

BQ21062 I²C Controlled 1-Cell 500-mA Linear Battery Charger with Power Path, Load Switch, 10-nA Ship Mode, and Regulated System (PMID) Voltage

1 Features

- Linear battery charger with 1.25-mA to 500-mA fast charge current range
 - 0.5% Accurate I²C programmable battery regulation voltage ranging from 3.6 V to 4.6 V in 10-mV steps
 - Configurable termination current supporting down to 0.5 mA
 - 20-V Tolerant input with typical 3.4-V to 5.5-V input voltage operating range
 - Programmable thermal charging profile, fully configurable hot, warm, cool and cold thresholds
- Power Path management for powering system and charging battery
 - I²C Programmable regulated system voltage (PMID) ranging from 4.4V to 4.9V in addition to battery voltage tracking and Input pass-through options
 - Dynamic power path management optimizes charging from weak adapters
 - Advanced I²C control allows host to disconnect the battery or adapter as needed
- I²C Configurable load switch or up to 150-mA LDO output
 - Programmable range from 0.6 V to 3.7 V in 100-mV steps
- Ultra low I_{ddq} for extended battery life
 - 10-nA Ship mode battery I_q
 - 400-nA I_q While powering the system (PMID and VDD on)
- One push-button wake-up and reset input with adjustable timers
 - Supports system power cycle and HW reset
- 20-Pin 2-mm x 1.6-mm CSP package
- 11-mm² Total solution size

2 Applications

- Headsets, earbuds and hearing aids
- Smart watches and smart trackers
- Wearable fitness and activity monitors
- Blood glucose monitors

3 Description

The BQ21062 is a highly integrated battery charge management IC that integrates the most common functions for wearable, portable and small medical devices, namely a charger, a regulated output voltage rail for system power, a Load Switch/LDO, and push-button controller.

The BQ21062 IC integrates a linear charger with Power Path that enables quick and accurate charging for small batteries while providing a regulated voltage to the system. The regulated system voltage (PMID) output may be configured through I²C based on the recommended operating condition of downstream IC's and system loads for optimal system operation.

Device Information⁽¹⁾

PART NUMBER	PACKAGE	BODY SIZE (NOM)
BQ21062	DSBGA (20)	2.00 mm x 1.60 mm

(1) For all available packages, see the orderable addendum at the end of the data sheet.

4 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

Changes from Revision * (July 2020) to Revision A (April 2023)	Page
• Changed $t_{HW_RESET_WD}$ Test Conditions and MAX value.....	10
• Changed t_{RESET_WARN}	10
• Changed t_{HW_RESET}	10
• Changed Figure 9-3	20
• Changed $t_{HW_RESET_WARN}$ to t_{RESET_WARN} in Section 9.3.7.2	21
• Changed VIN presence to valid VIN presence in Section 9.3.7.2	21
• Changed text in Section 9.4.1	29

5 Description (continued)

The device supports charge current up to 500 mA and supports termination current down to 0.5 mA for maximum charge. The battery is charged using a standard Li-Ion charge profile with three phases: pre-charge, constant current and constant voltage regulation.

The device integrates advanced power path management and control that allows the device to provide power to the system while charging the battery even with poor adapters. The host may also control the power path through I²C allowing it to disconnect the input adapter and/or battery without physically removing them. The single push-button input eliminates the need of a separate button controller IC reducing the total solution footprint. The push-button input can be used for wake functions or to reset the system. The low quiescent current during operation and shutdown enables maximum battery life. The input current limit, charge current, LDO output voltage, and other parameters are programmable through the I²C interface making the BQ21062 a very flexible charging solution. A voltage-based JEITA compatible (or standard HOT/COLD) battery pack thermistor monitoring input (TS) is included that monitors battery temperature and automatically changes charge parameters to prevent the battery from charging outside of its safe temperature range. The temperature thresholds are also programable through I²C allowing the host to customize the thermal charging profile. The charger is optimized for 5-V USB input, with 20-V absolute maximum tolerance to withstand line transients. The device also integrates a linear regulator to provide a quiet rail for radios or processors and can be independently sourced and controlled through I²C.

6 Device Comparison Table

Table 6-1. Device Comparison

PARAMETER	BQ21061	BQ21062
ICHARGE (default)	10mA	67.5mA
IPRECHARGE (default)	2.5mA	8.75mA
INLIM (default)	500mA	100mA
WATCHDOG TIMER (default)	Enabled	Disabled
VINDPM (default)	Disabled	Enabled
DPPM	Enabled	Disabled
LS/LDO (default)	Enabled	Disabled
LDO CONFIG (default)	LDO	Load Switch
BATUVLO (default)	3V	2.8V
MR HW RESET (default)	8s	14s
AUTOWAKE TIME (default)	1.2s	2.4s
TS THRESHOLD (default)	TWARM = 45°C; THOT = 60°C	TWARM = THOT = 45°C

7 Pin Configuration and Functions

Figure 7-1. YFP Package 20-Pin DSBGA Top View

Table 7-1. Pin Functions

PIN		I/O	DESCRIPTION
NAME	NO.		
IN	A1	I	DC Input Power Supply. IN is connected to the external DC supply. Bypass IN to GND with at least 1-μF of capacitance using a ceramic capacitor.
PMID	A2, B2	I/O	Regulated System Output. Connect 22-μF capacitor from PMID to GND as close to the PMID and GND pins as possible. If operating in VIN Pass-Through Mode (PMID_REG = 111) a lower capacitor value may be used (at least 3-μF of ceramic capacitance with DC bias de-rating).
GND	A4	PWR	Ground connection. Connect to the ground plane of the circuit.
VDD	D1	O	Digital supply LDO. Must connect a 2.2-μF from this pin to ground, do not leave floating.
$\overline{CE}$	C2	I	Charge Enable. Drive $\overline{CE}$ low or leave disconnected to enable charging when VIN is valid. $\overline{CE}$ is pulled low internally with 900-kΩ resistor.
SCL	E3	I/O	I ² C Interface Clock. Connect SCL to the logic rail through a 10-kΩ resistor.
SDA	E2	I	I ² C Interface Data. Connect SDA to the logic rail through a 10-kΩ resistor.
$\overline{LP}$	D3	I	Low Power Mode Enable. Drive this pin low to set the device in low power mode when powered by the battery. This pin must be driven high to allow I ² C communication when VIN is not present. $\overline{LP}$ is pulled low internally with 900-kΩ resistor. This pin has no effect when VIN is present.
$\overline{INT}$	D2	O	$\overline{INT}$ is an open-drain output that signals fault interrupts. When a fault occurs, a 128-μs pulse is sent out as an interrupt for the host.
$\overline{MR}$	C1	I	Manual Reset Input. $\overline{MR}$ is a general purpose input used to reset the device or to wake it up from Ship Mode. $\overline{MR}$ has in internal 125-kΩ pull-up resistor to BAT. The battery voltage V _{BAT} must be above V _{BATUVLO} in order for $\overline{MR}$ low logic level to be detected.
LS/LDO	D4	O	Load Switch or LDO output. Connect 2.2 μF of ceramic capacitance to this pin to assure stability. Be sure to account for capacitance bias voltage derating when selecting the capacitor. If LDO is not used, short to VINLS
VINLS	E4	I	Input to the Load Switch / LDO output. Connect at least 1 μF of ceramic capacitance from this pin to ground.

Table 7-1. Pin Functions (continued)

PIN		I/O	DESCRIPTION
NAME	NO.		
BAT	A3, B3	I/O	Battery Connection. Connect to the positive terminal of the battery. Bypass BAT to GND with at least 1 μ F of ceramic capacitance.
TS	B4	I	Battery Pack NTC Monitor. Connect TS to a 10-k Ω NTC thermistor in parallel to a 10-k Ω resistor. If TS function is not to be used connect a 5-k Ω resistor from TS to ground.
$\overline{\text{PG}}$	B1	O	Open-drain Power Good status indication output. The $\overline{\text{PG}}$ pin can also be configured as a general purpose open drain output or level shifter version of $\overline{\text{MR}}$.
VIO	E1	I	System IO supply. Connect to system IO supply to allow level shifting of input signals (SDA, SCL, LP and CE) to the device internal digital domain. Connect to VDD when external IO supply is not available.
NC1	C3	I	No Connect. Connect to ground if possible for better thermal dissipation or leave floating. Do not connect to a any voltage source or signal to avoid higher quiescent current.
NC2	C4	I	No Connect. Connect to ground if possible for better thermal dissipation. May be shorted to /LP for easier routing as long as Absolute Maximum Rating requirements are met..

8 Specifications

8.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)⁽¹⁾

		MIN	MAX	UNIT
Voltage	IN	−0.3	20	V
	TS, VDD, NC	−0.3	1.95	V
	All other pins	−0.3	5.5	V
Current	IN	0	800	mA
	BAT, PMID	−0.5	1.5	A
	INT, $\overline{\text{PG}}$	0	10	mA
Junction temperature, T_J		−40	125	°C
Storage temperature, T_{stg}		−55	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Rating* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Condition*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

8.2 ESD Ratings

		VALUE	UNIT
$V_{\text{(ESD)}}$ Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins ⁽¹⁾	±2000	V
	Charged device model (CDM), per JEDEC specification JESD22-C101, all pins ⁽²⁾	±500	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

8.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
V_{BAT}	Battery voltage range	2.4		4.6	V
V_{IN}	Input voltage range	3.15		5.25 ⁽¹⁾	V
V_{INLS}	LDO input voltage range	2.2		5.25 ⁽¹⁾	V
V_{IO}	IO supply voltage range	1.2		3.6	V
I_{LDO}	LDO output current	0		100	mA
I_{PMID}	PMID output current	0		1.5	A
T_A	Operating free-air temperature range	−40		85	°C

- (1) Based on minimum V_{OVP} value. 5.5V under typical conditions

8.4 Thermal Information

THERMAL METRIC ⁽¹⁾		BQ21062	UNIT
		YFP (DSBGA)	
		20-PIN	
$R_{\theta\text{JA}}$	Junction-to-ambient thermal resistance ⁽²⁾	36.1	°C/W
$R_{\theta\text{JA}}$	Junction-to-ambient thermal resistance	74.4	°C/W
$R_{\theta\text{JC(top)}}$	Junction-to-case (top) thermal resistance	0.5	°C/W
$R_{\theta\text{JB}}$	Junction-to-board thermal resistance	17.6	°C/W
Ψ_{JT}	Junction-to-top characterization parameter	0.3	°C/W
Ψ_{JB}	Junction-to-board characterization parameter	17.7	°C/W

8.4 Thermal Information (continued)

THERMAL METRIC ⁽¹⁾		BQ21062	UNIT
		YFP (DSBGA)	
		20-PIN	
$R_{\theta JC(bot)}$	Junction-to-case (bottom) thermal resistance	N/A	°C/W

- (1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.
- (2) Measured in BQ21062EVM board.

8.5 Electrical Characteristics

$V_{IN} = 5V$, $V_{BAT} = 3.6V$, $-40^{\circ}C < T_J < 125^{\circ}C$ unless otherwise noted. Typical data at $T_J = 25^{\circ}C$.

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
INPUT CURRENTS						
I _{IN}	Input supply current	PMID_MODE = 01, V _{IN} = 5V, V _{BAT} = 3.6V			500	μA
		V _{IN} = 5V, V _{BAT} = 3.6V Charge Disabled			1.6	mA
I _{BAT_SHIP}	Battery Discharge Current in Ship Mode	V _{IN} = 0V , V _{BAT} = 3.6V		10		nA
I _{BAT_LP}	Battery Quiescent Current in Low-power Mode	V _{IN} = 0V , V _{BAT} = 3.6V, LDO Disabled		0.46	0.9	μA
		V _{IN} = 0V , V _{BAT} = 3.6V, LDO Enabled		1.7	1.9	μA
I _{BAT_ACTIVE}	Battery Quiescent Current in Active Mode	V _{IN} = 0V , V _{BAT} = 3.6V, LDO Disabled		18	23	μA
		V _{IN} = 0V , V _{BAT} = 3.6V, LDO Enabled		21	25	μA
POWER PATH MANAGEMENT AND INPUT CURRENT LIMIT						
V _{PMID_REG}	Default System (PMID) Regulation Voltage			4.5		V
V _{PMID_REG_ACC}	System Regulation Voltage Accuracy	V _{IN} = 5V, V _{PMID_REG} = 4.5V. I _{PMID} = 100mA, T _J = 25°C	-1		1	%
		V _{IN} = 5V, V _{PMID_REG} = 4.5V. I _{PMID} = 0-500mA	-3		3	%
R _{ON(IN-PMID)}	Input FET ON resistance	I _{LIM} = 500mA (I _{LIM} = 110), V _{IN} = 5V, I _{IN} = 150mA		280	520	mΩ
V _{BSUP1}	Enter supplements mode threshold	V _{BAT} > V _{BATUVLO} , Charge disabled		V _{PMID} < V _{BAT} – 40mV		mV
V _{BSUP2}	Exit supplements mode threshold	V _{BAT} > V _{BATUVLO} , Charge disabled		V _{PMID} < V _{BAT} – 20mV		mV
I _{LIM}	Input Current Limit	Programmable Range	50		600	mA
		I _{LIM} = 50mA		45	50	mA
		I _{LIM} = 100mA		90	100	mA
		I _{LIM} = 150mA		135	150	mA
		I _{LIM} = 500mA		450	500	mA
V _{IN_DPM}	Input DPM voltage threshold where current in reduced	Programmable Range	4.2		4.9	V
	Accuracy		-3		3	%
BATTERY CHARGER						
R _{ON(BAT-PMID)}	Battery Discharge FET On Resistance	V _{BAT} = 4.35V, I _{BAT} = 100mA		100	175	mΩ
V _{BATREG}	Charge Voltage	Programmable charge voltage range	3.6		4.6	V
	Voltage Regulation Accuracy		0.5		0.5	%
I _{CHARGE}	Fast Charge Programmable Current Range	V _{LOWV} < V _{BAT} < V _{BATREG}	1.25			mA
	Fast Charge Current Accuracy	I _{CHARGE} > 5mA	-5		5	%

8.5 Electrical Characteristics (continued)

 $V_{IN} = 5V$, $V_{BAT} = 3.6V$, $-40^{\circ}C < T_J < 125^{\circ}C$ unless otherwise noted. Typical data at $T_J = 25^{\circ}C$.

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
I _{PRECHARGE}	Precharge current	Precharge current programmable range	1.25			mA
	Precharge Current Accuracy	$-40^{\circ}C < T_J < 85^{\circ}C$	-10		10	%

8.6 Timing Requirements

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
BATTERY CHARGE TIMERS						
t_{MAXCHG}	Charge safety timer	Programmable range	180		720	min
t_{PRECHG}	Precharge safety timer			$0.25 * t_{MAXCHG}$		
WATCHDOG TIMERS						

8.6 Timing Requirements (continued)

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
$t_{WATCHDOG_SW}$ SW Watchdog timer		25	50		s
$t_{HW_RESET_WD}$ HW reset watchdog timer	HWRESET_14S_WD = 1			14	s
LDO					
t_{ON_LDO} Turn ON time	100mA load, to 90% V_{LDO}		500		μ s
t_{OFF_LDO} Turn OFF time	100mA load, to 10% V_{LDO}		30		μ s
$t_{PMID_LDO_DELAY}$ Delay between PMID and LDO enable during power up	Startup		20		ms
PUSHBUTTON TIMERS (/MR)					
t_{WAKE1} WAKE1 Timer. Timer for Ship Mode wake.	MR_WAKE1_TIMER = 0	106	125	144	ms
t_{WAKE2} WAKE2 Timer. Time from /MR falling edge to INT being asserted.	MR_WAKE2_TIMER = 1	1.7	2	2.3	s
t_{RESET_WARN} RESET_WARN Timer. Time prior to HW RESET or entering shipmode with MR press	MR_RESET_WARN = 01	0.85	1	1.15	s
t_{HW_RESET} HW RESET Timer. Time from /MR falling edge to HW Reset or PMID falling for shipmode entry	MR_HW_RESET = 01	6.8	8	9.2	s
$t_{RESTART(AUTOWAKE)}$ RESTART Timer. Time from /MR HW Reset to PMID power up	AUTOWAKE = 01	1.05	1.2	1.35	s
PROTECTION					
t_{DGL_SLP} Deglitch time for supply rising above $V_{SLP} + V_{SLP_HYS}$			120		μ s
t_{DGL_OVP} Deglitch time for V_{OVP} Threshold	VIN falling below V_{OVP}		32		ms
t_{DGL_OCP} Battery OCP deglitch time			30		μ s
t_{REC_SC} Recovery time, BAT Short Circuit during Discharge Mode			250		ms
t_{RETRY_SC} Retry window for PMID or BAT short circuit recovery			2		s
$t_{DGL_SHT_DWN}$ Deglitch time, Thermal shutdown	T_J rising above $T_{SHUTDOWN}$		10		μ s
I2C INTERFACE					
$t_{WATCHDOG}$ I2C interface reset timer for host	When enabled		50		s
$t_{I2CRESET}$ I2C interface inactive reset timer			500		ms
INPUT PINS (/CE and /LP)					
$t_{LP_EXIT_I2C}$ Time for device to exit Low-power mode and allow I2C communication	$V_{IN} = 0V$.			1	ms

8.7 Typical Characteristics

$C_{IN} = 1 \mu F$, $C_{PMID} = 10 \mu F$, $C_{LSLDO} = 2.2 \mu F$, $C_{BAT} = 1 \mu F$ (unless otherwise specified)

9 Detailed Description

9.1 Overview

The IC is a highly programmable battery management device that integrates a 500-mA linear charger for single cell Li-Ion batteries, a general purpose LDO that may be configured as a load switch, and a push-button controller. Through its I²C interface the host may change charging parameters such as battery regulation voltage and charge current, and obtain detailed device status and fault information. The push-button controller allows the user to reset the system without any intervention from the host and wake up the device from Ship Mode.

9.2 Functional Block Diagram

9.3 Feature Description

9.3.1 Linear Charger and Power Path

The BQ21062 IC integrates a linear charger that allows the battery to be charged with a programmable charge current of up to 500 mA. In addition to the charge current, other charging parameters can be programmed

through I²C such as the battery regulation voltage, pre-charge current, termination current, and input current limit current.

The power path allows the system to be powered from PMID, even when the battery is dead or charging, by drawing power from IN pin. It also prioritizes the system load connected to PMID, reducing the charging current, if necessary, in order to support the load when input power is limited. If the input supply is removed and the battery voltage level is above $V_{BATUVLO}$, PMID will automatically and seamlessly switch to battery power.

A more detailed description of the charger functionality is presented in the following sections of this document.

9.3.1.1 Battery Charging Process

The following diagram summarizes the charging process of the BQ21062 charger.

Figure 9-1. BQ21062 Charger Flow Diagram

When a valid input source is connected ($V_{IN} > V_{UVLO}$ and $V_{BAT} + V_{SLP} < V_{IN} < V_{OVP}$), the state of the $\overline{CE}$ pin determines whether a charge cycle is initiated. When the $\overline{CE}$ input is high and a valid input source is connected, the battery charge FET is turned off, preventing any kind of charging of the battery. A charge cycle is initiated when the CHARGE_DISABLE bit is written to 0 and $\overline{CE}$ pin in low. [Table 9-1](#) shows the $\overline{CE}$ pin and bit priority to enable/disable charging.

Table 9-1. Charge Enable Function Through $\overline{\text{CE}}$ Pin and $\overline{\text{CE}}$ Bit

CE PIN	CHARGE_DISABLE BIT	CHARGING
0	0	Enabled
0	1	Disabled
1	0	Disabled
1	1	Disabled

Figure 9-2 shows a typical charge cycle.

Figure 9-2. BQ21062 Typical Charge Cycle

During Pre-Charge, where the battery voltage is below the V_{LOWV} level, the battery will be charge with $I_{\text{PRECHARGE}}$ current which can be programmed through I²C. During pre-charge, the safety timer is set to 25% of the safety timer value during fast charge. Once the battery voltage reaches V_{LOWV} , the charger will then operate in Fast Charge Mode, charging the battery at I_{CHARGE} which may also be programmed through I²C. Once the battery voltage approaches the V_{BATREG} level, the charging current starts tapering off as shown in Figure 9-2. Once the charging current reaches the termination current (I_{TERM}) charging is stopped. Note that to ensure that the battery is charged to V_{BATREG} level, the regulated PMID voltage should be set to at least 200mV above V_{BATREG} . Termination is only enabled when the charger CV loop is active in fast charge operation. No termination will occur if the charge current reaches I_{TERM} while VINDPM is active as well as the thermal regulation loop. Termination is also disabled when operating in the TS WARM region. The charger only goes to termination when the current drops to I_{TERM} due to the battery reaching the target voltage and not due to the charge current limitation imposed by the previously mentioned control loops.

Whenever a change in the charge current setting is triggered, whether it occurs due to I²C programming by the host, Pre-Charge/Fast Charge transition or JEITA TS control, the device will temporarily disable charging (for ~ 1 ms) before updating the charge current value.

9.3.1.2 JEITA and Battery Temperature Dependent Charging

The charger can be configured through I²C setting to provide JEITA support, automatically reducing the charging current and voltage depending on the battery temperature as monitored by an NTC thermistor connected to the BQ21062 TS pin. See Section 9.3.11 for details.

9.3.1.3 Input Voltage Based Dynamic Power Management (VINDPM)

The VINDPM loop prevents the input voltage from collapsing to a point where charging would be interrupted by reducing the current drawn by charger in order to keep V_{IN} from dropping below V_{IN_DPM} . Once the IN voltage drops to V_{IN_DPM} , the VINDPM loops will reduce the input current through the blocking FETs, to prevent the further drop of the supply voltage. The VINDPM function is enabled by default and may be disabled through I²C command. The V_{IN_DPM} threshold is programmable through the I²C register from 4.2 V to 4.9 V in 100-mV steps.

DPPM is disabled by default in this device and cannot be re-enabled through I²C. When the device enters this mode, the charge current may be lower than the set value and the corresponding status bits and flags are set. If the 2X timer is set, the safety timer is extended while the loop is active. Additionally, termination is disabled.

9.3.1.4 Battery Supplement Mode

When the PMID voltage drops below the battery voltage by V_{BSUP1} , the battery supplements the system load. The battery stops supplementing the system load when the voltage on the PMID pin rises above the battery voltage by V_{BSUP2} . During supplement mode, the battery supplement current is not regulated, however, the Battery Over-Current Protection mechanism is active. Battery charge termination is disabled while in supplement mode.

9.3.2 Protection Mechanisms

9.3.2.1 Input Over-Voltage Protection

The input over-voltage protection protects the device and downstream components connected to PMID, and BAT against damage from over-voltage on the input supply. When $V_{IN} > V_{OVP}$ an OVP fault is determined to exist. During the OVP fault, the device turns the input FET off, sends a single 128- μ s pulse on $\overline{INT}$, and the VIN_OVP_FAULT FLAG and STAT bits are updated over I²C. Once the OVP fault is removed, the STAT bit is cleared and the device returns to normal operation. The FLAG bit is not cleared until it is read through I²C after the OVP condition no longer exists. The OVP threshold for the device is 5.5 V to allow operation from standard USB sources.

9.3.2.2 Safety Timer and I²C Watchdog Timer

At the beginning of the charge cycle, the device starts the safety timer. If charging has not terminated before the programmed safety time, t_{MAXCHG} , expires, charging is disabled. The pre-charge safety time, t_{PRECHG} , is 25% of t_{MAXCHG} . When a safety timer fault occurs, a single 128- μ s pulse is sent on the $\overline{INT}$ pin and the SAFETY_TMR_FAULT_FLAG bit in the FLAG3 register is updated over I²C. The $\overline{CE}$ pin or input power must be toggled in order to reset the safety timer and exit the fault condition. Note that the flag bit will be reset when the bit is read by the host even if the fault has not been cleared. The safety timer duration is programmable using the SAFETY_TIMER bits. When the safety timer is active, changing the safety timer duration resets the safety timer. The device also contains a 2X_TIMER bit that doubles the timer duration to prevent premature safety timer expiration when the charge current is reduced by VIN DPM, thermal regulation, or a NTC (JEITA) condition. When 2X_TIMER function is enabled, the timer is allowed to run at half speed when any loop is active other than CC or CV.

In addition, the BQ21062 has a 50s watchdog timer which resets after every I²C transaction. This feature, which is disabled by default, resets all charger parameters registers to their default values when the timer expires.

9.3.2.3 Thermal Protection and Thermal Charge Current Foldback

In order to protect the device from damage due to overheating, the junction temperature of the die, T_J , is monitored. When T_J reaches $T_{SHUTDOWN}$ the device stops operation and is turned off. The device resumes operation when T_J falls below $T_{SHUTDOWN}$ by T_{HYS} .

During the charging process, the device will reduce the charging current at a rate of $(0.04 \times I_{CHARGE})/^{\circ}\text{C}$ once T_J exceeds the thermal foldback threshold, T_{REG} to prevent further heating. If the charge current is reduced to 0, the battery supplies the current needed to supply the PMID output. The thermal regulation threshold may be set through I²C by setting the THERM_REG bits to the desired value.

The die junction temperature, T_J , can be estimated based on the expected board performance using [Equation 1](#):

$$T_J = T_A + \theta_{JA} \times P_{DISS} \quad (1)$$

Where P_{DISS} is the total power dissipation in the IC. The θ_{JA} is largely driven by the board layout. For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics Application Report](#). Under typical conditions, the time spent in this state is very short.

9.3.2.4 Battery Short and Over Current Protection

In order to protect the device from over current and prevent excessive battery discharge current, the BQ21062 detects if the current on the battery FET exceeds I_{BAT_OCP} . If the short circuit limit is reached for the deglitch time (t_{DGL_OCP}), the battery discharge FET is turned off and start operating in hiccup mode, re-enabling the BATFET t_{REC_SC} (250 ms) after being turned off by the over-current condition. If the over-current condition is triggered upon retry for 3 to 7 consecutive times, the BATFET will then remain off until the part is reset or until V_{IN} is connected and valid. If the over-current condition and hiccup operation occurs while in supplement mode where V_{IN} is already present, V_{IN} must be toggled in order for BATFET to be enabled and start another detection cycle.

In the case where the battery is suddenly shorted while charging and V_{BAT} drops below V_{SHORT} , a fast comparator quickly reduces the charge current to $I_{PRECHARGE}$ preventing fast charge current to be momentarily injected to the battery while shorted.

9.3.2.5 PMID Short Circuit

A short on the PMID pin is detected when the PMID voltage drops below 1.6 V (PMID short threshold). PMID short threshold has a 200-mV hysteresis. When this occurs, the input FET temporarily disconnects I_N for up to 200 μ s to prevent stress on the device if a sudden short condition happens, before allowing a softstart on the PMID output.

9.3.3 VDD LDO

The device integrates a low current always-on LDO that serves as the digital I/O supply to the device. This LDO is supplied by V_{IN} or by BAT . The VDD LDO will remain on through all power states with the exception of Ship Mode.

9.3.4 Load Switch/LDO Output and Control

The device integrates a low I_q load switch which can also be used as a regulated output. The LDO/LS has a dedicated input pin V_{INLS} and can support up to 150 mA of load current.

The LS/LDO may be enabled/disabled through I^2C . The output voltage is programmable using the LS_LDO bits in the registers. To limit voltage drop or voltage transients, a small ceramic capacitor must be placed close to V_{INLS} pin.

Table 9-2. LDO Mode Control

I^2C EN_LS_LDO	LDO_SWITCH_CONFIG	LS/LDO OUTPUT
0	0	Pulldown
0	1	Pulldown
1	0	LDO
1	1	Load Switch

The current capability of the LDO will depend on the V_{INLS} input voltage and the programmed output voltage. When the LS/LDO output is disabled through the register, an internal pull-down will discharge the output. The LDO has output current limit protection, limiting the output current in the event of a short in the output. When the LDO output current limit trips and is active for at least 1 ms, the device will set a flag and send an interrupt to the host. The host must take action to enable the LDO if desired. The LS/LDO may be set to operate as a LDO by setting the LDO_SWITCH_CONFIG bit to 0. Note that in order to change the configuration, the LS/LDO must be disabled first, then the LDO_SWITCH_CONFIG bit is set for it to take effect. This is not the case when updating the LDO output voltage which can be done on the fly without the need of disabling the LDO first.

9.3.5 PMID Power Control

The BQ21062 offers the option to control PMID through the I²C PMID_MODE bits. These bits can force PMID to be supplied by BAT instead of IN, even if $V_{IN} > V_{BAT} + V_{SLP}$. They can also disconnect PMID, pulling it down or leaving it floating. See [Table 9-30](#) for details.

9.3.6 System Voltage (PMID) Regulation

The BQ21062 has a regulated system voltage output (PMID) that is programmable through I²C. PMID regulation is only active when the adapter is connected and $V_{IN} > V_{UVLO}$, $V_{IN} > V_{BAT} - V_{SLP}$ and $V_{IN} < V_{OVP}$. In Battery Tracking operation (PMID_REG_CTRL = 000), the PMID voltage will be regulated to about 4.7% over battery level ($V_{PMID} = V_{BAT} \times 1.047$) or 3.8 V, whichever is higher. Note that the PMID regulation target should be set to be at least 200mV higher than V_{BATREG} .

9.3.7 MR Wake and Reset Input

The $\overline{MR}$ input has three main functions in the BQ21062. First, it serves as a means to wake the device from Ship Mode. Second, it serves as a short button press detector, sending an interrupt to the host when the button driving the $\overline{MR}$ pin has been pressed for a given period of time. This allows the implementation of different functions in the end application such as menu selection and control. And finally it serves as a means to get the BQ21062 to reset the system by performing a power cycle (shut down PMID and automatically powering it back on) or go to Ship Mode after detecting a long button press. In order for the $\overline{MR}$ to be functional, the battery voltage V_{BAT} must be above the $V_{BATUVLO}$ level. The timing for the short and long button press duration is programmable through I²C for added flexibility. Note that if a specific timer duration is changed through I²C while that timer is active and has not expired, the new programmed value will be ignored until the timer expires and/or is reset by $\overline{MR}$. The $\overline{MR}$ input has an internal pull-up to BAT.

9.3.7.1 $\overline{MR}$ Wake or Short Button Press Functions

There are two programmable wake or short button press timers, WAKE1 and WAKE2. When the $\overline{MR}$ pin is held low for t_{WAKE1} the device sends an interrupt (128 μ s active low pulse in the $\overline{INT}$ pin) and sets the MRWAKE1_TIMEOUT flag when it expires. If the $\overline{MR}$ pin continues to be driven low after WAKE1 and the WAKE2 timer expires, the BQ21062 sends a second interrupt and sets the MRWAKE2_TIMEOUT flag. WAKE1 is used as the timer to wake the device from ship mode. WAKE2's only function is to send the interrupt and has no effect on other BQ21062 functions. These flags are not cleared until they have been read by the host. Note that interrupts are only sent when the flags are set and the flags must be cleared in order for another interrupt to be sent upon $\overline{MR}$ press. The timer durations can be set through the MR_WAKEx_TIMER bits in the [MRCTRL Register](#) section.

One of the main $\overline{MR}$ functions is to wake the device from Ship Mode when the $\overline{MR}$ is asserted. The device will exit the Ship Mode when the $\overline{MR}$ pin is held low for at least t_{WAKE1} . Immediately after the $\overline{MR}$ is asserted, VDD will be enabled and the digital will start the WAKE counter. If the $\overline{MR}$ signal remains low until after the WAKE1 timer expires, the device will power up PMID and LDO (If enabled) completing the exit from the ship mode. If the $\overline{MR}$ signal goes high before the WAKE1 timer expires, the device will go back to the Ship Mode operation, never powering up PMID or the LDO. Note that if the $\overline{MR}$ pin remains low after exiting Ship Mode the wake interrupts will not be sent and the long button press functions like HW reset will not occur until the $\overline{MR}$ pin is toggled. In the case where a valid V_{IN} ($V_{IN} > V_{UVLO}$) is connected prior to WAKE2 timer expiring, the device will exit the ship mode immediately regardless of the $\overline{MR}$ or wake timer state. [Figure 9-3](#) and [Figure 9-4](#) show these different scenarios.

Figure 9-3. MR Wake from Ship Mode (MR_LPRESS_ACTION = Ship Mode, VIN not valid)

Figure 9-4. MR Wake from Ship Mode – VIN Dependencies

9.3.7.2 MR Reset or Long Button Press Functions

The BQ21062 device may be configured to perform a system hardware reset (Power Cycle/Autowake), go into Ship Mode, or simply do nothing after a long button press (for example, when the $\overline{\text{MR}}$ pin is driven low until the MR_HW_RESET timer expires). The action taken by the device when the timer expires is configured through the MR_LPRESS_ACTION bits in the [ICCTRL1 Register](#) section. Once the MR_HW_RESET timer expires the device immediately performs the operation set by the MR_LPRESS_ACTION bits. The BQ21062 sends an interrupt to the host when the device detects that $\overline{\text{MR}}$ has been pressed for a period that is within $t_{\text{RESET_WARN}}$ from reaching $t_{\text{HW_RESET}}$. This may warn the host that the button has been pressed for a period close to $t_{\text{HW_RESET}}$ which would trigger a HW Reset or used as another button press timer interrupt like the WAKE1 and WAKE2 timers. This interrupt is sent before the MR_HW_RESET timer expires and sets the MRRESET_WARN flag. The $t_{\text{RESET_WARN}}$ may be set through I²C by the MR_RESET_WARN bits in the MRCTRL register. The host may change the reset behavior at any time after $\overline{\text{MR}}$ going low and prior to the MR_HW_RESET timer expiring. It may not change it however from another behavior to a HW reset (Power Cycle/Autowake) since a HW reset can be gated by other condition requirements, such as a valid VIN presence (controlled by MR_RESET_VIN

bit), throughout the whole duration of the button press. This flexibility allows the host to abort any reset or power shutdown to the system by overriding a long button press command.

A HW reset may also be started by setting the HW_RESET bit. Note that during a HW reset, VDD remains on.

Figure 9-5. MR Wake and Reset Timing with VIN Present or BAT Active Mode When $MR_LPRESS_ACTION = 00$

Figure 9-6. MR Wake and Reset Timing Active Mode When $MR_LPRESS_ACTION = 1x$ (Ship Mode) and Only BAT is Present

9.3.8 14-Second Watchdog for HW Reset

The BQ21062 integrates a 14-second watchdog timer that makes the BQ21062 perform a HW reset/power cycle if no I²C transaction is detected within 14 seconds of a valid adapter being connected. If the adapter is connected and the host responds with an I²C transaction before the 14-second watchdog window expires, the part continues in normal operation. The 14-second watchdog is disabled by default and may be enabled through I²C by setting the HWRESET_14S_WD bit. [Figure 9-7](#) shows the basic functionality of this feature.

Figure 9-7. 14-Second Watchdog for HW Reset Behavior

9.3.9 Faults Conditions and Interrupts (INT)

The device contains an open-drain output that signals an interrupt and is valid only after the device has completed start-up into a valid state. If the part starts into a fault, interrupts will not be sent. The INT pin is normally in high impedance and is pulled low for 128 μ s when an interrupt condition occurs. When a fault or status change occurs or any other condition that generates an interrupt such as CHARGE_DONE, a 128- μ s pulse (interrupt) is sent on INT to notify the host. All interrupts may be masked through I²C. If the interrupt condition occurs while the interrupt is masked an interrupt pulse will not be sent. If the interrupt is unmasked while the fault condition is still present, an interrupt pulse will not be sent until the INT trigger condition occurs while unmasked.

9.3.9.1 Flags and Fault Condition Response

[Table 9-3](#) below details the BQ21062 behavior when a fault condition occurs.

Table 9-3. Interrupt Triggers and Fault Condition Response

FAULT / FLAG	DESCRIPTION	INTERRUPT TRIGGER BASED ON STATUS BIT CHANGE	CHARGER BEHAVIOR	CHARGER SAFETY TIMER	PMID BEHAVIOR
CHRG_CV_FLAG	Set when charger enters Constant Voltage operation	Rising Edge	Enabled	No effect	IN powered if V _{IN} is valid
CHARGE_DONE_FLAG	Set when charger reaches termination	Rising Edge	Paused- Charging resumes with VIN or CE toggle or when V _{RCH} is reached	Reset	IN powered if V _{IN} is valid
IINLIM_ACTIVE_FLAG	Set when Input Current Limit loop is active	Rising Edge	Enabled. Reduced charge current.	Doubled if option is enabled	IN powered VIN powered unless supplement mode condition is met.
VINDPM_ACTIVE_FLAG	Set when VINDPM loop is active	Rising Edge	Enabled. Reduced charge current.	Doubled if option is enabled	VIN powered unless supplement mode condition is met.
THERMREG_ACTIVE	Set when Thermal Charge Current Foldback (Thermal Regulation) loop is active	Rising Edge	Enabled. Reduced charge current.	Doubled if option is enabled	VIN powered unless supplement mode condition is met.

Table 9-3. Interrupt Triggers and Fault Condition Response (continued)

FAULT / FLAG	DESCRIPTION	INTERRUPT TRIGGER BASED ON STATUS BIT CHANGE	CHARGER BEHAVIOR	CHARGER SAFETY TIMER	PMID BEHAVIOR
VIN_PGOOD_FLAG	Set when VIN changes PGOOD status	Rising and Falling Edge	If VIN_PGOOD_STAT is low, charging is disabled.	Reset	VIN powered (if VIN_PGOOD_STAT = 1) unless PMID_MODE is not 00.
VIN_OVP_FAULT_FLAG	Set when $V_{IN} > V_{OVP}$	Rising Edge	Charging is paused until condition disappears	Reset	BAT powered
BAT_OCP_FAULT_FLAG	Set when $I_{BAT} > I_{BATOC}$	Rising Edge	Disabled (BAT only condition)	N/A	Disconnect BAT
BAT_UVLO_FAULT_FLAG	Set when $V_{BAT} < V_{BATUVLO}$	Rising Edge	Enabled	No effect	IN powered if V_{IN} is valid
TS_COLD_FLAG	Set when $V_{TS} > V_{TS_COLD}$	Rising Edge	Charging paused until condition is cleared	Paused	IN powered if V_{IN} is valid
TS_COOL_FLAG	Set when $V_{TS_COLD} > V_{TS} > V_{TS_COOL}$	Rising Edge	Enabled. Reduced charge current.	Doubled if option is enabled	IN powered if V_{IN} is valid
TS_WARM_FLAG	Set when $V_{TS_HOT} < V_{TS} < V_{TS_WARM}$	Rising Edge	Enabled. Reduce battery regulation voltage.	No effect	IN powered if V_{IN} is valid
TS_HOT_FLAG	Set when $V_{TS} < V_{HOT}$	Rising Edge	Charging paused until condition is cleared	Paused	IN powered if V_{IN} is valid
TS_OPEN_FLAG	Set when $V_{TS} > V_{TS_OPEN}$	Rising Edge	Charging is paused until condition disappears	Paused	N/A
WD_FAULT_FLAG	Set when I ² C watchdog timer expires	Rising Edge	Enabled	N/A	N/A
SAFETY_TMR_FAULT_FLAG	Set when safety Timer expires. Cleared after VIN or $\overline{CE}$ toggle	Rising Edge	Disabled until VIN or $\overline{CE}$ toggle	Reset after flag is cleared	IN powered if V_{IN} is valid
LS_LDO_OCP_FAULT_FLAG	Set when LDO output current exceeds OCP condition	Rising Edge	N/A	N/A	N/A
MRWAKE1_TIMEOUT_FLAG	Set when $\overline{MR}$ is low for at least t_{WAKE1}	Rising Edge	N/A	N/A	N/A
MRWAKE2_TIMEOUT_FLAG	Set when $\overline{MR}$ is low for at least t_{WAKE2}	Rising Edge	N/A	N/A	N/A
MRRESET_WARN_FLAG	Set when $\overline{MR}$ is low for at least $t_{RESETWARN}$	Rising Edge	N/A	N/A	N/A
TSHUT	No flag. Die temperature exceeds thermal shutdown threshold is reached	N/A	Disabled	Disabled	Disabled

9.3.10 Power Good ($\overline{PG}$) Pin

The $\overline{PG}$ pin is an open-drain output that by default indicates when a valid IN supply is present. It may also be configured to be a general purpose output (GPO) controlled through I²C or to be a level shifted version of the $\overline{MR}$ input signal. Connect $\overline{PG}$ to the desired logic voltage rail using a 1-k Ω to 100-k Ω resistor, or use with an LED for visual indication. See [Table 9-30](#) for details.

9.3.11 External NTC Monitoring (TS)

The I²C interface allows the user to easily implement the JEITA standard for systems where the battery pack thermistor is monitored by the host. Additionally, the device provides a flexible voltage based TS input for

monitoring the battery pack NTC thermistor. The voltage at TS is monitored to determine that the battery is at a safe temperature during charging. The TS pin is not biased continuously, instead it is biased only when the voltage at the pin is being sampled (for about 25ms in 225ms intervals when VIN is present. Note that the TS biasing cannot be disabled when VIN is present.

The part can be configured to meet JEITA requirements or a simpler HOT/COLD function only. Additionally, the TS charger control function can be disabled. To satisfy the JEITA requirements, four temperature thresholds are monitored: the cold battery threshold, the cool battery threshold, the warm battery threshold, and the hot battery threshold. These temperatures correspond to the V_{COLD} , V_{COOL} , V_{WARM} , and V_{HOT} thresholds in the Electrical Characteristics table. Charging and safety timers are suspended when $V_{TS} < V_{HOT}$ or $V_{TS} > V_{COLD}$. When $V_{COOL} < V_{TS} < V_{COLD}$, the charging current is reduced to the value programmed in the [TS_FASTCHGCTRL](#) register. Note that the current steps for fast charge in the COOL region, just as those in normal fast charge, are multiples of the fast charge LSB value (1.25 mA by default). So in the case where the calculated scaled down current for the COOL region falls in between charge current steps, the device will round down the charge current to the nearest step. For example, if the fast charge current is set for 15 mA (ICHG = 1100) and TS_FASTCHARGE = 111 ($0.125 \times ICHG$), the charge current in the COOL region will be 1.25 mA instead of the calculated 1.85 mA.

When $V_{HOT} < V_{TS} < V_{WARM}$, the battery regulation voltage is reduced to the value programmed in the [TS_FASTCHGCTRL](#) register.

Regardless of whether the part is configured for JEITA, HOT/COLD, or disabled, when a TS fault occurs, a 128-μs pulse is sent on the INT output, and the FAULT bits of the register are updated over I²C. The FAULT bits are not cleared until they are read over I²C. This allows the host processor to take action if a different behavior than the pre-set function is needed. Alternately, the TS pin voltage can be read by the host if VIN is present or when BAT is present, so the appropriate action can be taken by the host.

When in Battery only mode, a reading of the TS pin can be triggered to check for any TS faults. This is done by setting the [TS_FAULT_MEAS register \(0x58\)](#) to 0x04 which sets the TS_FAULT_MEAS_ENABLE bit. The interval of the /INT interrupt can be configured in [TS_READ Register](#) to either be a manual read or every second in the INTERVAL bit. When configured to manual read, the fault read will have to be initiated by setting the GET_FAULT_ENABLE bit which will automatically enable the I_{TS_BIAS} current on TS.

9.3.11.1 TS Thresholds

The BQ21062 monitors the TS voltage and sends an interrupt to the host whenever it crosses the V_{HOT} , V_{WARM} , V_{COOL} and V_{COLD} thresholds which correspond to different temperature thresholds based on the NTC resistance and biasing. These thresholds may be adjusted through I²C by the host. The device will also disable charging if TS pin exceeds the V_{TS_OPEN} threshold.

The TS biasing circuit is shown in [Figure 9-8](#). Note that the respective V_{TS} for T_{COLD} (0°C), T_{COOL} (10°C), T_{WARM} (45°C) and T_{HOT} (60°C) changes for every NTC, therefore the threshold values may need to be adjusted through I²C based on the supported NTC type.

Figure 9-8. TS Bias Functional Diagram

The BQ21062 supports by default the following thresholds for a 10-K Ω NTC.

Table 9-4. TS Thresholds for 10-K Ω Thermistor with 3380 B-Constant

THRESHOLD	TEMPERATURE (°C)	V _{TS} (V)
Open	--	>0.9
Cold	0	0.585
Cool	10	0.514
Warm	45 ⁽¹⁾	0.265
Hot	45 ⁽¹⁾	0.265

(1) When V_{HOT} is set to the same or higher voltage level as V_{WARM}, the WARM region is overwritten by HOT region functionality (charge is disabled).

9.3.12 I²C Interface

The BQ21062 device uses a fully compliant I²C interface to program and read control parameters, status bits, and so on. I²C is a 2-wire serial interface developed by Philips Semiconductor (see I²C-Bus Specification, Version 2.1, January 2000). The bus consists of a data line (SDA) and a clock line (SCL) with pull-up structures. When the bus is idle, both SDA and SCL lines are pulled high. All the I²C compatible devices connect to the I²C bus through open drain I/O pins, SDA and SCL. A master device, usually a micro-controller or a digital signal processor, controls the bus. The master is responsible for generating the SCL signal and device addresses. The master also generates specific conditions that indicate the START and STOP of data transfer. A slave device receives and/or transmits data on the bus under control of the master device.

The BQ21062 works as a slave and supports the following data transfer modes, as defined in the I²C Bus Specification: standard mode (100 kbps) and fast mode (400 kbps). The interface adds flexibility to the battery charge solution, enabling most functions to be programmed to new values depending on the instantaneous application requirements.

Register contents remain intact as long as VBAT or VIN voltages remains above their respective UVLO levels.

The data transfer protocol for standard and fast modes is exactly the same; therefore, they are referred to as the F/S-mode in this document. The BQ21062 device 7-bit address is 0×6B (shifted 8-bit address is 0xD6).

9.3.12.1 F/S Mode Protocol

The master initiates data transfer by generating a start condition. The start condition is when a high-to-low transition occurs on the SDA line while SCL is high, as shown in Figure 9-9. All I²C-compatible devices should recognize a start condition.

Figure 9-9. START and STOP Condition

The master then generates the SCL pulses, and transmits the 8-bit address and the read/write direction bit R/W on the SDA line. During all transmissions, the master ensures that data is valid. A valid data condition requires the SDA line to be stable during the entire high period of the clock pulse (see Figure 9-10). All devices recognize the address sent by the master and compare it to their internal fixed addresses. Only the slave device with a matching address generates an acknowledge (see Figure 9-11) by pulling the SDA line low during the entire high period of the ninth SCL cycle. Upon detecting this acknowledge, the master knows that communication link with a slave has been established.

Figure 9-10. Bit Transfer on the Serial Interface

The master generates further SCL cycles to either transmit data to the slave (R/W bit 1) or receive data from the slave (R/W bit 0). In either case, the receiver needs to acknowledge the data sent by the transmitter. So an acknowledge signal can either be generated by the master or by the slave, depending on which one is the receiver. The 9-bit valid data sequences consisting of 8-bit data and 1-bit acknowledge can continue as long as necessary. To signal the end of the data transfer, the master generates a stop condition by pulling the SDA line from low to high while the SCL line is high (see Figure 9-9). This releases the bus and stops the communication link with the addressed slave. All I²C compatible devices must recognize the stop condition. Upon the receipt of a stop condition, all devices know that the bus is released, and wait for a start condition followed by a matching address. If a transaction is terminated prematurely, the master needs to send a STOP condition to prevent the slave I²C logic from remaining in an incorrect state. Attempting to read data from register addresses not listed in this section will result in FFh being read out.

Figure 9-12. Bus Protocol

9.4 Device Functional Modes

The BQ21062 has four main modes of operation: Active Battery Mode, Low Power Mode and Ship Mode which are battery only modes and Charge/Adapter Mode when a supply is connected to IN. [Table 9-5](#) below summarizes the functions that are active for each operation mode. Each mode is discussed in further detail in the following sections in addition to the device's power-up/down sequences.

Table 9-5. Function Availability Based on Primary Mode of Operation

FUNCTION	CHARGE/ ADAPTER MODE	SHIP MODE	LOW POWER MODE	ACTIVE BATTERY MODE
VOVP	Yes	No	Yes	Yes
VUVLO	Yes	Yes	Yes	Yes
BATOCPC	Yes	No	No	Yes
BATUVLO	Yes	No	Yes	Yes
VINDPM	If enabled	No	No	No
VDD	Yes	No	Yes	Yes
LS/LDO	Yes	No	If enabled	If enabled
BATFET	Yes	No	Yes	Yes
TS Measurement	Yes	No	No	If enabled
Battery Changing	If enabled	No	No	No
ILIM	Yes (Register Value)	No	No	No
$\overline{\text{MR}}$ input	Yes	Yes	Yes	Yes
$\overline{\text{LP}}$ input	No	No	Yes	Yes
$\overline{\text{INT}}$ output	Yes	No	No	Yes
I ² C	Yes	No	No	Yes
$\overline{\text{CE}}$ input	Yes	No	No	No

9.4.1 Ship Mode

Ship Mode is the lowest quiescent current state for the device. Ship Mode latches off the device and BAT FET until $V_{\text{IN}} > V_{\text{UVLO}}$ or the $\overline{\text{MR}}$ button is depressed for t_{WAKE1} and released. Ship mode can be entered regardless of the state of $\overline{\text{CE}}$. The device will also enter Ship Mode upon battery insertion when no valid VIN is present. If the EN_SHIPMODE is written to a 1 while a valid input supply is connected, the device will wait until the IN supply is removed to enter ship mode. If the $\overline{\text{MR}}$ pin is held low when the EN_SHIPMODE bit is set, the device will wait until the $\overline{\text{MR}}$ pin goes high before entering Ship Mode. [Figure 9-13](#) shows this behavior. The battery voltage must be above the maximum programmable V_{BATUVLO} threshold in order to exit Ship Mode with $\overline{\text{MR}}$ press. The EN_SHIPMODE bit can be cleared using the I²C interface while the VIN input is valid. The EN_SHIPMODE bit is not cleared upon the I²C watchdog expiring, this means that if watchdog timer fault occurs while the EN_SHIPMODE bit is set and the device is waiting to go into Ship Mode because V_{IN} is present or $\overline{\text{MR}}$ is low, the device will still proceed to go into Ship Mode once those conditions are cleared.

Figure 9-13. Ship Mode Entry Based On EN_SHIPMODE Bit

9.4.2 Low Power

Low Power mode is a low quiescent current state while operating from the battery. The device will operate in low power mode when the $\overline{\text{LP}}$ pin is set low, $V_{\text{IN}} < V_{\text{UVLO}}$, $\overline{\text{MR}}$ pin is high and all I²C transactions and interrupts that started while in the Active Battery or Charging Modes have been completed and sent. During LP mode the VDD output is powered by BAT, the $\overline{\text{MR}}$ inputs are active and the I²C is disabled. All other circuits, such as oscillators, are in a low power or off state. The LS/LDO outputs will remain in the state set by the EN_LS_LDO bit prior to entering Low Power Mode. The device exits LP Mode when the $\overline{\text{LP}}$ pin is set high or $V_{\text{IN}} > V_{\text{UVLO}}$.

In the case that a faulty adapter with $V_{\text{IN}} > V_{\text{OVP}}$ is connected to the device while $\overline{\text{LP}}$ pin is low, the device will be powered from the battery, but will operate in Active battery mode instead of Low Power mode regardless of the $\overline{\text{LP}}$ pin state.

When $\overline{\text{MR}}$ is held low while $\overline{\text{LP}}$ is low, the device will enter Active Battery Mode, this allows for the internal clocks of the device to be running and allow the $\overline{\text{MR}}$ long button press HW reset. I²C operation is also possible during this condition. Note that as soon as the $\overline{\text{MR}}$ input is released and goes high, the device will go back to LP Mode tuning off all clocks. Note that if a HW reset has occurred while $\overline{\text{LP}}$ is low, $\overline{\text{MR}}$ must remain low until the power cycle has completed (PMID and LDO enable) to allow completion of the power up sequence.

9.4.3 Active Battery

When the device is out of Ship Mode and battery is above V_{BATUVLO} with no valid input source, the battery discharge FET is turned on connecting PMID to the battery. The current flowing from BAT to PMID is not regulated, but it is monitored by the battery over-current protection (OCP) circuitry. If the battery discharge current exceed the OCP threshold, the battery discharge FET will be turned off as detailed in [Section 9.3.2.4](#).

If only battery is connected and the battery voltage goes below V_{BATUVLO} , the battery discharge FET is turned off. To provide designers the most flexibility in optimizing their system, an adjustable BATUVLO is provided. Deeper discharge of the battery enables longer times between charging, but may shorten the battery life. The BATUVLO is adjustable with a fixed 150-mV hysteresis.

9.4.4 Charger/Adapter Mode

This mode is active when $V_{\text{IN}} > V_{\text{UVLO}}$. If the supply at IN is valid and above the $V_{\text{IN_DPM}}$ level, PMID will be powered by the supply connected to IN. The device will charge the battery, if charging is enabled, until termination has occurred.

9.4.5 Power-Up/Down Sequencing

The power-up and power-down sequences for the BQ21062 are shown below. Upon V_{IN} insertion, $V_{\text{IN}} > V_{\text{UVLO}}$, the device wakes up, powering the VDD rail. If $V_{\text{IN}} > V_{\text{BAT}} + V_{\text{SLP}}$ and $V_{\text{IN}} < V_{\text{OVP}}$, PMID will be powered by VIN and if $V_{\text{IN}} > V_{\text{IN_DPM}}$ charging will start if enabled.

In the case where $V_{\text{IN}} < V_{\text{UVLO}}$ and the battery is inserted ($V_{\text{BAT}} > V_{\text{BATUVLO}}$), the device will immediately enter Ship Mode unless $\overline{\text{MR}}$ is held low. Upon battery insertion the VDD rail will come up to allow the device to check the $\overline{\text{MR}}$ state and if $\overline{\text{MR}}$ is high VDD will immediately be disabled and the device will enter Ship Mode. If $\overline{\text{MR}}$ is

low, the device will start the WAKE timer and power up PMID and other rails if $\overline{\text{MR}}$ is held low for longer than t_{WAKE1} .

10 Application and Implementation

Note

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

10.1 Application Information

A typical application of the BQ21062 consists of the device configured as an I²C controlled single cell Li-ion battery charger and power path manager or small battery applications such as smart-watches and wireless headsets. A battery thermistor may be connected to the TS pin to allow the device to monitor the battery temperature and control charging as desired.

The system designer may connect the $\overline{\text{MR}}$ input to a push-button to send interrupts to the host as the button is pressed or to allow the application's end user to reset the system. If not used this pin must be left floating or tied to BAT.

10.2 Typical Application

Figure 10-1. Typical Application Diagram

10.2.1 Design Requirements

The design parameters for the following design example are shown in the table below.

Table 10-1. Design Parameters

PARAMETER	VALUE
IN Supply Voltage	5 V
Battery Regulation Voltage	4.35 V
LDO Output Voltage	LDO (1.8 V)

10.2.2 Detailed Design Procedure

10.2.2.1 Input (IN/PMID) Capacitors

Low ESR ceramic capacitors such as X7R or X5R is preferred for input decoupling capacitors and should be placed as close as possible to the supply and ground pins for the IC. Due to the voltage derating of the capacitors it is recommended that 25-V rated capacitors are used for IN and PMID pins which can normally operate at 5 V. After derating the minimum capacitance must be higher than 1 μ F.

10.2.2.2 VDD, LDO Input and Output Capacitors

A Low ESR ceramic capacitor such as X7R or X5R is recommended for the LDO decoupling capacitor. A 4.7- μ F capacitor is recommended for VDD output. For the LDO output a 2.2- μ F capacitor is recommended. The minimum supported capacitance after derating must be higher than 1 μ F to ensure stability. The VINLS input bypass capacitor value should match or exceed the LDO output capacitor value.

10.2.2.3 TS

A 10-K Ω NTC should be connected in parallel to a 10-k Ω biasing resistor connected to ground. The ground connection of both the NTC and biasing resistor must be done as close as possible to the GND pin of the device or kelvin connected to it to minimize any error in TS measurement due to IR drops on the board ground lines.

If the system designer does not wish to use the TS function for charging control, a 5-k Ω resistor from TS to ground must be connected.

10.2.2.4 Recommended Passive Components

Table 10-2. Recommended Passive Components

	MIN	NOM	MAX	UNIT
C _{PMID} Capacitance in PMID pin	1 ⁽¹⁾	22	47	μ F
C _{LDO} LDO output capacitance	1	2.2	4.7	μ F
C _{VDD} VDD output capacitance	1	2.2	4.7	μ F
C _{BAT} BAT pin capacitance	1		–	μ F
C _{IN} IN input bypass capacitance	1	4.7	10	μ F
C _{INLS} VINLS input bypass capacitance	1		–	μ F
C _{TS} Capacitance from TS pin to ground	0	0	1	nF

(1) For PMID regulation loop stability, for better transient performance a minimum capacitance (after derating) of 10 μ F is recommended.

Figure 10-19. LDO Load Transient - VLDO = 3.3V

Figure 10-20. LDO Load Transient - VLDO = 1.2V

11 Power Supply Recommendations

The BQ21062 requires the adapter or IN supply to be between 3.4 V and 5.5 V with at least 600-mA rating. The battery voltage must be higher than 2.4 V or $V_{BATUVLO}$ to ensure proper operation.

12 Layout

12.1 Layout Guidelines

- Have solid ground plane that is tied to the GND bump
- Place LDO and VDD output capacitors as close as possible to the respective bumps and GND or ground plane with short copper trace connection
- Place PMID capacitor as close to the PMID bump as possible and GND or ground plane.

13 Device and Documentation Support

13.1 Device Support

13.1.1 Third-Party Products Disclaimer

TI'S PUBLICATION OF INFORMATION REGARDING THIRD-PARTY PRODUCTS OR SERVICES DOES NOT CONSTITUTE AN ENDORSEMENT REGARDING THE SUITABILITY OF SUCH PRODUCTS OR SERVICES OR A WARRANTY, REPRESENTATION OR ENDORSEMENT OF SUCH PRODUCTS OR SERVICES, EITHER ALONE OR IN COMBINATION WITH ANY TI PRODUCT OR SERVICE.

13.2 Documentation Support

13.2.1 Related Documentation

For related documentation see the following: [BQ21061EVM User's Guide](#) and [BQ21061 Setup Guide Tool](#)

13.3 Receiving Notification of Documentation Updates

To receive notification of documentation updates, navigate to the device product folder on [ti.com](#). Click on *Subscribe to updates* to register and receive a weekly digest of any product information that has changed. For change details, review the revision history included in any revised document.

13.4 Support Resources

[TI E2E™ support forums](#) are an engineer's go-to source for fast, verified answers and design help — straight from the experts. Search existing answers or ask your own question to get the quick design help you need.

Linked content is provided "AS IS" by the respective contributors. They do not constitute TI specifications and do not necessarily reflect TI's views; see TI's [Terms of Use](#).

13.5 Trademarks

TI E2E™ is a trademark of Texas Instruments.

All trademarks are the property of their respective owners.

13.6 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

13.7 Glossary

[TI Glossary](#) This glossary lists and explains terms, acronyms, and definitions.

14 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

Orderable part number	Status (1)	Material type (2)	Package Pins	Package qty Carrier	RoHS (3)	Lead finish/ Ball material (4)	MSL rating/ Peak reflow (5)	Op temp (°C)	Part marking (6)
BQ21062YFPR	Active	Production	DSBGA (YFP) 20	3000 LARGE T&R	Yes	SNAGCU	Level-1-260C-UNLIM	-40 to 85	BQ21062
BQ21062YFPR.A	Active	Production	DSBGA (YFP) 20	3000 LARGE T&R	Yes	SNAGCU	Level-1-260C-UNLIM	-40 to 85	BQ21062

⁽¹⁾ **Status:** For more details on status, see our [product life cycle](#).

⁽²⁾ **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

⁽³⁾ **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

⁽⁴⁾ **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

⁽⁵⁾ **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

⁽⁶⁾ **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

Important Information and Disclaimer:The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.
