

DAC8043

CMOS 12-Bit Serial Input Multiplying DIGITAL-TO-ANALOG CONVERTER

FEATURES

- 12-BIT ACCURACY IN 8-PIN SOIC
- FAST 3-WIRE SERIAL INTERFACE
- LOW INL AND DNL: $\pm 1/2$ LSB max
- GAIN ACCURACY TO ± 1 LSB max
- LOW GAIN TEMPCO: 5ppm/°C max
- OPERATES WITH +5V SUPPLY
- TTL/CMOS COMPATIBLE
- ESD PROTECTED

APPLICATIONS

- AUTOMATIC CALIBRATION
- MOTION CONTROL
- MICROPROCESSOR CONTROL SYSTEMS
- PROGRAMMABLE AMPLIFIER/
ATTENUATORS
- DIGITALLY CONTROLLED FILTERS

DESCRIPTION

The DAC8043 is a 12-bit current output multiplying digital-to-analog converter (DAC) that is packaged in a space-saving, surface-mount 8-pin SOIC. Its 3-wire serial interface saves additional circuit board space which results in low power dissipation. When used with microprocessors having a serial port, the DAC8043 minimizes the digital noise feedthrough from its input to output. The serial port can be used as a dedicated analog bus and kept inactive while the DAC8043 is in use. Serial interfacing reduces the complexity of opto or transformer isolation applications.

The DAC8043 contains a 12-bit serial-in, parallel-out shift register, a 12-bit DAC register, a 12-bit CMOS DAC, and control logic. Serial input (SRI) data is clocked into the input register on the rising edge of the clock (CLK) pulse. When the new data word had been clocked in, it is loaded into the DAC register by taking the $\overline{LD}$ input low. Data in the DAC register is converted to an output current by the D/A converter.

The DAC8043 operates from a single +5V power supply which makes the DAC8043 an ideal low power, small size, high performance solution for several applications.

SPECIFICATIONS

ELECTRICAL CHARACTERISTICS

At $V_{DD} = +5V$; $V_{REF} = +10V$; $I_{OUT} = GND = 0V$; $T_A =$ Full Temperature Range specified under Absolute Maximum Ratings, unless otherwise noted.

NOTES: (1) ±1/2 LSB = ±0.012% of Full Scale. (2) All grades are monotonic to 12-bits over temperature. (3) Using internal feedback resistor. (4) Applies to I_{OUT} . All digital inputs = 0V. (5) Guaranteed by design and not tested. (6) I_{OUT} Load = 100 Ω , $C_{EXT} = 13pF$, digital input = 0V to V_{DD} or V_{DD} to 0V. Extrapolated to 1/2 LSB: t_S = propagation delay (t_{PD}) + 9 τ where τ = measured time constant of the final RC decay. (7) $V_{REF} = +10V$, all digital inputs = 0V. (8) Absolute temperature coefficient is less than ±50ppm/ $^\circ C$. (9) Digital inputs are CMOS gates: I_{IN} is typically 1nA at +25 $^\circ C$. (10) $V_{REF} = 0V$, all digital inputs = 0V to V_{DD} or V_{DD} to 0V. (11) All digital inputs = 0V. (12) Calculated from worst case R_{REF} : I_{ZSE} (in LSBs) = ($R_{REF} \times I_{LKG} \times 4096$)/ V_{REF} . (13) Calculations from $e_N = \sqrt{4K TRB}$ where: K = Boltzmann constant, J/ $^\circ K$, R = resistance, Ω . T = Resistor temperature, $^\circ K$, B = bandwidth, Hz. (14) Tested at $V_{IN} = 0V$ or V_{DD} .

POWER SUPPLY				
Supply Current	I_{DD}	Digital Inputs = V_{IH} or V_{IL}	500	μA max
		Digital Inputs = $0V$ to V_{DD}	100	μA max

NOTE: Electrical tests are performed at wafer probe to the limits shown. Due to variations in assembly methods and normal yield loss, yield after packaging is not guaranteed for standard product dice. Consult factory to negotiate specifications based on dice lot qualifications through sample lot assembly and testing.

ABSOLUTE MAXIMUM RATINGS

V_{DD} to GND	0V, +7V
V_{REF} to GND	$\pm 25V$
V_{RFB} to GND	$\pm 25V$
Digital Input Voltage Range	-0.3V to V_{DD}
Output Voltage (Pin 3)	-0.3 V to V_{DD}
Operating Temperature Range	
AD	0°C to +70°C
U, UC	-40°C to +85°C
Junction Temperature	+150°C
Storage Temperature	-65°C to +150°C
Lead Temperature (soldering, 10s)	+300°C
θ_{JA}	+100°C/W
θ_{JC}	+42°C/W

CAUTION: 1. Do not apply voltages higher than V_{DD} or less than GND potential on any terminal except V_{REF} (Pin 1) and R_{FB} (Pin 2). 2. The digital control inputs are ESD protected; however, permanent damage may occur on unprotected units from high-energy electrostatic fields. Keep units in conductive foam at all times until ready to use. 3. Use proper anti-static handling procedures. 4. Absolute Maximum Ratings apply to both packaged devices. Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device.

PACKAGE/ORDERING INFORMATION

PRODUCT	INL	TEMPERATURE RANGE	PACKAGE	PACKAGE DRAWING NUMBER ⁽¹⁾
DAC8043U	1LSB	-40°C to +85°C	8-pin SOIC	182
DAC8043UC	1/2LSB	-40°C to +85°C	8-pin SOIC	182

NOTE: (1) For detailed drawing and dimension table, please see end of data sheet, or Appendix C of Burr-Brown IC Data Book.

PIN CONFIGURATION

ELECTROSTATIC DISCHARGE SENSITIVITY

Any integrated circuit can be damaged by ESD. Burr-Brown recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet published specifications.

Digital Inputs: All digital inputs of the DAC8043 incorporate on-chip ESD protection circuitry. This protection is designed and has been tested to withstand five 2500V positive and negative discharges (100pF in series with 1500 Ω) applied to each digital input.

Analog Pins: Each analog pin has been tested to Burr-Brown's analog ESD test consisting of five 1000V positive and negative discharges (100pF in series with 1500 Ω) applied to each pin. V_{REF} and R_{FB} show some sensitivity.

WRITE CYCLE TIMING DIAGRAM

TYPICAL PERFORMANCE CURVES

At $V_{DD} = +5V$; $V_{REF} = +10V$; $I_{OUT} = GND = 0V$; $T_A = \text{Full Temperature Range specified under Absolute Maximum Ratings, unless otherwise noted.}$

DISCUSSION OF SPECIFICATIONS

RELATIVE ACCURACY

This term, also known as end point linearity or integral linearity, describes the transfer function of analog output to digital input code. Relative accuracy describes the deviation from a straight line, after zero and full scale errors have been adjusted to zero.

DIFFERENTIAL NONLINEARITY

Differential nonlinearity is the deviation from an ideal 1LSB change in the output when the input code changes by 1LSB. A differential nonlinearity specification of 1LSB maximum guarantees monotonicity.

GAIN ERROR

Gain error is the difference between the full-scale DAC output and the ideal value. The ideal full scale output value for the DAC8043 is $-(4095/4096)V_{REF}$. Gain error may be adjusted to zero using external trims as shown in Figure 4.

OUTPUT LEAKAGE CURRENT

The current which appears at I_{OUT} with the DAC loaded with all zeros.

OUTPUT CAPACITANCE

The parasitic capacitance measured from I_{OUT} to GND.

FEEDTHROUGH ERROR

The AC output error due to capacitive coupling from V_{REF} to I_{OUT} with the DAC loaded with all zeros.

OUTPUT CURRENT SETTLING TIME

The time required for the output current to settle to within $\pm 0.01\%$ of final value for a full scale step.

DIGITAL-TO-ANALOG GLITCH ENERGY

The integrated area of the glitch pulse measured in nanovolt-seconds. The key contributor to digital-to-analog glitch is charge injected by digital logic switching transients.

CIRCUIT DESCRIPTION

Figure 1 shows a simplified schematic of a DAC8043. The current from the V_{REF} pin is switched between I_{OUT} and GND by 12 single-pole double-throw CMOS switches. This main-

FIGURE 1. Simplified Circuit Diagram for the DAC.

tains a constant current in each leg of the ladder regardless of the input code. The input resistance at V_{REF} is therefore constant and can be driven by either a voltage or current, AC or DC, positive or negative polarity, and have a voltage range up to $\pm 20V$.

A CMOS switch transistor, included in series with the ladder terminating resistor and in series with the feedback resistor, R_{FB} , compensates for the temperature drift of the ON resistance of the ladder switches.

Figure 2 shows an equivalent circuit for the DAC. C_{OUT} is the output capacitance due to the N-channel switches and varies from about 80pF to 110pF with digital input code. The current source I_{LKG} is the combination of surface and junction leakages to the substrate. I_{LKG} approximately doubles every $10^\circ C$. R_O is the equivalent output resistance of the D/A and it varies with input code.

FIGURE 2. Equivalent Circuit for the DAC.

INSTALLATION

ESD PROTECTION

All digital inputs of the DAC8043 incorporate on-chip ESD protection circuitry. This protection is designed to withstand 2.5kV (using the Human Body Model, 100pF and 1500Ω). However, industry standard ESD protection methods should be used when handling or storing these components. When not in use, devices should be stored in conductive foam or rails. The foam or rails should be discharged to the destination socket potential before devices are removed.

POWER SUPPLY CONNECTIONS

The DAC8043 is designed to operate on $V_{DD} = +5V \pm 5\%$. For optimum performance and noise rejection, power supply decoupling capacitors C_D should be added as shown in the application circuits. These capacitors (1μF tantalum recommended) should be located close to the D/A. Output op amp analog common (+ input) should be connected as near to the GND pins of the DAC8043 as possible.

WIRING PRECAUTIONS

To minimize AC feedthrough when designing a PC board, care should be taken to minimize capacitive coupling between the V_{REF} lines and the I_{OUT} lines. Coupling from any of the digital control or data lines might degrade the glitch performance. Solder the DAC8043 directly into the PC board without a socket. Sockets add parasitic capacitance (which can degrade AC performance).

AMPLIFIER OFFSET VOLTAGE

The output amplifier used with the DAC8043 should have low input offset voltage to preserve the transfer function linearity. The voltage output of the amplifier has an error component which is the offset voltage of the op amp multiplied by the “noise gain” of the circuit. This “noise gain” is equal to $(R_F/R_O + 1)$ where R_O is the output impedance of the D/A I_{OUT} terminal and R_F is the feedback network impedance. The nonlinearity occurs due to the output impedance varying with code. If the 0 code case is excluded (where $R_O = \text{infinity}$), the R_O will vary from R to $3R$ providing a “noise gain” variation between $4/3$ and 2 . In addition, the variation of R_O is nonlinear with code, and the largest steps in R_O occur at major code transitions where the worst differential nonlinearity is also likely to be experienced. The nonlinearity seen at the amplifier output is

$$2V_{OS} - 4V_{OS}/3 = 2V_{OS}/3.$$

Thus, to maintain good nonlinearity the op amp offset should be much less than $1/2\text{LSB}$.

UNIPOLAR CONFIGURATION

Figure 3 shows DAC8043 in a typical unipolar (two-quadrant) multiplying configuration. The analog output values

DATA INPUT	ANALOG OUTPUT
MSB ↓ ↓ LSB	
1111 1111 1111	$-V_{REF}$ (4095/4096)
1000 0000 0000	$-V_{REF}$ (2048/4096) = $-1/2V_{REF}$
0000 0000 0001	$-V_{REF}$ (1/4096)
0000 0000 0000	0 Volts

TABLE I. Unipolar Output Code.

FIGURE 3. Unipolar Configuration.

versus digital input code are listed in Table I. The operational amplifiers used in this circuit can be single amplifiers such as the OPA602, or a dual amplifier such as the OPA2107. C_1 provides phase compensation to minimize settling time and overshoot when using a high speed operational amplifier.

If an application requires the D/A to have zero gain error, the circuit shown in Figure 4 may be used. Resistor R_2 induces a positive gain error greater than worst-case initial negative gain error. Trim resistor R_1 provides a variable negative gain error and have sufficient trim range to correct for the worst-case initial positive gain error plus the error produced by R_2 .

BIPOLAR CONFIGURATION

Figure 5 shows the DAC8043 in a typical bipolar (four-quadrant) multiplying configuration. The analog output values versus digital input code are listed in Table II.

The operational amplifiers used in this circuit can be single amplifiers such as the OPA602 or a dual amplifier such as the OPA2107. C_1 provides phase compensation to minimize settling time and overshoot when using a high speed operational amplifier. The bipolar offset resistors R_1 – R_2 should be ratio-matched to 0.01% to ensure the specified gain error performance.

DATA INPUT	ANALOG OUTPUT
MSB ↓ ↓ LSB	
1111 1111 1111	$+V_{REF}$ (2047/2048)
1000 0000 0001	$+V_{REF}$ (1/2048)
1000 0000 0000	0 Volts
0111 1111 1111	$-V_{REF}$ (1/2048)
0000 0000 0000	$-V_{REF}$ (2048/2048)

⁽¹⁾ **Status:** For more details on status, see our [product life cycle](#).

⁽²⁾ **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

⁽³⁾ **RoHS values:** Yes, No, RoHS Exempt. See the [TI RoHS Statement](#) for additional information and value definition.

⁽⁴⁾ **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

⁽⁵⁾ **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) Part marking: There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.
