2.2.2 Selecting Feedback Divider Resistors

For this design example, V_{OUT} is set to 5 V. The following equations set the output voltage:

$$V_{OUT} = V_{FB} \times (1 + R_1 / R_2) \quad (8)$$

$$R_1 + R_2 \leq V_{OUT} / (I_{FB} \times 100) \quad (9)$$

For improved output accuracy, use [Equation 9](#) and $I_{FB(TYP)} = 10 \text{ nA}$ as listed in the [Electrical Characteristics](#) table to calculate the upper limit for series feedback resistance, $R_1 + R_2 \leq 5 \text{ M}\Omega$.

The control-loop error amplifier drives the FB pin to the same voltage as the internal reference ($V_{FB} = 1.24 \text{ V}$ as listed in the [Electrical Characteristics](#) table). Use [Equation 8](#) to determine the ratio of $R_1 / R_2 = 1.66$. Use this ratio and solve [Equation 9](#) for R_2 . Now calculate the upper limit for $R_2 \leq 1.24 \text{ M}\Omega$. Select a standard value resistor of $R_2 = 1.18 \text{ M}\Omega$.

Reference [Equation 8](#) and solve for R_1 :

$$R_1 = (V_{OUT} / V_{FB} - 1) \times R_2 \quad (10)$$

From [Equation 10](#), $R_1 = 1.96 \text{ M}\Omega$ can be determined. From [Equation 8](#), select $V_{OUT} = 3.299 \text{ V}$.

8.2.2.3 Thermal Dissipation

Junction temperature can be determined using the junction-to-ambient thermal resistance ($R_{\theta JA}$) and the total power dissipation (P_D). Use [Equation 11](#) to calculate the power dissipation. Multiply P_D by $R_{\theta JA}$ and add the ambient temperature (T_A), as [Equation 12](#) shows, to calculate the junction temperature (T_J).

$$P_D = (I_{GND} + I_{OUT}) \times (V_{IN} - V_{OUT}) \quad (11)$$

$$T_J = R_{\theta JA} \times P_D + T_A \quad (12)$$

[Equation 13](#) calculates the maximum ambient temperature. [Equation 14](#) calculates the maximum ambient temperature for typical design applications.

$$T_{A(MAX)} = T_{J(MAX)} - (R_{\theta JA} \times P_D) \quad (13)$$

$$T_{A(MAX)} = 125^\circ\text{C} - [167.8^\circ\text{C/W} \times (5.3 \text{ V} - 3.3 \text{ V}) \times 0.2\text{A}] = 57.88^\circ\text{C} \quad (14)$$

8.2.3 Application Curve

Figure 8-5. Line Transient (4.3 V to 5.3 V)

8.3 Power Supply Recommendations

The device is designed to operate with an input supply range of 2.4 V to 18 V. If the input supply is noisy, additional input capacitors with low ESR can help improve output noise performance. Connect a low output impedance power supply to the input pin of the TPS7A24. In order to optimize regulation, see the [Feature Description](#) section for more information on operation modes and performance features.

8.4 Layout

8.4.1 Layout Guidelines

- Place input and output capacitors as close to the device pins as possible
- Use copper planes for device connections to optimize thermal performance
- Place thermal vias around the device to distribute heat

8.4.2 Layout Examples

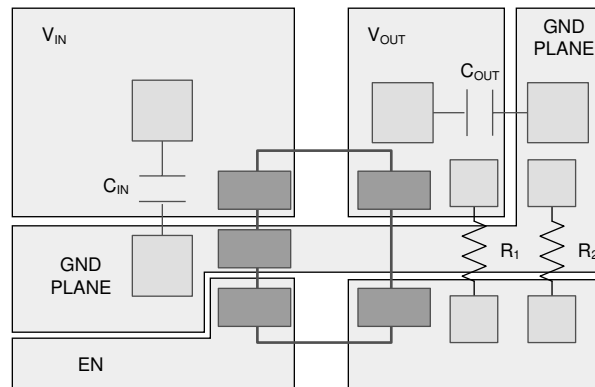

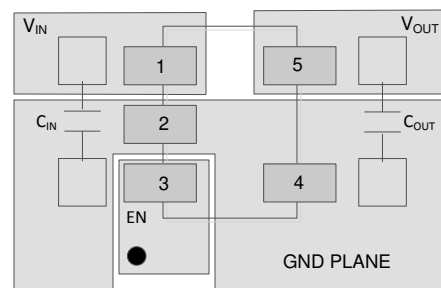

Figure 8-6. Adjustable Version Layout Example

● Represents via used for application specific connections

Figure 8-7. Fixed Version Layout Example

9 Device and Documentation Support

9.1 Device Support

9.1.1 Device Nomenclature

Table 9-1. Device Nomenclature⁽¹⁾

PRODUCT	V _{OUT}
TPS7A24xx(x)yyyz	<p>xx(x) is the nominal output voltage. For output voltages with a resolution of 100 mV, two digits are used in the ordering number; for output voltages with a resolution of 50 mV, three digits are used (for example, 28 = 2.8 V; 125 = 1.25 V). 01 indicates adjustable output version.</p> <p>yyy is the package designator.</p> <p>z is the package quantity. R is for large quantity reel</p>

(1) For the most current package and ordering information see the Package Option Addendum at the end of this document, or visit the device product folder at www.ti.com.

9.2 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on ti.com. Click on *Subscribe to updates* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

9.3 Support Resources

[TI E2E™ support forums](#) are an engineer's go-to source for fast, verified answers and design help — straight from the experts. Search existing answers or ask your own question to get the quick design help you need.

Linked content is provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

9.4 Trademarks

TI E2E™ is a trademark of Texas Instruments.

All trademarks are the property of their respective owners.

9.5 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

9.6 Glossary

[TI Glossary](#) This glossary lists and explains terms, acronyms, and definitions.

10 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

⁽¹⁾ **Status:** For more details on status, see our [product life cycle](#).

⁽²⁾ **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

⁽³⁾ **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

⁽⁴⁾ **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

⁽⁵⁾ **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

⁽⁶⁾ **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.
