

## CDCVF2509 3.3V Phase-Lock Loop Clock Driver

### 1 Features

- Designed to meet and exceed PC133 SDRAM registered DIMM specification Rev. 1.1
- Spread Spectrum Clock-compatible
- Operating frequency: 50MHz to 175MHz
- Static phase error distribution at 66MHz to 166MHz is  $\pm 125$ ps
- Jitter (cyc - cyc) at 66MHz to 166MHz is typical = 70ps
- Advanced deep submicron process results in more than 40% lower power consumption versus current generation PC133 devices
- Available in plastic 24-pin TSSOP
- Phase-lock loop clock distribution for synchronous DRAM applications
- Distributes one clock input to one bank of five and one bank of four outputs
- Separate output enable for each output bank
- External feedback (FBIN) terminal is used to synchronize the outputs to the clock input
- 25- $\Omega$  On-chip series damping resistors
- No external RC network required
- Operates at 3.3V

### 2 Applications

- DRAM applications
- PLL-based clock distributors
- Non-PLL clock buffers

### 3 Description

The CDCVF2509 is a high-performance, low-skew, low-jitter, phase-lock loop (PLL) clock driver. The device uses a PLL to precisely align, in both frequency and phase, the feedback (FBOUT) output to the clock (CLK) input signal. The device is specifically designed for use with synchronous DRAMs. The CDCVF2509 operates at a 3.3V  $V_{CC}$  and provides integrated series-damping resistors designed for driving point-to-point loads.

One bank of five outputs and one bank of four outputs provide nine low-skew, low-jitter copies of CLK. Output signal duty cycles are adjusted to 50%, independent of the duty cycle at CLK. Each bank of outputs is enabled or disabled separately through the control (1G and 2G) inputs. When the G inputs are high, the outputs switch in phase and frequency with CLK. When the G inputs are low, the outputs are disabled to the logic-low state.

Unlike many products containing PLLs, the CDCVF2509 does not require external RC networks. The loop filter for the PLL is included on-chip, minimizing component count, board space, and cost.

The device is based on PLL circuitry, therefore the CDCVF2509 requires a stabilization time to achieve phase lock of the feedback signal to the reference signal. This stabilization time is required following power up and application of a fixed-frequency, fixed-phase signal at CLK, and following any changes to the PLL reference or feedback signals. The PLL can be bypassed by strapping  $AV_{CC}$  to ground.

The CDCVF2509A is characterized for operation from 0°C to 85°C.

For application information, see the [High Speed Distribution Design Techniques for CDC509/516/2509/2510/2516](#) and [Using CDC2509A/2510A PLL with Spread Spectrum Clocking \(SSC\)](#) application notes.

## Pin Configuration and Functions

**Table 4-1. Pin Functions**

PIN		TYPE	DESCRIPTION
NAME	NO.		
CLK	24	I	Clock input. CLK provides the clock signal to be distributed by the CDCVF2509A clock driver. CLK is used to provide the reference signal to the integrated PLL that generates the clock output signals. CLK must have a fixed frequency and fixed phase for the PLL to obtain phase lock. Once the circuit is powered up and a valid CLK signal is applied, a stabilization time is required for the PLL to phase lock the feedback signal to its reference signal.
FBIN	13	I	Feedback input. FBIN provides the feedback signal to the internal PLL. FBIN must be hard-wired to FBOU to complete the PLL. The integrated PLL synchronizes CLK and FBIN so that there is nominally zero phase error between CLK and FBIN.
1G	11	I	Output bank enable. 1G is the output enable for outputs 1Y(0:4). When 1G is low, outputs 1Y(0:4) are disabled to a logic-low state. When 1G is high, all outputs 1Y(0:4) are enabled and switch at the same frequency as CLK.
2G	14	I	Output bank enable. 2G is the output enable for outputs 2Y(0:3). When 2G is low, outputs 2Y(0:3) are disabled to a logic low state. When 2G is high, all outputs 2Y(0:3) are enabled and switch at the same frequency as CLK.
FBOU	12	O	Feedback output. FBOU is dedicated for external feedback. It switches at the same frequency as CLK. When externally wired to FBIN, FBOU completes the feedback loop of the PLL. FBOU has an integrated 25-Ω series-damping resistor.
1Y (0:4)	3, 4, 5, 8, 9	O	Clock outputs. These outputs provide low-skew copies of CLK. Output bank 1Y(0:4) is enabled via the 1G input. These outputs can be disabled to a logic-low state by deasserting the 1G control input. Each output has an integrated 25-Ω series-damping resistor.
2Y (0:3)	16, 17, 21, 20	O	Clock outputs. These outputs provide low-skew copies of CLK. Output bank 2Y(0:3) is enabled via the 2G input. These outputs can be disabled to a logic-low state by deasserting the 2G control input. Each output has an integrated 25-Ω series-damping resistor.
AV <sub>CC</sub>	23	Power	Analog power supply. AV <sub>CC</sub> provides the power reference for the analog circuitry. In addition, AV <sub>CC</sub> can be used to bypass the PLL. When AV <sub>CC</sub> is strapped to ground, PLL is bypassed and CLK is buffered directly to the device outputs.
AGND	1	Ground	Analog ground. AGND provides the ground reference for the analog circuitry.
V <sub>CC</sub>	2, 10, 15, 22	Power	Power supply
GND	6, 7, 18, 19	Ground	Ground

## 4 Specifications

### 4.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)<sup>(1)</sup>

	UNIT
$AV_{CC}$ Supply voltage range <sup>(2)</sup>	$AV_{CC} < V_{CC} + 0.7\text{ V}$
$V_{CC}$ Supply voltage range	$-0.5\text{ V to }4.3\text{ V}$
$V_I$ Input voltage range <sup>(3)</sup>	$-0.5\text{ V to }4.6\text{ V}$
$V_O$ Voltage range applied to any output in the high or low state <sup>(3) (4)</sup>	$-0.5\text{ V to }V_{CC} + 0.5\text{ V}$
$I_{IK}$ Input clamp current ( $V_I < 0$ )	$-50\text{ mA}$
$I_{OK}$ Output clamp current ( $V_O < 0$ or $V_O > V_{CC}$ )	$\pm 50\text{ mA}$
$I_O$ Continuous output current ( $V_O = 0$ to $V_{CC}$ )	$\pm 50\text{ mA}$
Continuous current through each $V_{CC}$ or GND	$\pm 100\text{ mA}$
Maximum power dissipation at $T_A = 55^\circ\text{C}$ (in still air) <sup>(5)</sup>	$0.7\text{ W}$
$T_{stg}$ Storage temperature range	$-65^\circ\text{C to }150^\circ\text{C}$

- (1) Stresses beyond those listed under "absolute maximum ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2)  $AV_{CC}$  **must not** exceed  $V_{CC} + 0.7\text{ V}$
- (3) The input and output negative-voltage ratings may be exceeded if the input and output clamp-current ratings are observed.
- (4) This value is limited to 4.6 V maximum.
- (5) The maximum package power dissipation is calculated using a junction temperature of  $150^\circ\text{C}$  and a board trace length of 750 mils. For more information, see the *Package Thermal Considerations* application note in the *ABT Advanced BiCMOS Technology Data Book* (SCBD002).

### 4.2 Dissipation Ratings

(1) For conditions shown as MIN or MAX, use the appropriate value specified under the *recommended operating conditions* section.

(2) For dynamic I<sub>CC</sub> vs Frequency, see [Figure 4-6](#) and [Figure 4-7](#).

## 4.6 Timing Requirements

over recommended ranges of supply voltage and operating free-air temperature

	MIN	MAX	UNIT
f <sub>clk</sub> Clock frequency	50	175	MHz
Input clock duty cycle	40%	60%	
Stabilization time <sup>(1)</sup>		1	ms

(1) The time required for the integrated PLL circuit to obtain phase lock of its feedback signal to its reference signal. For phase lock to be obtained, a fixed-frequency, fixed-phase reference signal must be present at CLK. Until phase lock is obtained, the specifications for propagation delay, skew and jitter parameters given in the *switching characteristics* table are not applicable. This parameter does not apply for input modulation under SSC application.

### 6.4 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

<sup>(1)</sup> **Status:** For more details on status, see our [product life cycle](#).

<sup>(2)</sup> **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

<sup>(3)</sup> **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

<sup>(4)</sup> **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

<sup>(5)</sup> **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

<sup>(6)</sup> **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.
